Grant anticipation revenue vehicles (GARVEEs) are another tool States can use to finance highway infrastructure projects. GARVEE bonds are any bond or note repayable with future Federal-aid highway funds. The NHS Act and TEA-21 brought about changes that enabled States to use Federal-aid highway apportionments to pay debt service and other bondrelated expenses and strengthened the predictability of States' Federal-aid allocation. While GARVEEs do not generate new revenue, the new eligibility of bond-related costs for Federal-aid reimbursement provides States with one more option for repaying debt service. Candidate projects are typically large enough to merit borrowing rather than pay-as-you-go grant funding; do not have access to a revenue stream (such as local taxes or tolls) or other forms of repayment (State appropriations); and have support from the State's DOT to reserve a portion of future year Federal-aid highway funds to fund debt service. In some cases, States may elect to pledge other sources of revenue, such as State fuel tax revenue, as a backstop in the event that future Federal-aid highway funds are not available.

Table 3: State's use of GARVEE bonds

| State      | Date of issuance           | Face amount of issue                                | Projects  | Backstop financing  |
|------------|----------------------------|---|---|---|
| Alabama    | Apr-02                     | \$200 million                                       | County Bridge Program   | All Federal construction reimbursements. Also insured   |
| Arizona    | Jun-00<br>May-01           | \$39.4 million<br>\$142.9 million                   | Maricopa freeway projects                                     | Certain sub-account transfers   |
| Arkansas   | Mar-00<br>Jul-01           | \$175 million<br>\$185 million                      | Interstate highways   | Full faith and credit of State, plus State motor fuel taxes   |
| Colorado   | May 00<br>Apr-01<br>Jun-02 | \$537 million<br>\$506.4 million<br>\$208.3 million | Any project financed wholly or in part by Federal funds.      | Federal highway funds as allocated annually by CDOT; other State funds  |
| New Mexico | Sep-98<br>Feb-01           | \$100.2 million<br>\$18.5 million                   | New Mexico SR 44  | No backstop; bond insurance obtained  |
| Ohio       | May-98<br>Aug-99<br>Sep-01 | \$70 million<br>\$20 million<br>\$100 million       | Spring-Sandusky project and Maumee River Bridge Improvements. | Moral obligation pledge to use State gas tax funds and seek general fund appropriations in the event of Federal shortfall |
| Total      |                            | \$2,301.7 million.                                  |   |   |

## RESPONSES BY JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR BAUCUS

*Question 1.* One way of organizing some of these ideas are selling bonds for project specific financing versus using bond proceeds to supplement the Highway Trust Fund. Will you comment on the advantages and disadvantages of each?

Response. Mr. Chairman, in the competition for finite transportation resources, selling bonds to help finance a specific project can help advance a project that might otherwise go unfunded or be delayed. In addition, project-specific financing can be useful for large-dollar projects that would otherwise take up a large portion of a State's Federal highway apportioned funds in any given year. However, as we indicated in our statement, given the restrictions in some State laws and the views of some State officials, project-specific financing currently has limited applicability. As a result, not all States can use project specific financing, nor can it be used for all projects. In addition, State officials will weigh the risks associated with project-based bonds against the expected benefits from those projects to determine whether the added risk is justified.

In the short term, using bond proceeds to supplement the Highway Trust Fund would increase the available funding, and this additional funding would then be apportioned to all the States. This approach could enable a wider range of projects to be advanced. If the Federal Government sold these bonds, they would be less risky than project-specific bonds. Consequently, investors would not demand as high an interest rate as they would for the project-specific bonds. However, this debt would ultimately have to be repaid—either by the general population through increases in general fund taxes or reductions in other government services, or by earmarking funds from the Highway Trust Fund. If funds were earmarked from the Highway Trust Fund to repay the bonds in the future, highway funding would not be increased. Rather, costs would be shifted to future users.

Raising new sources of funding presents Congress with the option of devising alternatives to the existing formula-based grant program for delivering funds, in either a project-or program-based fashion. This could open the possibility of engaging new approaches to deal with seemingly intractable transportation problems and national priorities. For example, DOT and FHWA have concluded that the reliability and effectiveness of the freight transportation system is being constrained because of increasing demand and capacity limitations. Many observers have questioned the ability of our surface transportation systems to keep pace with the growing demands being placed upon them as pressure continues to build on already congested road and rail connections to major U.S. seaports and at border crossings. Either a project-based or a program-based financing approach could target funds to these or other major national priorities.

RESPONSES BY JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* In your statement you make reference to the lack of qualified personnel at the Department of Transportation in regard to financing. How many positions (FTE) does the DOT currently have invested in finance personnel? What is your best guess as to the percentage of those FTEs having the necessary skill sets to advance a more aggressive transportation financing program?

Response. Mr. Chairman, FHWA requested 2,412 FTEs for fiscal year 2003. Of these, 99 were for financial manager and financial specialist positions. The degree to which staff in these positions are involved in innovative finance activities varies. They include staff located in each of FHWA's division offices in every State who have some involvement with innovative finance, staff located in headquarters and other locations who specialize in innovative finance, and other staff who are not directly involved with innovative finance but need some knowledge of it.

We have not reviewed DOT's staffing profile in sufficient detail to determine whether the right number of personnel are performing these functions or to assess their skills. But the department—and indeed all Federal agencies—face a growing human capital crisis that threatens their ability to effectively, efficiently, and economically perform their missions and to ensure maximum government performance and accountability for the benefit of the American public. For that reason, as you know, we have designated strategic human capital management as a high-risk concern governmentwide. As I mentioned in my statement, this challenge ripples throughout the State and local transportation agencies that build, maintain, and operate the vast preponderance of the nation's transportation system. About 50 percent of the people who plan, develop, and manage the nation's transportation system will become eligible to retire in the next 5 years. A survey of State departments of transportation conducted by the New Mexico State Highway and Transportation Department in 1999 identified the need to attract, hire, and retain skilled personnel as the greatest human resource issues facing these departments. In addition, the Transportation Research Board has cited the impending shortage of skilled personnel as among our nation's most critical transportation issues.

In our view, addressing human capital challenges requires comprehensive workforce planning strategies to identify the mix of skills needed to accomplish an agency's mission, the skill mix the agency has on hand, whether those employees are expected to retire and when, and a recruiting and hiring strategy to fill the gaps where needs exist. For example, any examination of the transportation finance arena would necessarily reflect the changing nature of the surface transportation program—from a federally funded formula grant program to one involving a multiplicity of funding sources and delivery mechanisms. This change requires people with new skills—for example, persons skilled in public finance who can navigate the private capital markets. DOT has made progress addressing its human capital concerns by publishing its Human Resources Strategic Action Plan for 2001–2003 with goals that call for increased human capital investments and workforce planning. In addition, FHWA is actively working with major national and State transportation organizations and independent experts to identify human capital needs and innovative ways to meet them. Clearly, it is important that the needs of financing the nation's transportation system be part of this assessment. In January 2003, we will be reporting further on human capital challenges faced by DOT and other Federal agencies in our biannual high risk and performance and accountability assessment.

*Question 2.* One of the outcomes of reauthorization should be the ability to allow for more meaningful investment by the private sector into transportation. Current transportation bonding techniques do not seem to provide the income that the private sector is seeking since we primarily use tax-exempt mechanism. Can you provide more insights on how we can “decouple” the bonding process to make it more attractive to these types of investors? Are there examples where such activity is occurring?

Response. Mr. Chairman, proponents of tax credit bonds have advocated “decoupling” as you suggested. These proponents contend that if the bonds are sold as two separate components—the right to receive the tax credits and the right to receive the principal repayment when the bond comes due—then the bond issuer could receive larger proceeds for selling a bond with a given face value. This practice is known as “stripping.” The reason this result is expected is that each component of the bond would be better tailored to suit the requirements of different types of investors. For example, some investors may prefer to receive the periodic benefit of the tax credit and may be less interested in receiving a principal repayment in the distant future. Other investors, such as pension funds or taxpayers setting up individual retirement accounts, have no need for current income or tax benefits and may simply prefer

to receive a certain amount of money at a specified future date. Therefore, the sum that the two different types of investors would be willing to pay for the two components is likely to be larger than the sum that either type of investor would be willing to pay for an "unstripped" bond.

The practice of "stripping" is prevalent in the sale of interest-bearing securities. For example, Treasury bonds with maturities of 10 years or longer generally can be sold as two separate components. However, under current law, no existing tax credit bonds can be stripped. A Treasury department official told us that the monitoring of tax compliance would be more complicated if tax credit bonds were allowed to be stripped. For example, if the tax credits ever had to be recaptured because of noncompliance on the part of issuers, it might be difficult to track down the recipients of the credits if those credits had been resold separately in the secondary market.

*Question 3.* It seems that our current transportation financing mechanisms work well for large-scale projects. What avenues are available for smaller scale projects? Are there other models which have worked well in other areas which could be helpful here—for example the Farm Credit system sells securities to raise funds to make loans. What existing financing ideas regarding other Departments, Government Sponsored Enterprises, Federal or State agencies, or private entities should we at least consider in terms of the reauthorizations?

While our current transportation financing mechanisms are—for the most part—geared toward larger scale projects, Mr. Chairman, at least one mechanism, SIBs, have effectively supported smaller projects. TIFIA, as you know, is limited by statute to projects with an estimated cost of \$100 million or more, and States that have used GARVEEs have generally done so to support the financing needs of large projects. Although SIBs have also been used to fund some large projects—such as the projects in South Carolina's "27 in 7" program—they also support smaller projects in those States that have SIBs. For example, loans in Missouri have averaged \$7 million per project, while loans from Maine's SIB have averaged \$76,000 per project. FHWA officials told us that SIBs have been effectively used for smaller projects that might otherwise have received a lower priority for funding. However, these projects have required some type of revenue stream in order for the borrower—often a municipality—to repay the loan.

I agree with you, Mr. Chairman, that a variety of financing mechanisms exist in different sectors to bring private participation and investment to the table in support of public goals and purposes. For example, as you pointed out, the Congress has created government-sponsored enterprises (GSE) such as the Farm Credit System—as well as Fannie Mae, Freddie Mac, and the Federal Home Loan Bank System—to provide support for agricultural and home lending beyond what the financial markets would provide in their absence. These GSEs are sophisticated financial institutions with Federal charters that grant them benefits so that they can help achieve their public missions. Among these benefits, GSEs can issue debt in the capital markets at favorable interest rates to help finance a wide range of lending to farmers and homeowners. Our work has shown that these institutions often have unique flexibilities and play a key role in providing services and options that are beyond the capacity of public agencies or financial markets to provide.

However, the Congress did not decide to create these entities lightly. Because of the sophistication of their financial operations, the risks they face, and the requirements of their missions, GSEs require public oversight mechanisms to ensure their safety and soundness, and to ensure that the public purposes for which they were created are being carried out. As such, a decision to create a GSE might best follow a conclusion that one was uniquely positioned to fulfill unmet national needs and priorities and that the benefit of government sponsorship and the role of such an institution in fulfilling those needs and priorities exceeded the costs of creating and operating it. To date, GSEs have not been used for financing public facilities, such as highways. We have completed an extensive body of work on this subject and would be pleased to work with you and the committee staff to examine more specifically the potential application of these and other financing mechanisms to meeting our surface transportation needs.

*Question 4.* I am interested in attracting private capital to supplement the Highway Trust Fund in meeting the nation's transportation needs. The key consideration for private investors is the availability of a reliable revenue stream to retire debt. Where might we turn to secure such revenue streams?

Response. Mr. Chairman, probably the most prevalent and reliable revenue stream is the user fee. User fees can be in the form of tolls, fuel taxes, or license and vehicle fees—and States have turned to a variety of user fees to finance transportation projects. For example, Arkansas imposed a diesel fuel tax to partially pay

for the GARVEE bonds issued to reconstruct the State's interstate highways, while Illinois increased its vehicle registration fees to finance bonds for its "Illinois First" project—which included a number of significant highway renovations. User fees are increasingly taking less conventional forms—Florida intends to repay part of its TIFIA loan for the Miami Intermodal Center from fees levied on rental cars while New York's Farley Penn Station TIFIA loan is to be repaid from lease payments from the Port Authority of New York and New Jersey, revenues from Amtrak, and rents paid from planned station retail facilities. In addition to highway user fees, many States and localities have tapped property-based sources of financing, including general property taxes, real estate transfer taxes, and developer impact fees to finance surface transportation projects.

As we discussed in our March 2000 report (Port Infrastructure: Financing of Navigation Projects at Small and Medium-Sized Ports), some States allow local sponsors of Corps of Engineers' navigation projects to levy property taxes or issue general obligation or revenue bonds. General obligation bonds issued to support projects are generally paid for through taxes implemented by State or local governments. Revenue bonds issued to support a particular project are typically paid for out of the revenues generated by that project.

---

STATEMENT OF JANICE HAHN, MEMBER, LOS ANGELES CITY COUNCIL CHAIRWOMAN,  
ALAMEDA CORRIDOR TRANSPORTATION AUTHORITY

Mr. Chairmen, and members of the joint committees, good morning, and thank you for inviting me here today. My name is Janice Hahn. I am a Los Angeles City Councilwoman and serve as Chairwoman of the Governing Board of the Alameda Corridor Transportation Authority. The Alameda Corridor Transportation Authority is a joint-powers authority created by the Cities of Long Beach and Los Angeles in 1989 to oversee the financing, design and construction of the Alameda Corridor. The Governing Board of the Alameda Corridor Transportation Authority is a seven-member board representing the cities of Los Angeles and Long Beach, the ports of Los Angeles and Long Beach and the Los Angeles County Metropolitan Transportation Authority (MTA).

On behalf of city of Los Angeles Mayor James Hahn, city of Long Beach Mayor Beverly O'Neill, the Corridor Authority's Governing Board, and our CEO Jim Hankla, I am honored to be here.

INTRODUCTION

We are commonly called ACTA. ACTA is the public agency that built the Alameda Corridor, a 20-mile-long freight rail expressway linking the Ports of Los Angeles and Long Beach to the rail yards near downtown Los Angeles. The project was monumentally complex, running through eight different government jurisdictions in urban Los Angeles County, requiring multiple detailed partnerships between public and private entities, and presenting extensive engineering challenges.

One of the key partnerships that has been vital over the years has been with the U.S. Congress. We greatly appreciate the strong support you and your colleagues provided to ACTA in developing the innovative loan from the Department of Transportation. We are particularly thankful for the strong leadership demonstrated by many of you in Congress including our two distinguished Senators, Dianne Feinstein and Barbara Boxer along with California Congressman Stephen Horn and Congresswoman Juanita Millender-McDonald. Without their vision and support it is unlikely the Alameda Corridor would be in operation today, strengthening the nation's global economic competitiveness.

Over the years there were many who doubted the Corridor project could be built, let alone on time and on budget. But after more than 15 years of planning and 5 years of constructing the \$2.4 billion Alameda Corridor, one of the nation's largest public works projects opened on time and on budget on April 15. Today, more than 35 freight trains per day use the Alameda Corridor, handling containers loaded with shoes, clothing, furniture and other products bound for store shelves throughout the United States. They also deliver to the ports U.S. goods such as petroleum products, machine parts, and agricultural products for shipment to worldwide markets.

A trip from the Ports of Los Angeles and Long Beach to the transcontinental rail yards near downtown Los Angeles used to take more than 2 hours. It now takes about 45 minutes. As cargo volumes increase, this enhanced speed and efficiency will be critical; more than 100 trains per day are expected on the Alameda Corridor by the year 2020. It is important to note that ACTA is collecting revenue from these rail shipments in amounts sufficient to meet its current and future financial obligations.

## MODEL FOR SUCCESS

Because of our success, the Alameda Corridor is considered a model for how major public works projects should be constructed. The Corridor illustrates the significance of intermodalism to the future of our economic and transportation systems. Among those praising the Alameda Corridor have been Transportation Secretary Norman Mineta—a long time supporter and friend of the Corridor project—and three of his predecessors, one from the first Bush Administration and two from the Clinton Administration.

At our grand opening ceremony last April, Secretary Mineta said this about the Alameda Corridor: “Its successful completion demonstrates what we can accomplish with innovative financing and public-private cooperation, and it provides a powerful paradigm for the kinds of intermodal infrastructure investment we want to encourage as we begin working with the Congress to develop legislation reauthorizing America’s surface transportation programs.” We were also pleased to see that just this month in testimony before a joint hearing of the Environment and Public Works and Commerce Committees, Associate Deputy Secretary of Transportation Jeff Shane praised the Corridor project as a national model. The project, he said, “will have far-reaching economic benefits that extend well beyond Southern California.” Similarly, in an article written for *TrafficWorld*, former U.S. Department of Transportation Secretaries Federico Pena and Samuel Skinner said: “The Alameda Corridor is of national significance not only because of its direct economic impact on jobs, taxes and commodity prices but because the corridor serves as a model of how our country can and must expand and modernize our freight transportation system if we are to remain a world-class trading partner.” In addition, former U.S. Department of Transportation Secretary Rodney Slater has also been a supporter of the Alameda Corridor project.

We are flattered by the accolades and pleased and proud to share our experience with those who hope to benefit from it. In fact, one of the goals of the ACTA Governing Board is to support other projects that promote international trade and the efficient movement of cargo.

The key to our success can be attributed to two major themes that guided us throughout the planning, financing and construction of the project: First is multi-jurisdictional cooperation. The Alameda Corridor is built on the partnerships forged between competitive public agencies and between those agencies and the private sector. We have demonstrated that governments can work together, and they can work with the private sector, putting aside competition for the benefit of greater economic and societal good. Second is direct and tangible community benefits. The Alameda Corridor provided direct community benefits in the form of significant traffic congestion relief, job training and other programs. We have proven that communities don’t have to sacrifice quality of life to benefit from international trade and port and economic activity.

## PROJECT NEED AND PLANNING

The roots of our multi-jurisdictional cooperation began to take hold in the early 1980’s, when a committee was formed by the Southern California Association of Governments to study ways to accommodate burgeoning trade at the Ports of Los Angeles and Long Beach. The panel included representatives of the ports, the railroad and trucking industries, the Army Corps of Engineers as well as local elected officials and others. The ports had projected—accurately, it turns out—massive cargo increases driven by the growing use of intermodal containers transferred directly from ships to rail cars and trucks. The volume of containers crossing the wharves doubled in the 1990’s and last year reached more than 10 million 20-foot containers per year. That figure is expected to exceed 36 million by the year 2020. Last year, the ports handled more than \$200 billion in cargo, or about one-quarter to one-third of the nation’s waterborne commerce. This has had huge ripple effects in Southern California and across the country in the form of jobs, tax revenues and general economic activity.

In the early 1980’s, there was growing concern about the ability of the ground transportation system to accommodate increasing levels of trade-related rail and truck traffic in the port area. By 1989, the cities and ports of Los Angeles and Long Beach had joined forces to form a joint powers authority that later became the Alameda Corridor Transportation Authority. The agency then selected a preferred project: consolidating four branch lines serving the ports into a 20-mile freight rail expressway that is completely grade-separated, including a 10-mile-long 30-foot-deep trench that runs through older, economically disadvantaged industrial neighborhoods south of downtown Los Angeles. The project would eliminate traffic conflicts at more than 200 street-level railroad crossings.

## PROJECT FINANCING AND FUNDING

Our broad base of cooperation is also evident in the project's unique finance plan, which draws revenue from a range of both public and private sources.

The linchpin of this funding plan was designation of the Alameda Corridor as a "high-priority corridor" in the 1995 National Highway System Designation Act. That designation cleared the way for Congress to appropriate \$59 million needed to back a \$400 million loan to the project from the U.S. Department of Transportation. As mentioned previously, Senators Boxer and Feinstein, along with California Congressman Stephen Horn and Congresswoman Juanita Millender-McDonald and other members of our congressional delegation, were instrumental in helping to form a bipartisan congressional coalition to support this effort. It is important to point out that this financing arrangement preceded the passage of TEA-21, and the associated provisions known as TIFIA. ACTA was pleased to work cooperatively with Department of Transportation officials and congressional staff, to be a "trail-blazer" with the Office of Management and Budget and forge an innovative arrangement to finance an intermodal project of national significance.

Similarly, at the State level, ACTA worked closely with both Republican and Democrat members of the Legislature, Governor Pete Wilson along with the California Business, Transportation and Housing Agency, the California Transportation Commission and the Department of Transportation to include the project in short- and long-range plans and to expedite State funding. At the local level, ACTA coordinated closely with Mayor Beverly O'Neill of Long Beach and then-Mayor Richard Riordan of Los Angeles for support of the project, and ACTA worked closely with the Los Angeles County Metropolitan Transportation Authority to set aside State and Federal grant funds and local transportation sales tax revenues for use on the Alameda Corridor. And, of course, the ports provided almost \$500 million in startup funding and for the purchase of rights-of-way.

The collective assistance offered by Federal, State and local agencies and elected officials provided the base funding—the leverage, if you will—for the biggest piece of our financing package—more than \$1.1 billion in proceeds from revenue bonds sold by ACTA. The bonds and the Federal loan are being retired by use fees paid by the railroads. The Use and Operating Agreement between ACTA and Burlington Northern and Santa Fe Railway and Union Pacific Railroad, approved in October 1998, is truly unprecedented. Never before had the competitive railroads cooperated on a project to the extent that they did on the Alameda Corridor. Like the ports, the BNSF and the UP put aside their rivalry to cooperate on a project with positive economic implications at the national, regional and local levels.

In the end, funding for the Alameda Corridor came from multiple public and private sources and resulted from bipartisan support. The funding breaks down roughly like this: 46 percent from ACTA revenue bonds; 16 percent from the U.S. Department of Transportation loan; 16 percent from the ports; 16 percent from California State and local grants, much of it administered by the Los Angeles County Metropolitan Transportation Authority, and 6 percent from other sources.

## PROJECT CONSTRUCTION

As with project planning and funding, construction also required extensive cooperation and coordination among multiple entities.

The Alameda Corridor included, among other elements, construction of 51 separate bridge structures, relocation of 1,700 utilities, pouring of 27,000 concrete pilings and removal of 4 million cubic yards of dirt excavated to make way for the Mid-Corridor Trench. More than 1,000 professionals from 124 engineering and construction management firms, as well as more than 8,000 construction workers, contributed to the project. Moreover, construction occurred in eight different government jurisdictions. Any project of the Alameda Corridor's size and scope inevitably encounters hurdles in the construction process that can lead to delays. There are many reasons why our project stayed on schedule, but at the top of the list are our permit facilitating agreements with corridor communities and utility providers, and our decision to use a design-build contract for the Mid-Corridor Trench.

ACTA saved an estimated 18 months on project delivery by utilizing the design-build approach for our largest contract, the Mid-Corridor Trench. The design-build approach allows for the overlapping of some design and construction work and provides greater control over cost and scheduling. Design-build authority was obtained through an ordinance approved by the Los Angeles City Council. This enabled ACTA to subject the contractor to significant liquidated damages if the contract was not completed by a fixed date at a fixed price.

Before construction began, ACTA negotiated separate Memoranda of Understanding with each city along the route, detailing expedited permitting processes,

haul routes for construction traffic and the protocol for lane closures and temporary detours. By agreeing in advance on these and other issues, we streamlined a complex construction process and saved time and money.

#### DIRECT COMMUNITY BENEFITS

One key to securing the MOUs and additional community cooperation and support was to deliver on our promises of direct community benefits.

By eliminating more than 200 at-grade railroad crossings, the Alameda Corridor is projected to reduce emissions from idling trucks and automobiles by 54 percent, slash delays at railroad crossings by 90 percent and cut noise pollution by 90 percent. The project also reduces traffic congestion through improvements to Alameda Street. But from the start, the ACTA Governing Board wanted to leave a lasting legacy beyond construction of a public works project. This was accomplished by creating several community-based programs.

Through its contractors and various community partnerships, ACTA administered several programs designed to provide local residents and businesses with direct benefits that would long outlive construction. For example:

- The Alameda Corridor Business Outreach Program offered technical assistance, networking workshops and aggressive outreach to provide disadvantaged business enterprises with the tools they need to compete for work on the project. Disadvantaged firms—known as DBEs—have earned contracts worth more than \$285 million, meeting our goal for 22 percent DBE participation.

- The goal of our Alameda Corridor Job Training and Development Program was to provide job training and placement services to 1,000 residents of corridor communities. We exceeded that goal—almost 1,300 residents received construction industry-specific job training, and of those 637 were placed in construction-trade union apprenticeships.

- The Alameda Corridor Conservation Corps provided life skills training to 447 young adults from corridor communities, exceeding the goal of 385. While studying for high school class credits, these young adults completed dozens of community beautification projects in corridor communities, including graffiti eradication, tree-planting and debris pickup. After completing the 3-month program, recruits had the option to join the Los Angeles or Long Beach conservation corps chapters full time, phase into a city college program or enroll in a business, vocational, trade school or apprenticeship program.

- And finally, in partnership with the World Trade Center Association Los Angeles–Long Beach, the Alameda Corridor Transportation Authority International Trade Development Program has provided technical training and international trade-specific job skills to 30 entry-level job seekers in local communities. In addition, some 600 local companies seeking inroads into the import or export business have been identified for one-on-one technical assistance. That assistance is being provided throughout this year. This unique program is helping local residents and businesses capitalize on international trade.

These community-based programs ensured that local residents and businesses did not get left behind, that they would receive direct and long-lasting benefits from the project.

#### THE FUTURE

The efficient movement of cargo through our nation's ports and on our rail lines and highways is a critical issue not only in Southern California—which has the nation's two busiest ports—but the Nation as a whole. The Alameda Corridor is truly the backbone of an emerging trade corridor program in Southern California. Already, others are following our lead, including governmental agencies in Los Angeles, Orange, San Bernardino, and Riverside Counties who are building grade-separation projects.

In addition, ACTA and the California Department of Transportation are working under an innovative cooperative agreement to develop plans for a Truck Expressway that would provide a "life-line" link between Terminal Island at the Ports and the Pacific Coast Highway at Alameda Street. The Alameda Corridor Truck Expressway is intended to speed the flow of containers into the Southern California marketplace. Environmental reports are being prepared, and the project could be ready for approval as early as March 2003. At ACTA, we believe that by restructuring our Federal loan we can undertake this critical Truck Expressway project without any additional Federal financial support.

## IMPLICATIONS AND RECOMMENDATIONS

The Alameda Corridor not only creates a more efficient way to distribute cargo, but it also boosts the regional and national economies by keeping the ports competitive and capable of generating additional economic growth. Moreover, it provides direct, long-lasting benefits to local residents and companies, benefiting the entire region with a legacy well beyond actual construction. In short, the Alameda Corridor has demonstrated the benefit of investment in well-planned and well-executed intermodal transportation infrastructure.

As your committees, the full Congress, and the U.S. Department of Transportation begin the TEA-21 reauthorization process, including the formulation of policies to address growing freight rail and truck traffic congestion and other challenges posed by international trade, we respectfully offer these policy recommendations, based on our experience with the Alameda Corridor:

- The planning and funding of intermodal projects of national significance, directly benefiting international trade, should be sponsored at the highest levels within the Office of the Secretary of Transportation. There should be a national policy establishing the linkage between the promotion of free trade and support for the critical intermodal infrastructure moving goods to every corner of the United States. Public-private partnerships do in fact work and should be promoted and encouraged by Federal transportation legislation.

- A specific funding category is needed to support intermodal infrastructure projects, and trade connector projects. Consideration should be given to new and innovative funding strategies for the maritime inter-modal systems, infrastructure improvements enhancing goods movement.

- The Alameda Corridor project benefited from a Department of Transportation willing to undertake risk and provide loan terms that were not available on a commercial basis. This Federal participation gave private investors confidence in the project and made bond financing possible.

Most important, in my mind, is this: The success of the Alameda Corridor has shown that Federal investment in trade-related infrastructure can benefit the economy without sacrificing quality-of-life issues.

Mr. Chairmen, once again, thank you for inviting me here today. That concludes my remarks. I would be happy to address any questions.

---

STATEMENT OF PETER RAHN, CABINET SECRETARY, NEW MEXICO STATE HIGHWAY AND TRANSPORTATION DEPARTMENT

INNOVATIVE FINANCE: LEVERAGING ORDINARY RESOURCES INTO EXTRAORDINARY SUCCESSES

Mr. Chairman and members of the committee, I appreciate this opportunity to submit testimony concerning the positive benefits that the State of New Mexico has received through innovative financing for transportation, and how our State has leveraged ordinary resources into extraordinary successes.

Flexible and stable revenue from Congress has enabled the New Mexico State Highway and Transportation Department the ability to deliver dramatic results for our citizens through improvement and enhancement of our transportation system. We have developed and implemented new ways to finance and contract highway construction projects.

Since 1998 we have used innovative financing techniques to bond \$1.2 billion that advance highway construction projects by as much as 27 years. We are building quality projects that provide enormous returns on investment for the taxpayers and deliver economic benefits today.

New Mexico's strategy is to connect our communities to regional and national economic opportunities by building four-lane corridors. This access has historically been limited to our Interstate system, serving less than 70 percent of our population. Today we have added 653 miles of new four-lane highways that link 96.7 percent of our citizens to these vital economic opportunities.

As well as adding 653 miles of four-lane highways, we have built 4 urban relief routes, 15 interstate interchanges and the Big I, which is the intersection of the Interstates 25 and Interstate 40-that serves as a bridge for regional, national and global commerce. Our efficiency, combined with stable and flexible Federal funding, provides a seamless regional transportation system to serve this commerce and continue the movement of products to market. Our urban citizens are moving more quickly and safely to work, school and medical care.

Innovative finance enabled us to use Grant Anticipation Revenue Vehicle Bonds (GARVEE Bonds) to construct four-lanes on NM 44 from central to northeast New

Mexico. Because of Federal revenue stability, both Standard and Poor's and Moody's rated our bonding proposals at "A" level investment grade. We were able to construct a 118-mile four-lane highway corridor in 28 months with a 20-year warranty that will save the taxpayer \$89 million in maintenance costs. This 118-mile corridor would have taken 27 years to construct under traditional methods.

We have also improved the road quality of our Interstate and State Highway system through our innovative financing program. We have reversed a 20 5-year trend in our deteriorating State and interstate highways. Since 1998, we have improved 3,035 miles highways—a 51 percent decrease in our deficient status highway miles. In 1999 only 81.8 percent of our Interstate highway system was rated in good condition—today 98.7 percent of this system is in good condition.

In addition to major improvements to our system, our citizens have benefited through economies of scale. In 1995 New Mexico's cost per mile of four-lane construction was \$1.3 million. In 2002, through our large bonding program, we reduced that cost to \$740 million per mile. This economy of scale construction saves our State over \$182 million in four-lane corridor construction.

Investment in the nation's transportation infrastructure yields high returns. Based on information generated by the National Highway Users Alliance, the Big I will save personal and commercial users \$8.1 billion in time; \$870 million in fuel; \$460 million in safety; and another \$670 million in environmental impacts. This \$286 million investment by Congress will realize a \$10.1 billion return on investment. This \$10.1 billion return on investment for one project is 34 times greater than the interest paid on our entire bonding program.

It is critically important that we understand and acknowledge our innovative financing program would not be the success that it is without the provision for flexible, stable and reliable funding. States across the country have invested in the national infrastructure based on the guaranteed funding levels. These guarantees have enabled us to program and deliver projects in a predictable financial climate. In fact-based on the FHWA highway construction inflation rate of 4.5 percent—our entire bonding program, with an interest rate of 4.47 percent, delivers \$1.2 billion of transportation improvements to New Mexico at a lower cost and the benefit of being used today rather than years in the future.

We can assure our citizen's that all user fees directed to the Highway Trust Fund are being spent for its designated purposes, and we can speak with confidence about the Federal transportation-financing picture over a multi-year period. Strong budgetary mechanisms, balanced planning and streamlining program delivery have made innovative finance work for New Mexico.

---

RESPONSES OF PETER RAHN TO ADDITIONAL QUESTIONS FROM SEN. BAUCUS

*Question 1.* I have some concerns about Garvee bonds. I understand the advantage using future apportionments to guarantee bonds, so you can enjoy the additional capital today. But what is going to happen tomorrow when you need to use your future apportionments to build and maintain highways, but the money already been spoken for as repayment for the project you did today?

Response. States have to be adept at what they utilize GARVEE bonds for. Critical projects that produce major returns on investment in the areas of economic development opportunities, safety and congestion relief are most suitable for bonding, especially when the cost of the project is outside the bounds of what can be accommodated within the normal STIP process. By this I mean, that a single project would take an inordinate percentage of the annual construction program to construct. Three of our bonded projects would have each exceeded the total annual construction dollars available to New Mexico and three more would have each exceeded 50 percent.

To utilize GARVEE bonds, or any bonds for that matter, to pay for maintenance activities would be a mistake. Maintenance should be accommodated within existing budgets, as we have provided for in our future plans. However, the notion that new construction projects will be on hold until the issued bonds are retired—and therefore bonds should not be used at all—is flawed. If bonds had not been issued in New Mexico, not only would those other projects be waiting, so would the projects now in place.

The economic benefits of bonding must also be factored into the decision. Building large projects at one time can produce many millions of dollars in savings from economies of scale. Additionally, current low interest rates are attractive when compared to nearly identical inflation costs within the highway construction sector. The true costs are practically the same, but the benefits of use are available today.

*Question 2.* Why didn't the State just issue State general obligation bonds or private activity bonds? Why chose Garvees?

Response. New Mexico chose to issue GARVEE bonds rather than general obligation bonds due to the ease and speed with which GARVEES could be taken to market versus the lengthy process required by the State constitution to utilize GO bonds. Private activity bonds do not enjoy the same tax advantages as GARVEE bonds.

STATEMENT OF JOHN HORSLEY, EXECUTIVE DIRECTOR, THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

Mr. Chairmen and members of the committees, my name is John Horsley. I am the Executive Director of The American Association of State Highway and Transportation Officials (AASHTO). I am here today to testify on innovative and other financing issues as the Congress begins consideration of legislation to reauthorize the Federal-aid highway and transit programs.

First, I want to thank you both for your leadership in fully restoring highway funding for fiscal year 2003 to \$31.8 billion as AASHTO, the National Governors' Association and many others have urged. As I will discuss today, RABA needs to be fixed next year to avoid radical swings in funding levels, but without your help, we would still be facing a disastrous cutback this year.

Senator Baucus, AASHTO would like to commend you for your leadership in transferring the 2.5 cents per gallon of gasohol tax revenues from the General Fund to the Highway Trust Fund and for your efforts to credit interest to the Highway Trust Fund where it belongs and will help greatly.

In addition, I want to thank both Chairmen for demonstrating their leadership by scheduling this very important hearing. I am honored to be invited to testify on these important issues and to offer the views of AASHTO on a variety of financing issues. Mr. Chairmen, I would like to begin by recognizing the contribution that TEA-21 has made to address the nation's need to invest in our highway and transit systems. We have seen record level investment made possible by that legislation and we at AASHTO commend the Congress and these two committees for your contributions to achieving that result. However, as much as that investment has contributed (\$208 billion), the national needs continue to far outstrip the available resources. Your holding this hearing gives us the opportunity to recognize those needs and to suggest ways that working together we can increase investment in surface transportation as part of the reauthorization bill while maintaining fiscal discipline.

HIGHWAY AND TRANSIT FINANCING HISTORY

Mr. Chairmen, the Federal-aid highway program since 1956, and since 1982 the mass transit program, have financed critical national transportation investments primarily from the dedicated depository of revenue the Highway Trust Fund. There are a variety of fees deposited in the Trust Fund, but the largest source of income by far has been fees levied on motor fuels (gasoline and diesel). Although the needs for highway and transit investment have dramatically increased, fuel-related user fees have been adjusted only on a sporadic basis. The following chart provides a history of changes in rates since the creation of the Trust Fund in 1956.

Changes in Gasoline Tax: 1956-Present

| Year       | Total Tax | Highway Account | Mass Transit Account | Deficit Reduction | Leaking Under-ground Storage Tank |
|------------|-----------|-----------------|----------------------|-------------------|-----------------------------------|
| 1956 ..... | 3         | 3               |                      |                   |                                   |
| 1959 ..... | 4         | 4               |                      |                   |                                   |
| 1983 ..... | 9         | 8               | 1                    |                   |                                   |
| 1987 ..... | 9.1       | 8               | 1                    |                   | 0.1                               |
| 1990 ..... | 14.1      | 10              | 1.5                  | 2.5               | 0.1                               |
| 1993 ..... | 18.4      | 10              | 1.5                  | 6.8               | 0.1                               |
| 1995 ..... | 18.4      | 12              | 2                    | 4.3               | 0.1                               |
| 1997 ..... | 18.4      | 15.44           | 2.86                 | 0.1               |                                   |

Source: FHWA, "Financing Federal Aid Highways," 1999

In concert with increases in user fees there was growth in funding for both the highway and transit programs. The most dramatic growth occurred since 1991 starting with the enactment of ISTEA and reinforced by TEA-21. However, in spite of

this growth, needs continue—by anyone’s measures—to far outstrip available Federal, State and local resources. At its completion, TEA-21 will have provided \$208 billion for highways, transit and safety, but the needs as measured by the U.S. Department of Transportation are far greater than even this record level investment.

In the 1990’s, various innovative financing techniques were piloted and then enacted into law through the National Highway System Designation Act and TEA-21. Among the tools that now are part of many State DOT financing approaches are: eligibility of Federal-funding to pay debt service for project financings; grant anticipation notes also known as GARVEE Bonds; tapered match, which allows States to manage matching shares over the life of a project; and the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA) program introduced in TEA-21 that provides secured loans, loan guarantees and standby lines of credit to surface transportation projects of national or regional significance. These tools are useful but only fill a niche in the program and project financing toolkit. We clearly need to do more with innovative financing in the future to enhance the mechanisms, and apply innovative financing to more areas of surface transportation. I will provide ideas for the committees’ consideration later in my testimony.

#### AASHTO’S PROPOSED FUNDING LEVELS FOR REAUTHORIZATION AND FINANCING OPTIONS

Mr. Chairmen, we believe the central issue in reauthorization will be how to grow the program. Huge safety, preservation and capacity needs exist in every region of the country. AASHTO will release shortly its Bottom Line Report, which projects needed highway investment to assure American mobility and to advance our economy.

The report will show that the annual level of investment needed to maintain current conditions and performance of our highway systems is \$92 billion. The estimated annual level of investment needed to maintain the current conditions and performance of the nation’s transit systems is \$19 billion. These investment levels far exceed current investment and we recognize that the magnitude of increase needed is not likely to be made available through the Federal-aid highway program.

However, to begin to address these needs, AASHTO is seeking a substantial increase in funding over TEA-21 for both the highway and transit programs. Overall, as compared to TEA-21<sup>1</sup> obligation levels for highways and funding for transit, we seek to grow the program from at least \$34 billion in fiscal year 2004 to at least \$41 billion in fiscal year 2009 for highways and, likewise, from at least \$7.5 billion in fiscal year 2004 to at least \$10 billion in fiscal year 2009 for transit. These minimum figures represent 35 percent and 45 percent program increases, respectively.

The challenge is how to fashion a funding solution that can achieve these goals and garner the bipartisan support needed for enactment next year.

New sources of funding are needed to significantly grow the program. Without the introduction of new sources of funding, growth in the highway and transit programs will rely on additional revenues from increased travel and truck sales. Based on the latest data available to AASHTO, these revenues would translate to about a 10 percent program increase for highways over the life of a 6-year reauthorization bill.

This increase would not even come close to keeping up with the loss of purchasing power due to inflation. From 1996 projecting through 2009, inflation as measured by the Consumer Price Index results in a 26 percent decline in purchasing power. If reauthorization of TEA-21 includes only “status quo” options for achieving a larger program, we will soon find that the status quo is actually a rather a dramatic decline in investment due to the erosion of purchasing power. The following graph illustrates the impact of inflation on the current user fee rates.

<sup>1</sup>Growth calculations: Highway baseline of \$168.7 billion includes TEA-21 obligation limitation, exempt and RABA. Transit baseline includes guaranteed funding of \$36.35 billion.

Put another way, based on the Bureau of Labor Statistics inflation calculator, merely to have maintained the purchasing power of the three cent gasoline tax as was instituted in 1956, the gasoline tax today would need to be 20 cents.

Maintaining the status quo is not an option; however, as I said, the challenge is to develop a solution that attains at least \$41 billion for highways and \$10 billion for transit by 2009 that garners bipartisan support. The AASHTO Board of Directors is considering a menu of funding options to create additional revenues that includes drawing down the Highway Trust Fund reserves; capturing 2.5 cents per gallon gasohol revenues currently going to the General Fund for the Highway Trust Fund; transferring the equivalent of 5.3 cents per gallon of gasohol tax from the General Fund to the Highway Trust Fund to make up for the rate differential between gasohol and gasoline; capturing interest on Highway Trust Fund reserves; increasing General Fund support for transit; selling financial instruments; and indexing and raising Federal fuels taxes.

Although the program could grow somewhat without raising taxes, it would fall short of meeting national needs. AASHTO recognizes that the Congress needs funding and financing options beyond the traditional user fee increase approach. The Board also directed the AASHTO staff to explore the feasibility of leveraging new revenues through a Transportation Finance Corporation. While most of AASHTO's funding options are very straightforward, I would like to take a few minutes to describe the proposal to create a Transportation Finance Corporation, which could achieve AASHTO's goals for highway and transit funding without indexing or a tax increase, in more detail.

#### TRANSPORTATION FINANCE CORPORATION

In order to help close the sizable funding gap between surface transportation investment needs and projected resources available in the Highway Trust Fund, AASHTO is exploring including among its menu of funding options the concept of establishing a new tax credit bond program to raise revenue in the capital markets. We describe this concept as program finance, rather than project finance.

AASHTO proposes that Congress consider chartering a private, non-profit organization-the Transportation Finance Corporation-to serve as the centralized issuer of tax credit bonds. Approximately \$60 billion in bonds would be issued between 2004 and 2009. From the bond proceeds, approximately \$34 billion would be distributed to the highway program through FHWA according to an apportionment formula determined by Congress (perhaps similar to the current Federal-aid highway funding formula). About \$8.5 billion would be made available to transit agencies on a basis to be determined. From a State (or transit agency) perspective, these funds would essentially be indistinguishable from regular Federal-aid apportionments: States would be required to comply with all Title 23 requirements to use the funds. In summary, the TFC would leverage approximately \$18 billion in new revenues into an increase of nearly \$43 billion in program funding for fiscal year 2004-2009.

The States would not in any way be liable for the repayment of the bonds. A portion of the bond proceeds (approximately \$17 billion) would be set aside at issuance

and deposited in a sinking fund, which would be invested in Federal agency or other high-grade instruments. At maturity, the sinking fund will have grown to be sufficient to repay the bond principal. These taxable bonds would have a term of 20–25 years.

In lieu of interest, the bond holders would receive taxable tax credits that could be applied against the holder's Federal income tax liability. There is a cost to the U.S. Treasury for this type of tax credit program. The Treasury would be reimbursed for the budgetary cost of the program (arising from tax expenditures) by additional Highway Trust Fund receipts derived from a new net source of revenue. Thus, there would be no impact on the Federal deficit.

This summer, AASHTO met with seven major bond underwriting firms (investment banks), two ratings agencies, and a bond insurer to assess the viability of the Transportation Finance Corporation proposal from the perspective of the financial community. In our due diligence we investigated the ability of the capital markets to absorb an additional \$60 billion in investment; overall marketability of the bonds, including necessary and preferred characteristics of the financial instruments; potential investors; and credit assessment.

In addition, the TFC proposal contemplates up to \$5 billion of Federal funding being used to fund a Capital Revolving Fund, which would make available direct loans, loan guarantees and standby lines of credit to a variety of surface transportation projects not readily fundable under existing Federal programs. This fund would be a catalyst to leverage capital for an expanded list of transportation to include, highways, transit, freight rail, passenger rail and security infrastructure. This funding would assist in promoting public private partnerships and attract new private capital to transportation projects.

Overall, we found a high level of interest in the program due to the equity and efficiency advantages of using debt proceeds to finance long-term infrastructure investments. Our key findings:

Tax credit bonds are marketable. The Corporation should be authorized to decouple the principal from the stream of tax credits, and market each portion of the financing instrument to different groups of buyers on a discounted basis. For example, the principal component is likely to appeal to pension funds, and tax credits should be attractive to financial institutions & corporations. Major individual investors anticipating Federal income tax liability in future years are also potential purchasers of the tax credits, as are individual investors interested in safe, long-term investments. Securities firms would maintain an active and continuous secondary market in both the principal and tax credit portions to assure their liquidity.

Capital markets can absorb TFC paper. The proposed size of the program (an average of \$10 billion per year over 6 years) equals 0.2 percent (two tenths of 1 percent) of the U.S. bond markets' \$4.6 trillion debt issuance volume in 2001.

Marketability and liquidity are enhanced by a central issuer. Larger, more homogeneous issues than the fragmented Qualified Zone Academy Bond (QZAB) school construction program should result in a more efficient secondary market and reduced transactions fees as well as centralized investor information leading to price transparency. A centralized issuer also mitigates tax compliance risk and ensures that all States benefit from the program rather than only States using debt financing.

There is a broad potential investor base. Decoupling tax credits from principal will be more efficient and result in a broader investor base. The principal component should appeal to pension funds; tax credits are likely to be attractive to financial institutions and corporations; and allowing individuals to buy credits will broaden the market. The TFC will need to mount an investor education program to develop an efficient market.

Other aspects of the due diligence show that tax credit bonds are likely to be investment grade and, of course, that specific terms of the legislation will be critical to the success of the program.

Our analysis shows that AASHTO's funding targets through fiscal year 2009 could be achieved through the Transportation Finance Corporation without indexing or raising fuel taxes. However, the program level would drop below fiscal year 2009 slightly for the following 3 years before it resumes positive growth in 2013. In our modeling, when the TFC concept was combined with indexing, the program continues healthy growth from fiscal year 2010 on. As you can see, the AASHTO staff and our Financial Issues Work Team have developed a creative proposal that appears feasible and has been well received. We commend it to you for your consideration.

#### *Potential Program Growth Summary*

The following charts illustrate potential sources of growth in highway and transit program funding.

“Incremental” represents revenues from travel growth, 2.5 cent per gallon gasohol transfer, and drawing down the Highway Trust Fund.

*Innovative Financing Options*

In addition to the menu of funding options, AASHTO wants to work with the Congress to enhance and strengthen current Innovative Financing tools. These changes include enacting legislation to extend the legislative authority in TEA-21 for State Infrastructure Banks to all States, assuring the continuance of the current innovative financing provisions and making improvements to the TIFIA program. Specifically, regarding TIFIA we recommend that the current \$100 million threshold be reduced to \$50 million which will serve to expand the universe of projects that can take advantage of this financing tool. In addition we urge the Congress to make clear the intent of the program is to be a minority investor and thus to demonstrate more flexibility in taking credit actions under TIFIA. This is not to suggest that care should not be taken in transactions involving taxpayer money but rather to meet

the program goals which are to round out financing of projects with Federal assistance.

The Board of Directors will be making final decisions on AASHTO's reauthorization financing recommendations in the late fall and I note that Chairman Baucus has included a number of items similar to those on the menu of options in legislation he recently introduced.

#### OTHER FINANCING ISSUES

##### *Guaranteed Spending*

One of the key features of TEA-21 is guaranteed spending. The assurance of stable, predictable funding has made it much easier for States to plan and carry out programs. AASHTO has adopted as a top priority ensuring the continuation of funding guarantees. Funding guarantees are essential to meeting our commitment to the traveling public, which pays the dedicated user fees for highways and transit programs, that they are receiving the benefits of their fees. The return on this investment in transportation programs is ensuring a competitive economy with hundreds of thousands of high-paying American jobs.

##### *RABA Calculations*

Another key feature of TEA-21 is the budgetary mechanism known as Revenue Aligned Budget Authority (RABA). This mechanism was designed to ensure that the receipts coming into the Highway Trust Fund Highway Account are fully utilized by the program. This mechanism added over \$9 billion to the program through fiscal year 2002. However, due to the downturn in the economy, the look-ahead provision of RABA substantially overestimated fiscal year 2001 revenues; thus the RABA adjustment for fiscal year 2003 would have reduced the obligation levels for the highway program by \$8.6 billion or 26 percent. AASHTO is pleased that the Congress is moving to restore this much needed investment funding.

AASHTO believes that it is necessary to preserve a RABA mechanism. However, action is necessary to ensure a more stable and predictable outcome. Therefore, we offer an option that would eliminate the look-ahead provision of current law and replace it with a provision that retains the look-back part of the calculation. This likely will make the program funding more stable but also will cause a buildup of revenue in the Highway account. Therefore to ensure full use of the revenue we also recommend including a provision that would reduce the cash balance in the Highway Account to a fixed minimum by raising the program level in the last year of the authorization bill to a level sufficient to reduce the balance.

##### *Long-term Financing*

Given the advent of more fuel efficient vehicles and the increasing use of alternative fuels, income to the Highway Trust Fund may be significantly reduced. In order to prepare for future reauthorizations AASHTO recommends that Congress create a Blue Ribbon Commission to study financing options and report its findings prior to the next reauthorization cycle.

#### CONCLUSIONS

The Federal-aid highway and transit programs have a long history of strong partnership with the States and have made major contributions to creating surface transportation systems that are among the best and safest in the world. However, by all measures surface transportation needs far outstrip investment resources.

AASHTO recognizes the need for additional investment and has proposed program increases of 35 and 45 percent for highways and transit. This increased investment is vital to the nation's economy and assures the continuance of high paying jobs in the transportation sector.

Recognizing the need to offer creative solutions for revenue generation, AASHTO is considering including a proposal for the creation of a Transportation Finance Corporation in its menu of funding options. This federally chartered non-profit corporation would leverage funds for the program and take advantage of the private capital markets for bringing revenue into the program. In addition, the TFC would include a Capital Revolving Fund that could leverage as much as \$30 billion in credit support for a variety of transportation programs including, highways, transit, freight, and passenger rail and security infrastructure. This fund will likely serve as a catalyst for generating public/private partnerships and thus further expand investment in transportation programs.

Guaranteed spending is a key feature of TEA-21. It provides predictable funding so that States can plan with a greater degree of certainty. It assures that dedicated

user fees are spent on the programs for which they were collected in a timely manner. One of AASHTO's reauthorization goals is to preserve guaranteed spending.

RABA has served to ensure that increased revenue is utilized for programs without having to wait until the next reauthorization cycle to increase program levels in highways. There needs to be adjustments to the RABA mechanism to make the results more predictable and AASHTO has offered a solution that could accomplish that end.

In the long-term, consideration needs to be given to possible new sources of income and way to collect income to ensure that there is sufficient income to make the investments in transportation necessary to meet the nation's needs in the future.

We look forward to working with the Congress to enact legislation that will ensure continuing maximum possible investment in our transportation system. 1 Growth calculations: Highways baseline of \$168.7 billion includes TEA-21 obligation limitation, exempt and RABA. Transit baseline includes guaranteed funding of \$36.35 billion.

---

RESPONSES OF JOHN HORSLEY TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* A major piece of your testimony centers on the creation of a Transportation Finance Corporation. Under your proposal, the TFC would issue tax credit bonds. We have heard testimony from GAO that these instruments are the most costly long-term to the Federal Government. Why does AASHTO consider this to be the most appropriate bonding mechanism for the Federal-aid program?

Response. I think GAO's testimony points out how difficult it is to compare these disparate financing tools on an "apples-to-apples" basis.

On the one hand, it shows that financing transportation improvements by issuing debt—whether through TIFIA credit instruments, tax credit bonds or tax exempt bonds—entails a cost (interest expense) that could be avoided if sufficient grant funds were on hand in the first place. But the problem, of course, is that grant moneys often are not available up front. And obtaining the benefits of accelerating infrastructure investment through debt financing techniques, while perhaps not the least costly method, may in fact be the most cost effective approach taking into account the benefits as well as the costs.

On the other hand, GAO's testimony reveals the different ways in which certain financing tools are used and the different levels of Federal subsidy conferred by those techniques. GAO's cost assumptions attempt to capture the various financial profiles of "typical" transportation projects that might benefit from the different financing tools. For example, under the normal Federal-aid grant reimbursement scenario, the Federal share is 80 percent. Compared to that traditional pay-as-you-go approach, the various debt financing techniques tend to leverage Federal resources and induce greater non-Federal investment. The average Federal share ranges from about 20 percent for projects funded with tax-exempt bonds to about 25 percent for TIFIA-funded projects to somewhere between 50 and 70 percent for projects funded with tax credit bonds (depending on several underlying assumptions). In all cases, however, the relative Federal share is less than that of the base case of grant reimbursements.

The important point, I think, is that these different tools may be most cost-effective for different types of projects that require different levels of Federal assistance. If critical infrastructure investments need to be made, and up-front grant funding is not available, then project sponsors simply must look at other financing options. And depending on a particular project's costs, benefits and access to revenues, the use of one or more of the financing tools examined by GAO may prove cost effective.

Mr. Chairman, we are looking for the art of the possible. When we tried to put together a vehicle that, as Pete Rahn was describing, could leverage revenues that are potentially available to achieve the overall funding targets we are seeking for fiscal years 2004–2009, we looked at several options.

We looked at whether simply relying on tax-exempt municipal bonds issued at the State level would work, and concluded it would not—because so many States have obstacles, either statutory or constitutional, to the issuance of debt and the utilization of GARVEEs and some of the other financing techniques. So we figured that simply proposing what is currently allowed would not extend universal help to all 50 States with regard to raising overall transportation funding levels.

We looked at the possible utilization of tax-exempt bonds at the Federal level and figured that would compete directly with Treasury securities, so that was not a good vehicle. We then looked at the appeal of the tax credit bond concept. It was currently pending in RIDE-21 (the Rail Infrastructure Development and Expansion Act

for the 21st Century) as a vehicle for funding high-speed rail, and has been used to help fund schools through the so-called QZAB (Qualified Zone Academy Bond) program.

Our conclusion was that the TFC (Transportation Finance Corporation) was the most efficient, most viable method for boosting surface transportation funding. It would score well under the Federal budgetary scoring rules and, just in practical terms, would get us with current or likely revenues—or revenues enhanced with indexing—to the overall funding targets that the States feel are essential: more than \$40 billion annually for highways and more than \$10 billion annually for transit.

*Question 2.* Does it make sense to issue bonds to support the mainline work of State DOTs, namely system preservation? Would it not be more appropriate to reserve debt financing for capital improvements, and particularly for those projects with associated revenue streams?

Response. Mr. Chairman, the Transportation Finance Corporation we are talking about we classify as program financing, which would be available to all States to use for those purposes. TFC proceeds, in our proposal, would be available for the same types of capital outlays eligible under title 23 and title 49 as are Federal-aid grants and GARVEE bonds today. Maintenance and system preservation would still be the responsibility of the States.

We are looking for a near-term practical solution that gives you a measure you can pass with bipartisan support to boost funding for the next cycle to the levels we are after.

When it comes to the issuance of municipal bonds at the State level, I think each State has to make a judgment about whether they should issue long-term debt for long-term purposes, such as schools, water and sewer plants, and hospitals.

Almost every other area of public infrastructure is financed significantly through debt. We think that transportation has been slower than those other sectors to come to the table and use debt financing for long-term infrastructure. But we think the time has come.

As you have heard from both of these panels, the market is there and the transportation agencies are there and are utilizing debt financing on an increasing basis. But the one differentiation I wanted to make was between program finance, which would generate grants from bond proceeds that flow out to all the States as cash over the 6-year reauthorization period—and then State DOTs could leverage it further by issuing GARVEEs or through other means—as opposed to project finance (bonds earmarked for a particular project), which States can do today and which we also support.

---

STATEMENT OF JEFFREY CAREY, MANAGING DIRECTOR, MUNICIPAL MARKETS,  
MERRILL LYNCH & CO.

MAINSTREAMING INNOVATIVE FINANCE: A CAPITAL MARKETS PERSPECTIVE

Chairmen, Ranking Members, members of the committees, ladies and gentlemen, I am Jeff Carey, a Managing Director in Municipal Markets at Merrill Lynch. As a 24-year veteran in public, transportation, and infrastructure finance, I have had the privilege to work with U.S. Department of Transportation and Federal Highway Administration officials, as well as our clients, State transportation officials and other project sponsors, during the last decade on the development and implementation of “Innovative Finance” mechanisms for Federal-aid transportation programs. Thank you for inviting me to provide a wrap-up commentary from a Capital Markets perspective at today’s Joint Hearing.

You have heard testimony this morning from two very experienced panels of U.S. DOT and State transportation officials, a city councilwoman, the GAO, and Professor Seltzer on the very significant accomplishments of the DOT Innovative Finance Initiatives. Public finance industry professionals are pleased to have played a role in creating the strong market reception for the new transportation funding tools and expanded flexibility for public/private partnerships. We commend these panel participants, and the leadership from DOT and FHWA, other State transportation officials, and private sponsors for the dramatic evolution from the Eisenhower-era, Federal-aid funding to the wide array of financing instruments and programs introduced and utilized over the last 8 years.

To briefly reflect on the prior testimony involving program and project finance and case studies, ISTEAs, post-ISTEA initiatives and TEA-21 implementation have produced the following market-related accomplishments: 1) dramatically increasing bondholder investment in transportation projects and State programs; 2) new and/or specially dedicated revenue streams, particularly for the purpose of retiring debt

obligations; 3) broad market acceptance of the use of Federal-aid funding for debt instrument financing; 4) more coordination with other funding partners beyond States, and; 5) lower financing costs and increased project feasibility through Federal credit enhancement.

1. Addressing characteristics sought by the Capital Markets and private sector project sponsors provides efficient market access and innovative transportation finance opportunities. What do market intermediaries underwriters, rating agencies, bond issuers, project sponsors and institutional and individual investors want?

*Characteristics*

- Sound, understandable credits
- Evidence of government support
- Strong debt service payment coverage
- Predictability and Federal program consistency with evolution of new instruments
- Market rate investment returns for bonds, development costs, and equity
- Reasonable and reliable timing of issuer's revenue/grant receipts
- Acronyms that capture the Federal programs' spirit and promote investor familiarity
- Diversified range of investment opportunities
- Volume, market profile, and liquidity

For example, the track record and predictability of the Federal-aid highway program since the Eisenhower-era has enabled Grant Anticipation Revenue Vehicles (GARVEE) bonds to be structured without the double-barrel credit of other State credit backstops, as first used in New Mexico.

It was the strong issuance history of municipal bond banks in States such as Vermont, as well as the successful use of State wastewater and clean water revolving funds, that served as the model for the development of State Infrastructure Banks (SIBs) in the mid-1990's.

And it was the broad market acceptance of municipal bond insurance and bank letters of credit that provided a model for the development of TIFIA credit assistance and pre-TIFIA successes such as the Alameda Corridor multi-modal project.

As David Seltzer commented in the first panel, are the Federal policy incentives in Innovative Finance initiatives suitable to attract and expand capital markets investment? And are the programmatic tools and requirements balanced to provide the characteristics sought by debt investors and private sponsors, as well as public entities?

2. How various Innovative Financing components have been used by public agencies and, in some cases, private sponsors, and received by the markets provides a roadmap for surface transportation reauthorization.

When State Infrastructure Banks (SIBs) were created as part of the NHS Act in 1995, the pilot program for 10 State transportation revolving funds became very popular in 1996, in part, because of supplemental Federal funding for "seed" capitalization matched with non-Federal funds. As highlighted in FHWA's State Infrastructure Bank Review from earlier this year, 32 States have active SIBs and have made different levels of highway and transit project assistance primarily through loans, despite widespread under-capitalization and the curtailment of the program in TEA-21. Limited capitalization has resulted from the inability to use Federal-aid funds, outside of four States, and the application of Federal requirements to all moneys deposited in the SIB, regardless of whether the source was State or private contributions, or repaid loans. In addition, only two States have leveraged their SIB programs through the issuance of bonds.

As a flexible, State-directed tool, SIBs have greater potential to provide loans and credit enhancement that can be realized through further modification as part of Reauthorization:

- Extend the program to included all States;
- Expand capitalization to meet demands with supplemental Federal appropriations and by permitting the use of future Federal-aid funds to capitalize SIBs;
- Rollback the imposition of Federal requirements on SIB-funded projects, or, at least, exempt "recycled" loan repayments and State contributions, as permitted under the 1995 NHS Act Pilot Program;
- Encourage States to expand capitalization by leveraging their SIB program through the issuance of bonds; and
- Remove "pilot" moniker from the SIB Pilot Program to send strong signal of on-going Federal support.

Reauthorization should provide incentives for public/private, market-based partnerships that finance, develop, operate, and maintain highways, mass transit facili-

ties, high-speed rail and freight rail, and inter-modal facilities. This could be accomplished by permitting the targeted use of \$15–20 billion of a new class of private activity bonds, and/or by modifying certain restrictions in the Internal Revenue Code on tax-exempt bond financing of transportation modes. We commend the members of the Senate and the Finance Committee for your prior consideration of the Highway Innovation and Cost Savings Act (HICSA, 1999), the Highway Infrastructure Privatization Act (HIPA, 1997), and, most recently, the Multi-Modal Transportation Financing Act (Multitrans).

My office is across West Street from the World Trade Center site. As workers in downtown Manhattan, we greatly appreciated your passage of Federal legislation creating a “Liberty Zone” for the redevelopment of lower Manhattan and for the creation of a new type of tax-exempt private activity bonds, Liberty Bonds, for the rebuilding and economic revitalization of New York City.

Existing tax law discourages private investment in transportation projects, prohibiting lower cost tax-exempt financing for projects involving private equity investment and incentive-based, private sector operating contracts. Transportation infrastructure financing deserves a bond mechanism similar to Liberty Bonds under Reauthorization to attract more private investment, as well as increase the use of new construction techniques, cost controls, performance guarantees and technologies. A new class of private activity bonds for qualified highway infrastructure, mass commuting vehicles, and other transportation projects would expand the application of the tax-exempt financing and lower the cost of capital, making public-private partnerships more attractive to public sector sponsors than conventional approaches.

3. Past “Innovative Finance” should become mainstream transportation finance under TEA–21 reauthorization and the Federal Government should provide new financing tools and initiatives, at least on a pilot basis. From a financial markets perspective, Congress should use this opportunity to make refinements to more clearly articulate transportation financial assistance goals and send a consistent message as to how the Federal Government is going to act toward investors, project sponsors and all program participants.

- TEA–21’s funding guarantees and firewalls that permit the flexible use of GARVEE Bonds beyond multiple reauthorization periods should be maintained, and radical swings in budgetary funding from RABA (Revenue Aligned Budgetary Authority) should be avoided. Similarly, transit funding guarantees should also be preserved.

- Examine the creation of a government corporation, perhaps in a form discussed by AASHTO, to provide a focus on transportation infrastructure finance, possibly administer a portion of DOT’s financing programs, and provide a basis for new financing tools, such as tax credit bonds. Federal Government corporations have helped the capital markets create strong and liquid markets to fulfill other policy and programmatic objectives.

The creation and implementation of U.S. DOT Innovative Financing Initiatives over the last 8 years has prompted an even more vigorous debate about transportation financing issues, challenges, and future innovation with the coming year’s surface transportation reauthorization. This ongoing debate, coupled with past and current Program successes, will encourage a further willingness to look beyond Federal-aid grant reimbursement, introduce additional players in transportation finance and enlarge the spectrum of instruments and programs to attract additional private and capital markets investment. The success of Innovative Finance places a higher level of responsibility on the Federal reauthorization process to maintain the characteristics attracting strong capital markets participation. Municipal Markets participants will continue to work with Congress, DOT, States, local governments, and private sector sponsors to maximize leverage and investment levels in transportation infrastructure over the coming authorization period and beyond.

I am pleased to have the opportunity to participate in today’s Joint Hearing with such knowledgeable witnesses. Thank you, again, for the opportunity to testify. I look forward to responding to any questions you may have.

---

RESPONSES OF JEFFREY CAREY TO ADDITIONAL QUESTIONS FROM SENATOR BAUCUS

*Question 1.* The Capital Markets would positively view and receive a Tax Credit bond proposal where the proceeds of the bonds are deposited directly into the Trust Fund. First, raising and depositing additional funds to the Trust Fund will supplement and diversify the sources of Trust funding, adding to the proposed sources from the MEGA-TRUST Act, and further address characteristics sought by the capital markets, as noted in my testimony. This additional, predictable funding will fur-

ther strength GARVEE credits and other Federal aid highway derived project financing.

Response. In your question, you correctly acknowledge that QZABs, as the only existing tax credit bonds, provide little guidance for the market's receptivity due to relatively small issuance volume, disparate issuers, and credit considerations. The proposed year sale of \$3 billion, Qualified Highway Bonds by Treasury under the MEGA-INNOVATE Act responds to some tax credit bond marketability concerns by providing larger issuance volume over the Reauthorization period by a centralized issuer. Market participants continue to believe that the centralized issuance of tax credit bonds where the tax credit can be decoupled, or stripped, from the principal repayment stream could attract major buyer interest, as well as active trading by securities dealers. Decoupling would broaden the market for the bonds since tax credit bonds are hybrids, with a tax-advantaged non-cash piece (the credits) and a cash-on-cash piece (the principal), attracting different types of investors. This follows the Senate Finance Committee Chairman's goal to attract new and different taxable bond and tax credit investors to supplement the current, dominant buyers of tax-exempt transportation bonding.

*Question 2.* The advantages and disadvantages of using some of the proposed Tax Credit bond proceeds to go into a sinking fund to repayment bond principal closely relate to using a centralized issuer, either Treasury or dedicated national transportation issuer.

Response.

*Advantages of a Sinking Fund:*

- Should result in very low risk of default of principal, if sinking fund investments are limited to highly rated instruments;
- Homogenizes the creditworthiness of different series of bonds, enhancing marketability/liquidity (no local issuer variances); and
- Overcomes disparities among States in terms of their legal ability to incur debt or their political willingness to do so.

*Disadvantages of a Sinking Fund:*

- Somewhat inefficient from a tax viewpoint, in that 30 percent (plus or minus) of the tax expenditures are for bonds that are funding the retirement of principal rather than funding new transportation projects.
- At some point, it may be difficult to find attractively priced, highly rated, long-term defeasance investments in sufficient volume.

---

RESPONSES OF JEFFREY CAREY TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* As many in the Senate will recall, Private Activity Bond (PABs) rules were historically an outgrowth of the perceived overuse of industrial development bonds, where purely corporate investments were nominally financed through a State or local industrial development authority to gain tax exemption without adequately serving governmentally perceived, economic development or service objectives. As a result of successive Federal tax acts and IRS regulations, we now have a patchwork of inconsistent tax rules—i.e., seaports and airports can issue PABs not subject to volume cap; transit systems can finance infrastructure with PABs, but subject to volume cap. Neither transit rolling stock nor highways can be financed with tax-exempt bonds at all if there is what is termed “private use” and a so-called “private security interest.” Within TEA-21 Reauthorization, the Senate should consider providing a new concept centered on whether the transportation project is of “public benefit.” If a highway (or transit line) is publicly available to any user, what difference should it make if there is incidental private management of the asset? The State or local political subdivision would already have determined that the public (and taxpayers) would benefit from private sector participation

Response. Private participation is not just applicable to the development of toll roads. Even greater potential application is outsourcing the asset maintenance of expressways and freeways to private firms which agree to maintain roads to publicly required standards, in compliance with GASB 34. Current IRS “Qualified Management Contract” provisions do not permit incentive, performance-based compensation. Allowing the financial interests of the private sector developer/manager (in combination with private equity) to be aligned with the tax-exempt bond investors (i.e., maximize net revenues) should facilitate the financing for additional transportation projects. Tolls and private sponsor or participant returns can be regulated using a rate covenant (governmental utility model) or regulated return on capital (investor-owned utility model) mechanics. The Multimodal Transportation Financing

Act ("MultiTRANS", S. 870) would achieve most of the aforementioned, desired tax law or regulatory reforms.

*Question 2.* One of the outcomes of reauthorization should be the ability to allow for more meaningful investment by the private sector into transportation. There seems to be barriers for participation for numerous large investment sectors. One example is pension plans or retirement investment sector. Current transportation bonding techniques do not provide the income this sector is seeking since we primarily use tax-exempt mechanisms. Can you provide more insights on how we can "decouple" the bonding process to make it more attractive to these types of investors? Are there examples where such activity is occurring? Are there changes that need to be made to statute to assist this type of activity?

Response. As your question correctly recognizes, pension funds represent one of the largest sources of capital in the economy—for the 1,000 largest plans in the U.S., the total assets are \$3.6 trillion in defined benefit plans and \$1.2 trillion in defined contribution plans (2001). Pension funds are invested in multiple asset classes (including overseas infrastructure) with the exception of domestic infrastructure. Yet, as tax-exempt entities they have no demand for lower returns on tax-exempt securities. An objective going back to the 1993 Infrastructure Investment Commission—develop an investment product that is cost-effective to the transportation project sponsor (overwhelmingly, a public sector entity eligible to issue tax-exempt bonds), while at the same time providing competitive, pre-tax returns to the pension funds. One possibility, highlighted above, is decoupled tax credit bonds. The tax credits could be sold to taxable investors, leaving a zero coupon, taxable bond with a sufficient credit rating to be marketed to pension funds—providing a secure long-term asset to offset long-term liabilities (retirement benefits). It is important to note that decoupling routinely occurs with other market instruments, including U.S. Treasury bonds (since 1985) and the mortgage-backed securities market.

[From The Bond Buyer, Wednesday, June 12, 2002, Vol. 340]

SENATE PANEL LEADERS LOBBY DOT TO USE INNOVATION IN ITS FUNDING

(By Humberto Sanchez)

WASHINGTON—Leaders of the Senate Finance and Environment and Public Works committees urged the Department of Transportation yesterday to investigate new ways to leverage Federal funds to finance the construction of needed infrastructure, including using a centralized entity to fund loans and issue taxable tax-credit bonds.

In a letter sent to Transportation Secretary Norman Y. Mineta, Sens. James M. Jeffords, I-Vt., chairman of the public works panel, Max Baucus, D-Mont., chairman of the finance committee, and 11 other senators said they want the DOT to look closer at "ways to leverage limited Federal resources through so-called 'innovative finance' techniques."

The senators also said they believe that additional research into the matter "would benefit the administration and the Congress as we develop" reauthorization proposals for the Transportation Equity Act for the 21st Century, which expires Sept. 30, 2003.

The senators—including public works ranking member Robert C. Smith, R-N.H., and finance ranking member Charles E. Grassley, R-Iowa—said they are interested in exploring the possibility of "using a centralized entity to fund loans and provide credit enhancement, and the use of tax credit bonds as a financing vehicle for transportation infrastructure," according to the letter.

The letter comes as the American Association of State Highway and Transportation Officials is floating a similar proposal in which a federally chartered corporation would be authorized to sell taxable tax-credit bonds in order to provide funds to States for construction of roads, mass transit, and rail.

Under the AASHTO plan, the transportation finance corporation would use new or increased Federal funds to back a \$60 billion tax-credit bond issue that, over 6 years, would increase funding for highways by \$34 billion, \$8.5 billion for transit, and \$5 billion for other needs, including rail.

The senators wrote that "a detailed examination of some of these fairly complex financial tools and vehicles is warranted." They also said that they look forward to "close coordination regarding the continuation of" State infrastructure banks—which provide low-interest loans to local governments to build transportation infrastructure—and the TIFIA program, which provides direct loans, loan guarantees, and

lines of credit for up to 33 percent of the construction cost of transportation projects costing at least \$100 million.

A joint public works and finance committee hearing on innovative finance is being planned for late September.

---

[From the Bond Buyer, Thursday, August 1, 2002, Vol. 341, No. 31440]

SENATE PANEL TELLS TIFIA PROGRAM TO MAKE DO WITH 2002 LEFTOVERS

(By Humberto Sanchez)

Because the TIFIA program has only awarded funds to 11 transportation projects since it was launched in 1998, the Senate Appropriations Committee has decided not to provide any more funds to the slow-starting financing program in fiscal 2003.

Under the \$64.6 billion fiscal 2003 transportation funding bill that was approved by the committee last week, the \$130 million that was authorized under the Transportation Infrastructure Finance and Innovation Act to provide credit assistance to large transportation projects would be shifted to three other programs in the fiscal year that starts Oct. 1. Those are the transportation and community and system preservation pilot program, the national corridor planning and development program, and the coordinated border infrastructure and safety program.

The proposed diversion of funds means that any transportation projects selected for TIFIA loans, loan guarantees, or lines of credit in fiscal 2003 would have to make do with the \$96 million that program administrators estimate is left over from the \$120 million authorized in the current fiscal year.

So far, in fiscal 2002—which ends Sept. 30—the Department of Transportation has designated just one project for TIFIA assistance—a subsidy to back a \$450 million loan for a \$3.3 billion plan to fortify and rebuild parts of the San Francisco-Oakland Bay Bridge that was severely damaged by an earthquake 12 years ago. Although the Texas Turnpike Authority closed on a \$916.76 million TIFIA loan Monday, that aid was actually approved in 2001.

“We think we’ll have enough to finance any projects that we anticipate,” said Max Inman, acting head of the DOT office that oversees the TIFIA program. “Hopefully it won’t have an impact. But you never know what might happen later in the year. Currently, we are not seeing anything that would be beyond the anticipated need.”

Documents accompanying the transportation appropriations bill—which was approved last Thursday and is currently awaiting consideration by the full Senate—explain that the committee diverted the funds because it believes that demand for credit assistance has not kept pace with the amount of subsidy available under the program. Meanwhile, the House Appropriations Committee has not started work on its bill and has not decided whether to follow the Senate panel and transfer TIFIA funds to other projects.

While TIFIA program administrators agree that the program has more funds than it will likely use, they contend that the program could assist more projects after project sponsors and TIFIA administrators get used to the subtleties of the program.

Despite the diversion of funds, the program has strong support. “The committee believes that TIFIA is an important part of the Federal Government’s overall infrastructure investment effort—one that is likely to grow in importance and size in the future,” the Senate Appropriations Committee said in the report accompanying the 2003 transportation bill.

Last month Transportation Secretary Norman Y. Mineta lauded the program and noted that it will be included in the Bush Administration’s plan to reauthorize the Transportation Equity Act for the 21st Century, or TEA-21, which expires on Sept. 31, 2003. Mineta will unveil the proposal in the fiscal 2004 budget, which is due to be sent to Congress in February.

The Senate Environmental and Public Works Committee and the Finance Committee plan to hold a hearing in September on innovative finance where ways of making the program more efficient will be explored.

To date, the DOT has selected 11 projects in eight States, the District of Columbia, and Puerto Rico to receive TIFIA assistance. At a budgetary cost of slightly more than \$200 million to the Federal Government, the projects have provided \$3.7 billion in credit assistance that has backed transportation investments worth more than \$15 billion. The program provides direct loans, loan guarantees, and lines of credit—in lieu of traditional grants—and can cover up to 33 percent of the cost of major surface transportation projects that cost at least \$100 million.

[From The Bond Buyer, Tuesday, September 3, 2002, Vol. 341, No. 31462]

#### ROAD REVOLUTION COMING?

(By Humberto Sanchez)

WASHINGTON—First of a two-part series.

##### FANNIE MAE AND FREDDIE MAC REVOLUTIONIZED THE MORTGAGE BUSINESS.

Now a plan being floated by the American Association of State Highway and Transportation Officials wants to copy that success by establishing the Transportation Finance Corporation, a centralized, federally chartered entity that would issue taxable tax-credit bonds to finance transportation infrastructure projects.

Fannie Mae and Freddie Mac are publicly held corporations that were established by the Federal Government to increase the availability of home mortgages by establishing a liquid, well-functioning home loan secondary market. The corporations, known as government-sponsored enterprises, or GSEs, purchase mortgages from banks and financial firms and package them into securities that are sold to investors. The banks' financial firms use the money from the sale of the home loans to make more loans.

But the TFC, whose name some believe will be shortened by lobbyists and congressional staffers to Trannie Mae or Trans Mac, would be designed to increase Federal investment in transportation infrastructure by establishing an active market for tax-credit bonds.

The plan, calls for Congress to charter the TFC as a new, private, nonprofit organization that would be authorized to sell about \$60 billion in tax-credit bonds over 6 years. The bond proceeds would be given as grants to States primarily to help finance highway and transit projects, and the Treasury would provide a tax credit to investors in lieu of interest payments.

AASHTO—the lobbying group representing State departments of transportation—is currently shopping the proposal around to Congress, investment bankers, and rating agencies to assess its viability. Depending upon the level of interest in the plan, the association will vote later this fall on whether to adopt the proposal as part of its lobbying campaign to reauthorize the 1998 Transportation Equity Act for the 21st Century, which expires Sept. 30, 2003.

But while AASHTO maintains that preliminary responses to the proposal have been positive, the success of the plan rests on its ability to balance Congress' cost concerns with the transportation finance interests of States and the interest of investors.

##### HOW THE TFC WOULD WORK

Under AASHTO's plan, the TFC would issue the \$60 billion in tax-credit bonds over 6 years, starting the year TEA-21 is reauthorized and extending through the transportation act's proposed 6-year life span.

"The bonds would have a 20-to 25-year life," said Jack Basso, AASHTO's director of management and business development. "We would cycle them out so that we have a 25-year level of activity because of the way the bonds are issued over time."

Of the \$60 billion in bond proceeds, about \$17 billion would be set aside in a sinking fund that would be used to pay back the principal. The sinking fund would invest in Treasuries or other similarly safe instruments that, over time, should yield enough to pay back the principal.

"We are assuming that we will get about a 6 percent return on our investment, and our market research says that that is perfectly reasonable," Basso said. "At the end of that 25-year cycle, that \$17 billion will have grown sufficient to pay off the principal of the bonds—the \$60 billion."

The plan also calls for repaying the Federal Government for the income tax credits—which go to bondholders in lieu of debt service payments—through one or more strategies that are currently being explored by the association.

States would be required to provide a 20 percent match to receive their share of the bond proceeds, which would be distributed to States through apportionment formulas similar to the ones currently used to redistribute gas tax receipts collected into the highway trust fund. States would not be liable for repayment of the bonds because a portion about 30 percent of the bond proceeds would be invested in a sinking fund that would raise the money to pay back the bond principal, and the tax credits would be paid by the Treasury.

However, the plan calls for the tax credits—which AASHTO estimates will cost the Federal Government roughly \$19 billion—to be repaid by one or more methods

from a list of possible strategies. The list includes drawing down reserves in the highway trust fund, collecting the interest on fund reserves, a gas tax increase, or indexing the gas tax.

Other possibilities AASHTO is exploring to generate funds to pay for the tax credits include capturing the 2.5 cents for each gallon of ethanol sold that now goes into the general fund rather than the highway trust fund, and the 5.3 cents per gallon subsidy that encourages the use of ethanol and ethanol blended fuels, such as gasohol.

The highway trust fund—a pool of money created by gasoline and highway user taxes and tapped to finance the nation's highway and transit projects—is the primary funding source for highway and transit construction. Transportation infrastructure advocates are concerned that increased use of ethanol would deplete the trust fund.

Ethanol is currently taxed at 13.1 cents per gallon—5.3 cents a gallon less than gasoline. However, 2.5 cents of the 13.1 cents goes into the Treasury's general fund, rather than the highway trust fund. AASHTO believes that the trust fund could gain an additional \$3 billion to \$4 billion over 6 years by capturing that 2.5 cents.

AASHTO would also like to have an amount equal to the 5.3 cents per gallon ethanol subsidy paid into the trust fund, a move the group estimates would add \$6 billion to \$7 billion to the trust fund over 6 years.

Diverting the 2.5 cents per gallon in ethanol taxes into the trust fund has a good chance of becoming law, the group believes, because it has support in the House and Senate and is included in the energy bill that is currently being negotiated by the two chambers. If the energy bill fails to become law, which many observers expect, Sen. Max Baucus, D-Mont., who heads the Senate Finance Committee, is expected to push legislation he introduced in June to get both the 2.5 cents and the equivalent of the 5.3 cents in reduced taxes per gallon of ethanol paid into the trust fund.

In addition to the ethanol-related funds, the group anticipates that the highway trust fund will grow by an additional \$17 billion over 6 years due to an estimated 3 percent increase in travel.

"There is this menu of several possible options," said Bryan Grote, a principal with Mercator Advisors, which is working on the plan with the group. "AASHTO is not advocating any particular option at the moment, they are just saying that from one or more of those menu items, you could possibly raise additional revenues that would offset the budget costs of the tax credits of this proposal."

#### POLITICS

The inclusion of a device to repay the \$19 billion in tax credits gives the measure a significant advantage in gaining approval from Congress, the plan's proponents believe.

"In order for this to have any kind of realistic consideration, they have to propose some budgetary offset to the cost of those tax credits," said Grote, a former official with the Department of Transportation.

There are currently two tax-credit bond measures pending in Congress, and AASHTO believes that the TFC proposal has an advantage over both. The pending measures include a bill in the House that would authorize States to issue \$12 billion in taxable tax-credit bonds and \$12 billion in tax-exempt bonds over 10 years for high-speed rail projects and legislation in the Senate that would authorize Amtrak to issue \$12 billion in tax-credit bonds over 10 years for high-speed rail projects.

"What makes this proposal unique, as opposed to other proposals of this nature, like the high-speed rail bill or the Amtrak bill, is that we propose a way to raise revenue to pay the tax-credit costs," said AASHTO's Basso. "Our strategies will allow us to raise the money and reimburse the Treasury for the cost of those tax credits. That's a very significant and distinguishing feature in this matter," he said.

Despite any advantages the plan may have, Members of Congress still need to be convinced.

One objection Congress may have to the plan, according to a staffer, is that the proposal would, in effect, take the funds out of Congress' control and put it in the hands of the board that would run the TFC.

However, AASHTO maintains that the TFC board would just administer the operation of the entity and the issuing of the bonds. The bond proceeds would be distributed to the States according to a congressionally approved formula.

"The board's purpose would be to administer the bonds; do the fiduciary work that's necessary from an investor's standpoint," Basso said. "But principally the decisions on money would work exactly as they do now because the bulk of the highway and transit funding, almost all of it, would go out under congressionally mandated formulas. The program, from the State's perspective, would look and feel and

work pretty much as it does today; the difference is where the money's coming from," he said.

The principal committees that would need convincing are the two tax-writing committees—the Senate Finance Committee and the House Ways and Means Committee.

The transportation authorizing committees—the House Transportation and Infrastructure Committee and the Senate Environment and Public Works Committee—would also have jurisdiction. The Senate Banking Committee, in addition, would have a say in the legislation because it oversees the nation's transit program.

While it's early in the process of selling the plan to Congress, AASHTO officials maintain the reception to it so far has been favorable.

"It's important that we work with the Congress to help find some way to increase transportation funding," said Pennsylvania Transportation Secretary Bradley L. Mallory, who is also AASHTO's president. And "the political reception to the plan has been good."

But that does not surprise AASHTO officials, since some of the chairmen of these committees are very amenable to innovative finance ideas for transportation projects.

For example, Sens. James M. Jeffords, I-Vt., chairman of the public works panel, and Baucus plan to hold a joint Environment and Public Works and Finance committee hearing on innovative finance as soon as this month.

The two, along with 11 other senators, sent a letter on June 11 to Transportation Secretary Norman Y. Mineta, asking him to investigate new ways to leverage Federal funds to finance the construction of needed infrastructure, including using a centralized entity to fund loans and issue taxable tax-credit bonds.

The senators—including Robert C. Smith, R-N.H., and Charles E. Grassley, R-Iowa, the top Republicans on the public works and finance committees—said they are interested in exploring the possibility of "using a centralized entity to fund loans and provide credit enhancement, and the use of tax credit bonds as a financing vehicle for transportation infrastructure," according to the letter.

In the House, Rep. Thomas E. Petri, R-Wis., chairman of the Transportation and Infrastructure Committee's highways and transit subcommittee, has shown interest in the plan, noting at a hearing in May that AASHTO had "stepped up to bat."

Officials in the Bush Administration are also exploring the plan, but have not endorsed it.

At a hearing in May, Federal Highway Administration chief Mary E. Peters told a congressional panel that she had met with AASHTO representatives and is reviewing their initiatives.

"We are actively working at a number of the options but have not yet taken an administration position on any," Peters said.

#### STATES' NEEDS

States have long argued that increasing traffic congestion around the Nation has resulted in a pressing need to build additional roads and highways, as well as to maintain and improve aging ones. According to the DOT, an annual investment of \$56.6 billion is needed over the next 20 years just to maintain the physical condition of existing highways and bridges.

To meet these needs, AASHTO wants to increase funding each year to \$41.4 billion for highways and to \$10 billion for transit by the end of the 6-year life span of the successor to TEA-21. By comparison, the Federal Government in fiscal 2002 provided \$31.8 billion for highway programs and \$6.8 billion for transit.

The TFC, the proceeds of which would work in conjunction with the highway trust fund, would play a crucial role in achieving those funding levels and would increase funding by \$34 billion over 6 years for highways and \$8.5 billion for transit, AASHTO officials maintain. The plan also would provide \$5 billion for a capital revolving fund that would help finance other needs, such as freight rail, intermodal projects, passenger rail, and transportation security infrastructure. The \$5 billion could be generated, over 6-years, from the menu of revenue-generating options, but the association has not specified where the funds would come from. The revolving fund would provide direct loans, lines of credit, and loan guarantees.

"The dollars that we have in the system just don't come anywhere near meeting the needs at the State, city, and county level," said John Horsley, AASHTO executive director. "When we look at what is needed out there and where we stand in the current program, it is clear that we need to substantially grow the program."

Previously, it was a gas tax increase that provided additional funding for road construction. During the administrations of Presidents George Bush and Bill Clin-

ton, highway trust fund revenues—which are made up of gas-tax receipts—were doubled.

But, “this time we are not seeing a willingness, or an openness, or an appetite, in Congress or the administration to enact a substantial fuel-tax increase,” Horsley said.

The TFC would allow all States to benefit from debt leveraging and innovative finance and meet the funding goals, AASHTO contends.

Horsley noted that bonding and innovative finance “have enabled many States to do substantially more than they could with just current cash-flows or current Federal allocations,” and he cited the issuance of Garvees, the use of State infrastructure banks, and the Transportation Infrastructure Finance and Innovation Act in particular.

Grant anticipation revenue vehicles, or Garvees, are backed by annual Federal transportation grants, while State infrastructure banks provide low-interest loans to local governments to build transportation infrastructure. The TIFIA program provides direct loans, loan guarantees, and lines of credit for up to 33 percent of the construction cost of transportation projects costing at least \$100 million.

“But we’ve also seen some States that are restricted by constitution, restricted by statute, or simply haven’t, as a matter of practice, gone to debt financing to extend what they could do,” Horsley said.

In addition, the primary funding mechanism for highway and transit financing, the highway trust fund, is under fire because gas tax receipts have been down and subsidies for alternative fuels have reduced the fund.

Under TEA-21, receipts going into the highway trust fund were tied to Federal highway and transit funding levels so that the funds could only be used to finance highway and transit projects.

As a result, TEA-21 provided specified funding amounts for highway and transit programs for fiscal 1999 through 2003 and included a provision that the funding levels would be recalculated annually to reflect actual and projected increases and decreases in tax receipts over the 6-year life of the law.

States were initially pleased with this arrangement, and the adjustment, referred to as the revenue aligned budget authority, has added over \$9 billion to the nation’s highway programs, due primarily to the booming economy of the late 1990’s.

But as the economy stalled and estimates of gas-tax receipts turned out to be too optimistic, funding for highways in fiscal 2003 under TEA-21 was set at \$23.3 billion—\$8.5 billion below the fiscal 2002 funding amount. The cut was included in the president’s fiscal 2003 budget, which sought \$23.3 billion for highway programs.

But highways will get at least \$27.7 billion in 2003 after \$4.4 billion was included in the emergency supplemental spending measure approved this summer. In addition, the Senate Appropriations Committee recently approved a \$64.6 billion transportation-spending package for fiscal 2003, which included \$31.8 billion for highway construction. Most observers believe that fiscal 2003 highway funding will fall somewhere in this range.

State departments of transportation are anxiously watching to see how much highway funding they’ll get, because a cut from the \$31.8 billion could adversely affect the ability of States to use bonds to finance transportation projects.

“I think what we are doing with the TFC proposal is expanding substantially on the concept of innovative finance,” Basso said.

While programs such as TIFIA and State infrastructure banks boosted the number of transportation projects, AASHTO maintains that they are niche programs and don’t help finance the most projects in the most States.

Under TIFIA, a project has to cost at least \$100 million, a threshold that AASHTO contends is too high to help many States. Also, due to the manner in which TIFIA was authorized, State infrastructure banks finance projects in only a limited number of States. Thirty-nine States are authorized to operate State infrastructure banks, but under TEA-21, only four States—California, Florida, Missouri, and Rhode Island—are permitted to augment their funds with new Federal transportation grants. As a result, most State programs have failed to take off to the extent many observers had expected. The TFC proposal, AASHTO maintains, is a broader form of innovative finance and will help more States and finance more projects.

“They work for certain types of projects, but they aren’t universal,” Basso said. “What we are proposing here is a very centralized, universal attempt to raise money.”

Next: How a market for tax credit transportation bonds can be created.

[From Transportation Watch, Thursday, September 26, 2002]

FOR UPCOMING REAUTHORIZATION OF TEA-21 SENATORS EYE EXPANDING INNOVATIVE FINANCE

Senators interested in alternative financing methods for highway and transit projects learned Sept. 25 that while existing programs have accelerated project construction, limitations cause States to continue to look for traditional pay-as-you-go financing.

As Congress prepares for the 2003 reauthorization of the Transportation Equity Act for the 21st Century (TEA-21), lawmakers are looking for ways to boost revenues to the Highway Trust Fund and to develop project financing mechanisms beyond the trust fund that would encourage greater private sector investment.

"As successful as the trust fund has been, our transportation needs far outweigh our resources," Senate Finance Committee Chairman Max Baucus (D-Mont.) said at a rare joint hearing of his committee and the Senate Environment and Public Works Committee.

The three main innovative financing methods currently in use to make highway investments are State Infrastructure Banks (SIBs), Grant Anticipation Revenue Vehicles (GARVEEs) and the Transportation Infrastructure Finance and Innovation Act (TIFIA).

Innovative financing techniques give States additional options to accelerate projects, leverage Federal investments, and increase the "tools in the toolbox" of States and local or regional governments, according to JayEtta Z. Hecker, the General Accounting Office's director of physical infrastructure issues.

According to the Federal Highway Administration, as of June 2002, six States have issued GARVEE bonds that are repayable with future Federal aid totaling \$2.3 billion; 32 States have SIBs including 294 loan agreements worth \$4.06 billion, that once the loans are repaid, the money will recycle back to the revolving fund; and 9 States have TIFIA credit assistance agreements for 11 projects representing \$15.4 billion in investment.

*Downsides Noted*

With the advantages, however, come a wide array of disadvantages, Hecker said. State DOTs that are comfortable and used to traditional funding methods are not always willing to use innovative financing nor do they always see the advantage.

"States are very cautious about debt financing," Hecker said. In her written testimony, she said two States said they have a philosophy against committing their Federal dollars to debt service, rendering themselves unable to partake in new funding methods.

There also are a number of limitations in State and Federal law that do not give States the authority to use these funding methods. For example, California requires voter approval to use its trust fund allocations to pay for debt servicing costs, Hecker said. Other States have laws that restrict public-private partnerships.

The TIFIA program has a requirement that projects cost at least \$100 million, which limits it to large projects.

In response to a question by Senate environment committee Chairman James M. Jeffords (I-Vt.), Phyllis F. Scheinberg, DOT's deputy assistant secretary for budget and programs, said it was unclear if lowering the TIFIA threshold to \$50 million would make a difference.

"No one has come in and said they can't meet the \$100 million threshold," Scheinberg said. "We have a \$30 million threshold for ITS and don't have takers on that."

*Looking to Reauthorization*

States also need to determine the short and long-term costs associated with various financing mechanisms to determine which best fits their needs and abilities. They also must decide which form of debt financing is best, with it being repaid by highway users or by the general population, Hecker said.

One public finance industry professional told senators that TEA-21's successor should provide incentives for public/private, market-based partnerships that finance, develop, operate, and maintain highways, mass transit facilities, high-speed and freight rail and inter-modal facilities.

"This could be accomplished by permitting the targeted use of \$15-\$20 billion of a new class of private activity bonds, and/or by modifying certain restrictions in the Internal Revenue Code on tax-exempt bond financing of transportation modes," said Jeffrey Carey, managing director in Municipal Markets at Merrill Lynch.

Carey also supported a proposal by the American Association of State Highway and Transportation Officials to create the Transportation Finance Corporation, a

federally chartered, nonprofit corporation that would provide increased investment resources through the leveraging of existing resources.

“Federal Government corporations have helped the capital markets create strong and liquid markets to fulfill other policy and programmatic objectives,” Carey said.

Even if lawmakers refine some of these innovative finance tools to make them more mainstream, they will not supplant existing funding methods.

“What we discuss today is a complement to our traditional programs, not a replacement,” Jeffords said.

*Upcoming Highway Hearings*

The House Highways and Transit Subcommittee will hold a hearing Sept. 26 on capital and maintenance needs of the highway and transit system. The Senate Transportation, Infrastructure, and Nuclear Safety Subcommittee will hold a hearing Sept. 30 to examine the conditions and performance of the Federal-aid highway system.

The Federal Highway Administration’s long-awaited Conditions and Performance Report remains tied up at the Office of Management and Budget and DOT’s Office of the Secretary and will not be available until October, a spokesman said. However, it will be discussed at both hearings.

---

AMERICAN HIGHWAY USERS ALLIANCE

*September 24, 2002.*

The Honorable MAX BAUCUS,  
*Chairman, Committee on Finance,*

The Honorable JAMES JEFFORDS,  
*Chairman, Committee on Environment and Public Works,*  
*U.S. Senate,*  
*Washington, D. 20510.*

RE: Joint Hearing of September 25, 2002

DEAR CHAIRMEN BAUCUS AND JEFFORDS: The Highway Users Alliance (AHUA) takes this opportunity to briefly address issues regarding the Federal highway program and asks that this letter be included in the record of the hearing of the Finance and Environment and Public Works Committees on this subject.

Your committees are to be commended for holding this hearing on how the Federal Government can finance an increases level of Federal investment in highways—an investment that will provide important benefits country.

As the nation’s broadest-based highway advocacy organization and the organization that represents the motorists, truckers, and businesses that pay the taxes that fully fund and rely on our nation’s highway and bridge investments, The Highway Users is particularly interested in your joint efforts to improve revenue collection and increase investments.

America’s roads have serious and documented funding needs—too many Americans are dying or being injured on roads suffering from outmoded design—traffic congestion is worsening, threatening safety, slowing air quality progress, increasing tailpipe greenhouse gas emissions, wasting fuel, slowing product deliveries, and taking commuters away from their families and other productive exercises.

Some have called for increasing Federal fuel taxes. If there are demonstrated needs and current funding is being invested appropriately, highway users will seriously consider that option. But we believe that your committees must first improve where today’s taxes are going, prevent further erosion of available resources, and examine all means available to boost highway revenues without raising taxes.

Thus, we take this opportunity to support S. 2678, the “Maximum Economic Growth for America Through the Highway Trust Fund Act,” bi-partisan legislation introduced earlier this year by Chairman Baucus. The 12 co-sponsors of that bill include the following members of the Finance or Environment and Public Works Committees: Senators Daschle, Reid, Graham, Warner, Bond, Thomas, and Crapo. We thank all the supporters of that legislation for their leadership in advancing the provisions of that bill.

Among other provisions, S. 2678 would provide that the 2.5 cents per gallon of tax on gasohol that currently is directed to the General Fund of the Treasury would be deposited in the Highway Account.

In addition, S. 2678 would deposit into the Highway Account an amount equal to the fuel taxes not imposed on gasohol due to the gasohol tax preference. This is in keeping with historical precedence of funding agricultural programs, like ethanol, from the general fund. The bill would not raise the tax imposed on gasohol. This

means that the Highway Account would receive treatment on gasohol comparable to the treatment currently given to the Mass Transit Account. That account, unlike the Highway Account, already receives the same amount of funding for a gallon of gasohol as it does for a gallon of regular gas.

S. 2678 would also resume the practice of crediting the Highway and Mass Transit Accounts of the Highway Trust Fund with interest on their respective balances. While we would prefer that Congress invest those surpluses, the trust fund should receive interest on highway use taxes collected, but not invested.

Increased revenues for the highway program can also come from improved collections. We ask that the two committees work to achieve greater compliance with our tax laws that support the Highway Trust Fund. We have heard, for example, that changing the point of collection of aviation fuel taxes could add billions to the Trust Fund over the life of a reauthorization. Other enforcement steps could be beneficial as well. We urge the Congress to take appropriate steps to achieve the highest possible rate of collection of the taxes due to the Highway Trust Fund.

In addition, we understand that Senator Baucus is exploring additional legislation that would allow the Secretary of the Treasury to sell tax credit bonds. The proceeds would go into the Highway Trust Fund and the General Treasury would be responsible for the principal and interest. We are eager to see this approach advance as an additional means of increasing highway investment.

Mssrs. Chairmen, the American Highway Users Alliance commends the Committees for holding this hearing and urges enactment of legislation, in accord with the points outlined above, to finance increased Federal highway investment. Thank you for your consideration of our views on this important matter.

Respectfully submitted,

WILLIAM D. FAY, *President and CEO,*  
*American Highway Users Alliance.*

---

STATEMENT OF THE TRANSPORTATION DEPARTMENTS OF MONTANA, IDAHO, NORTH DAKOTA, SOUTH DAKOTA, AND WYOMING

The transportation departments of Montana, Idaho, North Dakota, South Dakota, and Wyoming submit this brief statement for the record of the joint hearing held on this date by the Committee on Finance and the Committee on Environment and Public Works.

We are extremely pleased that, today, there is a consensus in the country that a well funded highway program makes an important and positive contribution to our nation's economic prosperity and quality of life. But we urge the Congress not to rest on that consensus, but to build upon it and increase today's level of Federal investment. As the Congress receives testimony and prepares to shape legislation to reauthorize federally assisted surface transportation programs, it is important to keep foremost in mind that increased transportation investments will truly advance the public interest and help all citizens and all States.

The two committees are to be commended for holding this hearing. The nation's ability to achieve increased transportation investment requires increased funding. It requires an answer to the question of how the Federal Government will finance its contribution to such an increase.

A very important part of the answer is already before you. Earlier this year, Chairman Baucus, with the co-sponsorship of Senators Crapo, Daschle, Thomas, Craig, Enzi, Johnson, Warner, Reid, Graham, Bond, Harkin, and Carnahan, introduced bi-partisan legislation, S. 2678, that would increase receipts into the Highway Trust Fund without raising taxes.

We support every provision of that legislation.

That legislation would allow the Highway Account of the Highway Trust Fund, which has foregone very significant revenue due to increased gasohol consumption, to be properly credited. The bill would ensure that the 2.5 cents per gallon of tax on gasohol that currently is directed to the General Fund of the Treasury would be deposited in the Highway Account. In addition, the bill would credit the Highway Account with funds equal to the amount of fuel taxes not imposed on gasohol due to the gasohol tax preference (currently 5.3 cents per gallon). The bill would not raise the tax imposed on gasohol. This approach would make the Highway Account whole with respect to taxes either paid or foregone with respect to gasohol consumption. It would allow the Highway Account to finally receive treatment on this issue comparable to the treatment on this issue currently given to the Mass Transit Account which, unlike the Highway Account, already receives the same funding for a gallon of gasohol as it does for a gallon of regular gas.

S. 2678 also properly would reinstate the principle that the Highway and Mass Transit Accounts of the Highway Trust Fund should each be credited with interest on their respective balances. The bill also includes a thoughtful provision requiring a commission to look at long-term issues in financing the surface transportation program.

So, while witnesses today may be emphasizing various innovative ways of financing increased Federal surface transportation investment, we wanted to emphasize our support for the important and straightforward provisions included in S. 2678, the "Maximum Economic Growth for America Through the Highway Trust Fund Act."

As to additional financing mechanisms, at this time we will limit ourselves to a brief positive comment on a concept that we understand to be under development by Senator Baucus. The approach would be for the Secretary of the Treasury to sell bonds with the proceeds being deposited in the Highway Trust Fund. The General Treasury would be responsible for the principal and interest. We welcome the development of this additional approach as a means of serving our national interest in increased investment in highways and transportation.

In closing, we commend Chairman Baucus and Ranking Member Grassley of the Finance Committee and Chairman Jeffords and Ranking Member Smith of the Environment and Public Works Committee for holding this hearing on the important issues of finding ways to finance increased Federal transportation investment. That investment is certainly essential to the economic future of our States and we appreciate this opportunity to offer views on how that might be achieved.

---

#### STATEMENT OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS

The American Society of Civil Engineers (ASCE) is pleased to provide this statement for the record on financing alternatives for the nation's surface transportation programs.

ASCE, founded in 1852, is the country's oldest national civil engineering organization representing more than 125,000 civil engineers in private practice, government, industry and academia who are dedicated to the advancement of the science and profession of civil engineering. ASCE is a 501(c)(3) non-profit educational and professional society.

ASCE believes the reauthorization of the nation's surface transportation programs should focus on three goals:

- Expanding infrastructure investment
- Enhancing infrastructure delivery
- Maximizing infrastructure effectiveness

ASCE's 2001 Report Card for America's Infrastructure graded the nation's infrastructure a "D+" based on 12 categories, including roads with a grade of "D," bridges with a grade of "C," and transit with a grade of "C-." Roads, bridges and transit have benefited from an increase in Federal and local funding currently allocated to ease road congestion, to repair decaying bridges, and to add transit miles. However, with 29 percent of bridges still ranked as structurally deficient or obsolete and nearly a third of major roads considered to be in poor or mediocre condition, engineers warn that Congress cannot afford to allow promised funding for transportation to lapse. Transit ridership has increased 15 percent since 1995, adding a strain despite unprecedented growth in transit systems and increased funding.

Establishing a sound financial foundation for future surface transportation improvements is an essential part of reauthorization. TEA-21 provided record funding levels to the States and significant improvements have been made to our nation's infrastructure. In spite of these notable efforts, the nation's surface transportation system will require an even more substantial investment. United States Department of Transportation (DOT) data reflect the fact that an investment of \$50 billion per year would be needed just to preserve the system in its current condition. With funding as the cornerstone of any attempt to reauthorize TEA-21 it is imperative that a variety of funding issues be advanced as part of ASCE's overall strategy.

#### *Sustaining Infrastructure Investment*

ASCE supports the following goals for infrastructure investment.

- A 6-cent increase in the user fee with one cent dedicated to infrastructure safety and security. These new funds should be distributed between highways and transit using the formula approved in TEA-21.
- The user fee on gasoline should be indexed to the Consumer Price Index (CPI) to preserve the purchasing power of the fee.

- The Transportation Trust Fund balances should be managed to maximize investment in the nation's infrastructure.
- Congress should preserve the current firewalls to allow for full use of trust fund revenues for investment in the nation's surface transportation system.
- The reauthorization should maintain the current funding guarantees.
- Congress should stop diverting 2.5 cents of the user fee on ethanol to the General Fund, and put it back into the Highway Trust Fund.
- Make the necessary changes to alter the Revenue Aligned Budget Authority (RABA) to decrease the volatility in the estimates from year to year and ensure a stable user fee based source of funding.
- The current flexibility provisions found in TEA-21 should be maintained. The goal of the flexibility should be to establish a truly multi-modal transportation system for the Nation.

ASCE supports a reliable sustained user fee approach to building and maintaining the nation's highways and transit systems. While ASCE supports a wide variety of innovative approaches to finance surface transportation projects, ASCE feels strongly that the current user fee arrangement is the most equitable and efficient means of ensuring stable transportation funding.

First to be addressed is the issue of raising the user fee on motor fuels. While the gas tax is an important element of the current revenue stream feeding the Federal Highway Trust Fund, it continues to erode in value due to its inherent inelastic nature. Two strategies must be advanced to remedy this condition. First, raise the gasoline user fee by six cents. This would provide a much needed infusion of funding toward the \$50 billion per year need. In tandem with raising the motor fuel tax, ASCE believes that it is important to shore up the weakness of the motor fuel tax and its inability to retain value over the long term by adding a provision to the law that would index it based on the Consumer Price Index (CPI). This would allow the rate to adjust and reflect the current economic conditions of the Nation.

#### *Innovative Financing*

ASCE supports the innovative financing programs and advocates making programs available to all States where appropriate. Additionally, the Federal Government should make every effort to develop new programs.

ASCE supports the following changes to enhance the existing programs:

#### *Transportation Infrastructure Finance and Innovation Act (TIFIA)*

- The TIFIA process for review, approval and negotiation is regarded as burdensome, and could be streamlined.
- TIFIA projects have a minimum eligibility threshold of \$100 million and consideration could be given to lowering this to \$50 million to expand the pool of projects.
- TIFIA loans could be "fully subordinated". Current TIFIA legislation is written to subordinate TIFIA loans to other creditors. However, in the event of liquidation/default, the TIFIA loan advances to parity status with other creditors. This is known as the "springing lien" provision. It is thought by some that this has limited the availability of other credit. The issue is controversial, with pros and cons on both sides, but reform should be seriously considered.

#### *State Infrastructure Banks (SIBs)*

- With the exception of five States (Texas, Rhode Island, Florida, Missouri, and California), TEA-21 did not permit further capitalization of SIBs with Federal funds. It is felt that this has suppressed SIB activity.
- Federal regulations still apply to loan funds that are repaid to the bank, encumbering SIB funded projects with Federal regulatory requirements.

#### *Grant Anticipation Revenue Vehicles (GARVEEs)*

- Increase the flexibility of GARVEE bond repayment methods. For example, utilize the total apportionment amount as a source of repayment (i.e., all funding categories), so that no particular funding category is overburdened.

New programs for consideration as part of the next reauthorization are:

- Increased use of user fees, tolls, value pricing, and HOT lanes.
- Possible indexing of highway trust fund motor fuels tax to inflation.
- Establishing a true multimodal funding program (i.e., funds can be used interchangeably for rail, highway, freight, intermodal facilities, etc.).
- Tax credit bonds, private activity bonds, and tax-exempt bonds for privately developed projects.

Tax-based revenues are not sufficient to keep pace with the nation's transportation needs.

There is a compelling need for enhanced funding, to a large extent through user-oriented fees that have been demonstrated to be a well-accepted and equitable source of infrastructure financing. In the case of surface transportation, federally sponsored studies demonstrate the need for higher levels of investment. An additional challenge is to convince our citizens and our elected leaders that we must either “pay now” or “pay later”, and that paying now is much more cost-effective and prudent in the long run.

Innovative financing techniques can greatly accelerate infrastructure development and can have a powerful economic stimulus effect compared to conventional methods. This is the current approach in South Carolina, Georgia, Louisiana, Florida, and Texas, where expanded and accelerated transportation investment programs have been announced. Innovative financing techniques, including toll road-based funding, figure heavily in several of these State programs.

The innovative programs in TEA-21 have been a good start, but more needs to be done to expand their scope, and new programs or approaches must be introduced. We must find new and innovative ways to finance the critical transportation infrastructure needs of the Nation.

#### *Life Cycle Cost & Surface Transportation Design*

The use of Life-Cycle Cost Analysis (LCCA) principles will raise the awareness of clients of the total cost of projects and promote quality engineering. Short-term design cost savings which lead to high future costs will be exposed as a result of the analysis. In the short-term the cost of projects will increase; however, the useful life of a project will increase, and there may be cost savings in operations and maintenance over the long term.

When the cost of a project is estimated only for design and construction, the long-term costs associated with maintenance, operation, and retiring a project, as well as the cost to the public due to delays, inconvenience and lost commerce are overlooked. The increasing use of bidding to select the design team has resulted in a pattern of reducing engineering effort to remain competitive, with the result of higher construction and life cycle costs.

ASCE encourages the use of Life-Cycle Cost Analysis (LCCA) principles in the design process to evaluate the total cost of projects. The analysis should include initial construction, operation, maintenance, environmental, safety and all other costs reasonably anticipated during the life of the project, whether borne by the project owner or those otherwise affected.

#### *Long-term Viability of Fuel Taxes for Transportation Finance*

ASCE supports the need to address impacts on future surface transportation funding and believes that provision should be made in the next surface transportation authorizing legislation to explore the viability of the most promising options to strengthen this funding. In particular, the impacts of fuel cell technology should be studied as well as how to create a mileage based system for funding our nation's surface transportation system as this technology comes to market and lessens the nation's dependence on gasoline as a fuel source for automobiles.

Fuel taxes have long been the mainstay for transportation infrastructure finance, but their future is now uncertain. In many States, there is a strong reluctance to raise fuel taxes, and some State legislatures have even reduced taxes to compensate for the sharp increase in average gasoline prices over the last 2 years. Many localities and States are supplementing or replacing fuel taxes with other sources, such as sales taxes and other general revenue sources. There is also a growing trend to use additives to gasoline for environmental reasons, and the most prominent additive, ethanol, enjoys a Federal exemption from fuel taxes that reduces Federal and State trust fund revenues by some several billion dollars annually. Looking ahead, a slow but steady increase in fleet efficiency—perhaps due to increased market penetration by electric, fuel cell, or hybrid technologies—would reduce the revenue per mile of use generated by users. Whereas cleaner-burning fuels and increased fuel efficiency are desirable policy goals in their own right, particularly in regard to global warming, they may reduce the ability to rely on fuel taxes in the future.

A helpful first step in this process will be the Transportation Research Board's recently initiated Study on Future Funding of the National Highway System, which will describe the current policy framework of transportation finance and evaluate options for a long-term transition to sources other than fuel taxes. The goals of the study are to: (1) determine the extent to which alternatives to fuel taxes will be needed in the next two decades or so; (2) analyze the pros and cons of different alternatives in terms of political feasibility, fairness, and cost; (3) suggest ways in which barriers to these alternatives might be overcome; (4) recommend ways in which the efficiency and fairness of the fuel tax could be enhanced, and (5) rec-

ommend, as necessary, a transition strategy to other revenue sources. The study's first task, to be summarized in an interim report, will provide one or more scenarios to illustrate the time span during which petroleum-based gasoline availability and cost might reduce fuel tax revenues. The interim report has been requested to provide insight to those parties involved in the development of the surface transportation reauthorization legislation, particularly with regard to projections of fuel tax revenues during the next reauthorization cycle. The study will also provide estimates of trends in expenditures for transportation infrastructure from sources other than the fuel tax.

---

STATEMENT OF ROSS B. CAPON, EXECUTIVE DIRECTOR, NATIONAL ASSOCIATION OF RAILROAD PASSENGERS

Thank you for the opportunity to present this information. Our non-partisan organization has worked since 1967 in support of more and better passenger trains of all types in the U.S. Our vision of the future includes an intercity rail passenger network that connects all regions and metropolitan areas of the country and serves all important transportation routes. Such a vision would be similar to the one adopted with the authorization of the Eisenhower Interstate Highway system in 1956.

It is critical that TEA-3 Reauthorization finally resolve the chronic under-funding of passenger and freight rail transportation by establishing a Federal program that encourages States to invest in both passenger and freight rail development.

At a time of unprecedented highway congestion, the freight railroads are reducing infrastructure improvement projects due to decreasing rates of return on capital investments. Meanwhile, for 31 years, we have subjected Amtrak to unpredictable funding levels that have left our national passenger rail system with a \$5 billion backlog in needed capital investments. In California alone, over \$100 million in intercity passenger rail investment plans that also would benefit freight operations have been shelved until more Federal funding becomes available. A strong rail system serving both passengers and freight is a national necessity.

Individual States will never fulfill rail funding needs on their own, nor will they sustain the national vision for an efficient freight and intercity passenger rail network beyond their own borders. To realize the national vision, the Federal Government must lead. The traveling public wants intercity passenger rail. The rules for success are simple: Give people half decent service, and they will ride; give them great service, and they will come in droves. Very modest investments in service have brought substantial returns in patronage. To name just a few:

- Downeaster (Portland, Maine to Boston): Inaugurated in December 2001, this new route exceeded all revenue projections for the entire year in only 6 months. Through the summer, the trains often had standees even though third and fourth coaches were added to the original consists (which had one combined cafe/coach/Coastal Club Service car and two coaches). Although driving is an hour faster (without traffic), New Englanders are choosing the train for its convenience and comfort. August ridership was 30,700. With four daily round-trips, that is an average of about 124 passengers per trip.

- Long Distance Sleepers: In the January-March, 2002, quarter, sleeping-car revenues increased 18 percent and travel (measured in passenger-miles) 11 percent above year-earlier levels. Airline revenues were still down about 20 percent.

- Amtrak carries more passengers between New York and Washington than all airlines, and Acela Express/Metroliner service is a big factor in that. When all city-pair combinations between New York and Washington are included, Amtrak's market share of the air-rail segment surpasses 70 percent. Premium Acela Express and Metroliner service has experienced a ridership surge of 35 percent since 2001.

- Amtrak's share of the Boston-Philadelphia air-rail market was 8 percent before Acela and Boston-New Haven electrification, but that rose to 26 percent in the January-March, 2002, quarter (most recent available). This means that, in spite of Amtrak running-times of almost 5 or 6 hours (Acela Express and Acela Regional, respectively), there is more than one Amtrak customer for every three airline passengers. \* In the Pacific Northwest, new Talgo trains helped boost ridership from 226,000 in 1993 to 658,000 in 2001. (Passenger-miles rose 2 percent during the first 11 months of fiscal 2002 in spite of the travel recession.) The overall growth from 1993 was based on marginal increases in frequency and speed (with the best Seattle-Portland schedules now taking 3 1/2 hours, a 53 mph average).

- Capitol Corridor: Since 1998, ridership on this bustling Sacramento-San Jose route has climbed 132 percent, surpassing one million annual passengers.

On the freight side, the Alameda Corridor in the Los Angeles area has improved over 200 grade crossings, reduced truck traffic, and tremendously enhanced the flow

of freight trains between Los Angeles and Long Beach. Not long before, freight-passenger interference was reduced with construction of a rail-over-rail flyover in Los Angeles.

To make similar success stories possible elsewhere in California and the rest of the Nation, the Federal Government must create a partnership with States that supports and encourages investment in passenger and freight rail. Several bills in the House and Senate, such as RIDE-21 and S. 1991, laudably set the framework for a Federal rail infrastructure program, where money should be spent, and how tax-exempt bonds, tax-credit bonds, and expanding the Rail Rehabilitation and Infrastructure (RRIF) program will provide the needed capital. However, none of these bills outline where the cash needed to support these Federal programs will come from.

Thus, the National Association of Railroad Passengers strongly supports the creation of a Rail Trust Fund, similar to those used so effectively for the highway and aviation modes.

While the Rail Trust Fund might eventually derive significant revenue from user fees, user-based revenue sources would not generate much revenue initially. In order for a rail trust fund to reach critical mass, the Federal Government must first "prime the pump" by earmarking revenue from other sources. Highways and aviation systems were already relatively mature before creation of their trust funds.

Some possible Rail Trust Fund sources already exist in the form of taxes levied on the railroads, which, unlike highway and aviation taxes, do not benefit further investment in their respective mode.

This counter-productive precedent has hindered development of both passenger and freight rail for decades. Between 1941 and 1962, the Railroad Ticket Tax raised billions in revenue, none of which went toward enhancing development of the freight or passenger rail service; some revenues actually went toward highway development. Today, through taxes levied on railroads on infrastructure and fuel, we continue to discourage investments in rail by funneling these revenues into the general treasury.

We believe rail should receive a portion of any future increase in gasoline or aviation taxes. We support many State DOTs in the view that they should be allowed to spend flexible gasoline-tax dollars on intercity passenger rail. We do not believe the Nation or the cause of balanced transportation benefits from an 'ironclad' mode-specific approach to trust funds, but in the present context we certainly agree that taxes levied on railroads (including Amtrak) should benefit railroads—passenger and freight.

We know that freight railroads are very sensitive to the possibility that creation of a trust fund would alter the competitive balance among the railroads, or result in rail tax payments cross-subsidizing passenger projects. We believe these challenges can be addressed. General guidelines about overall project balance between competing freight railroads and how improvements must benefit both freight and passenger service could establish a fair process of disbursement for all parties. Other stipulations about the share of allowable projects whose benefits are judged to be "passenger only" could be negotiated. If Congress does not repeal the 4.3 cent diesel tax which Amtrak and the freight railroads currently pay toward general deficit reduction, then the \$170 million raised annually from this tax should be directed into a Rail Trust Fund, and no longer be set aside for deficit reduction. This precedent has already been set, as similar airline and highway taxes were redirected into their respective trust funds in 1997. Since 1997, the railroads have paid approximately \$1 billion in diesel taxes to general revenue; this money should be retroactively rebated at its present value to the Rail Trust Fund and set aside for rail infrastructure development.

Other revenue sources being considered for the Rail Trust Fund include taxes on equipment sales, and passenger ticket taxes on commuter and Amtrak trains. Any new taxes levied on the freight railroad industry and passengers must not be viewed as a panacea, and be implemented with restraint. Raising taxes on equipment will increase startup costs for new services as well as decrease an already diminished rate of return for capital investments. An equipment tax will be pointless if railroads simply reduce their capital investments further because they are now paying a tax on new equipment. A net gain for capital investments infrastructure must accompany any tax levied on new equipment purchases.

With respect to passenger tickets, again, NARP believes these taxes must not be seen as a panacea, and be implemented cautiously (perhaps not at all, or only after the results of meaningful capital projects have become apparent in service improvements). Unfortunately, the vast reservoir of patronage that made the railroad ticket tax so successful (at raising general revenues!) between 1941 and 1962, is much smaller, and cannot generate nearly as much revenue as before. A passenger ticket

tax must not try to make up this difference by imposing a much higher tax rate; taxing passengers too much would stifle ridership to the point that nobody rides the train. Amtrak already tries to set fares to maximize revenues, and many fares already are very expensive. Also, Amtrak, as noted above, already pays the 4.3 cent fuel tax.

Polls over the years have consistently shown public support for faster, more frequent, and reliable passenger trains, including two national polls this summer. A poll conducted by CNN/Gallup/USA Today near the height of Amtrak's June cash crisis (June 21–23) found that 70 percent of the public support continued Federal funding for Amtrak. Similarly, The Washington Post found that 71 percent of Americans support continued or increased Federal funding for Amtrak (August 5 article reporting on July 26–30 poll).

If we provide quality service, the public will ride the trains. If the Federal Government provides States a meaningful match, the States will drive the needed investments. At the same time, the public also will realize a tremendous benefit from an improved freight rail network. Again, the key to realizing these benefits will be a long term Federal partnership with States, and an adequately supported Rail Trust Fund that would bring balance into national transportation policy, and ultimately benefit the users of every mode of transportation.

The web site of the National Association of Railroad Passengers is <[www.narprail.org](http://www.narprail.org)>.

---

STATEMENT OF STATE SENATOR BETTY KARNETTE, CALIFORNIA STATE CAPITOL,  
SACRAMENTO, CA

Thank you for having this important hearing to discuss the security and infrastructure needs of trade-based transportation throughout this great country of ours.

Clearly, America's long-term economic growth depends on our ability to move goods safely and efficiently. Throughout the Nation, we see how freight movement brings our trade economy to life. We can be proud of how we work as a nation to stay competitive in the global economy.

However, there are serious obstacles to our nation's freight security and mobility that could significantly reduce the safe and efficient movement of goods in the immediate future. Unless we address these problems in an innovative, systematic fashion—without delay—we risk America's ability to provide the type of transportation infrastructure on which the goods movement industry has come to rely.

Before 9/11/01, our freight mobility issues were already challenging enough. But today, we must also ensure that our nation's freight movement system is as secure as it is efficient. Clearly, our present challenge is to insure the security, efficiency and sustainability of the nation's freight movement system.

It is awe-inspiring to see how the various regions of this nation collaborate in manufacturing, selling and moving goods to each other and to our trading partners throughout the world. For example, nearly \$650 billion in domestic and international trade flows between California and other regions of the United States.

What would happen if the goods movement between the east coast, west coast and points in between were to collapse? Clearly, our economy—and those who rely on it—would be in serious trouble, and that day may not be far away. Rail lines and rail yards in California are expected to reach maximum capacity within five to 7 years. Moving a freight container from one side of Chicago to the other can often take up to 4 days.

There are countless examples of problems just like these that demonstrate the importance of developing a systematic strategy to meet the challenges that confront us. If we fail to act, our competitors in the global economy will be the only beneficiaries.

I would like to focus my testimony on how we can ensure that our nation's freight transportation network can keep pace with the demands of economic growth.

First, we need a comprehensive strategy for increasing capacity and improving the efficiency of goods movement in the United States. The strategy must be complete and it must include private sector participation.

As I have indicated in my attached report, National Freight Security and Infrastructure Bank, we can simultaneously meet the needs of both government and industry by creating an organization that focuses on public/private finance and project selection. A public/private partnership is the only sensible approach we can take. We must make sure that the two major stakeholders of the nation's freight system—government and industry—have a forum to collaborate and to solve national goods movement problems.

Second, as Congress rightfully confronts the issue of freight security, it is essential that any such effort include an innovative and comprehensive financing strategy to address it. We do not have sufficient financial support from existing Federal programs to guarantee the freight security and mobility in the way we would like. Therefore, I have developed an innovative finance proposal for freight projects.

My proposal for a National Freight Security and Infrastructure Bank demonstrates how to develop an innovative funding base and how to deliver freight transportation projects with public/private collaboration, while conforming to transportation programming requirements at the Federal, State and local levels.

While there may be some concern that user fees may not be the best way to fund freight security and mobility, we simply cannot lose sight of the option. Security and mobility are key elements of America's ability to remain competitive in the global economy.

These are the same considerations that led President Dwight David Eisenhower to create the Interstate Highway System. Creation of the Interstate Highway System was primarily driven by security concerns during the cold war years of the 1950's and 1960's (i.e., the need to quickly, safely and efficiently deploy troops and material).

Today we face similar security concerns that must be addressed as we aggressively pursue goods movement infrastructure development. Many of our present challenges may seem insurmountable. But our nation's history is rich with examples of how Americans can rise above the challenges of the day.

The bottom line is that a comprehensive approach will simultaneously enhance America's economic development and mitigate environmental and safety issues—while at the same time addressing national security.

#### *National Freight Security and Infrastructure Bank*

The National Freight Security and Infrastructure Bank (NFSIB), a stand-alone Federal agency, would be funded by a new uniform NFSIB security and infrastructure fee, administered by U.S. Customs, and based in part upon a percentage of the existing duties on all imported cargo through border crossings and through the nation's seaports. The NFSIB would establish security and infrastructure fees for certain commodities, which at present have no existing U.S. Customs duty, but which have security or infrastructure impacts. The amount of the NFSIB security and infrastructure fee would be adjusted annually based upon the change in the Consumer Price Index (CPI).

U.S. Customs would be responsible for collecting the NFSIB security and infrastructure fee. US Customs would receive compensation from NFSIB for providing this administrative service. Fees would flow to the National Freight Security and Infrastructure Trust Fund, which would be administered by the NFSIB. The NFSIB's staff and administrative costs would be funded by fees paid by project sponsors (from non-NFSIB import cargo fee resources). The NFSIB's Board of Directors would consist of 15 representatives from the public and private sectors, including the U.S. Department of Transportation, U.S. Customs, ports, steamship lines, shippers, trucking and railroad industries.

85 percent of the Trust Fund would be available as cash, or pledgable revenue to support project financings of eligible freight security and infrastructure projects. Project sponsors would be responsible for developing financing plans for individual projects. Project sponsors could choose direct funding, and/or use of leveraging strategies, including issuing debt, or a combination of funding strategies, in which the project sponsor would rely on cash or pledgable revenue provided by the NFSIB. 10 percent of the Trust Fund would be remanded to the U.S. Department of Transportation for grants for discretionary freight security and infrastructure projects, and 5 percent would be available to the U.S. Customs Service for administering the collection of fees.

Project sponsors/applicants may include any of the following: States; cities; regional and local public agencies; port authorities; joint powers authorities; and joint applicants involving public agencies and private transportation firms or associations.

All eligible projects must address security and transportation needs of imported cargo through seaports located in specified Global Gateway Regions of the United States, or through selected border crossings, or through selected inland cargo interchange points, or through the area of jurisdiction of the local Metropolitan Planning Organization. Projects nominated for funding must be included in the Regional Transportation Plan adopted by the Metropolitan Planning Organization. Regardless of their distance from the seaport, border crossing, or interchange point, all nominated projects must address one or more of the following goals associated with the movement of imported cargo: 1) increase national or homeland security, 2) expe-

dite shipments of imported cargo by increasing capacity, improving communications and information sharing, reducing delay or increasing speed or efficiency of shipment, and 3) relieve traffic congestion, reduce air and noise pollution or mitigate other environmental impacts.

The Board of Directors of the NFSIB will determine which projects will receive funding. Funds will flow directly from the NFSIB to project sponsors. Project sponsors must provide 25 percent matching funds from any source. The U.S. Department of Transportation shall approve projects recommended for funding by the NFSIB, and shall have veto power over any project funding recommended by the NFSIB.

Global Gateway Regions shall include:

- 1) Southern California, including ports of Los Angeles, Long Beach, Hueneme and San Diego;
- 2) Northern California, including the Port of Oakland, Port of Stockton; 3) Pacific Northwest, including the Ports of Portland, Seattle and Tacoma;
- 4) Gulf Coast, including the Ports of Galveston, Houston, Corpus Christi, New Orleans, Mobile, Tampa;
- 5) Southeast, including Jacksonville, Miami, Everglades, Palm Beach, Charleston, Charlotte, and Savannah;
- 6) Northeast and Mid-Atlantic, including the Ports of New York/New Jersey, Philadelphia, Boston, Wilmington, Baltimore and Norfolk;

Border Crossings shall include:

- 1) Laredo, TX
- 2) El Paso, TX
- 3) Bellingham, WA
- 4) Portal/Northgate, ND
- 5) International Falls, ND
- 6) Sault Ste Marie, MI
- 7) Detroit/Port Huron, MI
- 8) Niagara Falls, NY
- 9) Plattsburg, NY
- 10) Otay Mesa
- 11) Calexico

Inland interchange points shall include:

- 1) Chicago, IL
- 2) Memphis, TN
- 3) Kansas City, MO
- 4) Washington, DC
- 5) Richmond, VA
- 6) Charleston, WV
- 7) Ft Worth, TX
- 8) Chattanooga, TN
- 9) Denver, CO
- 10) Little Rock, AR
- 11) Minneapolis/St. Paul, MN
- 12) St. Louis, MO
- 13) Albany, NY
- 14) Syracuse, NY
- 15) Cincinnati, OH
- 16) Columbus, OH
- 17) Pittsburgh, PA
- 18) Hattiesburg, MS
- 19) Atlanta, GA
- 20) Lexington, KY
- 21) Birmingham, AL
- 22) Nashville, TN
- 23) Cairo, IL
- 24) Louisville, KY
- 25) Indianapolis, IN
- 26) Charlotte, NC
- 27) Raleigh/Durham, NC

Examples of projects that would be eligible for funding include:

*1) California Global Gateways*

Accounting for 40 percent of all U.S. waterborne commerce, California represents the largest trading complex in the United States. Freight transport capacity, however, has not kept up with demand. Although the Alameda Corridor opened in April of 2002, serious deficiencies in railroad track and yard capacity and freeway capacity still exist in the L.A. area. California is facing explosive growth in international

trade through its ports and border crossings over the next 20–25 years. Grade separations and other mitigations are needed to relieve freight-related congestion in local communities. Examples of specific projects that could apply for NFSIB funding include:

Alameda Corridor-East (extension of the Alameda Corridor through the San Gabriel Valley, Orange County, San Bernardino County, and Riverside County);—Gerald Desmond Bridge replacement in the Port of Long Beach;—Oakland Joint Intermodal terminal at the Port of Oakland.

2) *Florida's Gateway Project: The Americas Corridor*

Florida is the fourth largest container handling State in the Nation, with the State's South Florida seaports handling an important share of the international goods flowing through the State to and from global markets. The goal of the Americas Corridor is to optimize the movement of international cargo and domestic freight among seaports, rail lines and State highways in South Florida. In particular, the 60 linear miles of the intermodal transportation system linking South Florida's three seaports is of critical concern. The containers moving across the docks of three South Florida seaports, each of which is also a premier cruise port and located adjacent to a busy downtown center, must traverse the choked streets of urban neighborhoods to access the Interstate highway system, impeding mobility, productivity and compromising the nation's security. Double tracking of the rail system between Jacksonville and Miami is another specific project that will be required in the future.

3) *Chicago Cross Town Highway and Rail Improvements*

In Chicago six Class I railroads converge at some 18 major intermodal terminals ringing the city. 1,500 trains per day approach these terminals and 3,500 cross-town container moves occur daily. The stress on the region's roadways is enormous, and the delay to cargo delivery is increasingly inefficient. A series of improvements to this fragmented infrastructure would add capacity and velocity to the rail and trucking systems.

4) *New York/New Jersey Port Access Projects*

The Port of NY/NJ is the largest port complex on the east coast, and the second largest in the Nation. Significant environmental concerns hamper overall freight investment. New highway building is constrained by land availability and environmental concerns. 15,000 trucks move in and out of the port area each day, but each truck trip faces an average of 30–50 minutes of delay due to increasing congestion in the area. The port has devised a series of port access improvements and intermodal connectors needed in the region.

---

STATEMENT OF PROFESSOR DAVID J. FORKENBROCK, DIRECTOR, PUBLIC POLICY CENTER, UNIVERSITY OF IOWA

*A New Approach to Assessing Road User Charges*

This testimony describes a major study in progress to develop a new approach for charging vehicles that travel on public roadways. The new approach applies intelligent transportation system (ITS) technology to the problem of assessing road user charges, enabling these charges to be fairer, more stable, and more flexible. Though very simple in concept, the new approach has required that a number of institutional and technological issues be resolved. It is to resolve both types of issues that we are undertaking this research.

Phase I of this research was concluded in September 2002, and a final report is available from Professor Forkenbrock. The first phase of this research was funded through a special consortium comprised of the Federal Highway Administration and 15 State departments of transportation: California, Connecticut, Iowa, Kansas, Michigan, Minnesota, Missouri, North Carolina, Ohio, Oregon, South Carolina, Texas, Utah, Washington, and Wisconsin. If funded in the transportation reauthorization bill, Phase II will field-test the concepts developed, so that by the time implementation is considered, the new approach will be ready to implement by State legislatures and Congress. It is vital that it be fully tested because nationally the amount of revenue generated by road user charges is substantial—the motor fuel tax alone generates upwards of \$50 billion annually.

PROBLEMS WITH CURRENT METHODS FOR CHARGING ROAD USERS

At both the State and Federal level in the United States, the primary method for charging road users is the motor fuel tax. In many ways this tax has served quite

well. Road users are charged roughly on the basis of the amount of travel on the public road system. As such, motor fuel taxes have the desirable attribute of being a “pay-as-you-go” form of user charge. There are, however, several major shortcomings with motor fuel taxes including:

- first and foremost, an inability to generate the necessary revenue to provide quality transportation services in future years as hydrogen fuel cell vehicles and those with other new propulsion systems become more commonplace;
- high evasion, perhaps up to 10 percent for diesel fuel under some circumstances;
- increased fuel efficiency meaning lower receipts per mile traveled;
- no relationship to the type or cost of the facility being used or the level of service provided; and
- a weak relationship to the relative costs of particular trips such that some vehicle operators pay user charges that exceed the costs they impose, while others pay substantially less than their costs.

From the standpoint of public policy, motor fuel taxes are not entirely satisfactory. Vehicle operators are not given price signals to make them aware of the costs a particular trip may impose on society. With motor fuel taxes, it is not possible for government agencies to provide incentives to vehicle operators to change the nature of their road use, such as traveling on higher-standard roads or during off-peak hours.

The move away from State and Federal motor fuel taxes must be accomplished with great care. Combining fuel tax receipts at both levels of government, this tax accounts for almost two-thirds of all road user charges. In short, a very large amount of road financing capability is at stake.

#### STUDY OBJECTIVES

The purpose of Phase I of this research has been to design a system for charging road users that embodies as many attributes of an ideal user charge system as possible. Among the key attributes of an ideal system are that it enables:

- A low cost of collection for both agency and user.
- A stable revenue stream.
- An ability to assess higher user charges for users who impose higher costs (e.g., contributions to congestion delays by autos and road damage by heavy vehicles).
- A low evasion rate.
- Incentives for users to travel on appropriate roads and to spread their trips across time periods.
- Any form of vehicle propulsion to be accommodated.

The approach to charging road users must not be burdensome, and it must be tamperproof, highly reliable, and a useful tool for achieving a variety of policy objectives. Of paramount importance, it certainly must not diminish the privacy of road users.

Fortunately, newly emerging ITS technology makes it possible to design an approach to charging road users that avoids the problems and shortcomings of current mechanisms and that embodies the desirable attributes listed above.

To progress closer to an ideal system of road user charges, our research is leading to a new approach that is practical and cost-effective. The new approach will enable a real-time assessment of road user charges that is based on mileage accrual and, in the case of heavy vehicles, also on actual vehicle operating weights and configuration, as well as the type of road being traveled.

#### SKETCH OF THE NEW APPROACH

Key to the new approach is a simple on-board computer. The computer stores a record of actual road use charges. Periodically, this record is uploaded and transmitted to a data processing center; we refer to it as the collection center. The center bills a vehicle owner and reimburses the States, counties, and cities operating the roads on which the vehicle has traveled. The on-board system is simple, secure, and capable of protecting the user’s privacy. Importantly, the on-board system enables a variety of user charge conventions. In its simplest form, this approach can be used to assess a vehicle-miles-traveled (VMT) tax. With a VMT tax, the computer would calculate road mileage actually traversed; it compares this mileage with that obtained through an odometer feed. It then applies appropriate user charge rates to the mileage traveled within each jurisdiction (typically each State). Only data on user charges due are stored in the on-board computer (i.e., where travel has occurred is not stored). Periodically, the vehicle owner uploads these stored data to a collection center. The collection center operates much like a credit card billing center.

*Charging Autos*

Inputs to the computer can be quite simple for autos, involving only a global positioning system (GPS) receiver, a geographic information systems (GIS) data file, and the vehicle's odometer (for back-up data on distance traveled). The GIS file contains data polygons that define boundaries of the respective States. A receiver on-board the auto uses GPS signals to determine the vehicle's position. The computer reconciles this position with the stored data polygons to determine the State in which travel has occurred; the miles traveled within that data polygon are used to compute user charges, which in turn are stored. When a vehicle crosses into another State, it enters a different data polygon, and travel within that polygon is used to compute user charges. Of course, sub-State polygons, such as those defining a metropolitan area, also are feasible. The GIS file that defines polygons is stored in the on-board computer and is readily updateable. Periodically, the collection center transmits updates of the GIS file to the vehicle using a smart card as a "messenger." A smart card is a small credit card-sized plastic device that contains an internal embedded computer chip in the form of a microprocessor and/or a memory module. This technology was developed in France more than 20 years ago. Smart cards are very durable and should serve a typical user for the life of the vehicle. If the smart card is lost or destroyed, it can easily be replaced at a small cost to the user (a typical smart card costs less than \$5).

Communication via a smart card is done using a reader that closely resembles the credit card readers found in nearly all businesses.

Normally, the smart card occupies a slot in the vehicle's dash panel. The on-board computer continuously updates the smart card regarding total user charges owed to each State or other jurisdiction that is defined by a polygon. Data transferred to the smart card, then, are in units of dollars, the on-board computer having (1) measured the distance traveled within each polygon, (2) applied the appropriate per-mile user charge as established by the applicable jurisdiction, and (3) calculated the user charges owed to each jurisdiction. Thus, the vehicle operator can remove the smart card at any time and insert into a reader to transmit the charges due to the collection center.

Why would a vehicle owner want to upload billing data very often? A simple display on the instrument panel during vehicle startup displays the current user charges stored in the on-board computer. Each jurisdiction can choose to levy an interest charge for road use that occurred more than, say, 30 or 45 days in the past. The instrument panel display can show both current user charges and interest accrued. As the interest charges mount, the display will serve to encourage the person to upload the billing data. Failing to upload data at all may result in a requirement to pay all user charges in arrears before receiving the next year's vehicle registration.

During the data uploading process, the smart card authenticates the user and then anonymously uploads the road use information. When the collection center identifies the user, it checks for fraudulent behavior or malfunctions. If there is a problem, the smart card is notified to prompt the user to go to a service center, and the system flags that particular vehicle. During this communication, the collection center updates the vehicle's rate schedule through the smart card, if the stored schedule is not current. The center also provides a one-time encryption key to the smart card to facilitate anonymously uploading how much of the user charge arose from travel in each jurisdiction. Once the collection center receives the information on how much of the mileage occurred in which jurisdictions, the center correctly apportions the funds to the appropriate jurisdictions in which travel has occurred.

We stress that the apportionment data would be anonymous. It is not necessary to know which vehicle generated a particular sum of user charges for each jurisdiction; what is necessary is the amount to be apportioned. In every case, the total amount for all jurisdictions taken together equals the single value uploaded in the initial contact made by the vehicle via the smart card. Thus, all of the necessary data are transmitted, but the only figure that can be tied to a particular vehicle is a single dollar amount for total user charges and interest, if applicable, due. This approach maximizes user privacy.

User acceptance of the new approach to assessing user charges could be increased if other benefits result. For example, navigation displays, now a costly option on luxury autos, could become standard equipment or a low-cost option. Nearly all of the components needed for such displays would be on-board the auto; adding them in a mass-production manner would be simple. Note, too, that looking a few years into the future, regardless of how user charges are assessed, traveler information displays are likely to become commonplace (their costs already are beginning to fall). In that case, adding the capacity to store road use information would be easy and inexpensive.

Another user benefit of the GPS/GIS system would be emergency location notification. The Advanced Collision Notification System, which is beginning to receive national attention, uses cellular transmissions to relay a vehicle's exact location to the appropriate service provider in the event of a crash, health problem, or mechanical breakdown. The protection this sort of system offers motorists is likely to be valuable to many people, but it would be especially beneficial to elderly drivers and those who travel in remote areas or unsafe parts of cities. It should be stressed, however, that it is not the GPS system that transmits any form of location data. GPS satellites only send radio waves that the vehicle's GPS receiver uses to calculate its location. GPS satellites are unable to receive any form of information from a vehicle.

#### *Charging Heavy Vehicles*

In the case of large trucks and other heavy vehicles, the on-board computer system could be very simple, enabling only a per-mile user charge to be levied, or it may be slightly more complex. Like autos, heavy vehicles will have a GPS receiver and stored GIS information on data polygons. Because privacy is much less of an issue with commercial vehicles, the polygon data could be supplemented with several levels of road classes. In this way, user charges for road use by heavy vehicles can be varied according to the standard of road traveled. For example, a State may choose to levy a lower per-mile charge for travel by heavy vehicles on interstate highways and other facilities that are capable of withstanding high axle loads without being damaged. The road user charges uploaded to the collection center can easily be made to reflect several different per-mile rates that vary with the standard of road used. Likewise, combination trucks with additional axles could be assessed lower per-mile user charges because they damage roads less. Optionally, an on-board weight indicator could be included, which would be activated each time the cargo doors are closed (in the case of a freight semi-trailer truck). The weight indicator, which is a simple strain gauge attached to the trailer's suspension, transmits information to the on-board computer, indicating the current weight. A code informs the computer about the configuration of the trailer, especially the number of axles. The computer then takes into account vehicle weight and configuration, along with type of road being traveled, in calculating the road use charges that are due.

It is noteworthy that the new approach eliminates the pitfalls of such methods as weight-distance taxation: the uniform per-mile rate (regardless of current weight) of that approach is replaced with a much more flexible approach, and evasion will cease to be a problem. Of course, individual States can determine the extent to which they levy user charges based on the type of road being traveled or on vehicle weight and configuration.

With the new approach, motor carriers will benefit by the elimination of toll-booths, and interstate permitting can be automated. Also, opportunities that do not exist today become available; for example, by adding axles and traveling on higher-standard roads, operators could minimize their user charges.

#### *Related Advantages*

At least two related advantages would accrue to State departments of transportation in addition to the inherent benefits of the new approach. One advantage is that the expensive weigh-in-motion (WIM) scales used by many States can be eliminated. Another advantage is that toll facilities on roads and bridges no longer will be necessary. With segment-specific user charges, adjustments can be made for what are now toll roads and bridges. Privately owned highways, similar to SR 91 in California, will become highly feasible.

#### PROGRESS TO DATE-PHASE I

Phase I of the effort to design and test the new approach to assessing road user charges was recently completed. In Phase I, we accomplished the following:

- Developed the basic concept of using intelligent vehicle technology to assess road user charges.
- Refined the concept to absolutely maximize road user privacy.
- Incorporated features to ensure system security, robustness, and user convenience.
- Ensured that for the States, road use revenue will be stable, evasion will be extremely difficult, and fairness among both road users and taxing jurisdictions will be maximized.

*Research Process Followed*

Dr. David Forkenbrock, principal investigator of this research, formed a research team comprised of several groups, each of which has had specific responsibilities. The groups studied:

- Legal aspects of privacy as it relates to road use.
- The most promising computer and electrical engineering approaches to collecting, storing, and transmitting road use data.
- Economic and policy needs, desirable attributes, and practical considerations in assessing road user charges.
- Technological capabilities existent today and likely to become available in the coming few years related to GPS, GIS files, on-board computers, data transmission, and other key components.

Work completed by the respective groups has been published in the form of a report that is accessible to a layperson. The research leading to publication of this report was reviewed in a series of meetings with representatives of the 15 participating States and the Federal Highway Administration. Throughout the 2-year Phase I effort, one-to 2-day meetings have been held every 6 months. The States and FHWA have been kept fully apprised of research progress, emerging issues, and intended research directions. Attendance in these meetings by the States and FHWA has been excellent, nearly 100 percent.

*Where the Research Effort Currently Stands*

Phase I has led to the conclusion by the research team and the funding agencies that the new approach as described above is conceptually sound and operationally practical. It is highly flexible, so that each State can embody a variety of public policies regarding road user charges. The new approach will enable fair, stable user charges to be levied, even when hydrogen fuel cell vehicles and other vehicles that burn less or even no fossil fuels become commonplace, as they surely will. Many other limitations of current motor fuel taxes can be eliminated with the new approach, and essentially all of the attributes of an ideal user charge system listed at the beginning of this discussion paper can be incorporated.

Even though the concept and features of the new approach are technologically and practically feasible, a great deal of testing and refinement is needed before it is ready for national implementation. We need to study how best to integrate the on-board equipment with emerging vehicle technologies, the best way to operate the collection center, and how the States would prefer to structure their road user charges, given the advances possible with the new approach. Choices need to be made regarding the sorts of data storage and uploading features to adopt. The bottom line is that before a gradual replacement of the motor fuel tax can be implemented, all parties must be very certain that the new approach works very well and does what policymakers want it to. Extensive testing is the only way to be sure that the on-board equipment is reliable under widely varied weather and operating conditions, tamperproof, and convenient for diverse groups of drivers whose needs are quite different.

## THE NEXT STEP-PHASE II

Phase II is needed to fully test and demonstrate the basic concepts just discussed, to refine the working features of the new approach to assessing road user charges, and to develop working specifications for the applicable components.

*Context for the Research*

This is an opportune time to develop the new approach to assessing road user charges. Auto manufacturers are making rapid advances in the electrical systems of their products. Soon, many of the systems needed to deploy the new approach will become standard equipment on most if not all autos. It is especially significant that several auto manufacturers intend to incorporate on-board computers to carry out various functions that now rely on mechanical switches, gauges, and linkages. These on-board computers will afford much greater user flexibility, and they will include such features as GPS receivers to facilitate emergency location and navigation, as well as electronic odometers. Such odometers are an important back-up system in the event that the GPS receiver should fail or be denied signals. In the same vein, major trucking companies are making widespread use of GPS to pinpoint the location of freight shipments.

This is a propitious time to begin collaborating with motor vehicle manufacturers as they dramatically change their on-board electrical systems and include advanced new features. Specifically, we propose to work closely with these manufacturers to find the best means for incorporating the components needed to support the new approach. Early cost estimates are highly favorable in that the additional expense

of adding the data storage and uploading capabilities will not be at all large, less than \$100. Features like electronic odometers that cannot be tampered with are forthcoming, as vehicle manufacturers protect the limits of their mileage-based warranties.

#### *Phase II Work Plan*

Before State legislatures can pass the necessary enabling legislation, a comprehensive demonstration program must be carried out. As mentioned earlier, Federal and State motor fuel taxes generate over \$50 billion annually. One must be very sure that the replacement approach is completely sound before implementing it. Following are key components of the Phase II work plan:

- Systematically test the security and reliability of on-board computers and data uploading methods.
- Evaluate the acceptability of the approach by diverse user groups. These user groups include both operators of autos and various types of trucks.
- Carry out a well-designed operational test program. Five geographic areas across the United States will be selected as test sites, and several hundred autos and trucks will be outfitted with the required on-board equipment. Prototype uploading facilities will be established, and a prototype collection center will be developed cooperatively with a selected private firm.
- Work with several national interstate trucking firms to test the feasibility of assessing a mileage-based user charge system across numerous States. A key objective will be to make the new approach integrate well with trucking firm needs. Certainly, the greatest cost of Phase II will be outfitting participating autos and trucks with the necessary equipment to carry out a meaningful test of system robustness, security, and user convenience. Also significant will be the expenses related to establishing a prototype collection center. The center probably can be established cooperatively with a credit card processing company because the necessary capabilities are very similar.

#### *Funding Requested in the Transportation Reauthorization Bill*

As we have discussed, Phase II of this multi-year research program is critically important. It will enable the technology and implementation strategies to be fully refined before State legislatures debate a major change in transportation financing. Technological advances in cleaner, less fossil-fuel consuming vehicle propulsion systems mean change is inevitable; the issue is how best to charge vehicles with a range of propulsion systems for travel on public roads and highways.

Our research team estimates that funding Phase II of this university-based research program at the level of \$3 million per year for the duration of the forthcoming transportation reauthorization bill will enable a full operational test of this promising approach. We stress that most of these funds will be used to outfit private vehicles for the operational test. The remainder will be used to design the test, work with equipment manufacturers on detailed specifications for the on-board gear, recruit participants, and analyze the results.

The specific request is for an authorization of \$3 million per year to the Iowa Department of Transportation to commission a demonstration of the intelligent transportation system (ITS) approach to assessing road user charges based on on-board computerized systems. The Iowa DOT will in turn commission the University of Iowa Public Policy Center to carry out the demonstration.

#### *The Research Team*

Leading Phase I and the proposed Phase II is the Public Policy Center at the University of Iowa. The Center is an interdisciplinary research unit in the Office of the Vice President for Research. Director of the Center and Principal Investigator for this research is Dr. David Forkenbrock, who originally conceived the new approach. Dr. Forkenbrock has an international reputation as a scholar in the area of transportation policy and finance. He is assisted by a team of engineers, policy analysts, and social scientists from various universities and firms, who collectively are uniquely qualified to carry out this national study. New members with technical evaluation skills will be added to the research, and more active communications with vehicle designers within the auto and truck manufacturing industry will be established.

We foresee a continuing role for the 15 State departments of transportation that have worked closely with the research team during Phase I of this project. The representatives of these DOTs are knowledgeable about the new approach being developed, and they have offered many useful suggestions as our work has progressed. Together with the equally valuable representatives of FHWA, we propose to continue our association with them.

*Importance of Phase II Research*

Evidence of the importance of this issue may be found in the recent efforts by several European nations to implement some form of distance-based user charges. For example, the Netherlands' parliament has passed legislation calling for this type of user charges to be implemented within the next several years. The United Kingdom and Germany are evaluating similar proposals. The study team has been actively collaborating with senior staff in these countries.

The United States' energy security and environmental quality both will benefit by the exciting new vehicle propulsion technologies soon to be made operational. The need is to ensure that these vehicles can be charged for road use in a fair, cost-effective, and convenient way that protects the privacy of road users. At the same time, the inherent problems with the motor fuel tax can be eliminated.

## STATEMENT OF RIC WILLIAMSON, MEMBER, TEXAS TRANSPORTATION COMMISSION

## INTRODUCTION

My name is Ric Williamson, a member of the Texas Transportation Commission, and I am pleased to provide this testimony on behalf of the commission and the Texas Department of Transportation (TxDOT) regarding transportation financing innovations in Texas. This testimony will provide information on Texas' current use of available State and Federal transportation financing mechanisms and our plans to implement new tools. I will also suggest changes to the existing Federal transportation financing tools that will help Texas take better advantage of them in our continuing effort to meet our State's tremendous mobility and access needs as effectively and efficiently as possible.

## TEXAS' EXPERIENCE WITH EXISTING FEDERAL FINANCE TOOLS

The Federal Government has traditionally financed highways through 80 percent reimbursement grants but the last three major pieces of Federal transportation legislation—ISTEA, the NHS Act of 1995, and TEA-21—have produced alternative forms of “non-grant” assistance. Over that same timeframe (since the early 1990's), Texas has slowly accrued complementary authority on the State level to enable us to begin to use these new Federal financing tools for transportation. Positioning TxDOT to utilize innovative financing where it is determined to be appropriate serves the users of the State's transportation system by accelerating construction of select projects of significance, delivering customer benefits ahead of schedule, and augmenting stretched revenues. While this section describes our experience to date, it also represents only the beginnings of a new era in transportation financing for Texas.

*State Infrastructure Banks*

Background. In November 1995, the President of the United States signed Public Law 104-59, known as the 1995 National Highway System Designation Act (NHS Act). Section 350 of that law allowed the United States Secretary of Transportation to designate a maximum of ten States as pilot projects for the State Infrastructure Bank program. Texas was selected as one of the initial pilot States for an NHS Act SIB. About 30 States eventually elected to participate.

A State Infrastructure Bank, or a SIB, operates chiefly as a revolving loan fund and may provide a wide range of financial assistance in addition to loans. The purpose of the pilot program is to attract new funding into transportation, to encourage innovative approaches to transportation problems, and to help build needed transportation infrastructure. The NHS Act provides that each designated State may transfer up to 10 percent of certain Federal dollars, match those funds with State funds, and deposit them into a State Infrastructure Bank. The greatest benefit of this program may well be the creation of a self-sustaining, growing, revolving loan fund.

In 1997, the 75th Texas Legislature passed Senate Bill 370, which created the State Infrastructure Bank to be administered by the Texas Transportation Commission, the governing body of the Texas Department of Transportation. In September 1997, the Texas Transportation Commission approved the administrative rules that

govern the State Infrastructure Bank. The SIB allows cities and counties to access capital at lower-than-market rates. Since its creation, interest in the SIB program has been strong. TxDOT has approved 41 loans totaling more than \$252 million to cities, counties, and toll authorities around the State. The loans are helping fund more than \$1 billion in transportation projects in Texas.

**TEA-21 Changes.** Section 1511 of the Transportation Equity Act for the 21st Century (TEA-21) created a new State Infrastructure Bank (SIB) Pilot Program allowing the establishment of TEA-21 SIBs in only four States: California, Florida, Missouri, and Rhode Island. California, Florida, and Missouri also had NHS Act SIBs. Texas was not included. Pre-existing SIBs created pursuant to Section 350 of the NHS Designation Act of 1995 (NHS Act SIBs) continue to exist, but Federal funds authorized for fiscal year 1998 or later may not be used to capitalize them.

Through language in the fiscal year 2002 Department of Defense Appropriations Act, Texas Senator Kay Bailey Hutchison and Texas Congressmen Tom DeLay and Chet Edwards were instrumental in adding Texas to the list of TEA-21 SIB Pilot Program States. With this change, Texas may now use up to 10 percent of its NHS, STP, IM, Bridge, Seat Belt Incentive Grant, and Minimum Guarantee funds to capitalize its SIB. Without Federal funds, future loan applications—and any large single loan—would likely have little chance of being considered. The SIB has been our single most important financial tool in accelerating the delivery of projects. The ability to capitalize the SIB with future Federal funds will keep it an effective program for years to come.

Texas supports the continuation of the TEA-21 SIB authority Texas now enjoys. In addition, we recommend that the reauthorization legislation shorten the time limits on the ability to draw down the Federal funds to capitalize our SIB. Finally, we encourage you to clarify that repayments to the SIB are cleansed of Federal requirements to ensure that future lenders (mainly cities and counties in Texas) are able to access the funds without Federal restrictions. Cities and counties, who are currently not subject to Federal requirements on their own projects, may not have access to SIB funds if they must follow Federal rules to use those funds.

*The Transportation Infrastructure Finance and Innovation Act of 1998*

According to FHWA, the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA, sections 1501-1504 of TEA-21) is intended to provide Federal credit assistance to major transportation investments of critical national importance, such as intermodal facilities, border crossing infrastructure, expansion of multi-State highway trade corridors, and other investments with regional and national benefits. The TIFIA credit program is designed to fill market gaps and leverage substantial private and other non-Federal co-investment by providing supplemental and subordinate capital. Through three types of financial assistance products, TIFIA offers credit assistance of up to 33 percent of total project costs. The three types of products, designed to address projects' varying requirements throughout their life cycles, include:

- Secured loans, direct Federal loans to project sponsors offering flexible repayment terms and providing combined construction and permanent financing of capital costs;
- Loan guarantees, providing full-faith-and-credit guarantees by the Federal Government to institutional investors such as pension funds which make loans for projects; and
- Standby lines of credit as secondary sources of funding in the form of contingent Federal loans that may be drawn upon to supplement project revenues, if needed, during the first 10 years of project operations.

The kinds of projects specifically listed as eligible for TIFIA support include international bridges and tunnels, inter-city passenger bus and rail facilities and vehicles (including Amtrak and magnetic levitation systems), and publicly owned intermodal freight transfer facilities (except seaports or airports) on or adjacent to the National Highway System. However, any type of highway, intermodal, or transit project eligible for Federal assistance through surface transportation programs under Title 23 or chapter 53 of Title 49 U.S.C. is also eligible for TIFIA support, assuming it meets program criteria. Those criteria include: (a) project cost of at least \$100 million or 50 percent of the State's annual apportionment of Federal-aid funds, whichever is less, except that for intelligent transportation system projects, the minimum cost is \$30M; (b) project support in whole or in part from user charges or other non-Federal dedicated funding sources; and (c) inclusion in the State's transportation plan and the statewide Transportation Improvement Program (STIP).

Qualified projects meeting those criteria are evaluated by USDOT and selected based on the extent to which they generate economic benefits, leverage private capital, promote innovative technologies, and meet other program objectives. Each

project must receive an investment grade rating on its senior debt obligations before its Federal credit assistance may be fully funded.

*History of the Central Texas Turnpike Project TIFIA Loan*

The \$916.76 million TIFIA loan for the Central Texas Turnpike Project is the largest such loan in the history of the program. The TIFIA loan funds will help fund the \$3.6 billion first phase of the Central Texas Turnpike Project, which is a toll highway facility through central Texas.

The commission will use the loan proceeds to partly finance design and construction of the first phase of the Central Texas Turnpike Project, which is composed of three distinct elements: Loop 1, SH 45 North, and the northern segment of SH 130. Loop 1, a 3.5-mile element, will serve as a major north-south route in the Austin vicinity. SH 45 North, about 13.2 miles in length, will serve as a connector between the cities of Austin, Round Rock, and Pflugerville. SH 130, a 49-mile element, will be an eastern bypass for Austin, Texas, and is parallel to and east of I-35, one of the more congested urban parts of the interstate.

The Texas Turnpike Authority Division of TxDOT is managing the project. TxDOT has retained a general consultant engineer and two engineering firms to assist with management of the construction project. The Loop 1 extension and SH 45 will be constructed using the traditional design-bid-build process, and SH 130 is under an exclusive development agreement with Lone Star Infrastructure. The first phase of the turnpike project will be open in segments and the final phase will open to traffic in December 2007.

The entire 65-mile project is expected to be complete and open to traffic by December 2007.

- SH 130: From IH 35 south to US 71—September 2007
- SH 130: From SH 71 south to US 183—December 2007
- SH 130: From US 183 south to IH 10: to be determined based on future project financing
- SH 45: From Ridgeline East to three-quarters of a mile west of Loop 1 interchange—December 2007
- SH 45: From three-quarters of a mile west of Loop 1 interchange to SH 130—September 2007
- Loop 1: From Parmer Lane to one quarter mile south of SH 45 interchange: September 2007

Central Texas needs relief from traffic congestion as soon as possible and tolls are the fastest way to accomplish it. By selling bonds and using tolls to pay off the bonds, these roads will be completed and open to traffic years ahead of schedule compared to using traditional transportation funds. In addition, toll roads help stretch limited transportation dollars. In this case, the State is getting a \$2.9 billion project for only an initial \$700 million equity injection.

The four elements of the funding package include local contributions, State highway dollars, a Federal loan and the sale of bonds, which will be paid for through the collection of tolls. In addition to the TIFIA loan, the commission has issued \$1.2 billion in revenue bonds and \$900 million in bond anticipation notes. The remainder of the project will be financed through contributions from TxDOT and contributions of right-of-way by the surrounding jurisdictions.

The TIFIA loan is an example of a Federal program helping us bring these needed highway projects on-line. We could not have put this financial package together without the TIFIA loan. To maximize the use of the loan—and save taxpayers approximately \$75 million—we are using the TIFIA loan as a possible backstop to sell Bond Anticipation Notes (BANs) to finance construction and take advantage of current low short-term interest rates. The interest rate we get on the BANs is lower than the TIFIA loan. The full TIFIA loan may be used later, but only if interest rates make it a good deal for taxpayers.

The 65 miles of new toll roads in central Texas will cost \$2.9 billion. This covers right of way acquisition, utility adjustments, design, and construction for SH 45 North, Loop 1 and the first 49 (most needed) miles of SH 130. With the addition of required reserve funds, interest, insurance and issuance costs, the total estimated costs are \$3.6 billion.

Conservatively, it is estimated it would take at least 20 years to build these roads using traditional funding sources. By selling bonds, these roadways will be completed and open to traffic in 5 years.

Advance Construction/Partial Conversion of Advance Construction Advance construction (AC) and partial conversion of advance construction (PCAC) are cash-flow management tools that allow States to begin projects with their own funds and later convert these projects to Federal assistance.

AC allows a State to construct Federal-aid projects in advance of the apportionment and/or obligation limitation. Under normal circumstances, States can “convert” advance-constructed projects to Federal-aid at any time sufficient Federal-aid apportionments and obligation authority are available. States may convert and obligate the entire eligible amount, based on funding availability or, using PCAC may obligate funds in stages.

PCAC allows States to obligate only the Federal funds necessary for the amount of expenditures anticipated in a year. This process thereby eliminates a major single year “draw down” of Federal funds in one fiscal year. PCAC may be used in conjunction with GARVEE bonds when Federal funds are obligated for debt service payments over a period of time.

Using this technique affords the availability of Federal-aid funds to support a greater number of projects. The partial conversion technique can enable completion of a project earlier than under the conventional approach, avoiding construction cost inflation, and bringing the benefits of a completed facility to the public at an earlier date. To date, TxDOT has utilized the PCAC financing tool on approximately 170 projects.

#### *Tapered Match*

Tapered match enables the project sponsor to vary the non-Federal share of a Federal-aid project during development and construction so long as the total Federal contribution toward the project does not exceed the Federal-aid limit.

Under the tapered match approach, the non-Federal matching ratio is imposed on projects rather than individual payments. Therefore, Federal reimbursements of State expenditures can be as high as 100 percent in the early phases of a project provided that, by the time the project is complete, the overall Federal contribution does not exceed the Federal-aid limit established when the project was authorized. To ensure effective management of Federal funds, FHWA limits the use of tapered match to situations that result in expediting project completion, reducing project costs, or leveraging additional non-Federal funds. TxDOT has used tapered match to expedite project completion on approximately 880 projects.

Tapered match may be most useful in cases where the project sponsor of a Federal-aid project lacks sufficient funds to match Federal grants at the start of the project, but expects to accumulate the match in time for project completion. Tapering may also be beneficial when a project sponsor needs to overcome a near-term gap in State matching funds, thereby avoiding delays in getting the project underway. Tapering also allows a sponsor to advance a project before fully securing capital market financing.

This technique may be used to facilitate a project when a new local transportation tax has been enacted, but revenue collections have yet to accumulate sufficient matching funds. Using tapered match, the project can move forward immediately with 100 percent Federal funds, allowing time for the tax revenues to accumulate. The locally generated revenues would be used to fund the final 20 percent share of project costs.

#### *Toll Credits*

States may apply toll revenues used for capital expenditures to build or improve public highway facilities as a credit toward the non-Federal share of certain transportation projects. Toll credits are earned when a State, a toll authority, or a private entity funds a capital highway investment with toll revenues from existing facilities. The amount of toll revenues spent on non-Federal highway capital improvement projects earns the State an equivalent dollar amount of credits to apply to the non-Federal share of a Federal-aid project. To utilize this tool, the State must certify that its toll facilities are properly maintained and must pass an annual maintenance of effort test to earn credits. By using toll credits to substitute for the required non-Federal share on a Federal-aid project, Federal funding can effectively be increased to 100 percent.

Toll credits provide States with more flexibility in financing projects. For example, by using toll credits, 1) Federal-aid projects can be advanced when matching funds are not available, 2) State and local funds normally required for matching may then be directed to other transportation projects, or 3) project administration may be simplified when a single funding source is used. States wishing to take advantage of the toll credit provision must apply toll revenues to capital improvements and meet the maintenance of effort test that may result in an increased investment in transportation infrastructure. At this time, TxDOT has utilized toll credits on 34 construction projects. Toll credits have also been used on certain transit projects.

*Flexible Match*

Flexible match allows a wide variety of public and private contributions to be counted toward the non-Federal match of Federal-aid projects. The NHS Act and TEA-21 introduced new flexibility to the matching requirements for the Federal-aid program by allowing certain public donations of cash, land, materials, and services to satisfy the non-Federal matching requirement. These matching options include:

- The value of private and certain State and local contributions, including publicly owned property;
- Funds from other Federal agencies may count toward the non-Federal share of recreational trails and transportation enhancement projects;
- Funds from the Federal Lands Highway Program may be applied as non-Federal match for projects within or providing access to Federal or Indian lands; and
- Funds from Federal land management agencies may be used as the match for most Federal-aid highway projects.

Also States may seek program-wide approval for Surface Transportation Program (STP) projects. The matching requirement would then apply to the program instead of individual projects.

Flexible match provisions increase a State's ability to fund its transportation programs by:

- Accelerating certain projects that receive donated resources;
- Allowing States to reallocate funds that otherwise would have been used to meet Federal-aid matching requirements; and
- Promoting public-private partnerships by providing incentives to seek private donations.

To date, TxDOT has been unable to use this financing mechanism. The main reasons are that it is limited to certain programs within the Federal-aid highway program and that the program implementation requirements are cumbersome. While we are not currently using this financing option, we believe that the flexible match concept should be continued and indeed expanded in the TEA-21 reauthorization. We recommend that Congress expand the flexible match provision for use, at the State's discretion, in all of the existing Federal-aid highway programs.

*Section 129 Loans*

Section 129 loans allow States to use regular Federal-aid highway apportionments to fund loans to projects with dedicated revenue streams.

A State may directly lend apportioned Federal-aid highway funds to toll and non-toll projects. A recipient of a Section 129 loan can be a public or private entity and is selected according to each State's specific laws and process. A dedicated repayment source must be identified and a repayment pledge secured.

The Federal-aid loan may be for any amount, up to the maximum Federal share of 80 percent of the total eligible project costs. A loan can be made for any phase of a project, including engineering and right-of-way acquisition, but cannot include costs prior to loan authorization. A State can obtain immediate reimbursement for the loaned funds up to the Federal share of the project cost.

Loans must be repaid to the State, beginning 5 years after construction is completed and the project is open to traffic. Repayment must be completed within 30 years from the date Federal funds were authorized for the loan. States have the flexibility to negotiate interest rates and other terms of Section 129 loans. The State is required to spend the repayment funds for a project eligible under Title 23.

States can use Section 129 loans to assist public-private partnerships, by enhancing startup financing for toll roads and other privately sponsored projects. Because loan repayments can be delayed until 5 years after project completion, this mechanism provides flexibility during the ramp-up period of a new toll facility.

Loans can also play an important role in improving the financial feasibility of a project by reducing the amount of debt that must be issued in the capital markets. In addition, if the Section 129 loan repayment is subordinate to debt service payments on revenue bonds, the senior bonds may be able to secure higher ratings and better investor acceptance.

If a project meets the test for eligibility, a loan can be made at any time. Federal-aid funds for loans may be authorized in increments through advance construction procedures, and are obligated in conjunction with each incremental authorization. The State is considered to have incurred a cost at the time the loan, or any portion of it, is made. Federal funds will be made available to the State at the time the loan is made.

The President George Bush Turnpike Project in Texas exemplifies how a Section 129 loan can play an essential role in the total financing package. This project links four freeways and the Dallas North Tollway to form the northern half of a circumferential route around the city of Dallas. Primary funding for this \$940 million

project included a low interest, long-term Section 129 loan and revenue bonds. This \$135 million loan was critical in ensuring the affordability of the project's senior bonds. Completion of this important beltway extension will be accomplished at least a decade sooner than would have been possible under traditional pay-as-you-go financing.

*Summary of Texas Project Financing Mechanisms*

Texas has only recently begun to use the variety of Federal project financing mechanisms made available in ISTEA, the NHS Designation Act, and TEA-21. However, we have found their use to be beneficial and will continue their use in the future. Generally, as we've applied these financing options to our projects, we've found that they are most beneficial for projects that will take longer than 2 years to pay out, thereby allowing us to stretch our available funding and maintain a steady letting schedule from year to year. We typically consider using one of these financing options on projects over \$5 million and sometimes on smaller projects at the end of the fiscal year.

We encourage Congress to continue, expand, and enhance these Federal transportation financing mechanisms for use at the State's discretion. As we set a new course for a 21st century transportation system for Texas, we will continue to consider the use of all financing tools available to us to meet the transportation mobility needs of the State.

NEW TEXAS FINANCING TOOLS

In the statewide election on November 6, 2001, 68 percent of Texans voted in favor of the constitutional amendment known as Proposition 15. The passage of Proposition 15 provided TxDOT with three new tools to establish innovative financing for Texas State highways. With these tools TxDOT can begin to improve mobility and safety for all Texans by building more highways faster, thus keeping up with the population growth in the State and preparing for the opening of the border in June.

The three financing tools provided to TxDOT with the passage of Proposition 15 are the creation of the Texas Mobility Fund, the authority for the Texas Transportation Commission to approve the creation of Regional Mobility Authorities by counties, and the authorization for TxDOT to use State highway fund moneys for equity in toll roads.

*Texas Mobility Fund*

By voting to create the Texas Mobility Fund, Texas voters approved a funding mechanism to supplement the traditional pay-as-you-go method of financing highway construction in the State of Texas. Money in the Texas Mobility Fund must be appropriated by the State legislature and cannot include revenue from the gas tax, vehicle registrations or other dedicated funds. The legislature can provide revenue support to the Mobility Fund without raising taxes by committing general revenue to the fund.

Currently there is no money in the Texas Mobility Fund. Once money has been appropriated to the Texas Mobility Fund, however, it can be used to finance road construction on the State-maintained highway system, publicly owned toll roads, and other public transportation projects. It is estimated that for every \$100 million placed in the fund, \$1 billion in bonding for road projects will be created. The issuance of debt to pay for public works projects is well established at the local level. The Texas Mobility Fund now allows this method of funding to be used for State highway projects, on and off the State system, and allows a combination of both revenue and general obligation bonds.

In working to meet the States' transportation needs, the Texas Mobility Fund will help the department accomplish two things:

- Preserve the funds currently used for highway construction under the pay-as-you-go system; and
- Allow any new funding sources made available to highways to be used for payment of debt service on bonds issued to finance projects.

*Toll Equity*

Toll Equity, the second financing option made possible by the passage of Proposition 15, will make potential toll projects more viable, speeding up congestion relief, while stretching limited State transportation funds. Toll Equity allows, for the first time, State highway funds to be used on toll roads without requiring repayment of the funds. Before the passage of Proposition 15, TxDOT could loan highway funds for toll projects but they had to be repaid. The loan increased the initial borrowing costs for toll road projects, impacting the overall viability of the project. Having to

repay the department from tolls generated from the project often resulted in higher tolls and larger up front contributions from TxDOT.

Toll equity has made future toll projects more attractive to investors because it allows the projects to accelerate debt retirement and hasten production of toll revenues. If a community decides to go with a toll equity approach on a project in an existing toll authority, the commission must approve the project to be constructed by that toll authority. If the community and/or the project are outside an existing authority, the commission will consider creating a regional mobility authority, the third tool created by the passage of Proposition 15.

#### *Regional Mobility Authority*

A regional mobility authority (RMA) would be created for the purpose of constructing, maintaining, and operating a turnpike project in a region of the State. A RMA will allow local officials to exercise more responsibility, thus encouraging local innovation and better responses to the particular needs and desires of the local community. In order for a RMA to be created, one or more counties must petition the commission for authorization to create a RMA. The petition must contain certain information, such as a resolution from the commissioners court of each county and a description of how a RMA would improve mobility in that particular region. If TxDOT finds that the petition meets all the requirements it will notify the county(ies) and conduct one or more public hearings that conform to the criteria set forth in the rules adopted by the commission.

If and when the commission gives approval, the county that petitioned the authorization of the RMA will create a RMA by resolution of each county to be a part of the RMA. Each county resolution must appoint directors consistent with the rules adopted by the commission. A board of directors, appointed by the county commissioner's courts where the proposed turnpike project is, representing political subdivisions, would govern each RMA. The Governor will appoint the presiding officer.

Each TxDOT district will identify currently programmed projects that, from an engineering standpoint, could be developed as tolled facilities. These projects will be limited to new location or major capacity expansions. For each project selected with local support, any funds released from the State transportation plan through the issuance of revenue bonds for toll projects will be replaced by an equal amount of project funding in the same district and with the same programming authority as the original funds held.

In most cases, projects selected to be developed as toll projects will be accelerated due to the issuance of toll bonds as opposed to waiting for programmed dollars. In addition, major projects will be developed as one project instead of being segmented, for the same reason. Surplus revenues from an RMA toll project can be used for other transportation purposes within the authority, if needed.

#### *The Trans Texas Corridor*

Currently the department is focusing on how to use the Texas Mobility Fund, the toll equity concept, the authority of counties to create RMAs, and the exclusive development agreement concept to implement Governor Rick Perry's Trans Texas Corridor proposal.

The Trans Texas Corridor will be a multi-use, statewide transportation corridor that will move people and goods safely and efficiently. The Trans Texas Corridor will include toll roads, high-speed passenger and freight rail, regional freight and commuter rail, and underground transportation for water, petroleum, gas and telecommunications. The Corridor, as envisioned, is a 50-year plan for addressing the long-range transportation needs of Texas.

Governor Perry established the Trans Texas Corridor concept as the vision of the future of transportation in Texas. He has directed TxDOT to develop and refine the concept and come up with an implementation process. TxDOT has established a preliminary map showing where the Trans Texas Corridor should be developed. These corridors were selected based on the existing and forecasted infrastructure needs of the State. The current location of the State trunk system and congressional high priority corridors were also taken into account when developing the Corridors. In terms of a starting point, the Governor has asked the Commission to focus on developing routes that are already part of the States long-range plan. For example, SH 130 is a new location highway that eventually will run from Seguin to Georgetown and parallel to I-35. SH 130 is already a part of TxDOT's plans, therefore it is logical that SH 130 be a starting point for development of the Corridor. Ultimately, it will be the commission that will make the final decision about which projects are built and when.

Building the Trans Texas Corridor will provide Texans with more and better transportation options. The Corridor will improve mobility and safety by reducing

traffic congestion on current highways. The reduced congestion will have environmental benefits such as a reduction in the volume of air pollution in our urban areas. It will provide a fast, safe and reliable rail system, allowing Texans and their business to move, if they so choose, by rail instead of road, further reducing congestion and air pollution. The Corridor will move hazardous materials away from urban centers, and off heavily traveled highways, providing safer transport of such materials. The State will also benefit from economic development opportunities as a result of a faster, safer, and more comprehensive transportation system.

TxDOT delivered The Trans Texas Corridor Plan to the Governor this summer. The plan outlines the basic design of the system and identified four routes as priority corridor segments. Under the action plan approved by the commission, TxDOT has designated its Texas Turnpike Authority Division as the central office to oversee the development of the corridor. Although it is a process that could take up to 50 years, the corridor report's action plan sets forth a series of first steps to be undertaken over the next year. Estimated total cost of the corridor ranges from \$145.2 billion to \$183.5 billion. The report discusses a variety of funding possibilities, although planners generally envision a public-private effort paid for with tolls, bonds, and other financing tools.

The goal, at TxDOT, is to begin construction on the most appropriate segment as soon as practical. TxDOT envisions the build-out of the Trans Texas Corridor to take approximately 50 years. However, based upon our 85 years of experience in the business, TxDOT projects that most of the Corridor could be under construction or finished within 25 years and perhaps less. To a great degree, the time required to build the Corridor is dependent upon the interested parties and their proposals.

As mentioned previously, the Trans Texas Corridor will utilize three types of financing tools (the Texas Mobility Fund, RMAs, and toll equity) combined with a project delivery mechanism known as exclusive development agreements. The Texas Mobility Fund will be used, if properly capitalized, to help build the segments of the Corridor that are less toll viable. If the Corridor is attractive enough, the legislature may commit a portion of general revenue funds toward the construction. These funds would be released to the commission to pay debt service on bonds issued to finance the Corridor.

With regard to RMAs, certain high growth areas of the State are uniquely situated to help themselves and the State through the creation of a RMA. If we use the example of SH 130 and Travis, Williamson, and Hays Counties, you can see the benefit of RMAs to the Trans Texas Corridor. A RMA in Travis, Williamson, and Hays Counties would generate revenue to pay for local transportation goals much sooner while allowing the State to spread scarce State revenue over other important projects in the area—projects such as the segment of the Corridor east of I-35. In addition, a successful RMA could ultimately invest in light rail linked to a regional commuter rail that is part of the Trans Texas Corridor. The rules governing a RMA are flexible in nature and are intended to foster partnerships between local governments and the State in the development of transportation facilities that provide an efficient delivery of the end product.

Toll Equity, as mentioned before, is the phrase used to depict the amount of State Highway Funds that may be used to construct a toll road without the requirement that the funds be repaid. The law limits TxDOT's annual toll equity contributions to a percentage of the Federal funds it receives each year. TxDOT will use toll equity funds on those proposals that generate the maximum total funding on the most appropriate segments and routes identified during the planning stages. With toll equity, any segment of the Corridor could be made toll viable. However, TxDOT will create and construct the Corridor based on a plan that identifies the most financially viable segments and routes and constructs them first, providing cash-flow to pay for the next logical segments and so on.

An Exclusive Development Agreement is a contract and construction method that allows any organization to propose a transportation project, including design, construction, maintenance, and operation and/or financing to TxDOT. If TxDOT determines the concept is viable and it supports the long-range Transportation plan of the State, the concept is approved and put to the public for competing proposals. TxDOT will review all proposals and select the best one for negotiation and final contract. TxDOT must also determine a project is compatible with existing and planned transportation facilities before a concept may be approved.

For the Corridor, it is anticipated that interested parties will make proposals for the Corridor, resulting in permission to operate part, or the entire Corridor. For those parties that used this method to win a contract from TxDOT, the right for the Commission to assume control of any part of the Corridor will be negotiated into the contract. This will protect the public's investment into the future.

By State statute, TxDOT can use the Exclusive Development Agreement method for four projects only. Therefore, unless State law is changed, this will be a minor tool in the creation of the Corridor—unless, of course, one party proposed to build the entire Corridor or a major part of the Corridor and the Commission believed it to be in the best interest of the public.

All of the tools mentioned here (the Texas Mobility Fund, RMAs, toll equity, and Exclusive Development Agreements) can be used on any TxDOT project, not just the Corridor. No matter where these tools are used they will benefit the public. They will help us build more highways faster and continue to expand our infrastructure to keep up with growing population and increasing traffic.

#### HELPING STATES TAKE ADVANTAGE OF FINANCING TOOLS

Texans need to have a full array of financial and project development choices available to us, so that we can move forward to meet our transportation needs. Innovation and flexibility have become essential to enabling State and local governments to solve today's transportation challenges. The recently approved tolling authority for the I-10 (Katy Freeway) corridor is an example of the types of flexible financing and project development processes we now need for transportation projects. Reauthorization of Federal surface transportation programs and funding in 2003 will present many opportunities for releasing the creative powers of Texas and other States.

#### *Tolling of Interstate Routes*

In March 2002, the FHWA approved a toll road proposal that calls for the construction of four toll lanes in the median of the I-10 Katy Freeway in the Houston region. The toll lanes will generate up to \$500 million in revenue toward the reconstruction of I-10, thus completing funding for the project and potentially cutting construction time in half.

Despite the ultimate approval of the Katy Freeway tolling mechanism under Section 1216(a) of TEA-21, our experience with the process reveals some areas for improvement that, if implemented, would encourage more States to use this important financing option. In particular, the Harris County Toll Road Authority (HCTRA), one of our major partners in the Katy Freeway expansion project, had some initial concerns about certain requirements in the Section 1216(a) program that would have required a review and reapplication for the tolling authority every 3 years. This type of requirement often threatens the viability of the underlying bonding mechanism that the applicant is using to support the overall project. For the Katy Freeway project, HCTRA (the bonding authority in the project) was ultimately given a waiver of the reapplication process and HCTRA, TxDOT, and the Houston Metropolitan Transit Authority moved forward with our application under Section 1216(a).

TEA-21 also provided a pilot program under Section 1216(b) that allows States to toll portions of the interstate system. Thus far, no State has successfully applied for this authority. TxDOT initially applied for tolling authority under Section 1216(b) for the Katy Freeway project. However, we were unsuccessful in this application mainly because the program requires an analysis to demonstrate that the facility could not be maintained or improved from the State's apportionments and allocations. This analysis is not time restrictive, i.e., projects can be funded over long periods of time, and therefore it is very difficult to demonstrate the funding shortfalls required to obtain Section 1216(b) authority. For the Katy Freeway project application (and frankly for any other application we may attempt), TxDOT of course could choose to use any of its \$2.2 billion in annual Federal apportionments for the project instead of funding another project, so we couldn't pass the "funding shortfall" test. What we need is the ability to use this tolling authority to supplement our existing funding, not replace it. This situation is a major reason, we think, why this pilot program has never had a project approved for implementation. As currently written, this program appears too restrictive to go forth with a meaningful project.

While the States have not successfully pursued the interstate tolling authority provided in Section 1216(b) for a variety of reasons (including political opposition from those who would ultimately pay the tolls), we in Texas would like to see it continue as an option for States. At the time Texas first considered using this provision, we did not have the various State-supported financing mechanisms and authority that we have recently acquired to help us take a new look at ways to finance our transportation needs. Also, we now have the Trans Texas Corridor plan that could benefit from the potential use of the Section 1216(b) authority. As a result, we recommend that the Congress continue, expand, and improve the flexible application of the Section 1216(a) and Section 1216(b) provisions in the reauthorization of TEA-21.

Buying Back Portions of the Interstate to Allow Tolling. With the except of the Section 1216 provisions mentioned above, Federal law generally prohibits imposing tolls on Interstate highways for which Federal funds have been used. In several situations, however, Congress has enacted specific legislation to allow States to reimburse the Federal Government for Federal funds applied to a highway segment, thereby relieving a highway segment of the prohibition against tolls. The FHWA has provided TxDOT staff with six examples of legislation authorizing such repayment of Federal funds for highways in Connecticut, Delaware, Maryland, Michigan, New Hampshire, and New Jersey. Texas would like to pursue this option in the development of the Trans Texas Corridor and other needed improvements. Your efforts to make this option as easily accessible as possible will greatly assist our future endeavors as we seek new ways to fund our tremendous transportation needs in Texas.

Despite the availability of this option to buy back portions of the Interstate, we believe that the Congress needs to take a new look at the issue of residual Federal investment. For the most part, the Federal investment in the interstates has essentially been depreciated, leaving only increasing costs to maintain the aging system—costs that often are taken up by the States. We believe that States should be given the option to toll their interstates without the requirement of reimbursement of long-ago Federal funding so that we can improve and maintain the interstates to meet the mobility and access needs of our citizens and business communities.

Since the beginning of the Interstate era in 1956, Texas has contributed more in Federal motor fuels tax payments than the State has received in Federal highway program funds, including its share of the Interstate Construction and Interstate Maintenance program funds. When these interstate program funds were originally distributed to Texas, we did not get a 100 percent return on our contributions. Now, if we were to repay a portion of the Federal funding it would be redistributed to all States. Since Texas continues to get less than a dollar for dollar return, Texas would suffer twice in the distribution of those funds. Therefore, we recommend that donor States (those that received less than 100 percent of their share of contributions to the Highway Trust Fund compared to their share of distributions through the Federal-aid highway programs) be allowed to toll portions of the interstate system without Federal reimbursement. This approach would partially compensate the donor States for their contributions to the national system and allow them extra flexibility in handling the mobility needs in their States.

*Allow Toll Credits to be Derived from Federally Funded Projects*

Currently if a project utilizes any Federal funding then all costs of the project are ineligible to be counted as toll credits by the State. In today's environment where fewer and fewer projects are 100 percent toll-viable and require a mix of funding sources it is becoming more unlikely that a toll project will be built without some form of Federal assistance.

We believe the non-Federal expenditures on these projects should be eligible as toll credits on a pro-rata basis. We consider toll credits to be a valuable tool in Texas and have distributed these primarily to small transit providers who might otherwise have to turn down Federal assistance due to a lack of matching funds.

*Privatizing Rest Areas*

In a review of the Texas rest area system in the late 1980's, an internal TxDOT task force concluded that an innovative method of improving rest area quality without increasing costs appeared to be the concept of contracting with private developers to create joint development facilities. In other words, a commercialized rest area.

Commercialization could transform selected rest areas into "travel service centers," which would offer the traveling public facilities and services beyond those available at our existing sites. In addition to restrooms and picnic tables, commercialized rest areas could provide the public with food and fuel facilities and expanded travel information. These facilities could also provide expanded truck parking, a need that was only recently reaffirmed by a July 2002 FHWA Report on Truck Parking Facilities. One of the recommendations for State action in the FHWA report was to encourage the formation of public-private partnerships to address the nation's truck parking needs. At the same time, commercializing a rest area could reduce or eliminate the cost to the TxDOT of constructing and maintaining the facilities.

In 1990, the Center for Transportation Research (CTR) at the University of Texas began a study to determine the feasibility of rest area commercialization in Texas. This study found that commercialization would be feasible and could turn many rest areas sites into revenue generators. However, as the study points out, Title 23 USC,

Section 111 prohibits the commercialization of rest areas with direct access to an interstate highway. It should be noted that this concept is supported by AASHTO. A 1989 AASHTO Task Force that studied commercialization recommended that the Federal restriction be lifted. Language lifting the ban on rest area commercialization on the interstate system was included in an initial draft of ISTEA; however, interests opposed to the concept defeated the provision. Tourist industry interests, truck-stop interests (National Association of Truck Stop Owners), and other private sector interests view rest area commercialization as unwanted competition, even though they can participate in such development.

As we explore ways to maximize available funds to meet our transportation needs, Congress should allow States to use this concept on interstate routes.

*Continue and Improve Access to Railroad Rehabilitation and Improvement Financing Act Funds*

The Railroad Rehabilitation and Improvement Financing program (authorized in TEA-21) offers \$3.5 billion in loans and guarantees to public or private sponsors of intermodal and rail projects, with \$1 billion reserved for projects benefiting freight railroads other than Class I carriers. Projects can include acquisition, development, improvement, or rehabilitation of intermodal or rail equipment or facilities. The program is intended to make funding available through loans and loan guarantees for railroad capital improvements. No direct Federal funding is authorized in TEA-21; however, the Secretary is authorized to accept a commitment from a non-Federal source to fund the required credit risk premium.

Texas to date has had little opportunity to use the financing tools made available by the RRIF. In 2001 Amtrak approached the States of Mississippi, Louisiana, and Texas for assistance with the credit risk premium for a RRIF loan. The loan would have allowed one of the freight railroads in the region to upgrade its tracks to allow an extension of Amtrak's Crescent line to run between Meridian, Mississippi and Dallas/Fort Worth. The Texas Constitution prohibits the use of dedicated State Highway Fund dollars for non-highway purposes; therefore TxDOT was unable to participate in the opportunity to bring additional passenger rail service to our State. However, supporters of the rail proposal approached the Texas Legislature and garnered an appropriation of \$1.7 million in other State funds for Texas' share of the credit risk premium. Unfortunately, Amtrak later announced that it was postponing its plans for the extension, known as the Crescent Star.

Despite TxDOT's and Texas' limited involvement to date in railroad financing, as we begin development of the Trans Texas Corridor (which includes a freight rail, a commuter rail, and a high speed passenger rail component), the continued availability of financing from the RRIF will prove important. We encourage Congress to continue the program and to provide additional funds in the TEA-21 reauthorization.

*Changes to the TIFIA Program*

The Transportation Infrastructure Financing and Investment Act (TIFIA) program has been possibly the single most important benefit for public-private partnerships in transportation and has provided opportunities both to fill the gaps in finance plans and to make finance plans more efficient and cost effective. While the program may end the current authorization period undersubscribed, this is not a reflection on the program's value or its potential utility. Rather, it reflects the very long lead times required for project sponsors to design finance plans and adapt, often only with new State legislation, to new financing methods.

The clear benefit from TIFIA is flexibility in structuring repayment and deferral of interest. This feature enhances cash-flow from the projects during the initial construction period to pay for senior debt and fill rate stabilization and debt services reserve funds. Another benefit comes from the ability to leverage revenues from a "startup" toll road project. For a tax-exempt borrower such as TxDOT, the subordinate TIFIA loan produces savings in both interest rate costs and costs of bond issuance.

Our experience suggests several potential drawbacks from TIFIA. Resolving some of these concerns may require changes to the TIFIA law; others might be corrected within the existing statutory and regulatory framework.

Encourage Equity Investments in Projects Supported with TIFIA Credit. Congress should reauthorize the TIFIA program and refine it to encourage more private investment in projects supported with TIFIA credit. More thought should be given to the blending of private investment and TIFIA credit. Several of the current applicants for TIFIA credit, including TxDOT, are requiring private contractors to contribute subordinated debt or equity investments to the financing plan. Indeed, rat-

ing agencies and bond insurers have come to expect contractors to take part of their fee in the form of a project investment. Congress should encourage this expectation.

The good news is that the contracting community is increasingly able to make these investments. The bad news is that, if the owner is using TIFIA credit, TEA-21 currently offers the owner a Hobson's choice: either the contractor's credit must be investment grade according to rating agency criteria (a result more favorable to the contractor than the owner wants or needs to allow) or the contractor's investment must be subordinate to TIFIA in right of payment (a risk the contractors cannot accept when TIFIA credit is large). This challenge can be cured by refining TIFIA to rank a developer's claim senior to TIFIA's without requiring that the developer's credit be investment grade and to allow the developer to receive payment of equity returns and subdebt payoff as long as the entity receiving TIFIA funds meets all its debt service obligations and coverage ratios. To allay concerns about diluting TIFIA credit quality, TIFIA could limit subdebt or private equity payoff to a specified percentage of project costs.

**Minimize Impact of TIFIA Loan "Springing Up."** Legal advisors to FHWA have been reluctant to interpret the TIFIA statute to limit the event under which the TIFIA loan would "spring" to parity to a bankruptcy filing or similar proceeding that results in an abandonment, liquidation, or dissolution of the project. We are concerned that insolvency is defined broadly, resulting in the TIFIA loan "springing" to parity with senior bond indebtedness. This could adversely affect the ability to attract credit enhancement (e.g., insurance) for the bonds and result in higher interest cost. Credit enhancers consider the "worst case scenario" when evaluating their desire to guarantee bonds and the risk of doing so. The benefit of subordinating the TIFIA loan could be eroded if the credit enhancers evaluate their risk by assuming they will be sharing in revenues and other assets on parity with FHWA.

Following receipt of TxDOT's TIFIA commitment letter, FHWA announced it would apply the "Mega Project" finance plan and reporting requirements to all TIFIA projects. As interpreted by FHWA, these requirements are more burdensome than the capital markets or SEC disclosure rules require. Furthermore, it's unclear how FHWA will use this information.

**More Liberal Terms in TIFIA Loan Agreements.** To leverage new project revenue streams, reduce transactional costs, and attract private debt capital, FHWA must consider more liberal terms in the financial covenants in the TIFIA loan agreement. For example, we believe that there should be no debt service reserve requirement for the TIFIA loan. Also, FHWA must be willing to subordinate its debt to that issued to design/build contractors as payment for their work.

The Central Texas Turnpike Project is a multi-phased capital program with multiple funding sources. TIFIA loan draw requirements/priorities as well as provisions relating to repayment and final maturity of the TIFIA loan must give consideration to the complexity of the projects.

As mentioned earlier, Governor Perry is exploring large-scale corridor development in Texas. We certainly expect TIFIA to be an important financing tool in this effort. Critical to this would be the ability to subordinate TIFIA to equity returns as well as senior debt service payments.

**Change Internal Revenue Code Private Activity Rules.** Congress should modernize the Internal Revenue Code rules on private activity and management contracts as they apply to surface transportation. Project sponsors are now actually forced to turn down true private equity for important public projects if they expect to issue tax-exempt debt. This is not the result Congress intended when it adopted these restrictions in 1986. Inexplicably, these same restrictions do not apply to other public works such as airports and solid waste facilities. During the 106th Congress, Senator Smith authored a bill to cure these exact problems. Both houses of Congress ultimately passed this important curative legislation as part of a larger tax bill that year, but President Clinton vetoed the larger bill.

TxDOT is embarking on an ambitious program that has the potential for attracting significant private equity. Curing this anomaly in the tax code would allow sorely needed private equity and innovation to be incorporated into surface transportation development without sacrificing access to the lower interest rates in the tax exempt financing markets.

**Modernize Internal Revenue Code Advance Refunding Rules.** Congress should modernize the IRS rules applicable to surface transportation to permit two advance refundings. Most conventional transportation projects are funded on a pay as you go model or with bonds backed by tax revenues. As such, sponsoring agencies issue bonds only to advance funds as needed for construction. To finance a public-private partnership dependent in part on the project's own revenues, the bond markets require 100 percent of all capital costs be funded up front, at the time they invest.

This means that the sponsor is issuing bonds many years removed from the economic conditions that will affect the project when it has opened.

If interest rates become more favorable over time, IRS rules prevent the sponsor from refunding the bonds more than once, even though doing so would help reduce tolls, pay off debt quicker, and leverage dollars more efficiently. Other businesses aren't so restricted. These rules are even more puzzling because there is no loss to the Treasury from advance refundings.

Encourage Design-Build and DBOM Contracting. Congress should continue to encourage Design-Build and Design-Build-Operate-Maintain (DBOM) contracting for federally funded projects and remove regulatory barriers to State DOT use of procurement processes. Private section financing frequently requires certainty early in the design phase for capital and long-term maintenance and rehabilitation costs. In effectively providing such certainty, these forms of contracts are an essential building block for project financing.

TEA-21 required FHWA to issue a rule governing procurement. While the rule is not final, the problems identified in the published draft have been documented in comments submitted by AASHTO and others. Unless FHWA incorporates the recommended revisions into its final rule, this critical tool will have been undermined unless Congress intervenes.

Allow Selection of Contractor Prior to ROD to Enhance Financial Benefits of Construction Acceleration. Congress should make clear to the USDOT modal administrations that it did not intend NEPA to prevent procurement activity from being completed prior to issuance of records of decision (ROD). One of the key values of effective project financing is construction acceleration. We recognize the major contribution to environmental planning that NEPA has brought to major Federal actions. No one suggests that construction should commence before a ROD. But FHWA is reading NEPA to prevent the issuance of an RFP, the selection of a contractor, and the award of a contract pending a final ROD. None of these actions affects the selection of a project alternative or even the decision not to build. For a State DOT to use its own funds to accelerate contractor selection so that it is prepared to move quickly if a "build" alternative is selected is acting in parallel rather than in sequence. This does not prejudice the NEPA process.

#### *Modify Existing Transportation Programs to Enhance Funding Flexibility*

ISTEA and TEA-21 provided improved flexibility for States in addressing their varied transportation needs by allowing greater levels of transferability among the existing highways and transit funding categories. For example, States can transfer up to 50 percent of their National Highway System apportionments to the Interstate Maintenance, Surface Transportation Program, Congestion Mitigation and Air Quality Improvement Program, and Bridge Replacement and Rehabilitation Program. In addition, up to 100 percent of NHS apportionments may be transferred to STP if approved by the Secretary of Transportation. Similar transferability provisions are available for the other Federal-aid highway programs listed above. In addition, States have the option to use their Federal transit formula program funds for a highway project and vice versa. This type of transferability should be expanded, at State discretion, among the entire array of transportation programs.

ISTEA and TEA-21 also enhanced flexibility by expanding the list of eligible activities that can be funded with highway program funds. For example, STP funds can be used for highways, bridges, transit capital projects, and intracity and intercity bus terminals and facilities. However, this is an area where additional flexibility will help States in finding funding solutions to meet their varied transportation needs. When you consider a concept as complex as the Trans Texas Corridor, it becomes obvious that having the flexibility to address multimodal funding issues is essential. We encourage Congress to consider expanding the eligibility of existing highway, transit, and rail programs to allow, at the State's discretion, the use of any of these funds for a broader range of transportation activities. At the same time, it will be essential for Congress to either consolidate or simplify the program procedures of the various modal programs or allow States to use the simplest procedures among them so that the flexibility of expanded eligibility is not negated by regulatory differences among the modal programs. This flexibility will better enable us in Texas to pool our available resources to tackle multimodal transportation projects. This is the future of transportation in Texas; Federal funding programs should facilitate our efforts, not provide roadblocks to efficient and effective use of Federal transportation dollars.

#### CONCLUSION

As you can see, Texas has indeed entered a new era in planning, building, and financing needed transportation systems. We can no longer afford to rely solely on

the traditional pay-as-you-go method of finance for needed transportation systems. We are committed to taking advantage of every available transportation finance and project development mechanism. We will need your assistance to enable us to fully and flexibly use the complete range of tools to meet our growing transportation demands. We look forward to working with you to make our launch into the new century of transportation financing a continuing success for Texas and the Nation.

## TEA-21 REAUTHORIZATION

---

MONDAY, SEPTEMBER 30, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
SUBCOMMITTEE ON TRANSPORTATION, INFRASTRUCTURE AND  
NUCLEAR SAFETY,  
*Washington, DC.*

The subcommittee met, pursuant to notice, at 10:12 a.m. in room 406, Senate Dirksen Building, Hon. Harry Reid [chairman of the subcommittee] presiding.

### CONDITIONS AND PERFORMANCE OF THE FEDERAL-AID HIGHWAY SYSTEM

Present: Senators Reid, Voinovich, and Jeffords [ex officio].

### OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Senator REID. This committee will come to order.

I apologize to everyone for being late. I guess I should have gotten up earlier. I slept in until six this morning.

Welcome to today's hearing on the state of America's highway infrastructure. This is the last of a series of 14 scheduled hearings and roundtables that the committee and this subcommittee have held this year as we prepare to write the next transportation bill. We have addressed many important policy issues, including traffic congestion, planning, safety, operations, air quality, freight and project delivery. These hearings have made one thing very clear, that transportation is central to our growth, global competitiveness and quality of life.

In 1956, under the leadership of President Eisenhower, the Federal Government made a commitment to create an Interstate highway system. We have since expanded that commitment to include the national highway system in the broader Federal aid highway network. This system has been an enormous success and now includes 46,000 miles of interstate highways and one million miles of Federal aid highways. These roads serve as the lifeblood of our economy, moving people and freight trillions of miles each year. Our Nation's road and bridge infrastructure includes 8.2 million lane-miles of highway and 590,000 bridges valued at about \$1.5 trillion.

Our task is to protect this investment and ensure that it continues to meet the needs of our Nation's communities and businesses. Potholed roadways, deficient bridges and congested inter-

states threaten safety, diminish quality of life and impede economic efficiency.

Today, we will review two new reports on the status of American highway systems. I will ask that my full statement be made part of the record.

[The prepared statement of Senator Reid follows:]

Senator REID. We are honored to have as our first witness today the chairman of the Senate Appropriations Committee, Senator Byrd. No one has been a greater champion for increased investment in transportation than Senator Byrd. He was a leader of TEA-21 5 years ago and has been a leader every year as chairman of the Appropriations Committee. We do a transportation appropriations bill every year.

Those of us who support increased investment in America's transportation infrastructure are thankful for Senator Byrd's continued leadership. We all look forward to working with Senator Byrd as we write the next transportation bill. We will count on his wisdom and experience as we work our way through this very difficult process.

Mr. Chairman?

[The prepared statement of Senator Reid follows:]

STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Welcome to today's hearing on the state of America's highway infrastructure. This is the last in a series of 14 scheduled hearings and roundtables that the EPW committee and this subcommittee have held this year as we prepare to write the next transportation bill. We have addressed many important policy issues, including traffic congestion, planning, safety, operations, air quality, freight and project delivery.

These hearings have made one thing clear that transportation is central to our economic growth, global competitiveness, and quality of life. In 1956, under the leadership of President Eisenhower, the Federal Government made a commitment to create an interstate highway system. We have since expanded that commitment to include the National Highway System and the broader Federal-aid highway network. This system has been an enormous success and now includes 46,000 miles of interstate highways and one million miles of Federal-aid highways. These roads serve as the lifeblood of our economy, moving people and freight trillions of miles each year.

Our nation's road and bridge infrastructure includes 8.2 million lane miles of highway and 590,000 bridges, valued at \$1.4 trillion dollars. Our task is to protect this investment and ensure that it continues to meet the needs of our nation's communities and businesses. Potholed roadways, deficient bridges and congested interstates threaten safety, diminish quality of life and impede economic efficiency.

Today we will review two new reports on the status of America's highway system. The Federal Highway Administration will present the findings of its 2002 Conditions and Performance report, and the American Association of State Highway and Transportation Officials will unveil its Bottom Line report. These reports offer a mixed message. On the positive side, the increased investments provided by TEA-21 have begun to make a difference. Our infrastructure is in better shape today than it was a few years ago.

Unfortunately, while the condition of our transportation system has improved somewhat, its performance continues to worsen. The increasing congestion our nation's roads are experiencing means dirty air, wasted fuel, lost time and reduced productivity. In addition, we continue to have a significant backlog of repairs that must be made to deficient bridges and inadequate roadways.

Both studies conclude that America is spending too little money to maintain the current conditions and performance of our transportation system, much less improve conditions and performance. The needs have outpaced funding, and unless we change this pattern we will fail to address the backlog of infrastructure needs and will continue to experience deteriorating performance.

I have seen this performance deterioration firsthand at home in Nevada. As the Las Vegas and Reno regions have grown, so has traffic congestion. Worsening con-

gestion is one of the greatest threats to my State's continued economic growth and we will have to do things differently if we are to reverse this trend.

As we will hear, the solutions range from improving the conditions of our roadways, to building new roads, expanding and improving transit service, employing new technology, enhancing the management and operations of our transportation systems, improving planning, creating high-speed rail connections, and managing demand.

We have our work cut out for us as we begin the reauthorization process. It is our responsibility to ensure that the transportation infrastructure of this country meets the needs of America's citizens. I look forward to working closely with Chairman Jeffords and other members of this committee to develop a forward-looking reauthorization bill that adequately addresses the many challenges our transportation system is facing.

We are honored to have as our first witness today the chairman of the Senate Appropriations Committee, Senator Robert Byrd.

No one has been a greater champion for increased investment in transportation than Senator Byrd. He was a leader on TEA-21 5 years ago, and he is a leader every year as the chairman of the Appropriations Committee. Those of us who support increased investment in America's transportation infrastructure are thankful for Senator Byrd's continued leadership. I look forward to working with Senator Byrd as we write the next transportation bill and will count on his wisdom and experience as we work our way through this very difficult process.

Senator JEFFORDS. I will wait on my statement.

Senator REID. Senator Voinovich?

Senator VOINOVICH. Mr. Chairman, since we have the chairman of the Appropriations Committee here with us this morning and the subject of his testimony is the Appalachian Development Highway System, I will reserve my comments for after his presentation this morning.

Senator REID. Gentlemen, thank you very much. Again, I apologize to everyone for being late. I hate to be late.

Senator Byrd?

**STATEMENT OF HON. ROBERT C. BYRD, A UNITED STATES  
SENATOR FROM THE STATE OF WEST VIRGINIA**

Senator BYRD. Thank you, Mr. Chairman, and thank you Senators Jeffords and Voinovich.

In just a few months' time, this subcommittee will be responsible for reporting one of the most important pieces of legislation for the 108th Congress. As such, I am grateful to you, Mr. Chairman and members of your subcommittee for allowing me this opportunity to testify at this, the last hearing that you will hold in the Nation's Capital on the reauthorization of the Transportation Equity Act for the 21st Century, or TEA-21.

Later this morning, you will also take testimony from our capable Federal Highway Administrator, Mrs. Mary Peters, on the condition and the performance of our national highway system. The Administration's upcoming Conditions and Performance Report will again remind us that a great deal more needs to be invested in our infrastructure if we are not to fall farther and farther behind in stemming the deterioration of our Nation's highways and bridges, and alleviating congestion on our Nation's roads.

As Chairman of the Senate Appropriations Committee, I have sought to do my part by championing the highest level of Federal highway investment that is possible under our very tight budget constraints. The transportation appropriations bill for our fiscal year 2003 as reported by my committee back in July restores every penny of the \$8.6 billion cut in highway funding proposed by Presi-

dent Bush. I am pleased to say that every member of the Appropriations Committee, Republican and Democrat, voted to report that bill.

One of the observations contained in Administrator Peters' testimony that especially caught my eye is her statement that the condition of higher-order roads such as Interstates has improved considerably since 1993, while the condition on many lower-order roads has deteriorated. It appears, Mr. Chairman, that the pattern of road conditions is beginning to mirror the distribution of wealth in our country, whereby the rich are getting richer, while the poor are getting poorer.

That observation leads me into my ostensible topic for my testimony today, namely the need to use this next highway bill to finally fulfill a promise that was made to one of the most impoverished and isolated regions of our country more than 35 years ago, and that is the region of our country from which I come. We need to use this next highway bill to finally complete the 3,025-mile Appalachian Development Highway System or ADHS.

Mr. Chairman, while serving in the other body, I had the great privilege of casting my vote in favor of establishing the Interstate highway system. However, in 1964 it was recognized by the first Appalachian Regional Commission that while the Interstate highway system was slated to provide historic economic benefits to most of our Nation, the system was designed to bypass the Appalachian region due to the extremely high cost associated with building highways through Appalachia's rugged topography. As a result, the construction of the Interstates had the detrimental effect of drawing passengers and freight and the accompanying economic benefits away from the Appalachian region.

In 1965, the Congress adopted the Appalachian Regional Development Act, which promised a network of modern highways to connect the Appalachian region to the rest of the Nation's highway network, and even more importantly the rest of the Nation's economy. Absent the Appalachian Highway System, my region of the country, the southern West Virginia coal fields, would have been left solely with a transportation infrastructure of dangerous, narrow, winding roads which follow the paths of river valleys and stream beds between mountains. These roads are still more often than not dangerous two-lane roads that were built to inadequate design standards.

Mr. Chairman, as you know well, we have virtually completed the construction of the Interstate highway system and have moved on to many other important transportation goals. However, the people of my region are still waiting, still waiting for the Federal Government to live up to its promise made some 37 years ago to complete the Appalachian Development Highway System. The system is still less than 80 percent complete, and I regret to observe that my home State of West Virginia is below the average for the entire Appalachian region, with only 72 percent of its mileage complete and open to traffic.

It is without hesitation that I come before this subcommittee and make this request on behalf of the transportation needs of my State and my region. Throughout my 50 years in Congress, I have taken care to be attentive to such needs in other regions. In the

late 1960's, Mr. Chairman, I served as chairman of the Appropriations Subcommittee on the District of Columbia. I held that exalted position for 7 years, 7 years. I believe it was Jacob who worked 7 years for Rachel.

[Laughter.]

Senator BYRD. And then at the end of the seventh year, his future father-in-law gave him Leah, not Rachel, but Leah, who had weak eyes, said the Bible. So he had to work 7 years more in order to get Rachel. Well, I only had 7 years as chairman of that great subcommittee, and what a rough time it was—seven years, chairman of the District of Columbia Subcommittee. My old Pastor Shirley Donnelly, who was the chief chaplain in the Sixth Army, I believe it was, in World War II, always told me, “Bob, a big man makes a little job big; a big man makes a little job big.”

So I tried to make that little job big, and I think I did. I think I was able to do that. So in the late 1960's, I am glad I did not have to serve another 7 years, I served as chairman of the Appropriations Subcommittee on the District of Columbia. It was at that time, Mr. Chairman, that I, Robert C. Byrd, you are looking right straight at him, if you look this way.

[Laughter.]

Senator BYRD. That I provided the first appropriations for the initial construction of the Washington Metro system. Those first two appropriations together totaled less than \$100 million, but they would start the ball rolling toward Federal assistance that would total tens of billions of dollars to construct the Washington Metro system. So I thought I was entitled to try to get some money for West Virginia's roads as well.

The rationale behind the completion of the Appalachian Development Highway System is no less sound today than it was in 1964. Unfortunately, there are still children in Appalachia who lack decent transportation routes to school. There are still pregnant mothers, elderly citizens and others who lack timely road access to area hospitals. There are thousands upon thousands of people who cannot obtain sustainable well-paying jobs because of poor road access to major employment centers.

The entire status of the Appalachian Development Highway System is laid out in great detail in the Cost to Complete Report for 2002 just completed by the Appalachian Regional Commission this month. Mr. Chairman, I would ask if this report might be made part of the committee's record, or at least be in the committee's permanent files.

Senator REID. Hearing no objection, that will be the order.

[The document will be retained in the committee's files.]

Senator BYRD. Thank you.

The enactment of TEA-21 signaled a new day in the advancement of the ADHS. TEA-21 took a great leap forward by authorizing direct contract authority from the highway trust fund to the States for the construction of the ADHS. And Senator Phil Gramm of Texas, Senator John Warner of Virginia and Senator Max Baucus of Montana worked with me and helped me as we worked together to improve that bill. TEA-21 took a great leap forward by authorizing direct contract authority from the highway trust fund to the States for the construction of the ADHS. Up until that point,

funding for the ADHS had been limited to uncertain and inconsistent general fund appropriations.

By providing the States of the Appalachian Region with a consistent and predictable source of funds to move forward on its uncompleted ADHS segments, TEA-21 served to reinvigorate our efforts to honor the promise made to the people of the Appalachian region. As is made clear in the Cost to Complete Report, this initiative has been a great success, one for which this committee can be very proud. States are making greater progress toward the completion of the system than they would otherwise have made, and more than they have made in any 5-year segment in our recent memory. Since the last Cost to Complete Report, 183 miles of the system have been open to traffic and we have successfully brought down the cost to complete the system by roughly \$1.7 billion in Federal funds. Back when we were debating TEA-21, some questions were asked as to how committed the States would be to completing the unfinished segments of the Appalachian Highway System. I am pleased, Mr. Chairman, to report that the 13 States to date have succeeded in obligating just under 90 percent of the obligation authority that has been granted to them for the completion of the system. Of critical importance to this discussion is the fact that the unfinished segments of the ADHS represents some of the most dangerous, most deficient roadways in our entire Nation.

One thing that is often lost in our debate over the necessity to invest in our highways is the issue of safety. The Federal Highway Administration has published report indicating that substandard road conditions are a factor in 30 percent of all fatal highway accidents. I was in one of those fatal highway accidents, Mr. Chairman, and so was my former, late colleague Senator Randolph. We were driving one Sunday afternoon on a two-lane highway and we crashed head-on into a car coming from the opposite direction. So I know something about those highways. My wife and I have traveled them at all hours of the day and I think all hours of the night. I do not know of a road in West Virginia that we have not traveled on in these more than 50 years in which I have been in politics.

They have also found that upgrading two-lane roads to four-lane divided highways decreased fatal car accidents by 71 percent, and that widening traffic lanes have served to reduce fatalities by 21 percent. Had the highway on which I was traveling on that Sunday afternoon been a four-lane highway, that accident would not have happened. These are precisely the kind of road improvements that are funded through the ADHS. In my State, the largest segment of unfinished Appalachian highway if completed will replace the second most dangerous segment of roadway in my State.

So even those who would question the wisdom of completing these highways in the name of economic development should take a hard look at the fact that the people of rural Appalachia are taking their lives in their hands every day as they drive on their currently inadequate roads. Nor would the argument of economic development hold up against completing these Appalachian highways, certainly not in my State.

Mr. Chairman, it is time for this committee and the entire Congress, in concert with the Administration, to take the last great leap forward and authorize sufficient contract authority to finally

complete the Appalachian highway system. As you enact another 6-year highway bill with sufficient funds to complete the system, we will finally pay off the full costs of the ADHS almost by then, almost 45 years after the system was first promised to the people of my neglected region. When we convene the 108th Congress, it is my intention to introduce legislation to complete the job.

I am very pleased that this Administration has taken on the goal of completing the ADHS. In her letter accompanying the Cost to Complete Report, Administrator Peters said, "The completion of the Appalachian Development Highway System is an important part of the mission of the Federal Highway Administration," and that the ARC's 2002 Cost to Complete Report, "provides a sound basis for apportioning future funding to complete the system."

Mr. Chairman, I thank Mary Peters for her leadership on this issue and I look forward to seeing her commitment borne out in their reauthorization legislation which will be submitted next year. Completion of a new highway bill will be a mammoth task for the 108th Congress. I can say, Mr. Chairman, that over the many years of my public career, one of the accomplishments of which I am most proud was my amendment providing an additional \$8 billion in funding to break the logjam during the debate on the Intermodal Surface Transportation Efficiency Act in 1991. Another was my cosponsorship of the Byrd-Gramm-Baucus-Warner amendment during the Senate debate on the TEA-21 in 1998. That effort resulted in some \$26 billion in funding being added to that bill, and it put us on a path to historic funding increases for our Nation's highway infrastructure.

I look forward, again, to working with this committee on completion of a bill that makes the necessary investments in our Nation's highways, not just in the Appalachian region, but across our entire country. Now, someone will hand me this map—Mr. Chairman, I have been—I was not here when Noah started his ark, but Abraham lived to be 175, and Isaac lived to be 180. Abraham, Isaac—Jacob lived to be 147, and Strom Thurmond is just 100.

[Laughter.]

Senator BYRD. I am pressing on and during my work in representing West Virginia in the Congress, I am proud to show this map. This is a roadmap of West Virginia in 1947. I was in the West Virginia House of Delegates at that time. In the whole State, this rugged mountainous State of 24,000 square miles—rugged, rugged—in the whole State at that time, there were only four miles of divided four-lane highways. Governor Voinovich, on the roadmap of 1947, not one mile is shown on this map.

In those days, it took a day or a 1½ or 2 days to get from the southernmost point of West Virginia to the northernmost part, or to the eastern panhandle. And so it is a great joy to me to be able to look back and know that I voted with General Eisenhower in his days for the Interstate system. I used to say that Nixon was my favorite President in my time, my favorite Republican President, but I have changed that view. My favorite Republican President is former General Eisenhower. He said a prayer. He did not ask somebody else to order the prayer. He spoke the prayer in his first inauguration. He prayed, and that greatly impressed me. But he

was the daddy of the Interstate system, and I was a member of the other body and voted for it—voted for the money to pay for it.

Over the years as a member of that body and later as a member of the Senate, I voted to support moneys for the Interstate system and for the Appalachian Highway System. So I am very proud, Governor Voinovich, to be a neighbor of yours and we both know the importance and the value of good highways. But West Virginia is still wanting to have the promise fulfilled that we made back in 1965 when we inaugurated the Appalachian Regional Highway System.

Senator REID. How many miles of divided highway do you have now?

Senator BYRD. A little over 1,000.

So thank you very much, Mr. Chairman and members. I value my membership in the U.S. Senate at a time when there sit in that august body such Senators as the three who are before me today. I appreciate your courtesy and your kindness. May you succeed in your efforts and count on me if I can be of help, and I will certainly be there trying.

Senator REID. Senator Byrd, we are going to have a new panel now, but I am wondering if I could visit with you just on an unrelated matter. I will meet you outside.

Senator BYRD. Yes.

Senator VOINOVICH. Mr. Chairman, could I make a comment?

Senator REID. Of course.

Senator VOINOVICH. I would like to publicly thank Senator Byrd for the leadership that he has exercised over the years, particularly in regard to Appalachia. Senator, I can understand how you feel about this. You were there in the beginning of this work. A lot of projects have yet to be finished in Cleveland, ones that I started as mayor there. I want to help finish them up as a member of the U.S. Senate. I will join you to make it possible that you will finish up your work.

I think the committee should know that Appalachia still lags behind in America today. The infrastructure is not in place in spite of the fact that in my State, we have rebuilt many schools in rural areas, the most depressed areas, and brought in fiber-optics and technology and computers. In many of those communities, we are trying to get economic development and can't get economic development without highways.

In terms of the quality of life, the situation has improved substantially from the days when Senator John Kennedy campaigned there and showed the nation the dirt floors in people's homes. Today, the infant mortality is down. We are getting good health care. Part of it, and I want to thank this committee, is the reauthorization of the ARC, which is going to continue to bring money into those areas.

So Senator Byrd, thank you very much on behalf of the citizens of Ohio for your leadership over the years.

Senator BYRD. Thank you, Governor.

Our final miles in West Virginia on corridor D are in the Parkersburg area, where we cross over the river into your great State. I think you are a very valuable member of the Senate and a great

booster of our highway building and needs. We look to you to help us to fulfill this promise to our peoples on both sides of the river.

Senator JEFFORDS. Thank you, Senator, and I look forward to working with you on the reauthorization of our bill here, and for your help and guidance as we moved forward. You have been a tremendous help to this committee and we look forward to working with you.

Senator REID. The people of West Virginia should understand, as should the people in this whole corridor, Senator Byrd had the seniority to take the chairmanship of the Energy and Water Subcommittee when Senator Bennett Johnston left, but he said, "You can go ahead and take it, but the one thing I want is to make sure you take care of the Appalachian corridor." So I have done that every year.

Senator BYRD. Yes, you have.

Senator REID. I want you to know that I have not forgotten that.

Senator BYRD. Thank you.

Senator REID. That is in you would think an unrelated subcommittee, but because of Senator Byrd, it's related.

Senator BYRD. Thank you.

Senator REID. The next panel is the Honorable Mary Peters, the Honorable Joseph Perkins, and JayEtta Hecker. Would you please come forward and would you get them started? I am going to step outside.

Senator JEFFORDS. Senator Voinovich, do you have a statement that you would like to make while we get organized here?

Senator VOINOVICH. Yes, I think I would like to do that.

Senator JEFFORDS. Please do.

**OPENING STATEMENT OF HON. GEORGE V. VOINOVICH,  
U.S. SENATOR FROM THE STATE OF OHIO**

Senator VOINOVICH. First of all, I would like to thank the chairman for conducting this hearing today. I am glad that Gordon Proctor, who is the Director of the Ohio Department of Transportation, is going to be testifying today. Gordon worked with me when I was Governor, and with Jerry Raye, who was our director. It is nice to know somebody as they work their way up to have the main job today. We are looking forward to your testimony, Gordon.

Mr. Chairman, as the infrastructure built in the 19th and 20th centuries reaches the end of its useful life, we are now faced with a question of how to fulfill current requirements and make improvements to our infrastructure that will best serve our Nation in this century. And while progress has been made, we all know that large capital and maintenance investments are going to have to be made.

The first step in getting that done is developing a coherent and comprehensive national infrastructure strategy, and that is to get an assessment of the unmet infrastructure needs. When I was chairman of this subcommittee in 2000, I asked GAO to conduct a survey of the unmet major needs in the major public infrastructure areas which receive Federal assistance, including highways and mass transit.

IN JULY OF 2001, THE GAO RELEASED IN ITS REPORT, ENTITLED U.S. INFRASTRUCTURE AGENCIES APPROACHES TO DEVELOPING INVESTMENTS VARY. IN THE REPORT, THE GAO PROVIDED A SURVEY OF SEVEN AGENCIES. IN THE FEDERAL HIGHWAY ADMINISTRATION, THEY ESTIMATED THAT \$50.8 BILLION PER YEAR OVER 20 YEARS WOULD BE NEEDED JUST TO MAINTAIN THE CURRENT PHYSICAL CONDITION OF THE NATION'S HIGHWAYS AND BRIDGES. IN ADDITION, THEY SAID AN INVESTMENT OF \$83.4 BILLION PER YEAR—PER YEAR—OVER 20 YEARS WOULD BE NEEDED TO IMPROVE THE INFRASTRUCTURE.

The GAO report also reported that the Federal Transit Administration estimates the average cost to meet the Nation's mass transit needs is as high as \$16 billion per year for 20 years.

I understand that our witnesses this morning are going to be making mention of some of those estimates. I am anxious to hear about them. Senator Byrd already eloquently mentioned the Appalachian Development Highway System, and Madam Secretary, we are very pleased that you understand how important it is. It would be wonderful if this Administration could say, we put the frosting on the cake and finished it up.

It is no secret that the Nation has an aging infrastructure. We have got to figure our levels of funding and figure out where it fits in as far as this country's national priorities. I think that we need to, as Members of Congress and of this committee, develop a long-range strategy to deal with not only this infrastructure problem, but water and sewers and some of the other things that have been neglected around here for too long, while we go on undertaking other areas where perhaps Congress has not got as much authority or responsibility.

I ask that my statement be made part of the record, Mr. Chairman.

[The prepared statement of Senator Voinovich follows:]

STATEMENT OF HON. GEORGE V. VOINOVICH, U.S. SENATOR FROM THE STATE OF OHIO

Thank you, Mr. Chairman, for conducting this hearing today on the state of our nation's infrastructure.

I would especially like to welcome Gordon Proctor, Director of the Ohio Department of Transportation, who is here to testify on Ohio's transportation needs, particularly those of the State's aging interstate highway system.

Mr. Chairman, as the infrastructure built in the 19th and 20th Centuries reaches the end of its useful life, we are now faced with the question of how to fulfill current requirements and make improvements to our infrastructure that will best serve our nation in the 21st Century.

While progress has been made at the Federal, State, and local levels to acknowledge and begin to address public infrastructure needs, major areas are still not being addressed, such as large capital investments and operations and maintenance. I recognize that simply devoting more Federal money to infrastructure needs is not the solution. Rather, a strategy must be developed to address the full range of short- and long-term issues, including appropriate Federal and state roles, adequate project evaluation, priority-setting, program efficiency and management.

The first step in developing a coherent and comprehensive national infrastructure strategy is an assessment of our nation's unmet infrastructure needs. I realize that even the concept of "unmet needs" is difficult to define and that every Federal agency may define the term differently. That is why, as chairman of this subcommittee in 2000, I asked the General Accounting Office (GAO) to conduct a survey of unmet needs in the major public infrastructure areas which receive Federal assistance, including highways and mass transit.

Consequently, in July 2001, the GAO released its report, U.S. Infrastructure: Agencies' Approaches to Developing Investment Estimates Vary. In the report, the GAO provided a survey of seven Federal agencies' estimates for infrastructure investment. The Federal Highway Administration (FHWA), for example, estimated that \$50.8 billion per year over 20 years would be needed just to maintain the current physical condition of the nation's highways and bridges. In addition, an investment of \$83.4 billion per year over 20 years would be needed to improve the infrastructure.

The GAO also reported that the Federal Transit Administration (FTA) estimates the average cost to meet the nation's mass transit needs is as high as \$16 billion per year for 20 years.

I understand FHWA Administrator Mary Peters and other witnesses this morning will present updated needs estimates for our highways and transit systems.

In addition, the Appalachian Regional Commission (ARC) recently completed its Cost to Complete Report for the Appalachian Development Highway System (ADHS), a 3,025 mile system of highways that is designed to bring economic development to Appalachia. According to the Report, the estimated cost to complete the ADHS (combined Federal and State cost) is \$8.5 billion. Thanks to TEA-21, which authorized \$2.25 billion for the construction of the ADHS, the remaining Federal funds needed from Congress to complete the ADHS are \$4.5 billion, \$1.7 billion less than was needed in 1997. I look forward to addressing the ADHS' funding needs in next year's highway bill.

It is no secret that this nation has an aging transportation infrastructure. If we continue to ignore the upkeep, and allow the deterioration of our infrastructure, we risk disruptions in commerce and reduced protection for public safety, health, and the environment. In my view, it is the responsibility of Congress to ensure that funding levels are adequate and efficiently allocated to our nation's priority needs.

I strongly believe that Congress and the Administration need to develop a strategy to address the backlog of unmet infrastructure needs in this country, and ascertain the Federal role in responding to this backlog.

In 1998 Congress recognized the importance of our nation's transportation system through the enactment of the 6-year Transportation Equity Act for the 21st Century (TEA-21), which increased by nearly 40 percent Federal investment in highways and transit.

As Chairman of the National Governors Association, I was involved in negotiating TEA-21 and lobbied Congress to ensure that all Highway Trust Fund revenues were spent on transportation. I also fought to even out highway funding fluctuations and assure a predictable flow of funding to the States. TEA-21 achieved this goal with record, guaranteed levels of funding. However, more recently, as evidenced by this year's negative Revenue Aligned Budget Authority (RABA) calculation of \$4.4 billion, we need to find a better way to smooth out the effects of fluctuating trust fund receipts for the long-term without adding to the Federal budget deficit.

TEA-21 also dedicated nearly all highway gas taxes to transportation funding and guarantees that States will receive at least 90.5 percent of their share of their contribution to the highway account of the Highway Trust Fund. Under TEA-21, Ohio received a 23 percent increase in transportation funding.

While TEA-21 has enabled States and localities to improve the condition of deteriorating and unsafe highways and to increase capacity and performance, the system is still aging, and in need of additional investment.

As a member of this subcommittee and its former chairman I am eager to work on the reauthorization of the Federal-aid highway program. I understand that groups are talking about funding levels of up to \$50 billion a year, which is supported by the GAO study I mentioned earlier. I tell you now I do not think that is something we will be able to do unless Congress and/or the States raise the gas tax.

The short-and long-term viability of the Highway Trust Fund to meet our transportation needs is an issue that will be discussed in the coming months. In the short-term, we will have to determine the annual funding level the Highway Trust Fund can sustain and still meet its obligations. With our country's finances already in the red, I do not think we can expect that additional resources outside the Highway Trust Fund will be available for highway projects. We must plan for the future based on the principle that the highway program is a fully user-fee based system that pays its own way.

In the long-term, we also have to recognize that two of Congress' goals protecting the environment and promoting energy efficiency will inadvertently affect the amount of money available for transportation projects. For instance, improvements in fuel efficiency and the use of alternative fuels, which we should encourage because they are good for the environment, will decrease revenues to the Highway

Trust Fund. If we are to meet our future transportation needs, we will have to find ways to make up for this lost revenue.

Again, thank you, Mr. Chairman, for holding this hearing. I look forward to the testimony of today's witnesses.

Senator VOINOVICH. I just think that we have to understand that the money to do the job is not present. I met recently with the people who build the highways and we talked. They were reminding me that the GAO report said that it would take \$50-some billion a year, and I said, well, we are providing \$31.5 billion per year. If we go by the formula, we shouldn't be even providing that this year because of the fact that they miscalculated the amount of money that would be available.

So we have got to face up to the reality, and the reality is this, and nobody likes to talk about it, but we are going to have to increase the Federal gas tax and/or raise gas taxes in our respective States to meet the responsibilities that we have. We also have to take the dollars that we have available to us and work harder and smarter and do more with less, which was my credo when I was Governor of Ohio. But for us to think that somehow we are going to squeeze more money out of this and deal with our highway problems is just not being realistic.

I think it is really important that the people who are advocates of more highway spending better understand that we have gone from a \$313 billion surplus for 2002 to borrowing \$340 billion, including using all the Social Security surplus money, to run this government. At the rate we are going, next year we could be up around \$400 billion.

So I do not see money coming from some other source. In fact, there will be people here that will want to reach into the highway trust fund and use that for other purposes. As chairman of the National Governors' Association in 1998, we fought hard to put that firewall up and say that money that is going to be used for highways, and we need to have a continual amount of money that we could rely upon.

So I think that we are going to hear all this testimony today, but the fact is we are going to need some more money to get the job done, and I think everybody ought to face up to that responsibility and figure out how we can go about getting it.

Thank you, Mr. Chairman.

**OPENING STATEMENT OF HON. JAMES M. JEFFORDS,  
U.S. SENATOR FROM THE STATE OF VERMONT**

Senator JEFFORDS. Thank you for that realistic appraisal.

First of all, I want to thank Senator Reid, and not just for holding this committee hearing, but for all the work that he has done to benefit the committee regarding our most important responsibility next year—reauthorizing ISTEA and TEA-21. Congress is sometimes criticized correctly for waiting until a problem happens before action is taken, and then the law is sometimes passed very quickly, without enough careful analysis. Throughout the year, Senator Reid has greatly helped to gather much needed transportation information well ahead of time, that will be used and will be of great use as we are writing the transportation bill.

In the past year, we have had 14 hearings and roundtable discussions to learn about the successes of our current transportation

law. Today's hearing is a milestone in that it completes an ambitious and rigorous TEA-21 reauthorization hearing agenda which we unveiled 1 year ago. With the help of Senator Smith, we carved out a hearing agenda that explored a range of topics from rural transportation to air quality, freight delivery, transportation finance and everything in between. Throughout the year, this committee has sought out innovative ways to garner as much information as possible, and we have held two joint committee hearings, two field hearings and three roundtables in addition to 10 full subcommittee hearings.

We have heard testimony from over 100 witnesses over the course of the past year. These witnesses have hailed from 30 different States and have represented nearly 60 different organizations, State and Federal agencies and associations. This has not been an easy undertaking, but it was accomplished successfully through the hard work of dedicated members and staff, and a record of over 1,000 pages of testimony as a result of our efforts.

Today, we focus on the critical topic—the conditions of our transportation system and how best to maintain and manage this extremely valuable asset. Asset management may not seem exciting, but it is critical to America's future. At the micro level, asset management means that a parent racing out for a quart of milk does not hit the huge pothole and have to change tires at 7 a.m. At the macro level, it protects American commerce, while preventing much larger expenditures later.

Each dollar spent keeping a road in good condition save \$10, versus rebuilding roads that have deteriorated. Transportation assets are a key complement of Americans, a component of America's economy, critical to family farmers, small businesses and the Nation's greatest corporations.

There are least 3.11 million miles of public road mileage. There are over 550,000 bridges owned and maintained by the public, in addition to 9.4 billion rides taken by Americans on transit systems. We need to ensure that these assets are able to keep pace with the ever increasing demands that will be placed on the system in the coming years.

Our system must be well maintained and in good working condition. This will require a balanced energy investment that promotes good management of our current assets, while retaining the flexibility to add capacity in critical areas. Today, Vermont has approximately 14,000 miles of roadway, 32 [sic] miles of Interstate, and over 2,370 miles of toll-free State highways, and 11,210 miles of municipal roads. There are 16 public use airports and 10 State-owned airports—Burlington International Airport, the fourth busiest airport in New England, with eight carriers and approximately 900,000 passengers a year.

So Mr. Chairman, I appreciate all the work you have done, and now we look forward to hearing the testimony.

Senator REID. Thank you, Mr. Chairman.

Our first witness in this panel is Federal Highway Administrator Mary Peters. This is her third appearance this year before this subcommittee. I also want to express my appreciation for your coming to Nevada in February to join me in Reno. I'm sorry. The first hearing I want to express my appreciation was way back in Feb-

ruary when you just joined us in your Federal position. And then I want to express my appreciation to you for coming to Reno for the hearing that we had this past August. You made the hearing a real success.

Our second witness will be Joseph Perkins, Commissioner of the Alaska Department of Transportation and Public Facilities. Commissioner Perkins wins a prize for the longest trip, as you always do, to testify before this subcommittee. Thank you for traveling so far to join us. We look forward to your testimony about the American Association of State Highway and Transportation Officials, AASHTO, and their bottom line report.

Our third witness on the first panel will be JayEtta Hecker from the United States General Accounting Office. Ms. Hecker, thank you very much for being here. You, too, have appeared before this committee and subcommittee on a number of occasions. We appreciate the good work the GAO does in all fields, and especially in this area. We look forward to your work on the next transportation bill.

You are all familiar with this little light. I know that Mary Peters and JayEtta Hecker are familiar with it, but you, Joseph Perkins, should be aware that there will be a yellow light come up when you have a minute and a red light when you are all through. We would ask you to stick with this as much as you can. We have a lot of things going on around here this time of year, but your testimony is extremely important.

We will first hear from Mary Peters.

Please proceed.

**STATEMENT OF HON. MARY E. PETERS, ADMINISTRATOR, FEDERAL HIGHWAY ADMINISTRATION, U.S. DEPARTMENT OF TRANSPORTATION**

Ms. PETERS. Senator, thank you so much. Mr. Chairman, members of the committee, thank you for the opportunity to provide testimony on the state of our Nation's highway and bridge infrastructure.

First of all, I want to apologize for the delay in providing the Conditions and Performance Report to the committee. The report is now in final clearance and I am able to share some of the report's findings with you. A summary of the major findings of the report is attached to my written statement.

The 2002 addition of the C&P Report will be the first to capture the effect of increased investment in transportation infrastructure under TEA-21 by all levels of government. Increased Federal funding for highway capital investment through 2000 has been matched, and even exceeded, by increases in State and local investments as well. These funds have been very well spent.

Under TEA-21, States substantially increased their investment in system preservation projects, now reflected in the improvement in the overall physical condition of our Nation's infrastructure. For example, the percent of highway mileage with acceptable ride quality rose from 82.5 percent in 1993 to 86 percent in 2000.

The 2002 report also documents the Nation's continued improvement in the area of highway safety. I am pleased to report that highways have become safer even as travel on our Nation's system

has sharply increased. The fatality rate per 100 million miles traveled has decreased from 3.3 in 1980 to 1.5 in 2000. From 1997 to 2000, investment in system expansion grew more slowly, increasing 20.8 percent, from \$21.6 billion to \$25.9 billion. Thus, despite historic investment in highway infrastructure and improved conditions on many roads and bridges, operational performance of the system, as determined by congestion, has steadily deteriorated.

The heart of the Conditions and Performance Report is an analysis of future investment requirements under different scenarios. The Cost to Improve Highways and Bridges scenario defines the upper limit of cost effective national investment based on engineering and economic criteria. Essentially, it is an investment ceiling above which it would not be cost-beneficial to invest. This scenario implicitly assumes unlimited availability of funding and does not take into account competing investment options in the economy or even whether or not those additional investment options are available at all.

The Cost to Maintain Highways and Bridges scenario is designed to show the investment required to keep future indicators of conditions and performance at current levels. The current annual investment level under the Cost to Improve Highways and Bridges scenario is projected to be \$106.9 billion for 2001 through 2020. This is 65.3 percent higher than the \$64.6 billion of total capital investment by all levels of government in 2000.

The average annual investment under the Cost to Maintain scenario for highways and bridges is projected to be \$75.9 billion for 2001 through 2020. That is a 17.5 percent increase over capital spending in 2000.

If investments were to remain at 2000 levels, or anticipated levels for 2001 through 2003, it is projected that the recent trends observed in the condition and performance of the highways and bridges would continue. That is, conditions and safety performance would improve, but the operational performance of the highway system would further deteriorate. Average speeds would decline, the amount of delay experienced by drivers would increase, and congested periods on the Nation's urban principal arterials would lengthen. Although improvement in bridge conditions would continue, the aging of the Nation's bridges, particularly on the Interstate system, will present additional challenges to us all in the future.

Since 1997, infrastructure investment at all levels of government has been more successful in addressing physical conditions than operating performance on the system. Therefore, the 2002 Conditions and Performance Report indicates that, while future funding continues to address system preservation needs, it would now be cost-beneficial to devote a larger share of any available future increases in highway capital investment to expanding the capacity of our system.

Mr. Chairman and members of the committee, I thank you again for the opportunity to testify today, and I look forward to working with you as we prepare for reauthorization of the surface transportation programs. I would pleased to answer any questions you have at the appropriate time.

Thank you.

Senator REID. Mr. Perkins?

**STATEMENT OF HON. JOSEPH PERKINS, COMMISSIONER,  
ALASKA DEPARTMENT OF TRANSPORTATION AND PUBLIC  
FACILITIES**

Mr. PERKINS. Thank you, Mr. Chairman.

I am Joe Perkins, the Commissioner of the Alaska Department of Transportation, and chairman of AASHTO's Standing Committee on Highways. On behalf of the 50-State Departments of Transportation, I am here today to briefly summarize our recently completed bottom line report. This report is a comprehensive assessment of the investments needed from 2004 to 2009 to improve or maintain our national transportation system.

Our findings are as follows. An annual capital investment of \$92 billion for highways and bridges is necessary to maintain the condition and performance of the system. \$125.6 billion would be needed to improve their condition and performance. An annual capital investment of \$19 billion is required to maintain the condition and service performance of the Nation's transit systems. And \$44 billion would be needed to improve transit conditions and performance.

To put these figures in perspective, U.S. highway investment from all levels of government—Federal, State and local, including maintenance capital and other expenditures—grew from \$75 billion in 1990 to \$128 billion in 2000, an increase of 71 percent. Of this total, States contributed 51.7 percent, local governments 24.3 percent, and the Federal Government 24 percent.

Of the 2000 total dollars, \$64 billion was capital investment. If capital investment over the next decade were to increase at the same rate as overall highway spending in the 1990's, it would need to reach \$110 billion by 2010. This tells me our forecast to \$125 billion is right on the money.

Our assessment is based on data provided to the Federal Highway Administration by the States, considering 112,000 sample road segments, and on data provided to the Federal Transit Administration by transit agencies. Our methodology is based on that of USDOT Conditions and Performance Reports. Several factors create the basis of our findings. First, repair backlog—over time, weather, wear and age take their toll on roads, bridges and transit facilities. The repairs, replacements and upgrades needed to bring the existing system up to standards have created huge backlogs in these areas.

The good news is that because of the significant increase in funding made possible through ISTEA and TEA-21, progress has been made. The 1999 bridge repair backlog of \$87 billion has been reduced to \$52 billion today. Pavement conditions have improved on the Interstate, are holding their own in rural areas, but are deteriorating in urban areas. So while close to 80 percent of the roads are rated fair to good, much remains to be done.

The second factor is demand. The U.S. population grew by 100 million over the last 40 years and is expected to grow by at least 100 million over the next 40 years. Highway demand, measured through vehicles miles traveled, increased from 2.1 to 2.7 trillion over the last decade, and is expected to grow by another \$600 billion by 2010. Transit ridership has been growing at 3.5 percent for

the last 6 years. If that continues, transit ridership will double by 2020.

The challenges faced by my DOT in Alaska are somewhat different from those in the lower 48, but are just as significant. Our roads face extreme weather and geological conditions requiring more frequent repair. We have a marine highway system served by one of the largest ocean-going ferry fleets in the Nation, a network of remote airfields, as well as Anchorage and Fairbanks International Airports, and of course the Alaska Railroad. We also have over 300 miles of our national highway system that is not paved. In contrast, we have a congestion problem in Anchorage.

Mr. Chairman, we hope this comprehensive qualification of the Nation's highway and transit needs contained in our bottom line report is helpful to you in determining future funding levels needed for TEA-21 authorization.

Thank you for inviting me to make this presentation.

Senator REID. Ms. Hecker?

**STATEMENT OF JAYETTA HECKER, DIRECTOR OF PHYSICAL  
INFRASTRUCTURE ISSUES, GENERAL ACCOUNTING OFFICE**

Ms. HECKER. Good morning, Mr. Chairman, Senator Voinovich, Senator Jeffords. We are very pleased to be here today and speak on the report that we have done for you and you are releasing today on challenges confronting the Nation in dealing with the range of mobility needs for both surface transportation and for freight transportation.

The focus of the work really is on a couple of areas. One was, what are the key challenges in maintaining mobility in these areas; and then from that, we addressed what are some of the key strategies for addressing these problems.

I will briefly summarize the challenges and then spend most of the time on what we outlined as the key strategies. The challenge, as you have heard before, is preventing congestion from overwhelming the system. In fact, from the numbers you are hearing today, you can see there is widespread agreement that the challenge is actually to keep it from deteriorating; that just doing that is actually an enormous challenge.

So the data I am not going to review. It is unequivocal that we have got congestion. We also, though, have underutilized parts of the infrastructure, and that is an important thing that I will come back to. But there are peak periods, there are bottlenecks that are absolutely critical and that are continuing to play a key role. As you know, one of the key parts of our linkage of transportation investments is promoting efficiency, and we have generated very important benefits in logistics over the past decades, but in fact the congestion is beginning to deteriorate and we are not having those same potentials for improvement in the movement of goods and services.

The other kind of challenges really relate to something you heard from Senator Byrd—underserved populations, rural populations, elderly, which will be an increasing problem over the coming decades. So there are real challenges that already exist and are likely to be even more severe in the future, of underserved populations.

In addition, another challenge that we outline in the report that is inherent in transportation is achieving a balance with the environment and social goals. Clearly, the transportation system presents challenges to the environment and that balance is one of the critical challenges.

The first of three strategies that we outline is basically, focus on the whole system, move away from modal stovepipes. The second is, get more attention and focus on the performance of the existing infrastructure, not just building new. And the third is identifying financing options and new sources of revenue.

The first area, focusing on the entire system, rather than modes, builds on the concern that is a growing consensus that the modal funding mechanisms distort public decisionmaking. Particularly in the freight area, we are not getting the best investment, the best decisions. It is having to go forward only if there is CMAQ money or if there is NHS money, or if there is Border money, but there basically is an impediment for the best investment and the best decisionmaking in infrastructure and meeting mobility needs.

The second is to tie Federal funding to defined outcomes, and relate those to specific national interests and priorities. Again, that is an area that is not in the current system well enough.

The third is to match or better align funding criteria with national priorities. So that is the area of moving away from a pure modal focus and trying to get more intermodal integration in the way transportation is funded, and particularly focusing on both the freight side and the passenger side. We do a lot of work on Amtrak and the Amtrak relationship to highway investment, or to the essential air service. All of these programs have to be viewed in a coherent, integrated way.

The second point or strategy is probably the single most important one. It is, not relying on new construction; recognizing that in fact new construction cannot meet and match the mobility needs of the country. There is a limitation by available space, by public opposition, and clearly, by money. We have seen today, we have heard these numbers. There is no way that with our deficit situation that these kinds of numbers can be brought to bear. So the importance of focusing on performance is that is where we get more out of the existing infrastructure.

Focus on—I know you like specifics, Senator Reid—more focus on rehabilitation; more focus on improving traffic flow, incident management, coordinating traffic signals, better and more consistent use of technology. One of the hardest ones, yet one of the most promising, is demand management, moving toward a system where fees more accurately capture the cost of use so that individuals, freight, and passengers are making better choices about their use of infrastructure.

The third area I will just briefly mention, it is the area where you had the hearing last week, on focusing new sources of revenue. I think your realism, Senator Voinovich, was accurate. A lot of the notion of alternative financing, it is debt financing that ultimately still has to be repaid. The user principle is an important one. So as we look to new financing, new sources, recognize the importance of the user-pay principle for promoting efficiency in the use of our transportation infrastructure.

That concludes my statement. I would be pleased to answer any questions.

Senator REID. Thank you.

What I would ask is unanimous consent that the three symposia that the full committee held and this subcommittee held, be included in the official record of this year's hearing process in TEA-21 reauthorization. Hearing no objection, that is the order.

[Transcripts of the symposia referenced by Senator Reid appear in Part II of the hearings of the Committee on Environment and Public Works, S. Hrg. 107-668]

Senator REID. I also have a statement that I want made part of the record from Garth Dull. He represents—was formerly head of—the Nevada Department of Transportation and represents Safe Roads. I would ask that his statement be part of the record.

[The referenced document follows:]

STATEMENT OF GARTH DULL, NEVADA FOR SAFE ROADS

*Introduction*

Thank you, Mr. Chairman. My name is Garth Dull and I am here today to represent Nevada for Safe Roads, a highway safety coalition focused on keeping trucks from getting longer and heavier. Among the members of our coalition are the Nevada Conference of Police and Sheriffs, the Alliance for Retired Americans, and the AFL-CIO. Attached is a full membership list.

I have both hands-on and policy experience with the issue of truck size and weight from my more than 30 years as a practicing highway engineer and senior policy official with the Nevada Department of Transportation. I served as Director of NDOT from 1986 until 1995, during which time I was responsible for the agency's budget and oversaw the design, construction, and maintenance of over 5000 miles of roads and bridges. Truck size and weight directly impacts each. The heaviest trucks would tear up the pavements and reduce bridge life yet fail to pay their fair share of highway costs.

I know that there are a number of proposals to allow trucks to get longer and heavier. Let me say right now: That would be a bad idea. Trucks are big enough. If you allow them to get any bigger, they will wreak havoc on our highway infrastructure and cause more fatal crashes. There is no question about that.

*Bigger Trucks Would Tear Up Our Roads and Bridges*

In my tenure at NDOT, like all DOTs, we designed roads and bridges to accommodate projected heavy truck traffic. Most of Nevada's bridges—70–80 percent, in fact—were built before 1975, meaning they were not built to accommodate the weight or number of trucks on the road today. NDOT completed a study in 1994 showing that some of the heavy trucks using our roads today overstress our older simple span bridges by as much as 30 percent beyond their design parameters.<sup>1</sup> While no one can quantify exactly what truck weight does to bridge life, we know that it does shorten it. Bridges are designed with a safety margin to ensure against bridge failure. Bigger trucks erode that margin, increasing the number of bridges that must be replaced, strengthened, or posted.

About 15 percent of Nevada's bridges are structurally deficient or functionally obsolete, meaning they are in need of serious repair.<sup>2</sup> There is an even worse backlog nationwide: Nearly 30 percent of bridges nationwide are structurally deficient or functionally obsolete.<sup>3</sup> The US Department of Transportation found in its 2000 Comprehensive Truck Size and Weight Study that allowing bigger trucks nationwide would only increase the number of bridges that must be upgraded. Longer combination vehicles (LCVs)—long double and triple trailer trucks—would alone mean \$319 billion in additional bridge costs.<sup>4</sup>

Heavier trucks also have the potential to decrease pavement life, particularly when weight is added without adding additional axles. The American Association of Highway Transportation Officials (AASHTO) determined in its 1950's Road Test

<sup>1</sup>Nevada Department of Transportation (NDOT), (Bridge Study), 1994.

<sup>2</sup>USDOT's National Bridge Inventory, 2000.

<sup>3</sup>USDOT, 1999 Status Report on the Nation's Highways, Bridges and Transit: Conditions and Performance, Report to Congress, p. 3-14.

<sup>4</sup>USDOT Study, Vol. III, Table VI-2, p. VI-2.

that pavement damage increases exponentially with the weight of a truck. For example, one 80,000-pound five-axle truck does the same road damage as 9,600 cars. A seven-axle triple does as much damage as more than 27,000 cars. In a number of States, five-axle trucks operate well above 80,000 pounds. A number of States allow five-axle trucks to operate above 80,000 pounds on the Interstate highways under claims of grandfather rights.

The number of axles a triple trailer truck has is directly related to the amount of pavement damage it causes. Some triple trailer trucks will operate with nine axles, which is easier on pavements, but in Nevada, triples can run at 119,000 pounds with only seven axles. Seven axles give the operators the greatest payload per axle.

*The Heaviest Trucks Fail To Pay Their Fair Share*

To add insult to injury, the heaviest trucks fail to pay their fair share of road costs. The 2000 Federal Highway Cost Allocation Study found that heavy trucks on the road today underpay their share of highway costs nearly \$1.9 billion.<sup>5</sup> Triple trailer trucks pay 70 percent of their costs through fuel taxes, long doubles pay 60 percent, and 80,000-pound singles pay 80 percent. A single operating at 90,000 pounds, as some proposals suggest, would pay only 50–60 percent of its costs.<sup>6</sup>

NDOT found that Nevada's motorists subsidized heavy trucks for 15 of the 19 years between 1984 and 1998, when the agency completed its last highway cost allocation study. When I was Director of NDOT, I asked our State legislature to enact a cost recovery system. Between 1985 and 1989, the legislature enacted a tax structure that required trucks to pay their fair share of highway costs. Unfortunately, the legislature repealed this system in 1989.<sup>7</sup> Since then, underpayments have gotten consistently worse. In fact, heavy trucks underpaid by \$335 million in the 1998–1999 biennium.<sup>8</sup>

To simply maintain Nevada's roads and bridges at the current level of service will take an additional \$1.8 billion over the next 10 years.<sup>9</sup> Simply maintaining our nation's roads and bridges will take \$1.13 trillion over the next 20 years.<sup>10</sup> Bigger trucks would only mean higher costs.

*Bigger Trucks Would Be More Dangerous*

As you know, the Federal Government has responsibility for setting maximum truck weight limits on the Interstate Highway System, and for regulating the maximum length and weight of LCVs pursuant to the 1991 LCV Freeze. Our highways are dangerous enough as it is. Nearly 3,500 large trucks were involved in crashes in Nevada in the year 2000.<sup>11</sup> Increasing the weight of the typical tractor-trailer and expanding the routes on which LCVs are allowed to operate would put everyday motorists in even more danger.

In August of 2000, the US Department of Transportation completed its Comprehensive Truck Size and Weight Study (US DOT Study). In this study, the US DOT found that LCVs are likely to have fatal accident involvement rates at least 11 percent higher than today's single tractor-trailers.<sup>12</sup>

There is good reason to believe that the fatal accident rate for LCVs could be much higher. Trucks with multiple trailers have extra "articulation points," the points where the tractor and trailers hook up. These articulation points can add instability. One measure of stability is rearward amplification: After the tractor makes an evasive maneuver, a lateral force moves down the truck so that the rear trailer snaps back, much like creating a "crack-the-whip" effect. The US DOT Study found that on this measure of stability triples show more than 200 percent poorer performance than single tractor-trailers.<sup>13</sup>

Another problem with articulation points is trailer sway. In 1984, the California Department of Transportation (CalTrans) conducted its Longer Combination Vehicles Operational Test (CalTrans Operational Test), and found that the third trailer

<sup>13</sup>USDOT Study, Vol. III, Figure VIII–11, p. VIII–12.

on a triple trailer truck swayed constantly from side-to-side from four-to-six inches to as much as three-to-four feet, even on a straight road on a windless day.<sup>14</sup>

Because they are so big and so slow, LCVs have difficulty maintaining speed on upgrades, creating serious safety risks. During the CalTrans Operational Test, triples and long doubles on 3 percent to 4 percent grades achieved speeds that were 15mph to 22mph slower than the mean speed for single trailer trucks.<sup>15</sup> Slow trucks and fast cars are a dangerous combination. According to a 1981 University of Texas study, a speed differential of 15 mph increases accident risk nine times.<sup>16</sup>

Heavier single trailer trucks would also be more dangerous. Heavier single tractor-trailers will tend to have a higher center of gravity. Raising the center of gravity increases the risk of dangerous rollovers.<sup>17</sup> In Nevada, 115 large trucks were involved in rollover crashes in the year 2000.<sup>18</sup> I recently passed the scene of a rollover crash in the "Spaghetti Bowl," where I-80 and I-580 meet in Reno. A truck took a curve a little too fast and rolled over, backing up traffic for miles.

Increasing truck weight is also likely to lead to brake maintenance problems. Roadside inspections continually show that brake adjustment levels are a serious issue. The Commercial Vehicle Safety Alliance found during its Roadcheck 2000 that almost 30 percent of the vehicles inspected had brakes far enough out of adjustment to be taken out of service.<sup>19</sup> Heavier singles often have an extra axle at the rear of the truck to prevent additional pavement damage, and on that axle are two additional brakes. The US DOT expressed specific concern about the ability to maintain those extra brakes.<sup>20</sup> When brakes are out of adjustment, trucks can take substantially longer to stop. In one study, an 80,000-pound truck took 300 feet—the length of a football field—to come to a complete stop from 60mph on a dry road. When that truck's brakes were put out of adjustment to the level at which a law enforcement officer would take the truck out of service, the truck took 450 feet to come to a complete stop.<sup>21</sup>

Heavier weights also cause more severe accidents. According to the University of Michigan Transportation Research Institute (UMTRI), "The general point is that the energy to be dissipated in a collision, and hence the damage done, increases with weight, and that the probability of injury increases with increasing disparity of weights in two-vehicle collisions.<sup>22</sup> This is simple physics: Force equals mass times velocity. When you increase the mass—in this case, the weight of the truck—you increase the force, or the severity of the crash.

Finally, longer single trailer trucks also pose a safety hazard. Longer trucks take longer to pass and to be passed by other vehicles on a two-lane road.<sup>23</sup> Longer trailers also "swing out" into adjacent traffic lanes after the truck's tractor has completed its turn. This off-tracking can take up to more than half the width of the oncoming traffic lane. Motorists can be caught unaware by the unexpected swingout and be hit by the extra-long trailer.<sup>24</sup>

#### *The Transportation Research Board's Recent Report is Faulty*

In Special Report 267, issued this past May, the Transportation Research Board (TRB) recommended creating a new Federal bureaucracy to oversee truck size and weight regulation, in particular permit programs and pilot projects that would put bigger trucks on our roads now and test their impacts later. This report is based neither on sound analysis nor on sound public policy. The TRB conducted no new research and presented no significant new findings on the safety and infrastructure impacts of longer and heavier trucks. In fact, they ignored or attempted to discount the many studies that show that bigger trucks would be more dangerous and would have a negative impact on roads and bridges.

<sup>22</sup>USDOT Study, Phase 1, Working Papers 1 & 2: Vehicle Characteristics Affecting Safety, prepared by the University of Michigan Transportation Research Institute, 1995, p. 38.

<sup>23</sup>USDOT Study, Vol. III, p. VIII-11.

<sup>24</sup>USDOT Study, Phase 1, Working Paper 5: Roadway Geometry, prepared by the Battelle Team, 1995, Fig. 1, p. 4.

Take the issue of safety. The TRB declares that there is a “substantial probability” that the safety effects of bigger trucks—or, in plain English, the dangers of increasing truck size and weight—would be large. But the TRB says that it “hopes” that the changes would contribute to safety.<sup>25</sup>

The TRB cites the US DOT’s Comprehensive Truck Size and Weight Study as well as a 1991 Association of American Railroads (AAR) report on the safety of multi-trailer trucks. The US DOT found that multi-trailer trucks had an overall fatal crash involvement rate 11 percent higher than single trailer trucks after correcting for travel distribution differences by highway type. The AAR study found that multi-trailer trucks had an even higher fatal accident rate—66 percent higher than single trailer trucks.

The TRB says that the US DOT’s findings “contradict” the AAR’s findings, but the two studies support each other: they both found higher crash involvement rates for multi-trailer trucks. Because the studies were 9 years apart and used different analysis periods, it is reasonable to expect some variation in crash involvement ratios. Also, travel data for multi-trailer trucks suffers from fairly high uncertainty rates that result in large variations year-to-year in apparent fatality involvement rates. Either fatal crash rate—11 percent or 66 percent—or something in-between—is completely unacceptable.

As to bridges, the US DOT Study also concluded that there would be enormous additional bridge costs from the nationwide operation of LCVs and heavier singles. The US DOT based its analysis on a presumption that the Federal and State governments would spend the resources necessary to prevent bridges from collapsing or failing. As I said earlier, it found that with nationwide operations of LCVs, the total costs of reconstructing bridges would be \$53 billion, with an additional \$266 billion in costs borne by highway users in extra fuel and lost productivity.

The TRB criticizes the US DOT’s methodology for overestimating bridge costs because the DOT assumed that all affected bridges would need to be replaced. At the same time, the TRB said that the DOT underestimated bridge fatigue and the need to make future bridges stronger to accommodate the heavier trucks. Yet they say that the correct analysis has yet to be conducted, meaning they do not know what the bridge costs will be.<sup>26</sup>

As I said earlier, nearly 30 percent of our nation’s bridges are structurally deficient or functionally obsolete. There is an obvious backlog on maintenance and a shortage of funding. Yet the TRB is proposing testing these trucks on our highways.

We have had LCVs in Nevada for 30 years. Nobody has said that we have not learned enough about them and certainly no one wants more of them.

Congress Should Retain Jurisdiction Over Truck Size and Weight on the Federal System Proponents of bigger trucks have asked for a “State option” plan whereby the States would be able to set their own truck size and weight limits on the most important part of the Federal system: the Interstate highways. But any law regarding the national transportation system should have national oversight.

In a previous authorization debate, some suggested that Congress devolve power to the States to create their own highway design standards. Some joked that we could have green signs in Nevada and yellow signs in Wyoming, but more importantly Congress realized that there must be basic uniformity on the Federal Aid system. That is why the Federal Government sets design, maintenance and construction criteria for the Federal Aid Highway System. Truck size and weight should be no exception.

If the States were allowed to set their own limits, those with higher limits would place tremendous pressure on States with lower limits to allow bigger trucks to remain economically competitive. A number of Governors and State DOT directors have already rejected the State option approach for this reason. When Federal Highway Administrator Mary Peters was Arizona’s DOT Director, she wrote a letter to her Washington representatives opposing bigger trucks. In her words, while proponents of bigger trucks “argue that expanding the truck weight limit would be at a State’s discretion, Arizona could not realistically exclude larger trucks from commerce here if all of the States surrounding Arizona opt for the higher limits. Regulation of interstate commerce is clearly one of the areas reserved by the Constitution to the Congress.”<sup>27</sup>

<sup>25</sup>Transportation Research Board, Regulation of Weights, Lengths, and Widths of Commercial Motor Vehicles (TRB Report), Special Report 267, May 16, 2002, p. 3–21.

<sup>26</sup>TRB Report, pp. 2.21–2.23.

<sup>27</sup>Other State officials who have written letters (of which I am aware) are the Secretaries of the Florida Department of Transportation and the New Mexico State Highway and Transportation Department; the Illinois Secretary of State; and the Governors of Arkansas, Minnesota, Mississippi, Nevada and Rhode Island.

What's more, "State option" is the reason there are 50 different sets of truck size and weight limits on the Interstate System. Before Congress set the current size and weight limits on single trailer trucks and twin 28-foot "short" doubles in 1982, the States had jurisdiction and local pressures dictated the various limits. The trucking industry played the States off one another to get higher limits. When three States held out, the trucking industry claimed they were hurting productivity and asked Congress to force those States to raise their limits.<sup>28</sup>

For these same reasons, the western States should not be "carved out" of the Federal picture as some proponents of bigger trucks suggest. The West does have wide-open spaces and a greater distance between communities, but we also have many mountainous areas that make heavy truck operations treacherous. Truck operators do not always upgrade their engines to accommodate extra weight, and for that reason triple trailer trucks are often the slowest trucks on the road. Driving up steep grades, that power-to-weight ratio becomes even worse. The CalTrans Operational Test proved this point. CalTrans drove a triple trailer truck up the Grapevine, a 6 percent grade pass on 1-5. The triple was the slowest truck on the road and blocked traffic in the right lane. The lighter trucks passed the triple in the two lanes to the left, leaving only one lane for cars.<sup>29</sup>

Driving down steep grades can also mean serious braking problems. According to UMTRI, "Given that the pounds of brake mass to pounds of vehicle mass is limited for trucks, there is a greater tendency for truck brakes to overheat than there is for car brakes.<sup>30</sup> In other words, a truck's brakes can overheat when in constant use going down a hill. When that happens, the brakes fail to work properly, particularly when brakes are out of adjustment which, as I noted earlier, they often are.<sup>31</sup> That is why we build truck escape ramps.

Finally, a recent AAR study found that bigger trucks would result in 1,000 additional LCVs each day on 1-15 from Chicago to Los Angeles. That is a tremendous amount of truck traffic.

#### *The Safe Highways and Infrastructure Preservation Act*

I am here today to ask you to reject any increases in truck size and weight. But I also ask you to take it one step further. There are loopholes in the current law that allow trucks to get longer and heavier, and weights on the National Highway System (NHS) are being ratcheted up. "The Safe Highways and Infrastructure Preservation Act", which has been introduced in the House of Representatives, would put a stop to these backdoor increases. The bill would establish common sense truck size and weight limits on the National Highway System and close loopholes in the law that allow longer and heavier trucks. I urge you to support a similar measure in the Senate.

This is what the bill would do:

##### *1. The bill would freeze all current trailer lengths on the NHS*

Trucks have been getting longer. There is no Federal trailer length maximum, only a minimum of 48 feet. The standard trailer length has increased over time from 25 feet in 1946 to 53 feet today. Eleven States allow trailers 57 feet or longer to operate regularly, with more than half of these having legalized the extra long trailers since 1990.<sup>32</sup> H.R. 3132 would freeze all current trailer lengths on the National Highway System.

##### *2. The bill would freeze all overweight permitting practices*

Trucks have been getting heavier on our Interstate highways. Truck operators are applying for—and getting—more "multiple trip divisible load" permits to run well over the Federal legal limit. States that issue these permits claim grandfather rights to allow trucks to operate over the Federal legal limit. H.R. 3132 would freeze all overweight permitting practices.

<sup>32</sup>The 11 States and their year of legalization are Oklahoma (1983), Wyoming (1984), Louisiana (1985), New Mexico (1986), Texas (1989), Colorado (1990), Kansas (1991), Arizona (1991), Florida (1992), Mississippi (1993) and Alabama (1993).

3. *The bill would extend the Federal Interstate weight limits to the entire National Highway System, grandfathering in higher weights. The bill would also extend the LCV Freeze to the entire NHS Trucks have also been getting heavier on the non-Interstate portions of the NHS*

Federal truck weight limits, including the LCV Freeze established by ISTEA in 1991, are limited to the 44,000-mile Interstate Highway System. By contrast, State weight limits apply to the more than 156,000 miles of NHS.

In June of 2001, Ohio raised the allowable tandem axle weight on NHS routes from the Federal limit of 34,000 pounds to 40,000 pounds. Georgia raised the allowable tandem axle weight on NHS routes from 37,340 pounds to 40,680 pounds 3 years ago.

If NHS weights continue to rise across the country, Congress will be faced with similar pushes for heavier Interstate weight limits.

4. *The bill would address illegal overweight operations*

About 10–20 percent of trucks are operating illegally overweight.<sup>33</sup> The US DOT says that a truck operator who runs at 10,000 pounds over the Federal legal limit for 1 year will earn an extra \$25,000.<sup>34</sup> That is a huge profit incentive, especially when fines across the country often do not even cover the cost of filing the paperwork for the citation, let alone acting as any sort of deterrent.<sup>35</sup> H.R. 3132 would direct the US DOT to establish a model fine system.

The Federal Government has a responsibility to keep trucks from becoming bigger and more dangerous. I ask that you support this measure.

#### *Conclusion*

Thank you for inviting me to testify today. I am happy to answer any of your questions.

Senator REID. Senator Jeffords, would you ask the first round of questions? We will have 5 minutes, just like the witnesses. If you want to go again, we can have you do that. Chairman Jeffords?

Senator JEFFORDS. Thank you very much, Mr. Chairman.

Ms. Peters, I have a few questions for you. What avenues can Congress take to ensure the performance of the system does not continue to degrade?

Ms. PETERS. Mr. Chairman, I believe the way we can do that is to continue to have performance measures, as Ms. Hecker indicated. We need to have performance measures such as the pavement condition, the bridge condition, and monitor those to ensure that investments are made; that we are getting the best life out of our transportation assets.

Senator JEFFORDS. One of the key features of our transportation program is its flexibility. Under TEA-21, a State can move funds from program to program. This feature enjoys universal support. I wonder, however, if we should be concerned about flexing money out of the bridge or Interstate maintenance program. How can we be sure that our national interest in asset management is adequately addressed, while preserving the flexibility provisions under the law?

Ms. PETERS. Mr. Chairman, again I think what we need to do is establish metrics where we are spending the money and meeting certain performance measures, and ensuring that States are doing that before we are transferring money out. As you know, we are fans at the Department of this flexibility provision as well, but we need to balance that, of course, with the performance of the system.

Our preference is to work with States in establishing those performance measures and with the AASHTO community so that we all agree together how we can best get the longest useful life out of our transportation assets.

Senator JEFFORDS. The Interstate system is vital to the economy. It moves a majority of the traffic in our country. What level of investment is needed to ensure that this vital network is free of major problems?

Ms. PETERS. Mr. Chairman, we did look at the specific level of investment in our Interstate highways, and in fact some of the best pavement conditions and best bridge conditions, as indicated earlier, do exist on our Interstate highway systems today, which again is appropriate because those systems do carry the majority of the travel.

In looking specifically at those systems, I think we have to continue to focus both on how we are building, and on how we are maintaining and operating them to ensure that we are getting the maximum useful life out of them. Just for example, if we look at our pavement condition in the year 2000, overall pavement condition, it is about 86 percent, meaning the pavement with acceptable ride quality. On the Interstate system, it is nearly 97 percent, so continuing that type of focus is important in the future.

Senator JEFFORDS. Mr. Perkins, how is AASHTO's strategic highway safety plan different from previous safety related efforts and programs?

Mr. PERKINS. Our safety plan actually is taking a look at some 20-plus activities. We are trying to put everything together, which includes the driver, the vehicle, all aspects of safety. This will result in also looking to see what kind of safety measures we can take, such as widening, such as different kinds of intersections and so on that we can build to meet these safety things. It is much more comprehensive program, Senator.

Senator JEFFORDS. Ms. Hecker, how would you assess the quality of the data that is used by FHWA in the development of the Conditions and Performance Report? What can be done to improve the quality of future FHWA Conditions and Performance Reports?

Ms. HECKER. We have reviewed them in the past, and in fact have positive observations, both on the methodology and the quality of the data. I think the improvement goes to my point, though, about the strategies for improving the performance—those bottom line numbers, because they are so large and so beyond the existing resources or readily imaginable new resources. It is really, how do we get more for the money; how can we actually enhance the performance and do that, not with these numbers for new construction, but through less capital-intensive means that improve the performance of the system.

Senator JEFFORDS. We have heard a lot in previous hearings about the growing congestion overtaking our metropolitan areas. I see congestion even in my travels between Rutland and Burlington, Vermont. Is congestion a growing concern in the rural portions as well?

Ms. HECKER. Yes. We have recently completed a study of the Interstate, and while congestion was more serious in the urban areas, we saw substantial agreement among States that congestion was an emerging problem in rural areas as well. Part of this is really the interface of freight and passenger traffic. That is where you get a lot of these bottlenecks where it may not be a heavily populated area, but if you combine peak times with movements of freight traffic through the area at those same times, then it is going to create congestion.

Senator JEFFORDS. Thank you.

Thank you, Mr. Chairman.

Senator REID. Senator Voinovich.

Senator VOINOVICH. Ms. Peters, you talked about the increased congestion in urban areas. That has been a perplexing problem for this committee for as long as I have been here. What are your suggestions in terms of dealing with that? It gets into the environmental concerns and others, but we just, as you mention, I think, in your testimony, it is getting worse all the time. We are seeing more and more people sitting in their automobiles for hours in some cases trying to get home or go to work—usually it is going home. What are your ideas?

Ms. PETERS. I don't know, Senator. I spent literally two full hours trying to travel 13 miles in this region 1 day last week, so I think—and I was trying to get to work that day—so it is a problem both going to work and coming home from work. But I think

there are a variety of strategies we can employ. One of the things that really concerns us in looking at this edition of the Conditions and Performance Report, as was mentioned earlier, is congestion is no longer just a big city issue. Congestion in cities of 500,000 population or less has increased 217 percent from 1987 to 2000. So in answer to your question, sir, we believe that there are a variety of tactics that we can use—first of all, bringing as much as we can to the table in terms of investment, so that we have investment choices and we can make those investments; as was mentioned by GAO, operating the system more efficiently, using technology or what is known as intelligent transportation systems to increase the through-put of the systems; maintaining those systems so that we have the highest performance of those systems, as was mentioned, is another tool that we can use as well.

And, using the practices once we have decided to build a section of highway or freeway or expand that section of highway or freeway, of getting that done as quickly as and as efficiently as possible so that we have that portion of the transportation system available for use, is important.

All of these tools can be used to deal with this issue of congestion. I do believe, though, we still do need to strategically add capacity. In areas such as Senator Reid's State in the Las Vegas area, with the growth that they are seeing, it simply is not possible to deal with it, even using the methods that I have described.

Senator VOINOVICH. One of the things that I am hoping this committee can get done before we get into the final phase of this legislation is to get the 1309 provisions taken care of. We have been waiting years to get regulations out of the Department of Transportation going forward with those streamlined provisions of the legislation, recognizing the environmental concerns that we have. What are the chances of us getting something back that we can move on rapidly to get that out of the way?

Ms. PETERS. Senator, I think that the President's executive order which was issued the week before last was our effort both at withdrawing the existing regulations which were very controversial on both sides of the aisle, and moving forward with something that we believe will help us fulfill the tenets of section 1309 and get transportation projects moved through much more efficiently and effectively.

Within the context of the reauthorization proposal which the Administration would hope to bring forward early next year, we may have other suggestions, but we do believe that the President's executive order will help us get these projects moving without sacrificing environmental concerns.

Senator VOINOVICH. When you are entertaining highway projects, do you give consideration at all to the negative impact those projects might have on the traveling public? By that I mean, I will never forget when the State of Ohio contemplated putting a third lane on I-71. The original proposal was that we were going to shut it down to one lane. I just thought it was incredible, and they said, well, it's a way to save money. And I said, I can just see people traveling on I-71 in one lane and what it would do to the inconvenience to the public and the congestion and the use of gasoline, let

alone the stress on the individuals driving the automobiles, and their families.

Do you take that into consideration when you get some of these proposals back from the States on how they are going to go forward with a project?

Ms. PETERS. Senator, we do, and are working very actively with the AASHTO community, and in particular the committee that is chaired by Director Perkins here, the Standing Committee on Highways. We are looking at methods of constructing projects that are less detrimental to the traveling public, using tools such as design-build and lane rental incentives, we can keep more of the roadway section open and serving the public during construction periods than we have in the past. I think that is an area that is ripe for more improvement and we look forward to working with you and with members of the AASHTO community on making those improvements.

Senator VOINOVICH. I know that we had a project in the Cleveland area, and I think it may have been the first or second dual-dual highway system where you have the main road and then you can get off on kind of like a speedway—not a speedway, but it is less traffic. It is just amazing what a difference that has made. And that was insisted on because we needed to put an exit onto 271 Interstate highway, and that would have kind of shut the highway down. So somebody in Washington said, let's give consideration to putting in another roadway that we can keep going, and it has turned into this dual-dual. It has just been amazing what it has done to reduce congestion in the area.

The other thing I will never forget is that we had to raise our Ohio Turnpike—it had two lanes, and we increased the fees on the turnpike and went to a third lane. I do now know whether you have gone from a highway where you have gone from two lanes to three lanes, but it is just amazing how it has relieved some of the congestion and reduced the number of traffic fatalities that we have had there. But you do take those things into consideration?

Ms. PETERS. We do, sir.

Senator VOINOVICH. Because a lot of them cost money, but you have to weigh that versus some of the other things that are available.

Ms. PETERS. That is correct.

Senator REID. The only good news that I have heard this morning is from you, Ms. Hecker, and that is we have to try something new in this new highway bill, and that is really hard to do—to break our old legislative habits. Our legislative habit in the past has been just more roads, more highways. We don't have money to do that, so we are going to have to come up with something new. So what did you call it? Demand management? What was the term?

Ms. HECKER. Demand management has many aspects to it, but basically right now we are managing demand with congestion, that the excess of demand over supply is evidenced by people waiting in line and by the unreliability of trips.

Senator REID. This is really kind of a scary time to have this bill facing us. We know we do not have the money that we need. Some are talking about increasing gas taxes to try to meet the needs that

we have. There are lots of interesting proposals, but I do not think there is—I ask you this, Ms. Peters. Your proposal includes funding levels that are high enough to ensure both conditions and performance. I do not see how that is going to improve. You know, we are limited in money. So as I have heard here today, the best we can do is manage what we have and not look forward to a lot of improvement. Is that a fair statement?

Ms. PETERS. Mr. Chairman, Senator Reid, the report, the Conditions and Performance Report is intended to be an objective analysis of long-term needs only, and it does not get into some of the policy issues. But if I could go away from that report, I think Ms. Hecker is exactly right in terms of what we need to do in the future and look at managing our system as a whole. In the past, I believe that we as an industry have been too supply side focused, and we really need to look at the demand side and determine what are the ways that we can meet demand. One of the ways is to reduce that demand. Other ways are to strategically add capacity, get more out of the system that we have today. Those are the types of conversations that we look forward to having with you as the Administration develops a reauthorization proposal.

Senator REID. Ms. Hecker, you mentioned freight and passenger—the problems it causes. We have been trying for 5 years. We have approved Amtrak route from L.A. to Las Vegas. We have been trying for all those years to get that done. It would not seem like a real big deal. The tracks are already there. But the main problem is the freight and passengers. The passengers always take second-fiddle to freight. As a result of that, a ride from L.A. to Las Vegas should take 4 hours or thereabouts. I mean, they are saying it could take 8 or 9 hours. Well, it defeats the whole purpose of what we are trying to accomplish is to alleviate some of the problems we have on I-15, which is just a jam-packed highway system.

So I think we are going to have to put our heads together, all of us—AASHTO, Federal Highway Administration, see what we can get from the experts at GAO, as noticed, and look at this highway bill as a time for doing something different to alleviate the transportation problems of this country. Because as much as we all, and as Senator Byrd talked, we need more lanes and things that we have done in the past. We are going to have to come up with novel new ways with a limited amount of resources to try to alleviate the traffic that we have. Because as Senator Voinovich, the one thing you did not mention, Senator Voinovich, with your example of reducing the lanes from two to one while they put in a third lane, is what it does to people's businesses; what it does to commerce. Somebody is paying for those trucks that are stuck in traffic. Somebody is paying for those people who are trying to get to work and can't, or have another appointment someplace else. It just increases everyone's cost of doing business. That is one of the problems we have with these jam-packed highways.

I have a number of questions that I would submit to the witnesses in writing. I have several questions for you, Ms. Peters. I have questions for all three of you that I would like you to answer—the same question. And for you, Mr. Perkins, we have a number of questions that we need to ask, not the least of which is, we have some mega-projects coming up in this highway bill. Ques-

tion: What are these mega-projects like the Wilson Bridge out here—what does that do to overall highway funding? It is obvious, the answer is it hurts it very badly. And then for you, Ms. Hecker, I have a number of questions that I need to submit to you.

Thank you all very much for being here. I would ask that these questions that we submit to you, if you could get the answers back in a couple of weeks, that would be a big help to us.

Senator VOINOVICH. Mr. Chairman, I also have some questions that I would like to submit.

Senator REID. Yes, that would be certainly appropriate.

The third panel is the Honorable Gordon Proctor, who is the Director of the Ohio Department of Transportation. I don't know how he got on the witness list, but he is on it. We have Thomas L. Jackson, President-elect of the American Society of Civil Engineers. We have Dr. William Buechner, Vice President, Economics and Research, American Road and Transportation Builders Association.

We would ask you all to take your places here. You know what the rules are. We will first hear from Director Proctor, the State of Ohio. They are expecting you to do very, very well because Senator Voinovich has highly recommended you. So we have great expectations.

Mr. PROCTOR. I will try to fulfill his expectations, Mr. Chairman.

**STATEMENT OF GORDON PROCTOR, DIRECTOR, OHIO  
DEPARTMENT OF TRANSPORTATION**

Mr. PROCTOR. Mr. Chairman, members of the committee, I am Gordon Proctor, Director of the Ohio Department of Transportation. I very much appreciate this opportunity to testify, and we very much appreciate the assistance of Senator Voinovich. His leadership on transportation in Ohio is very much appreciated.

As you shape the next transportation act, I ask that you focus on the tremendous need to rebuild, reconstruct and rejuvenate the Interstate highway system. This system will reach its 50th anniversary in 2006, mid-way through the next act. The Interstate highway system has served us well and today plays a vital and irreplaceable role in our transportation system. At the same time, the system is aging, stressed and sorely in need of additional investment to ensure the safety, adequacy and competitiveness of our Nation's transportation system.

When we put this system in context, it represents only 1.2 percent of the public road miles in the United States, but it carries 24 percent of all traffic and an estimated 80 percent of all truck freight. Traffic volumes on the Interstate have risen 41 percent in the past 10 years, and truck volumes have grown by even more.

The advent of computerized inventory systems, combined with the ease and access of the Interstate highway network, led to the creation of just-in-time inventory. This strategy played a large role in dropping the Nation's cost of logistics from 16 percent of the gross domestic product in 1978 to only 10 percent of the gross domestic product today. That means that a substantial portion of America's rise in productivity in the past 20 years has been attributable to our Interstate highway system. As Governor Taft has said, the Interstates are the conveyor belt for America's just-in-time economy.

However, we are experiencing very troubling trends in Ohio and across the country. Ohio is a good microcosm because our Interstate highway system is America's fourth largest and we estimate it carries the third greatest value of truck freight. I mention it not because it is unique, but because it is so typical. In the past 25 years in Ohio, we have experienced an 89 percent increase in truck volumes. Routinely every day in Ohio, truck volumes on our major Interstate highways approach 20,000 trucks a day. We estimate truck volumes will grow by approximately 60 percent over the next 20 years, and some estimate that the growth will be even higher.

That means within 20 years, 30,000 trucks a day will be the norm on the Interstates in Cincinnati, Dayton, Springfield, Toledo, Cleveland, Akron, Canton and Youngstown. Those routes used to be our safest and most reliable routes, but now severe congestion, outdated interchanges, poor geometrics, and tremendous volumes have turned nearly every Interstate route in Ohio and in Ohio cities into a high congestion, high accident bottleneck. I-75 in Toledo carries 19,000 trucks a day. It is 43 percent over capacity and it has 100 accidents per mile, per year. On I-75 in Cincinnati, we have 184,000 vehicles, 14,000 trucks and an average of 80 accidents per mile, per year.

Our most congested location in Ohio is the overlap of Interstate 70 and 71 in Columbus, which is the literal and figurative crossroads of Ohio. Volumes are 114 percent over capacity and we average 274 accidents per mile, per year—274 accidents per mile, per year. That equals more than one accident per every business day. Within a 2.5 mile radius of the intersection of those two Interstates, we have had 2,037 accidents over a 3-year period.

I will offer one final example. Just in Dayton, where we have 19,000 trucks a day and 80 accidents per mile, per year, it would cost us \$750 million to reconstruct I-75 in Dayton to make it meet all current standards. We will never have \$750 million, so we have a secondary plan to invest \$300 million to merely make it adequate. We can afford \$300 million for Dayton. That equals 1 year's total new construction budget for the Ohio Department of Transportation. But you multiply that times 10, and you will know what we need in Cincinnati, in Columbus, in Cleveland and Akron and Canton and Youngstown, as well as Columbus. And then if you multiply that by all the States in the country, and as I say, what is in Ohio is not unique—it is very typical—it represents a major challenge that is addressed in the Condition and Performance Report.

What can Congress do? I would ask that you please not dilute the basic highway core formula. We ask that you protect us from historic preservation requirements that could treat the Interstate system as a historic artifact in a few years as it reaches its 50th year. We ask that no new regulations be adopted that could impede our progress. And finally, we endorse an idea first suggested by Administrator Peters that a national commission is needed to evaluate the future of the Interstate system.

Thank you very much, and I would be happy to answer questions at the appropriate time.

Senator REID. Very important testimony. I am very impressed.

Thomas Jackson, please proceed.

**STATEMENT OF THOMAS L. JACKSON, PRESIDENT-ELECT,  
AMERICAN SOCIETY OF CIVIL ENGINEERS**

Mr. JACKSON. Good morning, Mr. Chairman, and members of the committee. My name is Tom Jackson. Thank you for the opportunity to be here. I am currently serving as the President-Elect of the American Society of Civil Engineers, and I am pleased to represent ASCE here this morning.

For 150 years, ASCE has been representing engineers who are responsible for the Nation's built environment. ASCE represents more than 130,000 civil engineers worldwide. We look forward to working with the committee on the reauthorization of TEA-21. ASCE believes the reauthorization should focus on three goals: expanding infrastructure investment, enhancing infrastructure delivery, and maximizing infrastructure effectiveness.

In 2001, ASCE released a report card for America's infrastructure which gave America's infrastructure a grade of D-plus based on 12 categories. In our role as steward of the infrastructure, ASCE developed its first report card in 1998, and the infrastructure scored an overall grade of D. So there has been some modest improvement since 1998. In 2001, the Nation's roads earned a D-plus, up from a D-minus in 1998, and the Nation's bridges received a grade of C, an improvement from C-minus in 1998. The enactment of TEA-21 and additional State and local programs to fund surface transportation infrastructure has begun to address the investment crisis in crumbling infrastructure. But on our highways, nearly 70 percent of those traveling in peak hour traffic experience congested conditions. Vehicle travel on America's highways increased by 148 percent from 1970 to 2000. The Nation's population grew by 38 percent over that period, while new road mileage increased by only 6 percent.

According to a study by the Texas Transportation Institute, the total congestion bill for the 75 areas studied in 2000 came to \$67.5 billion. In 1998, 29 percent of the Nation's bridges were rated structurally deficient or functionally obsolete by the Federal Highway Administration. The FHWA tells us that \$10.6 billion are required each year for the next 20 years to eliminate the current backlog of bridge deficiencies and to ensure safety. Even with TEA-21's commitment, our Nation must increase its annual investment by at least \$35 billion at all levels to improve the condition of our highways. The Nation should invest \$106.9 billion a year in its road and bridge systems over the next 20 years, according to a FHWA 2002 report.

While traveling on our highways has increased dramatically in the past 10 years, America has been seriously underinvesting in needed road and bridge repairs, and has failed to even maintain the substandard conditions we currently have. This is a dangerous trend that is affecting highway safety and the health of the American economy.

Establishing a sound financial foundation for future surface transportation improvements is an essential part of TEA-21 reauthorization and one way to improve the Nation's infrastructure grade point average. The Department of Transportation data indicate that an investment of \$75.9 billion per year is needed to preserve the system in its current condition. ASCE supports the total

annual Federal funding of \$40 billion to \$50 billion for the Federal Highway Aid Program. To achieve this level, ASCE supports an increase of six cents per gallon in the Federal user fee on gasoline. Additionally, ASCE supports adding a provision to the law that would index it based on the consumer price index, or CPI. These changes would provide a much-needed infusion of funding toward the \$50 billion per year needed.

Safety and security have always been important, but have been driven to the top of our priority list by the events of 9–11. In response, ASCE believes that one cent of the proposed six cents increase in user fee be directed toward safety and security projects. Even with increases in gasoline user fee, it is likely that the tax base revenues will not be sufficient to keep pace with the Nation's transportation needs.

The innovative financing programs in TEA–21 have been a good start, but more needs to be done. ASCE encourages the use of life-cycle costs, analysis principles, and a design process to evaluate the total cost of the projects. The analysis should include initial construction, operation, maintenance, environmental, safety and all other costs reasonably anticipated during the life of the project, whether borne by the project owner or those otherwise affected. There continues to be a great deal of discussion on truck weights and sizes and their effects on roads and bridges. As an engineer, I can tell you increases in truck sizes and weights impact negatively on the life expectancy of roads and bridges.

However, it is important to note that highways can be designed and constructed to accommodate various truck sizes and weights. Truck and highway design should be coordinated through joint research activities such as the National Cooperative Highway Research Program. New and reconstructed roadways should be designed to support modern truck sizes and weight, and to ensure the safe operation of the system.

Let me conclude with this thought. A crumbling infrastructure cannot support a healthy economy or a healthy population.

Thank you very much. I will be prepared to answer to answer any questions.

Senator REID. Dr. Buechner?

**STATEMENT OF WILLIAM R. BUECHNER, VICE PRESIDENT, ECONOMICS AND RESEARCH, AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION**

Mr. BUECHNER. Mr. Chairman, Senator Voinovich—thank you very much for inviting the American Road and Transportation Builders Association to testify this morning. I am Dr. William Buechner, ARTBA's Vice President for Economics and Research. Prior to joining ARTBA in 1996, I served for 22 years as senior economist for the congressional Joint Economic Committee, and I have a doctorate in economics from Harvard University.

Mr. Chairman, at the outset, I want to express our association's deep appreciation to you personally and to the bipartisan leadership of this committee for your work this year to maintain the fiscal year 2003 highway program at the current-year \$31.8 billion funding level.

The 2002 Conditions and Performance Report discussed earlier this morning by Federal Highway Administrator Mary Peters indicates that an average annual investment of just under \$76 billion by all levels of government would be required during the next 20 years to maintain current conditions on the Nation's highways and bridges. During the past 20 years, the Federal share of highway investment has been around 45 to 47 percent, which implies that a Federal investment of about \$35 billion a year for the next 20 years would meet our highway investment requirements.

I think this greatly understates our investment needs. These conditions and performance reports are excellent reports, but you have to dig down into the details to find out the real level of needs. There are three reasons why the \$76 billion investment figure is understated. The first is that it is stated in year 2000 dollars. Obviously, future inflation will significantly add to the investment required. For example, with projected inflation over the next few years of 2.4 percent per year, costs would be 10 percent higher than that in 2004 when we start the reauthorization period, and almost 25 percent higher in 2009. Congress needs to take this into account when setting annual highway investment levels.

Second, it focuses on user costs, which are a combination of congestion costs, crash costs, and vehicle repair costs. The Conditions and Performance Report makes it very clear that the \$76 billion figure will not maintain current conditions in terms of congestion. Traffic congestion at that level will continue to get worse, and the Administrator said that this morning.

Finally, the report assumes that traffic growth is going to slow down significantly in the next 20 years, from 3 percent growth per year in the last 20 years to 2 percent per year in the next 20 years. This assumption greatly reduces the investment needs because less traffic means fewer highway repairs and less need for new capacity. Virtually every past report has understated traffic growth. This report points out that if you just assume continued traffic growth for the next 20 years as we have in the past 20 years, that we would actually require \$120 billion worth of investment just to maintain conditions.

The AASHTO bottom line report, which was discussed earlier, concluded that an average annual investment of \$92 billion in 2000 dollars by all level of governments would be needed to maintain conditions, which is about \$16 billion more than the Administrator focused on this morning.

When ARTBA analyzed the data in the 1999 Conditions and Performance Report and adjusted the data for inflation and VMT growth, we concluded it would take an average Federal program of about \$50 billion a year for the next 6 years just to maintain structural, safety and performance conditions on the Nation's highways and bridges. When the new report is finally released later this year, I think the data will inescapably show that a Federal highway investment of at least \$50 billion per year will be required, and maybe \$60 billion or more.

ARTBA has developed a TEA-21 reauthorization funding proposal, which we call "Two Cents Makes Sense," that shows how the Federal share of highway investment requirements during the next 6 years can be substantially met. First, we are recommending a

Federal highway program funded at \$35 billion in fiscal year 2004, and then growing \$5 billion a year to \$60 billion a year by fiscal year 2009. The program would also double transit investment to \$14 billion by 2009. This approach would result in a manageable program for both the State DOTs and the highway construction industry.

We are also suggesting a fundamental change in the way highway trust fund cash is managed, to assure that highway users pay no more into the trust fund than is needed to cover actual cash outlays from the trust fund. Under our recommended changes, we calculate that a small annual increase in the Federal highway user fee of about two cents per gallon per year would be needed at most to meet projected cash outlays from the highway trust fund to fund the program that we have recommended. About a half a cent of this increase would come from permanently indexing the highway user fee to the consumer price index, and the other penny and a half a year would have to be included in the reauthorization legislation.

To put this into perspective, we have included a chart in our prepared statement showing that the average weekly change in the retail price of gasoline over the last year and a half has been two-and-a-half cents a week. So we are talking about an annual increase that is smaller than the weekly change that Americans have become used to in the retail price of gasoline.

Finally, we have proposed a change in the RABA provision to assure that the funding would be completely budget-neutral and would have no impact on the Federal surplus or deficit.

Mr. Chairman, again I appreciate the opportunity to discuss the Nation's highway investment requirements and how to meet them. I would be prepared to answer questions.

Senator REID. Mr. Proctor, the State of Ohio has not grown much in the way of people, right, in the last decade?

Mr. PROCTOR. That is correct, Mr. Chairman.

Senator REID. Tell me why the traffic is increasing so much, then?

Mr. PROCTOR. As the gross domestic product rises, volumes of traffic, and particularly truck volumes, correlate almost one to one. In my written testimony, we have a chart to that effect. As we rise in affluence, we buy more things. Each product gets a little more complicated. With the advent of just-in-time inventory, people do not store components. So the volume of traffic per dollar of output has grown steadily over the last few decades, to the point where we have had a 90 percent increase in truck volumes in Ohio in the last 25 years, whereas Senator Voinovich knows our State's population has grown very little.

Senator REID. I want to compliment all the witnesses today, but I particularly want to compliment you. The work that you have done preparing for this hearing will serve the committee big-time, so to speak.

Mr. PROCTOR. We hope so, Mr. Chairman.

Senator REID. You have done a very good job, and I appreciate very much your work.

Mr. PROCTOR. And if I could stress, too—I cite this not because Ohio is so unique, but my counterparts from Pennsylvania and New Jersey or Virginia . . .

Senator REID. Are having the same problems.

Mr. PROCTOR. . . . or anywhere else could have made this same presentation and we think that is a national issue for all of my counterparts.

Senator REID. Mr. Jackson, you have indicated that you feel the gas tax should be increased by six cents a gallon. Is that right?

Mr. JACKSON. Yes.

Senator REID. That would be about \$8 billion a year or something like that—that would raise? Is that about right?

Mr. JACKSON. Yes, we support an increase in the user fee on gasoline, as we prefer to call it.

Senator REID. Now, Dr. Buechner, did you also recommend an increase in the gas tax?

Mr. BUECHNER. Our “Two Cents Makes Sense” proposal found that it would take about two cents a year for the next 6 years to fund a program that would grow from \$35 billion to about \$60 billion, which is a practical program for meeting the investment needs.

Senator REID. Also, you indicated that would cause also the transit to also be about \$14 billion or \$15 billion a year, is that right?

Mr. BUECHNER. Yes, sir.

Senator REID. Mr. Jackson, your report card on America should not make us feel very good—a D-plus and a C. My concern, though, is why did the bridges do so well, because we hear all the time about the deteriorating status of our bridges.

Mr. JACKSON. In the ISTEA and TEA-21 programs there has been a considerable amount of work done on the bridges, which helped. The Federal Bridge Replacement Program has also addressed those bridges which were structurally deficient.

Senator REID. So we have done some good, then.

Mr. JACKSON. There has been some headway made on the Federal Bridge Program.

Senator REID. Each of you know that we are really not talking about raising the gas tax. I think it is going to be hard to do. But you have made it very clear that under the present conditions and the amount of money we have, we are in big trouble. Is that what you are telling us?

[All witnesses respond in the affirmative.]

Senator REID. Because with the trust fund being less than we expected, if we can get up to levels from previous years, we will be doing well. And even at that, we are slowly going under. Is that a fair statement?

Mr. BUECHNER. It would be fiscal year 2006 under current revenue projections before we even got back to the 2002 funding level.

Senator REID. What does that do to our highway system in the country?

Mr. BUECHNER. Congestion will continue to get much worse, and it will start having a significant impact on the economy. I think we are at a level now, at a situation now where failing to address some of these things will start to have an impact on jobs, on growth.

Senator REID. You, as a PhD Harvard economist, have no doubt that this congestion will hurt the economy?

Mr. BUECHNER. Oh, I think it is probably already doing that. It is probably already having a significant influence, and letting it get worse will just make things worse.

Senator REID. Do either of the two of you disagree?

[Both witnesses indicate in the affirmative.]

Senator REID. Senator Voinovich?

Senator VOINOVICH. It is interesting. I have a reputation for being a deficit hawk in the Senate, and I vote against most appropriation bills. I received a call from Mitch Daniels early on telling me that we had made a mistake on the trust fund and that we had overextended ourselves and we needed to reduce it substantially. I said, in spite of my feelings regarding the budget, that I thought it was important that we at least bring the amount of money up to the \$28.7 billion that we had promised when we put the program together, and underscored how important this even amount of money meant to the industry and to the States.

That being said, I think that we ought to recognize that the additional money, if we reach the \$31.5 billion we want, a portion of that money is going to be borrowed to pay for that. That is money we are going to borrow from the—either be paid for with the Social Security surplus, or we borrow. Whatever the case may be, we are borrowing it. We are going to have to remedy that formula, as you point out, with the—what did you say?—2006 to get up to the level where we are right now. So that is going to be a major consideration by this committee. If we are going to not have that happen, it means that we are going to have to have more money.

Now, either we borrow the money to pay for it, or we raise the money to pay for it. That means that if you are fiscally responsible and we have this agreed upon user-pay philosophy in this area, that gas taxes, if we are going to get the job done, are going to have to be raised. In addition to that, they may have to be raised on the State level in some places.

The issue is, what is the proper relationship in terms of the State and the local and the Federal? This was, as one of our witnesses said, 51 percent was State, 23 percent was local and then 24 percent Federal. Is that the breakdown? Do you know what the percentages are?

Mr. BUECHNER. That would be the breakdown for all highway expenses, including standard maintenance, which is generally not eligible for Federal aid. It includes highway patrol. It includes bond redemptions and things like that.

Senator VOINOVICH. Let's say about the Interstate—how much of that is paid for by the Federal Government?

Mr. PROCTOR. Eighty percent, approximately.

Senator VOINOVICH. About 80 percent.

Mr. PROCTOR. About 80 percent, at least using Ohio as an example, about 80 percent.

Senator VOINOVICH. So if we were going to do a better job and meet this—and by the way, this number, the \$50 billion, is the one that has been bandied around. This is the one that, as I mentioned, in July of 2001, the GAO said that it was going to be \$50.8 billion over 20 years, and then if we wanted to do an additional investment, it would take another—we would have to bring it up to \$83.4 billion. So the real issue here is, where are we going to get the

money to do the job that needs to be done, and Mr. Chairman, what responsibility do we have on the Federal level for this, and what responsibility should the States have as our partner. Do you want to comment on that?

Mr. BUECHNER. For the capital costs, the real construction work, the Federal share has been about 45 to 47 percent over the last 20 years. So the Federal program is a major source of funding for the improvements that we are talking about here.

Senator VOINOVICH. Gordon, do you want to respond?

Mr. PROCTOR. Yes, Mr. Chairman, Senator Voinovich, clearly the cost has to be shared, and the States have to do their part. They cannot say this is solely a Federal problem, and I believe both States and the Federal Government have to step forward. I do have to say, even though the numbers are huge, an incremental increase will still do a lot of good for a lot of people. We may not solve everything, but eliminating one bottleneck in Cincinnati with the Fort Washington Way project created tremendous benefits. Eliminating one bottleneck in Toledo by eliminating a lift-bridge on the Interstate, we did not solve all of Toledo's problems, but that one project is creating a tremendous amount of good.

So if we can get any increment of investment, we may not be solving every problem, but we will be doing a lot of citizens a lot of good in a lot of cities. And so we cannot be paralyzed by the magnitude of those numbers. We have to keep thinking incrementally how can we steadily approach this problem. It does do tremendous amounts of good if we can get any incremental growth.

Senator REID. You illustrated that very well with your Dayton example. I am sorry, Senator Voinovich, I hope there is nothing to this, but we have had another letter that is very suspicious in nature delivered to the Senate credit union. This announcement is that no one should go into the Hart Building. So we will submit some questions to you in writing. Is that where your office is?

Senator VOINOVICH. Yes, it is.

Senator REID. So Senator Voinovich cannot go back into his office. We hope this is of short duration, but it is the world we live in. We have questions we will submit to you. We are sorry that this has arisen and we will submit some questions to you in writing.

[Whereupon, at 11:53 a.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. ROBERT C. BYRD, U.S. SENATOR FROM THE STATE OF WEST VIRGINIA

Mr. Chairman, in just a few months time this subcommittee will be responsible for reporting one of the most important, if not the most important, pieces of legislation for the 108th Congress. It is impossible to overstate the importance that I attach to the reauthorization of the Federal-aid Highway Program. This program is at the very core of the Federal infrastructure investment exercise. As such, I am grateful to you, Mr. Chairman, for allowing me this opportunity to testify at this, the last hearing you will hold in the nation's Capitol on the reauthorization of the Transportation Equity Act for the 21st Century, or "TEA-21."

Later this morning, you will also take testimony from our very capable Federal Highway Administrator, Ms. Mary Peters, on the condition and performance of our National Highway System. The Administration's upcoming Conditions and Performance Report will again remind us that a great deal more needs to be invested in our infrastructure if we are not to fall further and further behind in stemming the deterioration of our nation's highways and bridges and alleviating congestion on our

nation's roads. Administrator Peters will testify that, even in the wake of the historic funding increase accomplished through TEA-21, congestion on our roads continues to worsen. An investment in our highway infrastructure by all levels of government will have to increase by more than 65 percent or \$42.2 billion per year to actually improve the condition of our nation's highways. A funding increase of more than 17 percent or \$11.3 billion will be necessary simply to maintain the current inadequate conditions of our highway network, where more than one in four of our nation's bridges are classified as deficient. As chairman of the Senate Appropriations Committee, I have sought to do my part by championing the highest level of Federal highway investment that is possible under our budget constraints. As a member of the Appropriations Committee and the Transportation Subcommittee, you are well aware that the involvement of the Appropriations Committee has never been more critical than this year. The Transportation Appropriations Bill for Fiscal Year 2003 as reported by my committee back in July restores every penny of the \$8.6 billion cut in highway funding proposed by President Bush. And I am pleased to say that every member of the Appropriations Committee voted to report that bill.

Mr. Chairman, one of the observations contained in Administrator Peters' testimony that especially caught my eye is her statement that, "The condition of higher-order roads, such as Interstates, has improved considerably since 1993 while the condition on many lower-order roads has deteriorated." It appears that the pattern of road conditions is beginning to mirror the distribution of wealth in our country, whereby the rich are getting richer while the poor get poorer. That observation leads me into my principal topic for my testimony this morning—the need to use this next highway bill to finally fulfill a promise that was made to one of the most impoverished and isolated regions of our country more than 35 years ago. We need to use this next highway bill to finally complete the Appalachian Development Highway System or "ADHS."

Mr. Chairman, while serving in the other body, I had the great privilege of casting my vote in favor of establishing the Interstate Highway System back in 1958. However, in 1964 it was recognized by the first Appalachian Regional Commission that while the Interstate Highway System was slated to provide historic economic benefits to most of our Nation, the system was designed to bypass the Appalachian Region due to the extremely high cost associated with building highways through Appalachia's rugged topography. As a result, the construction of the interstates had the detrimental effect of drawing passengers and freight, and the accompanying economic benefits, away from the Appalachian Region.

In 1965, the Congress adopted the Appalachian Regional Development Act which promised a network of modern highways to connect the Appalachian Region to the rest of the nation's highway network and, even more importantly, the rest of the nation's economy. Absent the Appalachian Highway System, my region of the country would have been left solely with a transportation infrastructure of dangerous, narrow, winding roads which follow the path of river valleys and stream beds between mountains. These roads are still, more often than not, two-lane roads that are squeezed into very limited rights-of-way. They are characterized by low travel speeds and long travel distances and are often built to inadequate design standards.

Mr. Chairman, as you know well, we have virtually completed the construction of the Interstate Highway System and have moved on to many other important transportation goals. However, the people of my region are still waiting for the Federal Government to live up to its promise, made some 37 years ago, to complete the Appalachian Development Highway System. The system is still less than 80 percent complete and I regret to observe that my home State of West Virginia is below the average for the entire Appalachian Region with only 72 percent of its mileage complete and open to traffic.

Mr. Chairman, the rationale behind the completion of the Appalachian Development Highway System is no less sound today than it was in 1964. Unfortunately, there are still children in Appalachia who lack decent transportation routes to school; and there are still pregnant mothers, elderly citizens and others who lack timely road access to area hospitals. There are thousands upon thousands of people who cannot obtain sustainable well paying jobs because of poor road access to major employment centers. The entire status of the Appalachian Development Highway System is laid out in great detail in the Cost to Complete Report for 2002 just completed by the Appalachian Regional Commission this month. I would ask, Mr. Chairman, if this report could be made part of the committee's permanent hearing record. This is the most comprehensive report on the status of the Appalachian Development Highway System to date and I commend the staff of the Appalachian Regional Commission for their hard work on this report. The last report was completed in 1997 just prior to congressional consideration of TEA-21.

The enactment of TEA-21 signaled a new day in the advancement of the Appalachian Development Highway System. Through the work of this committee, the House Transportation and Infrastructure Committee and the Administration, we took a great leap forward by authorizing direct contract authority from the Highway Trust Fund to the States for the construction of the ADHS. Up until that point, funding for the Appalachian Highway System had been limited to uncertain and inconsistent general fund appropriations. By providing the States of the Appalachian Region with a consistent and predictable source of funds to move forward on its uncompleted ADHS segments, TEA-21 served to reinvigorate our efforts to honor the promise made to the people of the Appalachian Region.

As is made clear in the Cost to Complete Report, this initiative has been a great success—one for which this committee can be very proud. States are making greater progress toward the completion of the system than they have in any 5 year segment in recent memory. Since the last Cost to Complete Report, 183 miles of the system have been opened to traffic and we have successfully bought down the cost to complete the system by roughly \$1.7 billion in Federal funds.

Back when we were debating TEA-21, some questions were asked as to how committed the States would be to completing the unfinished segments of the Appalachian Highway System. I'm pleased to report that the 13 States, to date, have succeeded in obligating just under 90 percent of the obligation authority that has been granted to them for the completion of the system. I think you will find, Mr. Chairman, that a 90 percent obligation rate compares quite favorable to some of the other programs through which the States were granted multiple years to obligate their funds.

TEA-21 apportioned \$2.25 billion in contract authority to the Appalachian Highway System over the life of the reauthorization bill. However as I stated, over the period covered by that bill, we will have bought down roughly \$1.7 billion of the cost to complete the system. I believe the difference in those two figures merits some explanation. The remaining Federal funds needed to complete the ADHS are now estimated by the Appalachian Commission to be \$4.467 billion.

The considerable cost in completing the last 20 percent of the system is explained by the fact that the easiest segments of the system to build have already been built. With the availability of the contract authority in TEA-21, the Appalachian States turned in earnest to designing some of their unfinished segments. That design process revealed cost growth that exceeded the roughly 20 percent cost growth that is attributable to the inflation index associated with highway construction. Much of the cost growth, it should be mentioned, is attributable to complying with other Federal laws, especially costs associated with environmental mitigation measures.

However, of critical importance is the fact that these unfinished segments represent some of the most dangerous and most deficient roadways in our entire nation. One thing that is often lost in our debate over the necessity to invest in our highways is the issue of safety. The Federal Highway Administration has published reports indicating that substandard road conditions are a factor in 30 percent of all fatal highway accidents. I'm quite sure that the percentage is a great deal higher in the Appalachian Region.

The Federal Highway Administration found that upgrading two-lane roads to four-lane divided highways decreased fatal car accidents by 71 percent and that widening traffic lanes has served to reduce fatalities by 21 percent. These are precisely the kind of road improvements that are funded through the ADHS. In my State, the largest segment of unfinished Appalachian Highway, if completed, will replace the second most dangerous segment of roadway in my State. So, even those who would question the wisdom of completing these highways in the name of economic development should take a hard look at the fact that the people of rural Appalachia are taking their lives in their hands every day as they drive on their currently inadequate roads.

Mr. Chairman it is time for this committee and the entire Congress, in concert with the Administration, to take the last great leap forward and authorize sufficient contract authority to finally complete the Appalachian Highway System. If you enact another 6 year highway bill with sufficient funds to complete the system, we will finally pay off the full costs of the ADHS almost 45 years after the system was first promised to the people of my region. When we convene the 108th Congress, it is my intention to introduce legislation which will be named the "Appalachian Development Highway System Completion Act". That bill will provide sufficient contract authority to complete the system. Importantly, it will guarantee that the States of the Appalachian Region do not pay a penalty, either through the distribution of minimum allocation funds, or the distribution of obligation limitation, for receiving sufficient funds to complete the Appalachian system.

I'm very pleased that this Administration has taken on the goal of completing the ADHS. In her letter accompanying the Cost to Complete Report, Administrator Peters said "The completion of the ADHS is an important part of the mission of the Federal Highway Administration. We consider the accessibility, mobility and economic stimulation provided by the ADHS to be entirely consistent with the goals of our agency". She goes on to say the Appalachian Regional Commission's 2002 Cost to Complete Report "provides a sound basis for apportioning future funding to complete the system." I thank Mary Peters and the entire Federal Highway Administration for their leadership on this issue and I look forward to seeing their commitment borne out in their reauthorization legislation which will be submitted next year.

Completion of a new highway bill will be a mammoth task for the 108th Congress. I can tell you, Mr. Chairman that over the many years of my public career, one of the accomplishments of which I am most proud was my amendment providing an additional \$8 billion in funding to break the logjam during the debate on the Intermodal Surface Transportation Efficiency Act in 1991. Another was my sponsorship of the Byrd, Gramm, Baucus, Warner Amendment during the Senate debate on TEA-21 in 1998. That effort resulted in some \$26 billion in funding being added to that bill and put us on a path to historic funding increases for our nation's highway infrastructure. I look forward again to working with this committee on completion of a bill that makes the necessary investments in our nation's highways, not just in the Appalachian Region, but across our entire country.

Thank you Mr. Chairman.

---

STATEMENT OF HON. MARY E. PETERS, ADMINISTRATOR, FEDERAL HIGHWAY  
ADMINISTRATION, DEPARTMENT OF TRANSPORTATION

Mr. Chairman and members of the committee, thank you for this opportunity to discuss the state of our Nation's highway and bridge infrastructure.

Section 502(g) of title 23 United States Code (U.S.C.) requires the Secretary of Transportation to submit to the Congress every 2 years a report that describes "estimates of the future highway and bridge needs of the United States" and "the backlog of current highway and bridge needs." This is commonly known as the Conditions and Performance Report. Since 1993, the Federal Highway Administration (FHWA) has partnered with the Federal Transit Administration (FTA) to produce a Conditions and Performance Report that contains both highway and transit data.

The 2002 edition of the Conditions and Performance Report is in final clearance. I know that this report is of interest to Congress in the reauthorization process, and it is my hope that the report will be transmitted to the Congress this fall. Today, I would like to share some of the findings from the Conditions and Performance Report that can help you understand the state of the Nation's highway and bridge infrastructure. In addition, a summary of the major findings of the Conditions and Performance Report is attached to this statement.

*Significant Increases in Highway and Bridge Infrastructure Investment*

The 2002 edition of the Conditions and Performance Report is the first edition to capture the effects of investment in highways, bridges, and transit under the Transportation Equity Act for the 21st Century (TEA-21). Since the enactment of TEA-21 in 1998, combined investment in highway infrastructure, by all levels of government, has increased sharply. Total highway expenditures by Federal, State, and local governments increased by 25.0 percent between 1997 and 2000. This equates to a 14.4 percent increase in constant dollar terms. Highway capital spending alone rose to \$64.6 billion in 2000, a 33.7 percent increase over 1997.

The increased Federal funding levels for highway capital investment under TEA-21 through 2000 have been matched and exceeded by increases in State and local investment. This is a very important point. State and local governments did not simply substitute Federal funds for their own during this robust economic period. Instead, they poured billions of additional dollars into transportation projects beyond the minimum increases necessary to meet Federal matching requirements. As a result, the State share of highway capital investment rose from 1997 to 2000. In 1998, the State share of highway capital outlays was above 60 percent for the first time since 1959, and remained above that level through 2000.

*New Emphasis on System Preservation*

The TEA-21 era coincided with a shift in the types of capital improvements made by State and local governments. Under TEA-21, States redirected their investments toward system preservation projects (the resurfacing, rehabilitation, or reconstruction of existing highway lanes and bridges). There was a 45.7 percent increase in

spending on system preservation, from \$23.2 billion in 1997 to \$33.6 billion in 2000. The fact that system preservation projects tend to have shorter lead times and are often less controversial than system expansion projects, may have contributed to such projects attracting a greater share of the increased funding available under TEA-21. Investment in system expansion (the construction of new roads and bridges and the widening of existing roads) grew more slowly, rising 20.8 percent from \$21.6 billion to \$25.9 billion.

This increase in system preservation investment has had a profound effect on the overall physical condition of the Nation's highway and bridge infrastructure. The percentage of highway mileage with "acceptable" ride quality rose from 82.5 percent in 1993 to 86.0 percent in 2000. The percentage of bridge deck area considered deficient dropped from 30.9 percent in 1996 to 27.9 percent in 2000. These improvements, however, were not uniform across all highways and bridges. For example, the condition of higher-order roads, such as Interstates, has improved considerably since 1993, while conditions on many lower-order roads have deteriorated. Bridge condition also differs by functional system. Interstate bridges, for example, tend to be less structurally deficient or functionally obsolete than bridges on collector or local roads.

#### *Continued Improvement in Highway Safety*

The 2002 Conditions and Performance Report also documents the Nation's continued improvement in the area of highway safety. Safety is the top priority for the Department of Transportation. I am pleased to report that highways have become safer even as travel sharply increased. The fatality rate per 100 million vehicle miles traveled has decreased, from 3.3 in 1980 to 1.5 in 2000, which met the Department's Performance Plan target. The Department will continue to work with our State and local partners to reduce the number of crashes on our Nation's highways even further.

#### *Deterioration in Operational Performance*

Despite the historic investment in highway infrastructure and improved conditions on many roads and bridges, operational performance of the infrastructure—the quality of the user's experience—has steadily deteriorated over the past decade. In 1987 for example, a trip that would take 20 minutes during non-congested periods required, on average, 25.8 minutes under congested conditions. By 2000, the same trip under congested conditions required 30.2 minutes, or an additional 4.4 minutes.

Some estimates attribute as much delay to incidents as to recurring congestion. Part of the answer to all forms of congestion is an increased emphasis on operations, including more effective responses to incidents, better management of work zones, and deployment of Intelligent Transportation Systems.

#### *Highway Investment Requirements Analysis*

The heart of the Conditions and Performance Report is an analysis of future capital investment requirements under different scenarios. The Cost to Improve Highways and Bridges scenario is intended to define the upper limit of cost-effective national investment based on engineering and economic criteria. This is essentially an "investment ceiling" above which it would not be cost-beneficial to invest. This scenario implicitly assumes unlimited availability of funding, and does not take into account competing investment options in the economy that may have an even more favorable cost-benefit return. The Cost to Maintain Highways and Bridges scenario is designed to show the investment required to keep future indicators of conditions and performance at current levels, based on long term projections of future highway use. These benchmarks are intended to be illustrative and do not represent comprehensive alternative transportation policies.

In addition to these primary scenarios, the report also identifies the projected level of investment required to achieve other specific benchmarks, such as average pavement conditions, and estimates the current backlog of cost-beneficial preservation and capacity investments based solely on current conditions and traffic volume.

It is important to note that the scenarios in the Conditions and Performance Report are intended to address investment requirements for all levels of government combined. The report makes no attempt to address the question of what share of total infrastructure investment should be borne by the Federal Government, State governments, local governments, or the private sector.

The average annual investment level under the Cost to Improve Highways and Bridges Scenario is projected to be \$106.9 billion for 2001 through 2020, stated in constant year 2000 dollars. This is 65.3 percent higher than the \$64.6 billion of total capital investments by all levels of government in 2000. The average annual investment level under the Cost to Maintain Highways and Bridges is projected to be

\$75.9 billion for 2001 through 2020, which is 17.5 percent larger than the \$64.6 billion of capital spending in 2000.

Capital spending by all levels of government is projected to increase in constant dollar terms over the remainder of the life of TEA-21. This assumes, however, that Federal, State, and local governments will be in a financial position to allow them to continue to increase their highway and bridge investments. Government at all levels may not be able to sustain the rate of increase in infrastructure investment observed in recent years.

In addition to the two investment scenarios I have just described, the Conditions and Performance Report also predicts the impacts of numerous alternative investment levels on a variety of condition and performance indicators.

If investment were to remain at year 2000 levels, or anticipated levels for 2001 to 2003, it is projected that recent trends observed in the condition and performance of the highway system would continue. At this range of investment levels, physical conditions and safety performance would improve, but the operational performance of the highway system would further deteriorate. Average speeds would decline, the amount of delay experienced by drivers would increase, and the average length of congested periods on the Nation's urban principal arterials would increase. Recent trends toward improvement in bridge conditions would also continue; however, the aging of the Nation's bridges, particularly on the Interstate system, will present additional challenges in the future.

The preceding edition of the Conditions and Performance report suggested that it would be cost-beneficial to apply a larger share of future highway investment increases to system preservation. As I previously noted, such a shift did occur between 1997 and 2000, resulting in significant improvements in the physical conditions of the Nation's highways and bridges; however, the operational performance of the highway system continued to decline over this period. Since 1997, infrastructure investment at all levels of government has been more successful in addressing physical conditions than operating performance. Therefore, the Conditions and Performance Report now suggests that it would be cost-beneficial to devote a larger share of future increases in highway capital investment to system expansion.

#### *Conclusion*

In conclusion, the state of the Nation's road and bridge infrastructure has generally improved due to the significant investment increases of the TEA-21 era. Since the enactment of TEA-21, State and local governments-spurred in part by higher levels of Federal investment-have poured billions of dollars into highway infrastructure. This investment led to improved highway and bridge conditions, particularly on higher-order functional systems. Despite record levels of funding, however, operational performance-measured by congestion-worsened throughout the country. Congestion increased in metropolitan areas of every size. FHWA's analysis of highway and bridge needs and investment requirements suggests that future funding continue to address system preservation needs, but that increases be reoriented toward system expansion to reduce user costs and enhance system performance.

Mr. Chairman and members of the committee, this concludes my statement. I again thank you for the opportunity to testify today and I look forward to working with you as we prepare for reauthorization of the surface transportation programs. I will be pleased to answer any questions you may have.

### System and Use Characteristics: Highways

There were over 3.95 million miles of public roads in the United States in 2000. This mileage was overwhelmingly rural and locally-owned. About 3.09 million miles were in rural areas in 2000, or 78 percent of total mileage. The remaining 860,000 miles were in urban communities. There were 586,930 bridges in the United States in 2000.

Numerous trends are changing the extent and use of the American highway network. While locally-owned road mileage increased between 1993 and 2000, rural mileage decreased during that period. This has been an ongoing trend, partly reflecting the reclassification of Federal roads and the growth of metropolitan areas throughout the United States.

| FUNCTIONAL SYSTEM            | MILES         | LANE-MILES    | VEHICLE-MILES TRAVELED |
|------------------------------|---------------|---------------|------------------------|
| <b>Rural Areas</b>           |               |               |                        |
| Interstate                   | 0.8%          | 1.6%          | 9.8%                   |
| Other Principal Arterial     | 2.5%          | 3.1%          | 9.0%                   |
| Minor Arterial               | 3.5%          | 3.5%          | 6.2%                   |
| Major Collector              | 11.0%         | 10.6%         | 7.5%                   |
| Minor Collector              | 6.9%          | 6.6%          | 2.1%                   |
| Local                        | 53.5%         | 51.3%         | 1.6%                   |
| <b>Subtotal Rural</b>        | <b>78.2%</b>  | <b>76.6%</b>  | <b>39.4%</b>           |
| <b>Urban Areas</b>           |               |               |                        |
| Interstate                   | 0.6%          | 0.9%          | 14.4%                  |
| Other Freeway and Expressway | 0.4%          | 0.5%          | 6.4%                   |
| Other Principal Arterial     | 1.4%          | 2.3%          | 14.5%                  |
| Minor Arterial               | 2.3%          | 2.8%          | 11.8%                  |
| Collector                    | 2.2%          | 2.3%          | 5.0%                   |
| Local                        | 15.3%         | 14.6%         | 8.6%                   |
| <b>Subtotal Urban</b>        | <b>22.2%</b>  | <b>23.4%</b>  | <b>60.6%</b>           |
| <b>Total</b>                 | <b>100.0%</b> | <b>100.0%</b> | <b>100.0%</b>          |

In terms of ownership, about 77 percent of miles were locally-controlled, 19 percent were controlled by States, and the remaining 3 percent

were controlled by the Federal Government. The share of locally-owned roads has steadily increased, while the shares of State and Federal roads have decreased. Much of the change in Federal ownership has occurred as Federal land management agencies reclassified some of their mileage.

Highway Mileage by Jurisdiction, 2000

Americans traveled 2.7 trillion vehicle miles in 2000. While highway mileage is mostly rural, a majority of highway travel (61 percent) occurred in urban areas in 2000. Since 1997, however, rural travel has grown at a faster average annual rate (2.8 percent) than urban travel (2.6 percent). This represents a change from the last Conditions and Performance Report, when urban travel growth rates were greater than the preceding decade. Still, vehicle miles traveled (VMT) increased on every highway functional system between 1997 and 2000.

Highway Vehicle Travel, 1993 to 2000

The growth in VMT has exceeded the increase in highway lane miles. Between 1993 and 2000, lane miles grew by 0.2 percent annually, while VMT increased by 2.7 percent annually. VMT for combination trucks grew faster between 1997 and 2000 than VMT for single-unit vehicles and passenger vehicles.

### System Conditions: Highway & Bridges

The ride quality of 86.0 percent of the total road mileage is rated "Acceptable" for 2000, up from 85.4 percent in 1999. Of the total rural road miles, 89.0 percent are rated as having acceptable ride quality, while 79.8 percent of total small urban road miles and 76.6 percent of the total road miles in urbanized areas are rated as having acceptable ride quality.

On the National Highway System (NHS), 93.0 percent of the pavements meet or exceed standards for acceptable ride quality. Of all vehicle miles traveled (VMT) on the NHS, 91.0 percent were on pavements with acceptable ride quality.

The condition of higher order roads improved, while those of the lower order roads declined.

Three indicators are commonly used to describe bridge condition. Bridge component ratings provide a detailed description of elements, but

these are more widely used within the engineering community. The number of deficient bridges is widely used by policymakers to describe bridge quality nationwide, but this indicator fails to provide a specific description of bridge elements. The Federal Highway Administration has developed a new indicator that will provide a better measure of bridges impact on mobility: the amount of deck area on deficient bridges.

In 2000, 27.9 percent of the Nation's bridge deck area was on bridges that were classified as structurally deficient. The percentage decreased on every functional system from 1996 to 2000. Rural Interstate bridges had the smallest amount in 2000 (about 15 percent), while urban collector bridges had the largest amount (39.6 percent).

#### Deficient Bridge Deck Area by Functional System, 2000

| FUNCTIONAL SYSTEM            |              |
|------------------------------|--------------|
| <b>Rural</b>                 |              |
| Interstate                   | 15.0%        |
| Other Principal Arterial     | 17.6%        |
| Minor Arterial               | 22.9%        |
| Major Collector              | 27.7%        |
| Minor Collector              | 22.5%        |
| Local                        | 25.1%        |
| <b>Subtotal</b>              | <b>21.8%</b> |
| <b>Urban</b>                 |              |
| Interstate                   | 31.6%        |
| Other Freeway and Expressway | 28.9%        |
| Other Principal Arterial     | 36.4%        |
| Minor Arterial               | 37.3%        |
| Collector                    | 39.6%        |
| Local                        | 36.4%        |
| <b>Subtotal</b>              | <b>33.6%</b> |
| <b>Bridge Total</b>          | <b>27.9%</b> |

**Operational Performance: Highways**

Since the last edition of the C&P Report, FHWA has adopted three new measures of congestion. These measures clearly show congestion is increasing throughout the Nation.

**Percent of Additional Travel Time:**

Percent of Additional Travel Time is an indicator of the additional time required to make a trip during the congested peak travel period rather than at other times of the day. In 2000, an average peak period trip required 51.0 percent more time than the same trip under non-peak, non-congested conditions. In 1987, a 20-minute trip during non-congested periods required 25.8 minutes under congested conditions. The same trip in 2000 required 30.2 minutes, or an additional 4.4 minutes. Between 1987 and 2000, the percent of additional travel time grew fastest in urbanized areas with a population between 1 million and 3 million.

**Annual Hours of Delay:**

Annual Hours of Traveler Delay is an indicator of the total time an individual loses due to traveling under congested conditions. Cities with less than 500,000 population experienced the greatest percentage growth in the average annual delay experienced by drivers, from 4.8 hours in 1987 to 15.2 hours in 2000—an increase of 217 percent. Drivers in cities with populations under 500,000 were experiencing close to the same delays in

2000 as communities with populations between 1 million and 3 million in 1997.

**Annual Hours of Traveler Delay, 1987 vs 2000**

**Percent of Travel Under Congested Conditions:**

Percent of Travel Under Congested Conditions is defined as the percentage of traffic on freeways and principal arterial streets in an urbanized area moving at less than free flow speeds. Congested Travel increased from 31.7 percent in 1992 to 33.1 percent in 2000. Based on this measure, the congested period, or "Rush Hour," increased from 5 to 5.3 hours per day over this period—approximately 18 minutes. For urban areas with populations greater than 3 million, 40.4 percent of daily travel in 2000 was under congested conditions.

**Percent of Travel Under Congested Conditions, 1987 vs 2000**

### Safety Performance: Highways

Safety is the top priority for the U.S. Department of Transportation. The Safety Strategic Goal in the Department's 2003 Performance Plan aims to "promote the public health and safety by working toward the elimination of transportation-related deaths and injuries."

Over the past thirty years, remarkable progress has been made in making highways safer, with highways becoming safer even as travel sharply increased. The exhibit below, for example, describes the fatality rate per 100 million vehicle miles traveled from 1980 to 2000. The fatality rate has decreased, from 3.3 in 1980 to 1.5 in 2000, which met the Department's Performance Plan target.

Source: Fatality Analysis Reporting System

The injury rate has also declined in recent years, as detailed in the exhibit below. In 1988, the rate was 169 per 100 million vehicle miles traveled; by 2000, that rate had dropped to 116. While significant, the declining injury rate falls short of the Performance Plan goal of 113 per 100 million vehicle miles.

Alcohol impairment is a leading cause of crashes and a serious public safety problem in the United States. In 2000, alcohol was involved in 40 percent of fatal crashes and 8 percent of all crashes.

There are three main groups involved in alcohol-impaired driving:

- The largest group, **21- to 34-year-old adults**, was responsible for 31 percent of all fatal crashes in 2000. Studies show that these drivers tend to have much higher levels of intoxication than other age groups.
- **Chronic drunk drivers** are another large group. Fatally injured drivers with a blood alcohol concentration greater than 0.10 grams per deciliter were six times as likely to have a prior conviction for driving while intoxicated than fatally injured sober drivers.
- Finally, **underage drinkers** are disproportionately over-represented in impaired driving statistics.

Speeding and alcohol impairment are closely linked in many crashes. In 2000, 23 percent of underage *speeding* drivers involved in fatal crashes were intoxicated. By contrast, 10 percent of underage *non-speeding* drivers involved in fatal crashes were intoxicated.

Source: Fatality Analysis Reporting System.

While the number of overall highway fatalities and injuries has decreased in recent years, this is not uniformly true for all vehicle groups. The number of occupants killed in passenger cars, for instance, decreased from 21,566 in 1993 to 20,492 in 2000. In contrast, the number of occupants killed in light and large trucks, motorcycles, and other vehicles all increased during this period.

**Finance: Highway and Bridge**

Taken together, all levels of government spent \$127.5 billion for highways in 2000. The Federal government funded \$27.7 billion (21.7 percent). States funded \$67.0 billion (52.6 percent). Counties, cities, and other local government entities funded \$32.7 billion (25.7 percent).

**Total highway expenditures by all levels of government increased 25.0 percent between 1996 and 2000.** Highway spending rose faster than inflation over this period, growing 14.4 percent in constant dollar terms.

Of the total \$127.5 billion spent for highways in 2000, \$64.6 billion (50.7 percent) went for capital outlay. This was the first time this percentage exceeded 50 percent since 1975.

**Capital outlay grew by 33.7 percent between 1997 and 2000.** Large increases in Federal investment under the Transportation Equity Act for the 21st Century (TEA-21) were outpaced by even larger increases in State and local investment, as the combined State and local share of funding for capital outlay rose from 58.4 percent in 1997 to 66.1 percent in 2000.

**State and local governments devoted a larger share of their capital spending to the preservation of their existing roads and bridges in 2000 than in 1997.** The share of

capital funds used for system preservation rose from 47.6 percent to 52.0 percent. All levels of government spent a combined \$33.6 billion of capital funds for system preservation in 2000; \$12.2 billion went for new roads and bridges; \$13.7 billion went for adding new lanes to existing roads; and \$5.1 billion went for system enhancements, such as safety, operational or environmental enhancements.

Highway-user revenues—the total amount generated from motor-fuel taxes, motor-vehicle fees, and tolls—were \$100.6 billion in 2000. Of this, \$81.0 billion (80.5 percent) was spent on highways. This represented 62.9 percent of the total revenues generated by all levels of government in 2000 for use on highways.

**Capital Investment Requirements: Highway and Bridge**

The average annual Cost to Improve Highways and Bridges for the 20-year period 2001-2020 is projected to be \$106.9 billion. This represents the investment by all levels of government required to implement all cost-beneficial improvements on highways and bridges. This level of investment would address the existing backlog of highway (\$271.7 billion) and bridge (\$54.7 billion) deficiencies, as well as new deficiencies as they arise during the 20-year period, when it is cost-beneficial to do so.

Investment requirements for system preservation make up 45.4 percent of the total Cost to Improve Highways and Bridges. This includes all capital investment required to preserve the condition of the pavement and bridge infrastructure, such as resurfacing, rehabilitation, and reconstruction. This does not include the costs of routine maintenance.

Investment requirements for system expansion make up 46.7 percent of the total Cost to Improve Highways and Bridges. The remaining 7.9 percent of the Cost to Improve is not directly modeled; this represents the current share of capital spending on system enhancements such as safety, operational, and environmental investments.

**Cost to Improve Highways and Bridges Distribution by Improvement Type**

The Cost to Maintain Highways and Bridges represents the investment required by all levels of government so that critical indicators of overall conditions and performance in the year 2020 will match their year 2000 values. For bridge preservation, it represents the level of investment required to maintain the existing backlog of bridge deficiencies at its current level. For system expansion, and pavement preservation, it represents the investment required to prevent average highway user costs (including travel time costs, vehicle operating costs, and crash costs) from rising in the future. Agency costs, such as maintenance, and societal costs, such as emissions, are also considered in the analysis, although they are not directly targeted. The average annual investment required for the Cost to Maintain Highways and Bridges is projected to be \$75.9 billion.

**Cost to Maintain Highways and Bridges Distribution by Improvement Type**

The scope of user costs has been expanded from those considered in previous reports to include an estimate for delays resulting from incidents, as well as for recurring daily congestion. A reliability premium has also been added to reflect the additional costs that unpredictable delays impose beyond those of expected delays for which drivers can plan. Including these items in the analysis makes it considerably more expensive to maintain average user costs.

### Comparison of Spending and Investment Requirements: Highway and Bridge

While this report does not recommend any specific level of investment, a comparison of the investment requirement scenarios with current and projected spending levels provides some insights into the likelihood that the level of performance implied by the scenarios will be obtained.

Federal, State, and local capital expenditures for highways and bridges totaled \$64.6 billion in 2000. Capital outlay by all levels of government would have to increase by 17.5 percent above this level to reach the projected \$75.9 billion Cost to Maintain Highways and Bridges level. An increase of 65.3 percent would be required to reach the projected \$106.9 billion Cost to Improve Highways and Bridges level.

**2000 Capital Outlay vs Highway and Bridge Investment Requirements**

Capital spending by all levels of government grew sharply between 1997 and 2000 and is projected to continue to increase in constant dollar terms from 2000 to 2003, albeit at a slower rate. These projected increases in combined Federal, State and local capital spending would move the Nation closer to the level of the investment requirement scenarios. However, capital outlay would still have to increase 11.3 percent above projected annual spending over this period to reach the Cost

to Maintain level, and would need to increase 56.6 percent to reach the Cost to Improve level.

In 2000, 40.1 percent of highway capital outlay went for system expansion, including the construction of new roads and bridges and the widening of existing facilities. The analytical models used to develop the investment requirements in this report suggest that if capital investment increases, it would be cost-beneficial to devote a larger share to system expansion to alleviate the effects that future travel growth would have on recurring and non-recurring delay.

For the Cost to Maintain Highways and Bridges, 43.3 percent of the projected 20-year investment requirements are for system expansion. If funding increases above this level, the analysis suggests increasing investment in system expansion, so that for the Cost to Improve Highways and Bridges, 46.7 percent of the total investment requirements are for system expansion.

**Investment Requirements and 2000 Capital Outlay Distribution by Improvement Type**

## Impacts of Investment: Highway and Bridge

### Linkage Between Recent Condition and Performance Trends and Recent Spending Trends

Spending by all levels of government on system preservation increased by 45.7 percent from \$23.0 to \$33.6 billion between 1997 and 2000. This increased investment in roadway and bridge rehabilitation and resurfacing is reflected in the improvements in pavement ride quality and reductions in bridge deficiencies that are described elsewhere in this report.

Investment in system expansion has also increased, but at a much lower rate relative to outlays for system preservation. While the rate of growth in average annual hours of traveler delay has decreased, the level of investment has not stopped the overall growth in congestion.

### Impact of Future Investment on Highway Conditions and Performance

If average annual highway capital investment from 2001 to 2020 reached the projected \$106.9 billion **Cost to Improve Highways and Bridges** level and is applied in the manner suggested by the analysis, the average pavement quality is projected to improve by 13.9 percent relative to year 2000 levels. Improvements in highway operational performance would cause average speeds to rise by 6.0 percent, while average highway user costs would decline by 3.6 percent.

If all levels of government combined invested at the **Cost To Maintain** projected level of \$75.9 billion, and shifted more of their investment toward system expansion to address increasing congestion problems, average speeds would improve, while average pavement roughness would worsen. By

definition, user costs would remain at year 2000 levels.

**Projected Changes in 2020 Highway Condition and Performance Measures Compared to 2000 Levels at Different Possible Funding Levels**

### Impact of Investment on Travel Growth

While future travel growth will be primarily driven by factors such as population growth and growth in economic activity, the amount of travel growth on a highway segment may also be affected by the level of investment on that segment. Investments that reduce the economic cost of using a facility may lead to increased use, while increasing congestion on an unimproved roadway may cause travel growth to be lower than it otherwise would be. The travel growth forecasts used in the analysis of highway investment requirements in this report are dynamic, in the sense that they allow feedback between the level of future investment and future VMT growth.

If highway-user costs are maintained at current levels as they would be under the **Cost to Maintain** scenario, the analysis projects that urban VMT would grow by an average annual rate of 1.96 percent. If highway-user costs declined, as they would under the **Cost to Improve** scenario this rate would increase to 2.19 percent per year.

**Sensitivity Analysis: Highway and Bridge**

The usefulness of any investment requirements analysis depends on the validity of the underlying assumptions used to develop the analysis. Since there may be a range of appropriate values for several of the model parameters used in these analyses, this report includes an analysis of the sensitivity of the estimated Cost to Maintain Highways and Bridges and Cost to Improve Highways and Bridges to changes in these assumptions.

**Travel Forecasts**

The Highway Economic Requirements System (HERS) assumes that the State-supplied baseline travel forecast for each highway section represents not what future travel *will* be, but what it *would* be if investment rose to the level required to keep highway user costs constant. The aggregate annual growth rate drawn from these section level forecasts is 2.08 percent. If instead, the 2.99 average annual VMT growth rate observed from 1980 to 2000 were a better predictor of future constant price VMT growth, then the estimated Cost to Maintain and Cost to Improve would each be over 50 percent higher. Conversely, if the "true" annual VMT growth that would occur at a constant level of service were only 1.17 percent, the Cost to Maintain and Cost to Improve would fall significantly.

**Value of Time**

The value of time in HERS was developed using a standard methodology adopted by the Department, but other values are used inside and outside the Federal government. Doubling the value of time would increase the Cost to Improve by 11.7 percent. Cutting it in half would reduce the Cost to Improve by 8.1 percent.

**Construction Costs**

If currently unforeseen circumstances were to cause future highway construction costs to unexpectedly rise by 25 percent in constant dollar terms, this would increase the Cost to Improve by 16.1 percent. The increased cost of individual projects would be partially offset in this scenario by some projects that would no longer be cost-beneficial.

**Note:**

The impacts of alternative model parameters and procedures are more ambiguous for the Cost to Maintain, as many of these parameters are used in the calculation of baseline user costs. By changing these parameters, the target user cost level being maintained under the scenario is also changed.

**RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH**

*Question 1.* You stated in your testimony that the percentage of "acceptable" highway mileage has increased since 1993. How do you define acceptable? What are the other ratings you use in the Conditions and Performance Report to describe highway and bridge infrastructure and how are these defined?

Response. The pavement ratings in the Conditions and Performance report are based primarily on the International Roughness Index (IRI) values, reported annually by the States as part of the Highway Performance Monitoring System (HPMS). The IRI measures the cumulative deviation from a smooth surface in inches per

mile. This standard is generally accepted worldwide as an effective pavement roughness measurement and, as an objective, mechanically measured value, is considered to be more consistent across jurisdictions than other more subjective measures. The HPMS reporting requirements allow States to provide a Pavement Serviceability Rating (PSR) in lieu of an IRI value for certain types of highways. The PSR is an older subjective rating system in which inspectors evaluate pavement condition on a scale of 1 to 5. In cases where PSR values are reported, a mathematical conversion was made to translate them to a roughly corresponding IRI value.

For all types of roads, the C&P report applies the pavement classification standards introduced in the annual FHWA Performance Plan for NHS routes. To be rated "acceptable," a highway section must have a measured International Roughness Index (IRI) value of less than or equal to 170 inches per mile. Good pavements comprise a subset of acceptable pavements. For a pavement to be rated as "good," the IRI value must be less than or equal to 95 inches per mile. Previous editions of the C&P report used a different set of pavement condition categories, oriented around PSR ratings, and utilizing a more relaxed set of standards for non-Interstate routes. To facilitate comparisons between this report and previous editions, some data are provided based on the old classification scheme.

The bridge condition ratings in the Conditions and Performance report are based on data reported in the National Bridge Inventory. Three indicators are examined in the report, bridge condition ratings, the number of deficient bridges, and the percentage of deck area on deficient bridges. Condition ratings are assigned to the bridge deck, superstructure, and substructure during bridge inspections, on a ten point system ranging from 9—"Excellent" to 0—"Failed". The number of deficiencies and the percentage of deck area on deficient bridges are both based on assessments on whether a bridge is structurally deficient or functionally obsolete. Bridges are considered structurally deficient if they are restricted to light vehicles, require immediate rehabilitation to remain open, or are closed. Bridges are considered functionally obsolete if they have deck geometry, load carrying capacity, clearance, or approach roadway alignment that no longer meets the criteria for the system of which the bridge is a part.

*Question 2.* In your testimony, you indicated that the condition of the higher-order roads have improved over the last several years while the condition of lower-order roads have deteriorated. What accounts for the deterioration of the lower-order roads? What impact has this had on roadway safety? What can be done to ensure lower-order roads are not neglected?

Response. The physical condition of lower-order roads (i.e., minor arterials and collectors) may have deteriorated due to greater emphasis placed on the maintenance, reconstruction, and construction of higher-order roads that carry the majority of the Nation's traffic. Since funds are limited, any increase in the commitment of funds to projects on higher-order roads reduces the amount of funds available for the lower-order roads.

The level of funding is not available to properly support the Nation's higher-order roads and at the same time totally support the lower-order roads. Since higher-order roads support greater levels of traffic and truck volumes, funds allocated to these projects have a potentially greater beneficial impact on the Nation's highway system. This does not mean the needs of the lower-order roads are ignored—only that available funds are being allocated in an attempt to provide the most benefit to the Nation's highway system user.

Regarding safety, some States provide safety set-aside funds for projects on any public road and 15 to 35 percent of bridge funds are set aside for "off-system" bridges on lower-order roads. But the responsibility of repairing and maintaining these roads falls primarily on local governments and some States. Safety conditions on these roads are poor, particularly in rural areas. From 1994 to 2000, over 59 percent of all fatalities occurred on rural roads, most of them considered lower-order. Rural local roads had a fatality rate six times higher than Urban Interstates in 1999 even though they had a third of the traffic.

Lower-order roads are often two-lane. In 2000, 57 percent of all fatalities occurred on two-lane roads and 76 percent of these fatalities occurred on rural two-lane roads. Incentives to States to provide greater funding and technical assistance to local transportation practitioners are needed to improve the safety of these roads.

*Question 3.* What affect has increased congestion over the last decade had on the condition, as well as performance, of the nation's highways and bridges? What is the most cost-effective way to deal with increasing congestion in our urban areas?

Response. Congestion is an indicator of the operational performance of the highway system rather than one of the physical condition of the infrastructure. However, they are indirectly related in the sense that both are affected by traffic volumes.

Increasing traffic volumes can contribute to both the accelerated deterioration of the infrastructure and to increased levels of congestion. The net impact on the condition and performance of the system depends on both the level of investment in highways and on the type of improvements that are implemented.

The most cost-effective approach to reducing highway congestion is likely to be different for different areas. In most areas, the best solution likely involves increasing the effective capacity of the corridor. This investment can come in many forms, including improved facility management and operations, selective additions of new roads and new lanes, or investments in new or upgraded transit facilities. In other cases, it may be more cost effective to address travel demand through road pricing, land use planning, and economic development policies. A comprehensive strategy incorporating elements of all of these approaches in varying degrees is likely to be the most cost-effective.

*Question 4.* In your testimony, you stated that “government at all levels may not be able to sustain the rate of increases in infrastructure investment observed in recent years.” Given increasingly tight State budgets and the economic downturn in recent years, has there been an indication that State and local governments may not be able to sustain a high level capital investment over the life of the next highway bill?

Response. Combined State and local government capital expenditures increased 37.1 percent from 1997 to 2000, rising even faster than Federal cash outlays during the first 3 years of TEA-21. Consequently, the portion of total capital investment funded by State and local governments rose above 60 percent for the first time since 1959. The rate of growth of State and local funding was unusually high during this 3-year period, relative to historic trends. Given increasingly tight State and local budgets, it would not be surprising if State and local highway capital investments were to grow more slowly in the short term.

While final data are not yet available, preliminary indications suggest that State and local capital investment has grown more slowly than Federal investment in 2001 and 2002. However, there is no indication that State and local governments would have major difficulties in sustaining their capital investment levels in the long term, though the high rates of spending growth experienced from 1997 to 2000 may not be repeated.

*Question 5.* Please explain how the operational performance of the nation’s highways and bridges declined at the same time as their physical condition has improved. What needs to be done to improve the operational performance of our highways and bridges?

Response. Changes in the condition and performance of the nation’s highway system over time depend both on changes in travel behavior and demand and on the level and type of investment in highway infrastructure. Some types of highway and bridge improvements (such as resurfacing and bridge rehabilitation) are aimed at preserving the existing infrastructure, while others (such as ITS and lane additions) are designed to increase the effective capacity of the system. During the late 1990’s, increases in the level of highway capital investment were accompanied by a shift in highway capital investment from system expansion toward system preservation. The result was a significant increase in system preservation expenditures, which in turn led to improvements in pavement quality and reductions in bridge deficiencies. Investments in system expansion, however, were not able to keep up with increases in highway travel, resulting in increased congestion and declining performance.

Congestion and performance are also affected by a variety of temporary disruptions, such as crashes and breakdowns, work zones, bad weather, and special events. FHWA is working with its State and local partners to improve traffic monitoring, incident response, work zone management, traveler information, and other operational strategies to mitigate the delay caused by these disruptions.

The C&P investment analysis suggests that there are tremendous current and future needs for strategies to address highway congestion and delay, in addition to investment needs to preserve the physical condition of the existing infrastructure. While investment in capacity expansion would be required to address growing congestion problems, this investment can come in many forms. A comprehensive strategy of improving the effective capacity of the highway system through improved facility management and operations, along with selective additions of new roads and new lanes may be the best approach for dealing with the capacity deficiencies identified in this report.

*Question 6.* I understand that you have called for the creation of a blue-ribbon commission to study and make recommendations on addressing the needs of the Interstate highway system. Can you describe in more detail what you propose the

blue-ribbon commission study? Will the blue-ribbon commission be ready to make recommendations in time to inform the debate for the highway bill next year?

Response. The Interstate System will reach its fiftieth year during the middle of the next reauthorization bill. As the Interstate System approaches this milestone, it is appropriate to critically examine all aspects of this System, the backbone of America's surface transportation network. That is why the Federal Highway Administration is seriously considering a blue-ribbon commission to evaluate the many dimensions of this system, including its needs, conditions, and performance. Additionally, the future of the Interstate System should be examined, including the System's relevance to emerging economic and demographic changes.

---

RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* We have heard from your testimony that we have seen some improvements in areas such as safety, bridge and pavement ratings due to increased funding levels of TEA-21. At the same time, system performance is on the decline despite our increased investment levels. What needs to be done in the way of improving the operation of our transportation system? Are there barriers within the current funding structure that limit a State's ability to make operational improvements or implement operational programs?

Response. The operation of our transportation system can be improved by monitoring and responding quickly to the many disruptions to traffic, such as incidents and bad weather. Work zones and special events can be better managed. More effective information can be provided to travelers so that they can adjust their routes, schedules, or choice of mode. Traffic signals can be better synchronized and modest design changes, such as turn lanes, can be made to improve traffic flow. These improvements typically involve the application of technology, the deployment of people and equipment to respond to incidents or clear snow, and better coordination of the many agencies which operate or affect local roads.

There are relatively few absolute barriers to spending on operational improvements, but there are numerous impediments and a common lack of priority. Many operational improvements are eligible for Federal funds, but operations have not been emphasized in legislative programs or policy statements as has the traditional focus on construction and preservation.

We have elevated the importance of operations with our Congestion Mitigation Vital Few Goal activities and the creation of our Office of Operations. We are working with our State and local partners to identify and encourage effective practices for incident management, work zone management, traveler information, and development of congestion management partnerships.

*Question 2.* We have heard a lot about the physical needs in terms of pavement, bridges, and buses for our transportation system. Are there any estimates for needed or desired operational improvements or programs? Intelligent Transportation Systems are tools that can assist in improving systems performance. Are there any estimates for implementing ITS nationally?

Response. A combination of improved operations, capital investments, and behavioral adjustments is needed to maintain flows of people and goods, respond to emergencies, correct unsafe conditions, reduce security threats, and preserve highway assets. Historically, highway agencies have focused most of their attention on building and maintaining road infrastructure. Less attention has been paid to operating the road system to provide the highest level of service possible. With increasing road congestion, the expense and difficulty of building new facilities, and the need for safe and secure highways, this view has begun to change. Many highway officials now recognize that operational strategies, including traffic control and enforcement, incident and emergency operational strategies, ice and snow removal, and the deployment of Intelligent Transportation Systems (ITS) technologies, can make a major difference in how the highway system performs.

We have begun to develop and validate a comprehensive assessment of operations as part of the Highway Economic Requirements System (HERS) for future editions of the Conditions and Performance Report. At this time, we have preliminary estimates for various aspects of operations, as described below.

Major forms of operational improvements in metropolitan areas include incident management, variable message signs, advanced traffic signal control, ramp metering, and emergency vehicle signal preemption. Infrastructure needed to support these strategies includes electronic roadway monitoring and traffic management centers. Over the next 20 years, \$8 billion may be needed just to maintain existing investments in metropolitan area operations. Expansion of technologies could cost

an additional \$5 billion for expansion at current rates, to \$29 billion for more aggressive deployment to meet the most pressing operational needs by 2020.

Weather has a major effect on highway mobility and safety and is a significant expense for State and local highway agencies. Each year, State and local agencies spend more than \$2 billion on snow and ice control operations, and over \$5 billion annually for infrastructure repair because of snow and ice damage.

Roadway Weather Information Systems (RWIS) provide critical data for efficient and effective responses to bad weather. The total capital cost for a basic nationwide system may be about \$32 million for expressways and \$54 million for principal arterials. The operation and maintenance cost of a weather station is estimated to be about 15 percent of the capital cost, which adds about \$13 million per year to the totals for expressways and principal arterials.

Traveler information systems provide assistance to the individual surface transportation traveler and allow transportation agencies in urban and rural environments to manage service disruptions and congestion. Costs for metropolitan areas may range from \$17 million to \$41 million for capital and \$1 million to \$2.4 million a year for operation and maintenance.

There are numerous other areas where investments will improve operations especially in the area of freight transportation. For example, the Federal Railroad Administration estimates that lost time for highway users at the most heavily traveled rail-highway grade crossings on the Federal-aid system will increase from between \$5.5 billion to \$7.8 billion over the 2003 to 2022 period. Annual hours of time wasted for autos could increase to between 35 million and 123 million hours by 2022. Trucks could spend between 4.9 and 6.6 million more hours behind closed gates by 2022 than presently, depending on how frequently trains passed through crossings during daily highway traffic peaks. Much of these losses can be eliminated by replacing the grade crossings with bridges.

*Question 3.* In your testimony, you mention the need for metrics and performance measures to better assist decisionmakers in making the proper balance of investments. What metrics and performance measures should be in place nationally to better assist Congress in understanding how and where to invest transportation resources?

Response. One of the purposes of the 1993 Government Performance and Results Act (GPRA) is to "improve Federal program effectiveness and public accountability by promoting a new focus on results, service quality, and customer satisfaction." FHWA has developed a Strategic Plan that sets out long-term programmatic, policy, and management goals. Strategic goals measure the FHWA's contribution to mobility; safety; productivity; the human and natural environment; and national security. Each year, the FHWA prepares a Performance Plan that helps the agency meet the broad goals in the Strategic Plan. These metrics help measure and assess how well the FHWA is delivering products and services to its customers.

The FHWA has been working to develop new metrics that better focus on the impact that the condition and performance of the highway system has on highway-users, our ultimate customers. For example, our Performance Plan has been modified to look at the percentage of travel that occurs on roads with acceptable ride quality, rather than simply looking at miles of pavement. New measures of operational performance have been adopted to measure the annual delay experienced by drivers, rather than simply looking at the percentage of congested roads. We are also engaged in research to better quantify the costs that congestion-related unpredictability of trip time imposes on drivers. As we have worked to improve our understanding of the impacts of different types of investments on highway-users, we have identified areas where we may need to change the type of condition, performance and safety data that we routinely collect. We will continue to work with our State and local partners to identify and obtain the information required to assist decision-makers at all levels of government in maximizing the effectiveness of their transportation spending.

*Question 4.* I look forward to working with the Administration on the next reauthorization. When can Congress expect to receive detailed legislative proposals from the Administration for the reauthorization of the transportation bill?

Response. The Administration is working expeditiously to complete its reauthorization proposal. Secretary Mineta has indicated his desire to transmit a reauthorization proposal no later than the transmittal of the President's fiscal year 2004 budget.

## RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Thank you for your testimony on the 2002 Conditions and Performance Report. Your statement highlights a simple fact: At existing levels of investment, travelers and freight haulers will continue to experience increased congestion and delays. Our transportation sector is too important to our economy and our quality of life to accept continued decline in system performance. Our greatest challenge will be to increase funding to levels necessary to address this deterioration in performance. In know that the Administration is currently developing its reauthorization proposal. Will your proposal include funding levels that are high enough to ensure that both conditions and performance will improve rather than decline over the next 6 years?

Response. The Conditions and Performance Report provides an important assessment of the needs and investment requirements of the Nation's highways and bridges. Accordingly, the Administration will use this report, along with other policy documents, when developing its reauthorization proposal. The reauthorization proposal will try to strike the appropriate balance between competing policy and budgetary interests.

*Question 2.* We appreciate your testimony today on the Department of Transportation's upcoming 2002 Conditions and Performance Report. This report provides us with information that is critical to our efforts to write the next transportation bill. When can we expect to receive the full report?

Response. Various officials within the Department of Transportation and the Office of Management and Budget have worked extensively to review, revise and clear the key report findings so that we could share them in today's testimony. However, the full report explores a number of other critical issues that have not been covered today, and these sections have not yet been fully reviewed. Also, due to the sheer size and complexity of the document, significant time will be required for the layout and printing of the report once the content has been finalized.

Based on these considerations, we anticipate that we will be transmitting the report to you in early December of this year; printed and electronic versions of the report should be available for the general public by the end of December.

*Question 3.* While DOT's Conditions and Performance Report finds that the conditions of our highway system have improved somewhat, the operational performance of our highway system continues to deteriorate. This comes as no surprise to anyone who drives regularly. Each of you recommends an increased emphasis on operations, which is the theme that this subcommittee has addressed twice in the past year with a hearing on Intelligent Transportation Systems and a symposium on operational issues. I intend to address this issue in next year's transportation bill and would appreciate your thoughts on how we can encourage States and metropolitan areas to focus more attention to the operations and management of road systems.

Response. The Federal Highway Administration recognized the importance of operations when it reorganized into core business units and placed operations on a par with infrastructure and safety. Other national organizations, such as the American Association of State Highway and Transportation Officials and the Transportation Research Board, have made similar changes to their committee structures. State Departments of Transportation tend to realign themselves to be consistent with their national partners, so we expect operations to receive increasing emphasis at the State and local levels.

FHWA further reinforced the importance of operations by assigning leadership for our Congestion Mitigation Vital Few Goal activities to our Office of Operations. We are focusing our attention on incident management, work zone management, traveler information, and development of congestion management partnerships.

FHWA met with officials from State and local governments at the National Summit on Operations, held in October 2001. Participants in the Summit recognized that managers of the highway system need timely and comprehensive information, effective traffic management tools, adequate financial resources, and institutional authority and accountability to enable users to make the best use of the transportation system. Much of the discussion centered on an information infrastructure, or "infostructure," and regional operations collaboration and coordination.

Participants discussed an "infostructure" of monitoring technology and data sharing to provide timely, comprehensive information to managers and users of highway and transit systems. The proposed infostructure would include statewide reporting of capacity reducing events on the National Highway System, additional monitoring of freeways and principal arterials in major metropolitan areas, and additional security monitoring of critical infrastructure. Participants also felt that locally determined additional monitoring of traffic conditions, weather, and surface transportation facilities should be encouraged.

An increased emphasis on Regional Operations Collaborations and Coordination (ROCCs) was proposed to provide the institutional coordination and accountability needed to operate highways and transit across jurisdictional and agency boundaries. ROCC activities would: establish and sustain a forum in which regional operations policies, protocols, activities, and projects are defined, discussed, debated, and coordinated by transportation system operators, including State and local transportation and public works agencies, public safety personnel, and transit system operators; carry out regional planning for operations activities, including development, maintenance, and monitoring of effective implementation of a regional concept of operations; set performance targets and report to the public on system performance; prepare a Regional Operations Action Plan, using performance data to identify operational problems, evaluate potential solutions, and facilitate their accomplishment; ensure the coordinated delivery of timely information on transportation system operations to the full range of system users; and provide substantive input to the state-wide and/or regional transportation planning process on necessary investments to improve system performance.

---

STATEMENT OF JOSEPH L. PERKINS, COMMISSIONER, ALASKA DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES, ON BEHALF OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

Founded in 1914, AASHTO represents the departments concerned with highway and transportation in the 50 States, the District of Columbia and Puerto Rico. Its mission is a transportation system for the Nation that balances mobility, economic prosperity, safety and the environment.

Mr. Chairman and members of the subcommittee, I am Joe Perkins, Commissioner of the Alaska Department of Transportation and chairman of the American Association of State Highway and Transportation Officials' (AASHTO) Standing Committee on Highways, and am appearing before you today on behalf of AASHTO's members, which include the transportation agencies representing the 50 States, the District of Columbia and Puerto Rico. I am here to report to you on AASHTO's Bottom Line Report which we released jointly with you on September 26th and which documents the nation's highway, bridge and transit needs.

First, however, I want to thank you for your recognition of the needs of our nation's surface transportation and its vital contribution to preserving the nation's economy and our quality of life. We appreciate your leadership and efforts to ensure that in the final year of the Transportation Equity Act for the 21st Century (TEA-21), funding will be restored to current levels.

#### *Key Findings*

As Congress begins its deliberations on the reauthorization of Federal highway and transit programs, AASHTO with the assistance of the U.S. Federal Highway Administration, the U.S. Federal Transit Administration and the Transportation Research Board has undertaken a comprehensive assessment of the investments needed through 2009 to maintain or improve our nation's surface transportation system.

The results of this assessment show that:

- An annual capital investment of \$92 billion by all levels of government for highways and bridges is necessary to maintain both the physical condition and performance of the system over 20 years and explicitly during the next reauthorization cycle. This level of investment holds user cost at less than a 1-percent increase; holds pavement roughness and delay constant; and maintains current levels of system reliability.
- An annual capital investment of \$125.6 billion by all levels of government for highways and bridges is necessary to improve both the physical condition and performance of the system over 20 years and explicitly during the next reauthorization cycle. With this level of investment, pavement condition improves by almost 15 percent; delay falls by almost 13 percent despite expected growth in travel; average speeds increase; and decreased user costs equate to an approximate \$60 billion per year savings.

From Fiscal Year 1990 to 2000, spending by all levels of government for capital, maintenance and operations grew from \$75 billion to \$128.5 billion—a 71 percent increase. In Fiscal Year 2000, \$64.4 billion from all levels of government was invested in highway and bridge capital improvements. Applying the same rate of growth—71 percent—would increase capital investment by all levels of government to \$110 billion, which is comparable to the results of AASHTO's assessment.

- An annual capital investment of \$18.9 billion is required between 2004 and 2009 from all levels of government just to maintain the existing physical condition

and service performance of the nation's transit systems, if ridership only grows modestly at 1.6 percent per year. In Fiscal Year 2000, about \$9.5 billion was spent by all levels of government on transit capital infrastructure.

- An annual capital investment of \$43.9 billion is required to improve the current physical condition and service performance of the nation's transit systems, if ridership continues to grow at 3.5 percent.

AASHTO's assessment of investment needs is based on rigorous, quantitative evaluation using the same data sets and models as used for the development of the U.S. Department of Transportation's Conditions and Performance Report. Highway data used for this assessment is provided to the FHWA by the State transportation agencies, which inventory and analyze 112,000 sample road segments. The source of bridge data is FHWA's National Bridge Inventory data base, and transit system and facility data supplied to FTA by transit agencies.

While AASHTO and FHWA utilize virtually the same data and modeling techniques, there are likely to be differences in the results that are reported. The differences can be attributed to variations in base years and time spans, and modeling assumptions and scenarios.

#### *Key Factors Contributing to Needs*

**The Backlog.** Our nation's repair backlog is a key contributor to our investment needs. Much of the growth in investment needs results from the aging of the transportation system. Over time, weather, wear and age take their tolls on roads, bridges and transit facilities. The repairs, replacements and upgrades needed to bring the existing system up to standard have created a huge backlog of needed investment.

The good news is that with the expanded funding under ISTEA and TEA-21, much progress has been made. The 1999 bridge repair backlog of \$87 billion has been reduced to \$57 billion today, and the percentage of bridges rated acceptable has increased from 65 percent to 72 percent. More than 80 percent of all roads are rated good to fair. Rural roads, which comprise the great majority of roads, but a much smaller share of travel, have been able to hold their condition relatively stable. Urban roads, in poorer condition to begin with, have deteriorated further. There is continuing improvement in the condition of Interstate pavements, both rural and urban, but despite this progress 18 percent of the Interstate pavements are in poor or mediocre condition, requiring immediate investment.

While we currently have no means of statistically monitoring highway performance, anecdotal evidence and specialized studies make it clear that congestion and declining performance is common. For example, according to the Texas Transportation Institute's most recent Urban Mobility Report, which examines congestion in 75 metropolitan areas, "All of the size categories show more severe congestion that lasts a longer period of time and affects more of the transportation network in 2000 than in 1982. The average annual delay per peak road traveler climbed from 16 hours in 1982 to 62 hours in 2000. And delay over the same period more than quadrupled in areas with less than 1 million people."

With regard to transit, the significant increase in funding made possible through ISTEA and TEA-21, together with expanded State and local investment, helped spur a 22 percent transit ridership increase during the past 6 years, bringing ridership to its highest level in 40 years. However, 22 percent of the nation's buses and 43 percent of its rail rolling stock currently exceed their recommended service life. In rural areas, an estimated 55 percent of the existing fleet has already exceeded their recommended service life.

While ISTEA and TEA-21 enabled us to make great strides, much remains to be done.

**The Outlook for Demand.** A second factor contributing to needs is demand. The U.S. population grew by 100 million over the last 40 years, and is expected to grow by at least 100 million over the next forty. Fifty-four percent of this travel takes place on major highways—Interstates, expressways and major arterials. These are the very facilities—under the States' jurisdiction—which must serve interstate, interregional, intercity commercial and passenger traffic while increasingly serving as the main streets for connecting us with the activities of our daily lives.

Over the past 30 years, the Nation has experienced extraordinary growth in workers and in their travel. This era has been characterized by the baby boom generation's arrival in the work force, the surge of women into the workplace, sharp increases in driver licensing and auto ownership and a shift in lifestyles. Growth in travel tracks directly with rising incomes, employment and the economy. Over the last decade, vehicle miles traveled (VMT) increased from 2.1 trillion miles to 2.7 trillion, and is expected to grow by another 600 billion by the year 2010.

Since the mid-1990's, transit ridership has increased more than 22 percent from 7.8 billion trips annually in 1995 to more than 9.5 billion trips in 2001. Transit rid-

ership has been growing at a rate of 3.5 percent annually over the last 6 years. If this rate of growth continues, ridership will double in the next 20 years.

Over the next 20 years, domestic freight moved by truck is expected to increase by 70 percent. International trade, which is expected to increase by more than 3 percent annually—doubling by 2020—will strain the nation's highways, ports and gateways. Growing volumes of NAFTA trade with Canada and Mexico, and trade with Latin America, the Pacific Rim and Europe—which is giving Americans and residents of other nations greater access to a wide variety of goods at lower costs—has brought significant challenges. The infrastructure at our seaports has grown older and less efficient. Larger trucks operating on older access routes have to deal with short traffic signal cycles and deficient roadway designs. Key border crossings are increasingly congested and our major trade corridors lack the capacity to accommodate projected freight traffic. Increased investment is needed to fix bottlenecks, provide capacity and enhance security.

In rural areas, the competitiveness of the U.S. agricultural sector depends on an efficient, economic and competitive U.S. domestic transportation system. In urban areas, businesses increasingly are dependent on reliable, just-in-time delivery.

*Managing the System.* Over the past 20 years, growth in travel on the nation's highways has far exceeded growth in highway capacity. As a result, congestion is a critical problem for metro areas nationwide. It is estimated that more than 60 percent of all delays are the result of non-recurring congestion caused by crashes, weather or other incidents. Efficient management and operation strategies can reduce delays and improve reliability, while also providing such benefits as quicker response by emergency vehicles.

System management and operations covers a wide array of strategies including: incident detection and response; snow and ice management; emergency and disaster response; planning construction disruption; traffic and transit operation and management; and traveler/shipper information. Both capital and operating investments are needed to achieve the benefits of system management. Such investments are eligible for TEA-21 funding, and are an important element for reauthorization.

#### *Other Highway Cost Factors*

In addition to the needs estimates produced through the modeling analysis, there are other cost factors, which need to be considered. These include estimates for safety and security, Interstate interchanges, and increasing program delivery costs, which together may equal as much as \$11 billion annually.

*Safety.* On a typical day, 114 people lose their lives on the nation's highways. In the year 2000, a total of 41,821 peoples died and 3.2 million were injured. Studies by the U.S. Department of Transportation show that this staggering number of deaths and injuries results in over a \$200 billion per year economic loss to the Nation. AASHTO has developed a Strategic Highway Safety Plan that identifies 22 key emphasis areas targeted at drivers, vehicles, highways, enforcement, emergency medical services and management. We estimate that implementation of activities in these emphasis areas could save even more that the goal of 5,000 to 7,000 lives annually. Implementation is estimated at \$3 billion annually in capital costs and \$1 billion annually in operating costs.

*Security.* The heightened threat of terrorism introduces new imperatives to the Nation's highway and transit systems. While our highway and transit network is robust and redundant, the consequences, direct and indirect, of a large-scale attack can be significant. Lost links could have long-term significant economic consequences—not to mention the immediate harm done. It is also critical as a means through which first responders reach impacted areas and by which the public is removed from the area in danger.

Protecting the traveling public and commerce from terrorism will require measures to harden facilities from attack, improve emergency response capabilities, upgrade traffic management during crises, and enhance communications among the public, the military, law enforcement and rescue services. Federal, State and local transportation agencies have a joint responsibility to minimize vulnerability of critical transportation infrastructure assets and to prepare for the transportation role in emergency response and recovery.

Over the past year AASHTO's members examined the security issue, focusing on defense mobilization, asset protection, emergency response preparation and motor carrier security activities, including tracking and credentialing. The cost of enhancing highway and transit security is estimated at \$2 billion annually in capital costs and at least \$1.2 billion annually in operating costs.

*The Cost of Interstate Interchanges.* The Interstate is an aging system. Many of the nation's interchanges are coming due for renewal and reconstructing them can be very costly, in part because these projects often involve safety and efficiency im-

improvements. There is a sense that these costs may be rising faster than other forms of highway costs.

Given the large number of interchange projects planned for the next 10 years, AASHTO in conjunction with TRB undertook an investigation of the cost of Interstate interchange projects and the portion of total Interstate spending they represent. Twelve States surveyed were chosen to provide diversity in terms of geography and Interstate system extent. The results indicate that over the past decade approximately 10 percent of national Interstate capital spending went to interchanges. Based on current programs, this percentage could double to 20 percent during this decade. In a few States, interchanges costs are consuming one-third to one-half of Interstate capital outlays.

Increasing Program Delivery Costs. The combination of environmental reviews and mitigation and right-of-way acquisition is adding time and cost to transportation projects. The increase nationally is conservatively estimated at \$1 billion annually.

#### *Transit Needs*

The nation's extensive public transportation network provides access to jobs; mobility for the young, elderly or disabled and helps reduce congestion, conserve fuel, enhance the efficiency of highway transportation, reduce air pollution and support security and emergency preparedness activities. An efficient, safe and environmentally sound public transportation system is essential to moving people in both urban and rural areas.

Transit capital asset needs include:

- Replace of bus and rail vehicles;
- Major rehabilitation of bus and rail vehicles;
- Elimination of the backlog of vehicle need to bring the nation's fleet into a state of good repair;
- Replacement or rehabilitation of bus and rail maintenance and yard facilities, stations and tracks;
- Fleet expansion to accommodate increased ridership demands; and
- Expansion of new rail systems to meet demand

If the nation's urban and rural transit systems only maintain physical conditions and service performance at the levels that are being observed today, annual capital investment needs will be about \$19 billion—assuming 1.6 percent annual ridership growth. If the decision is made to improve both the existing physical conditions and improve service performance at the current ridership growth rate of 3.5 percent, the annual transit capital need is about \$44 billion.

Core Capacity Needs. In many of the nation's largest cities, transit ridership has significantly increased during the last 6 years. As a result, existing rail systems are operating near to, or in excess of, their physical capacity and above a level that provides acceptable passenger comfort and safety. To meet this demand, upgrades will be necessary, including for example, new signal systems to allow more throughput of rail vehicles, double tracking of existing rail lines to provide for additional system capacity and station platform extensions.

New Starts. Many areas across the country have recently completed or are seeking major rail transit capital improvements. Between 1996 and 2001, more than 350 miles of rail transit service were added in 20 cities. The demand for future rail projects continues to grow. Currently, 26 States and the District of Columbia have 78 New Start projects that have moved beyond the study phase and which carry a price tag of an estimated \$47 billion. In addition, more than 150 studies are underway around the country.

Rural Public Transportation Needs. Mobility and access to meet the needs of the 60 million people living in rural areas must include the availability of safe and reliable public transit service, especially to meet the needs of the growing elderly population retiring to rural areas, the disabled and the young—all dependent on alternatives to the automobile. Rural transit needs consist of two major components—the maintenance of the existing system and the expansion of the system to address unmet needs.

The total estimated annual need for rural transit is:

- \$191 million for replacement and rehabilitation of existing general public vehicles; and
- \$194 million for replacement and rehabilitation of specialized vehicles
- \$50 billion for replacement and rehabilitation of intercity vehicles
- \$81 billion for replacement and expansion of rural general public and rural specialized maintenance and administrative facilities

- \$495 billion expansion of rural general public, rural specialized and rural facilities to improve service

In total, rural public transportation needs are estimated at \$0.5 billion annually for the maintain condition and performance scenario, and \$1.0 billion for the improve service performance scenario.

#### *Benefits of the Surface Transportation System*

Transportation is vital to the national economy and to our quality of life. Its benefits extend from maintaining America's competitiveness in the global economy to providing access to jobs and education. Here is a sampling of the many ways transportation contributes value to every aspect of American life:

- Today, 11.3 million Americans—one in 11—are employed in transportation occupations.
- Every billion dollars of Federal highway investment generates 47,500 jobs; for every billion in transit investment, job generation is virtually the same.
- In 1997, the country's roads, railroads, airways, waterways and pipelines shipped 11 billion tons of freight valued at \$7 trillion.
- The Federal-aid highway program creates 2.5 acres of wetlands for every acre it takes for road construction.
- Since 1970, States have built more than 1,600 miles of noise barriers at a cost of more than \$1.9 billion.
- Over the past 11 years, \$4.9 billion in enhancement projects—such as bike paths and the preservation of historic bridges and train stations—have been programmed for almost 15,000 communities.
- Today, 28 percent of U.S. production is based on just-in-time practices, which is dependent on a healthy transportation system.

Travel, Tourism and Recreation. Transportation and tourism are vital to our economy. In 2000, 51 million foreign visitors came to the United States, spending \$100 billion, generating more than 1.1 million jobs and making tourism America's fourth-largest export. Travelers to the United States from outside North America spend an estimated \$220 per visitor on transportation. Although many use transit or tour buses initially, significant numbers shift to private automobiles on second and third visits.

Domestic travel and tourism dwarf international visits. Americans touring America spent \$481 billion and generated an additional 6.5 million jobs during 2000. According to the Travel Industry Association of America, 43.9 million adults in the U.S. took some 272 billion business trips during 1998.

Recreation is one of the fastest growing sectors in the U.S. economy, expanding at 5 percent a year. The American Recreation Coalition estimates that there are 8.6 million recreation vehicle-owning households now and 10.4 million expected by 2010. The recreation sector is also heavily dependent on federally owned lands that comprise 650 million acres, or about 29 percent of the total land area of the country. National Park Service areas get more than 273 million visitors annually, who bring more than \$5.5 billion in spending a year to nearby communities. The use of Forest Service roads, which total over 380,000 miles, has increased 15fold over the past 20 years.

Business and leisure travelers, whether foreign visitors or next door neighbors, depend on our nation's infrastructure for access to a variety of activities and destinations. Transportation investment helps generate greater tourism earnings by making tourist destinations more accessible. Investments to relieve congestion, improve road conditions and signage and increase parking facilities and scenic turn-outs help increase tourist volumes, lengths of stay and spending while reducing tourist transportation costs. Investments in transit in and around popular tourist destinations create a more attractive and accessible environment for visitors.

#### *The Bottom Line Series of Needs Documentation*

The Bottom Line Report, which is attached, presents AASHTO's assessment of the nation's current and projected highway and transit capital investment needs, and was prepared as one source of documentation to inform the coming debate on reauthorization of the Federal highway and transit programs. We recognize, however, that the all the modes comprising the nation's transportation system are inextricably linked and we need all parts to function well for the health of the entire system. Moreover, over the next year Congress may consider reauthorization of Amtrak, freight rail financing and reauthorization of the Federal airport program as well as reauthorization of the Federal highway and transit programs. Therefore, the Highway and Transit Bottom Line Report is the first in a series of Bottom Line Reports that are underway. Others that are recently completed or currently underway include AASHTO's Freight Rail Bottom Line Report; AASHTO's Intercity Rail Pas-

senger Report; and AASHTO's Aviation Bottom Line Report, being prepared with cooperation from the National Association of State Aviation Officials.

AASHTO's Freight Rail Bottom Line Report concludes that to simply keep up with freight rail's share of forecasted demand, the freight rail system needs substantial addition capital investment. Estimates include:

- \$13.8 billion for rail safety, including warning systems, grade separations, grade crossing eliminations and track relocations for both freight and passenger systems.
- \$11.8 for short-line improvements, including upgrading of tracks and bridges to handle the newer 286,000 pound and 315,00 railcars coming into service.
- \$80 billion to \$100 billion over 20 years for Class I infrastructure repair and maintenance.
- \$70 billion over 20 years for Class I infrastructure improvements above and beyond repair.

The total cost to achieve this "base case" scenario is estimated at \$175 billion to \$195 billion over the next 20 years. A more aggressive investment strategy to capture a larger portion of the forecast growth in freight demand would require an additional \$30 billion.

Intercity Passenger Rail. AASHTO believes that intercity passenger rail service is a basic element of the nation's multimodal transportation system. Passenger rail offers opportunities to supplement highway and airport capacity in congested and rapidly growing traffic corridors, offers an essential transportation alternative and contributes to a more dependable and resilient transportation system. At least 36 States are involved in the operation and/or planning of intercity passenger rail corridors. By their estimate, over the next 20 years, \$60 billion in capital investment is needed for these rail corridors, which include the federally designated high speed rail corridors. This level of investment does not include additional capital resources needed for longer distance train routes nor does it include the costs of operations. Linked to air, bus and passenger car transportation, these corridors will expedite travel for short-to-mid-length trips in transportation corridors where highway travel is increasingly congested and air travel is increasingly difficult.

Mr. Chairman and members of the committee, AASHTO looks forward to working with you over the coming year as you begin your deliberations on reauthorization of the Federal highway and transit programs. I will be pleased to answer any questions now or that you may have for the record.

#### AT A GLANCE

- An annual investment of \$92 billion for highways and bridges, between 2004 and 2009, is necessary to **maintain** the physical condition and performance characteristics of the system.
- An annual investment of \$125.6 billion for highways and bridges is necessary to **improve** the physical condition and performance characteristics of the system over 20 years.
- An annual capital investment of \$19 billion is required, between 2004 and 2009, to **maintain** the physical condition and service performance of the nation's transit systems, if ridership only grows modestly at 3.6 percent per year.
- An annual capital investment of \$44 billion is required to **improve** the physical condition and service performance of the nation's transit systems, if ridership continues to grow at 3.5 percent per year.
- In 2000, transit investment from all levels of government totaled \$33.8 billion, with \$9.5 billion going to capital investment.
- The 1999 FHWA Condition and Performance Report placed the repair backlog at \$167 billion for highways and \$67 billion for bridges.
- In 2000, highway expenditures from all levels of government totaled \$127.5 billion, with \$94.8 billion going to capital investment.

- Highway vehicle miles traveled (VMT) increased 600 billion over the past decade from 2.15 to 2.75 trillion. VMT is expected to grow by another 600 billion over the next 10 years, an annual VMT growth rate of 2.2 percent.
- At least \$18 billion for highway infrastructure capital costs over six years and an additional \$1 billion per year for operating costs will be needed to implement AASHTO's Strategic Highway Safety Plan, which has a goal of saving 5,000 to 7,000 lives each year.
- At least \$22 billion in capital investment and \$1 billion in annual operating assistance will be needed for highway and transit security over the next six years.
- Every billion dollars of federal highway investment generates 47,500 jobs; for every billion dollars in transit investment, job generation is virtually the same.
- 11.3 million Americans — one in 11 — are employed in transportation occupations.
- In 1997, the country's roads, railroads, airports, waterways and pipelines shipped 11 billion tons of freight valued at \$2 trillion.
- International trade equivalent to a percentage of U.S. Gross Domestic Product increased from 13.4 percent in 1990 to 24.1 percent in 2000.
- The federal-aid highway program creates 2.5 acres of wetlands for every acre it takes for road construction.
- Since 1970, states have built more than 1,600 miles of noise barriers at a cost of over \$1.9 billion.
- Over the past 11 years, \$4.9 billion in enhancement projects — such as bike paths and the preservation of historic bridges and train stations — have been built in more than 14,000 communities.
- Today, 28 percent of U.S. production is already based on just-in-time practices. As more firms move toward such practices, the economy becomes more dependent on a healthy transportation system.
- At the millennium, the U.S. population stood at 281 million, up 100 million since 1960. Our population is expected to grow by at least 100 million in the next 40 years.
- Between 1980 and 2000, average commutes lengthened by four minutes nationally, to 25.5 minutes. The fact that this increase was limited to four minutes even though 35 million new commuters were added to the mix, is in part a tribute to our transportation system's flexibility.

## ACKNOWLEDGEMENTS

This report is the result of the efforts of many people. The Bottom Line Work Group, which is one of six work groups under the guidance of the AASHTO TEA-21 Reauthorization Steering Committee, prepared this report. A Bottom Line Advisory Committee, chaired by past AASHTO President E. Dean Carlson with members including several state department of transportation chief executive officers, provided oversight on behalf of the AASHTO Board of Directors. The work of the Bottom Line Work Group was supported by Alan E. Ptasinski, who as a consultant to AASHTO provided valuable assistance in compiling and writing the document.

Nancy Ross of the New York Department of Transportation, who chaired the Bottom Line Work Group, was instrumental in working with AASHTO staff, FHWA staff, consultants, and other state DOT representatives to lead this important effort, which has resulted in this significant input into the TEA-21 reauthorization process.

Ken Epstein of New York DOT and his team are also to be recognized for their work, in cooperation with the American Public Transportation Association (APTA) and the Community Transportation Association of America (CTAA) in developing the transit component of the Bottom Line Report.

Susan Bradley, Ross Crichem and their colleagues at the Federal Highway Administration provided technical advice on the nature of the modeling, the interpretation of past results, and alternative scenarios. Richard Steinmann of the Federal Transit Administration provided similar assistance with comparable transit information.

Some of the information in this report was developed through research conducted as part of AASHTO's National Cooperative Highway Research Program (NCHRP) projects 8-36, 20-7, and 20-24 and Transit Cooperative Research Program (TCRP) Project J-4. The NCHRP research was managed by Ronald D. McCready, NCHRP's senior program officer, and the TCRP research was managed by Christopher W. Jenks, TCRP manager.

AASHTO wishes to express its profound appreciation to all of those individuals who devoted long hours and shared their special knowledge to produce the Bottom Line Report. We believe it will be a key document in legislation reauthorizing TEA-21 in considered in the coming year.

The following is a list of specific individuals who provided important assistance in the development of this report:

## KEY FINDINGS

As Congress approaches the reauthorization of federal highway and transit programs, AASHTO, with the assistance of the Federal Highway Administration, the Federal Transit Administration and the Transportation Research Board, has taken a comprehensive look at the investments needed from 2004 through 2009 to maintain or to improve our nation's transportation system.

Transportation is vital to the national economy and to our quality of life. Its benefits extend from maintaining America's competitiveness in the global economy to providing access to jobs and education. Likewise, the costs of an inadequate transportation system are severe, including congestion, highway fatalities, and the inability to access health care.

The following are key findings of this analysis:

### HIGHWAY INVESTMENT REQUIREMENTS

#### A Scenario Approach to Future Investment

To estimate highway and bridge investment needs, two goal-based scenarios were employed. The goals of the "Maintain Conditions and Performance" scenario were to hold user costs constant, assure no increase in delay, maintain system physical condition and prevent further degradation. The goals of the "Improve Conditions and Performance" scenario were to make economically justifiable investments that improve pavement condition, increase average speed, and reduce delay and user cost. The performance of these scenarios was compared to 2004 baseline conditions that measured five factors: pavement roughness, delay, average speed, and user cost. The analysis shows the following:

##### Cost to Maintain

An annual investment of \$92.0 billion by all levels of government for highways and bridges is necessary to maintain both physical condition and performance characteristics of the system over 35 years and explicitly during the next reauthorization cycle. This scenario includes our estimation for such as new right-of-way as well as capacity expansion through lane additions within existing facilities. This level of investment holds user costs at less than a one percent increase. Pavement roughness and delay are also held constant. Levels of system reliability remain about the same as well. In FY 2000, \$44.5 billion from all levels of government was invested in highway and bridge capital improvements.

##### Cost to Improve

An annual investment of \$125.6 billion by all levels of government for highways and bridges is necessary to improve both physical condition and performance characteristics of the system over 35 years and explicitly during the next reauthorization cycle. This scenario is analogous to the Maximum Economic Investment scenario in the FHWA Condition and Performance Reports of recent years. The FHWA approach identifies beneficial investments that are possible within the constraints the modeling process used, and describes resulting performance effects.

This level of investment substantially improves the system by the end of the reauthorization period. Pavement condition improves by almost 15 percent from the base period. Much of this improvement

occur in urban areas, where pavements are currently much poorer in quality than in rural areas. This reduces but does not eliminate that disparity. Delay falls by almost 11 percent despite the expected VMT growth. Average speeds also improve considerably with gains in both rural and urban areas. User costs drop from \$917 per 1,000 miles of travel to \$911. This equates to roughly a \$60-billion-a-year saving.

**TRANSIT INVESTMENT REQUIREMENTS**

**Cost to Maintain**

An annual capital investment of \$19 billion is required between 2004 and 2009 from all levels of government just to maintain the existing physical condition and service performance of the nation's transit systems, if ridership only grows modestly at 1.6 percent per year. In FY2000, about \$9.5 billion was spent on transit capital infrastructure investments, about one-half of the minimum requirement based on the lowest range of transit ridership growth.

**Cost to Improve**

An annual capital investment of \$44 billion is required to improve the current physical condition and service performance of the nation's transit systems, if ridership continues to grow at 3.5 percent and if a decision is made to improve conditions and service quality for all users and services.

The magnitude of transit capital needs will depend in large part on ridership growth, and on policy decisions regarding the desired physical condition and service performance of the system. Significant increases in current transit infrastructure investment levels will be required from federal, state, and local governments to address state-of-good-repair and normal replacement needs, just to maintain the physical condition and performance of the existing system. Continued growth in ridership will also require substantial capital investment to accommodate increased demand. Similarly, if the physical conditions and service standards are to improve, capital needs will be much higher than if the system is maintained in a condition similar to today's.

|                      | Maintain Conditions and Performance Scenario | Improve Conditions and Performance Scenario |
|----------------------|--|---|
| Highways and Bridges | \$2.8 billion                                | 125.8 billion                               |
| Transit              | 18.9 billion                                 | 44.9 billion                                |

## OTHER KEY FINDINGS

Today, 11.3 million Americans are employed in transportation occupations. The country's roads, railroads, streets, waterways and pipelines shipped 11 billion tons of freight valued at \$7 trillion. International trade has grown from the equivalent of 13 percent of the GDP in 1980 to 24 percent today. Freight will double in the next 20 years, straining our highways, ports and border gateways. Just-in-time deliveries are vital to business productivity and overnight freight to customer convenience.

Meeting the transportation needs of metropolitan areas, which generate 84 percent of our GDP, will require improving community connectivity through investment in transportation, and making the movement of goods and people more efficient. Transportation connects rural residents to jobs, shopping and health care, and can mean the difference between isolation and opportunity.

Travel and tourism is the number-one industry in several states and in the top three in almost every state, generating \$50 billion in 2000.

Each billion of highway investment generates 47,500 jobs, and each billion of transit investment generates a similar number. More than 54 percent of all public transportation trips in the nation are reported to be work-related, confirming transit's importance to the economy.

## HIGHWAY NEEDS

### Repair Backlog

Over time, wear-and-tear and age take their toll on roads and bridges. The repairs, replacements and upgrades needed to bring the existing system up to standard have created a huge backlog of needed investments. These investments are justified immediately to capture benefits (reducing congestion or saving lives) or to prevent further deterioration that leads to higher investment needs. The 1999 FHWA Condition and Performance Report placed the backlog at \$107 billion for highways and \$47 billion for bridges.

### Travel Trends

The forecasts of vehicle miles traveled (VMT) growth are derived from state and local predictions based on factors such as population, income, household composition, and freight trends. They indicate that growth from 2004 to 2039 will average 2.2 percent per year, or 50 percent over 30 years. To put this in perspective, VMT increased approximately 75 percent over the past 30 years to 2.75 trillion vehicle miles traveled by 2000. Even with projected growth rates lower than those of the past 30 years, highway VMT may reach 3.15 trillion by 2032.

### Physical Condition

Although expanded funding under ISTEA and TEA-21 has improved the nation's highways in recent years, much remains to be done. More than 80 percent of roads are in the "very good/good/fair" range. Interstate pavement conditions in both rural and urban areas are improving. The condition of rural roads, which comprise the great majority of roads but a much smaller share of travel, has been able to hold relatively steady. However, urban roads, in poorer condition to begin with, have deteriorated further. In 1999, FHWA estimated that just to maintain the 47,000 mile Interstate Highway System in its current condition would require an investment of \$17 billion annually, over and above current investment.

#### System Performance

Evidence and specialized studies make it clear that congestion and declining performance are common in our nation's highway system. Commute times have increased, congestion is increasing in all sites of metropolitan areas, and according to a 2000 FHWA customer survey, the single largest source of motorist dissatisfaction is "traffic flow."

#### TRANSIT NEEDS

The nation's extensive public transportation network provides access to jobs, mobility for the young, elderly and disabled and helps reduce congestion, conserve fuel, enhance the efficiency of highway transportation, reduce air pollution and support security and emergency preparedness activities. An efficient, safe and environmentally sound public transportation system is essential to moving people in both rural and urban areas and to the health of the national economy.

Public transportation services are currently available in 319 urbanized areas, and every state has some level of public transportation service available to its rural areas. There are:

- 556 public transportation operators in urban areas
- 1,280 organizations that provide public transportation services in rural areas, and
- 3,660 organizations that provide public transportation services to the elderly and disabled people.

Increased federal, state and local investment in transit has helped spur a 22 percent ridership increase during the past six years, with the 9.5 billion passenger trips during 2001 — the highest level in 42 years. Continued ridership growth at levels comparable to those actually observed over the last six years would result in an average increase in passenger trips of approximately 3.5 percent annually, or a 100 percent increase over the next two decades.

Today, 27 percent of the nation's buses, and 41 percent of its rail rolling stock, exceed their recommended service life. An additional 40 percent of buses and 11 percent of rail rolling stock will exceed their recommended service life within the next six years.

Stable infrastructure investment is required to accommodate increased ridership demands, including the construction of new transit systems and expansion of existing fixed-guideway transit systems. Underinvestment in rural and specialized transit services has resulted in substantial unmet needs and under-served areas.

Significant infrastructure investment is required to address the replacement and rehabilitation needs of other transit assets, including, but not limited to: bus and rail maintenance and yard facilities; stations; track, signals, switching systems; power generation and distribution facilities; structures; fare collection and communication systems; and other associated capital equipment.

#### Technical Approach

In preparing this assessment, AASHTO incorporated the Federal Highway Administration's Condition and Performance (C&P) process and other analytical tools developed by federal agencies to assess the needs of the highway, bridge and transit systems, supplementing them with the knowledge and experience of state departments of transportation.

It should be recognized that these AASHTO statements of need are being prepared in parallel with FHWA's preparation of its forthcoming 2002 Conditions and Performance Report, so AASHTO will not have the benefit of the C&P findings in its analysis.

This analysis incorporates FHWA and FTA methods and assumptions, with two notable differences:

- The C&P report employs a 10-year time frame, while AASHTO's Bottom Line Report focuses on the six-year authorization period of 2004-2009.
- The C&P report starts from year 2001, while AASHTO's report starts from 2004.

Based on these differences, it would be expected that AASHTO's assessment of needs, starting from a base point in the future with higher traffic volumes, a more deteriorated system and a greater backlog of investments to be made, would show greater investment requirements than the FHWA report.

Cost estimates in this report are expressed in year-2000 dollars.

## THE VALUE OF TRANSPORTATION INVESTMENTS

### INTRODUCTION

Transportation is vital to the national economy and to our quality of life. Its benefits extend from maintaining America's competitiveness in the global economy to providing access to jobs and education. This section addresses many of the interactions between Americans and their transportation system, and how that system affects people's lives. It demonstrates the value of transportation and transportation investments to every aspect of American life.

### EMPLOYMENT AND OPPORTUNITY

Transportation has long been a leading generator of jobs, both directly through the construction, operation and maintenance of the nation's transportation system and indirectly through its support of the broader economy by making the movement of people and goods possible.

Today, 11.3 million Americans — one in 11 — are employed in transportation occupations. More than eight million of these workers are in industries directly linked to surface transportation manufacturing.

#### Transportation Jobs, 1999 (Millions)

| Type of Employment  | Surface Transportation | Aviation, Maritime | Total       |
|---|------------------------|--------------------|-------------|
| Transportation Operations                                   | 2.3                    | 2.1                | 4.4         |
| Vehicles and Equipment Manufacturing                        | 1.1                    | .8                 | 1.9         |
| Related (Highway Construction, Auto Dealers, Gas Stations)  | 4.4                    | 0                  | 4.4         |
| Government Employment (Aviation Operations, Public Transit) | 0.4                    | 0.2                | 0.6         |
| <b>Total</b>  | <b>8.2</b>             | <b>3.1</b>         | <b>11.3</b> |

Source: National Transportation Statistics, 2005.

All these occupations depend on a viable transportation system. They will continue to thrive only as long as strong investment in transportation infrastructure is sustained.

#### **Benefits of Transportation Investment**

The direct benefits of transportation investment have been thoroughly quantified. Each billion dollars of federal highway investment generates 61,500 jobs: 26,500 as roads and bridges are built and an additional 35,000 as those who earn their money directly from transportation activity buy goods and services. For every billion dollars in transit investment, job generation is virtually the same as that for highways.

### **TRANSPORTATION AND ECONOMIC ACTIVITY**

Transportation is a pillar of the American economy. The ability to move people and goods quickly, cheaply, and efficiently has enabled the U.S. to remain the world's largest and most successful economy. To understand the importance of transport to a nation the size of the United States, we need only know that the average freight shipment length in the United States is 472 miles — more than the distance between London, England and Hamburg, Germany, two of Europe's largest seaports.

#### **Freight Movement**

Freight movement uniquely underscores the importance of efficient transport to the national economy. In 1997, the country's roads, railroads, airways, waterways, and pipelines shipped 11.1 billion tons of freight valued at nearly \$7 trillion.

Although transportation costs have declined significantly throughout the nation's history, they still make up an important part of the total cost of certain goods. Almost 30 percent of the value of agricultural products is consumed by transportation costs. Other industries — such as motor vehicles, iron, steel, and food products — also rely heavily on efficient transport, with transportation costs ranging between 3.7 cents and 6.1 cents per dollar of output.

Adoption of just-in-time logistics and the blossoming of technology industries has caused another, more frequent shipment of high-value, low-weight goods to lead the growth in U.S. freight shipments. Although shipments of below 1,000 pounds accounted for only 18 percent of the value of all shipments in 1977, they accounted for 32 percent by 1997.

The importance of efficient transportation to our economy is clear.

#### **Transportation Investments Decrease Transit Time**

Sound transportation investments reduce transit time — the time it takes a motor carrier to make a delivery. Reduced transit time means lower labor costs and more efficient use of truck fleets, both of which help cushion cost expenses. Reduced transit times also can extend the reach of companies to new markets and new suppliers.

#### **Transportation Investments Increase Reliability of Shipments**

Increased transportation reliability lowers the costs of business. When reliability improves, companies can reduce their inventories, spare parts and storage of finished goods. They no longer need to keep extra material on hand to guard against late deliveries. In some areas, companies now can plan for delivery of products within a 15-minute window even on runs of 10 or more hours.

### **8 TRANSPORTATION — INVEST IN AMERICA**

#### Transportation Investments Reduce Inventory Costs

Improvements in transportation reliability have created the possibility for service innovations such as just-in-time logistics systems. These processes use information technology to optimize production and transportation, enabling customers to keep inventories at low levels and improving supply chain management. Today, 28 percent of United States production is already based on just-in-time practices. As more firms move toward such practices, an efficient transportation system becomes even more critical to a healthy economy.

#### Transportation Investments Make Business More Efficient

The integration of transportation, logistics and production is not only reducing costs, opening up new markets and making businesses more competitive but also spurring what has been called "the business reorganization effect." As companies integrate logistical gains into their operations, they are able to restructure themselves to seek additional productivity gains. The resultant economies of scale and cost reductions enhance the competitive advantage of these businesses. None of this can occur, however, if the speed and reliability of the freight transportation system is perceived as deteriorating.

#### Transportation Investments Preserve Productivity Gains

Congestion, with its resulting delays, is especially problematic for freight transportation. Continued deterioration of the reliability of the highway system threatens the productivity gains of businesses and their employees. A recent study indicated that, on average, a car's value in hours of transport time saved at \$166. However, avoiding an hour of non-scheduled delay was valued at \$371. In other words, system reliability is nearly twice as valuable as system speed.

#### Rate of Return of Highway Investment

The economic benefits of highway investment are substantial. In recent years, economists have been refining how they measure the impact of transportation investment on the economy. In the years immediately following the construction of the Interstate Highway System, the rate of return on public investment was dramatic: for every dollar of investment, there was an annual rate of return of 34 cents, which meant that investments recouped their costs in two years. As the system matured and the benefits of initial construction decreased, the annual return on investment was reduced, but still averaged 22 cents on the dollar during the 1980s. During the 1990s, the rate of return was about 17 percent; it has been rising since 1993.

Over the past 30 years, investments in the Interstate Highway System have produced an average rate of return two times that of private capital and four times that of bank commercial interest rates.

#### Average Net Rates of Return Per Dollar Invested in Highways

|                 | 1960-69 | 1970-79 | 1980-91 | 1990-91<br>Average |
|-----------------|---------|---------|---------|--------------------|
| Highway Capital | 0.34    | 0.27    | 0.22    | 0.32               |
| Private Capital | 0.16    | 0.16    | 0.17    | 0.17               |
| Interest Rate   | 0.08    | 0.08    | 0.10    | 0.08               |

## INTERNATIONAL TRADE AND TRANSPORTATION

### International Trade and the Economy

Transportation costs significantly affect the competitiveness of our products in foreign markets and the prices of foreign goods. Transportation investments that make the flow of goods across our borders more efficient help control these costs.

The importance of international trade as a factor in our economy continues to grow. The value of international imports and exports grew at an annual rate of 9.5 percent during the 1990s, from \$891 billion to \$2,152 billion, nearly double the 3.5 percent rate of GDP during the same period. This growth has increased the significance of international trade to our economy — equating 24.1 percent of GDP in 2000, compared to 13.4 percent in 1990.

The agricultural sector — deeply concerned with U.S. international trade — provides a clear example of the importance of transportation to the U.S. economy. The agricultural sector generates about 8 percent of the Gross Domestic Product. Factoring in farming, production and processing, this sector employs over 10 million people (about 6 percent of the labor force). The agricultural sector is the largest user of freight transportation services. Taking into account the movements of raw commodities, processed products and production inputs such as fertilizer and machinery, agriculture accounts for nearly one-third of all freight transportation services provided in this country.

Efficient, economical and competitive transportation makes possible the specialization in agricultural production that gives all Americans access to a wide variety of high-quality, reasonably priced food products. All modes of transportation are important to agriculture. Trucks are the most important, moving 45 percent of all agricultural products (measured in ton-miles), railroads follow with 32 percent and inland waterways, with 11 percent. The share varies greatly by product.

Agriculture is a critical contributor to U.S. competitiveness in the world economy, in large part because of the efficiency of the U.S. domestic transportation system. Despite relatively high production costs, the U.S. maintains a positive trade balance in the sector, exporting agricultural products with a value of more than \$200 billion a year. In the domestic market, a dollar of agricultural product requires — on average — about 37 cents of transportation services. In many foreign markets, the cost of transportation services can be twice as high.

To take a single example, the total production cost of a bushel of soybeans in the U.S. is well over a dollar higher than some South American producers — \$5.11 compared to the cost in Brazil. However, the U.S. internal transport and marketing cost is 43 cents compared to \$1.34 in Brazil, leading to a final price that makes U.S. soybeans competitive in world markets, which would not be the case without transportation efficiency. Competition, however, is not over still. Brazil is making inland-waterway improvements that will significantly reduce internal transportation costs for soybeans. To remain competitive, the U.S. must maintain and improve the efficiency of its transportation system.

**Overseas Inland Trade — Truck Traffic on U.S. Highway Network, in 2020**

Source: "National Freight Movement: Trends/Issues/Forecast/Policy Implications," Office of Freight Management and Operations, U.S. Department of Transportation, FHWA

**Trade Corridors**

Increased investment in maintaining and adding lanes to our trade corridors, and improving and replacing bridges on them, can speed the movement of international trade. Goods entering the United States in international trade move along highways, railroads or waterways toward their final destination. Inland trade corridors have traditionally followed the east-west development of our major population and industrial centers and reflected the importance of trade with Europe. With NAFTA, however, our north-south corridors have become increasingly significant. The future needs of these corridors are extensive, and their lack of capacity to accommodate future traffic is a major national challenge. Because these corridors involve multiple states, it is even more difficult to fully meet projected needs.

Other deficiencies in our trade transportation network include highway and rail access limits at ports, intermodal facility congestion, physical restrictions, and highway-related grade crossings.

**Conclusion**

International trade, expected to double by 2020, will strain highways, ports, and airways. The level of investment required to meet projected needs is enormous. A recent study estimated that \$93 billion would be required during the next 20 years just to meet desirable performance standards for highways, ports, and airports in 13 southeastern states and Puerto Rico. Studies in other regions of the country have identified a comparable level of investment needs to accommodate the projected growth in international trade.

Growing concern for these issues is reflected in the number of associations or alliances that have been formed to address the infrastructure needs of the future. The solution to these problems requires not only additional investment, but also public-private partnerships.

#### TRANSPORTATION AND SOCIETY

At the millennium, the U.S. population stood at 281 million, up 100 million since 1960.

The 1990s saw several surprising demographic trends, including higher-than-expected population increases. The South and West gained 77 percent of the nation's growth, down from 80 percent in the 1980s. Growth in major metropolitan areas was driven by immigration from abroad and a strong birthrate, rather than by migration from rural areas.

Today, 62 percent of Americans — 160 million people — live in the 50 metropolitan areas with populations of greater than one million; 25 percent live in smaller metropolitan areas with fewer than a million people; and the remaining 13 percent live in rural areas. Although most people live in the metropolis in which the greatest congestion occurs, the large number of people living in smaller cities and rural communities also have substantial, and growing, transportation needs as they exercise their choice of residential and work locations.

#### Suburban-Urban Balance

The long-term trend of the 20th century was toward the increasing number and size of metropolitan areas, and suburban growth within these metropolitan areas. Since 1950, metro areas have grown from 56 percent of national population to 80 percent. Suburban areas grew faster than their central cities.

#### Rural Challenges

Nearly 60 million Americans live in rural communities, and agriculture no longer dominates their economic life. Manufacturing, tourism and other services industries employ growing numbers in these areas, increasing the importance of effective transportation to link these dispersed communities. This will be problematic, because rural households already have by far the highest share of their spending going to transportation. However, lower housing costs more than compensate for these extra expenses.

#### Transitions

America over the past 32 years has experienced extraordinary growth in workers and in their needs. This era has been characterized by the baby boom generation's arrival in the work force, the surge of women into the workplace, sharp rises in driver licensing and auto ownership and a shift in lifestyles. There is immense time pressure in our society, perhaps best characterized by the fact that more than 40 percent of spending for food is for meals outside the home. In 1995, 24 percent of African American households and 12 percent of Hispanic households were without vehicles, compared to the average of 9 percent for all households. As minority incomes rise, it is expected that vehicle ownership and travel will increase as well.

### An Aging Society

By the year 2031, the proportion of Americans over age 65 will increase from 12 percent to 20 percent. The number and kinds of trips made by, and for, the elderly will change dramatically. A healthier, more affluent older populace accustomed to driving will add to vehicle trips. Already, retired citizens make almost as many non-work trips as the general population. Miles of travel by retired citizens have grown from less than half of that by all ages to about two-thirds of that.

### An Immigrant Nation

As it was a century ago, America increasingly is once again a nation of immigrants. As many as 14 million people may have immigrated to the United States during the 1990s, generating about 40 percent of the decade's population growth. From a transportation standpoint, immigrants often means immediate additions to the work force – and to the ranks of commuters. They have also concentrated in the areas of greatest growth – cities and the South and West.

## TRAVEL PATTERNS

Although suburb-to-central city commutes were the primary concern of transportation planning for generations, two factors have changed. First, work trips have become more dispersed in time and geography, especially to suburban job sites, and therefore are more difficult to serve. Second, work trips account for no more than 20 percent of all trips, especially as women travel outside the home on family and personal business. Overall, travel has increased by over 160 percent since 1990.

### Commuting

Over this past decade, commuters driving alone increased from 33 percent to 36 percent, carpooling and walking decreased, while transit's share remained at five percent. Over the six years since 1990, transit ridership surged by 22 percent, but its relative share of commuting held constant for the 1990s, because of an overall increase in workers of 11 percent.

#### Share of Commuting Travel — (percentages)

|                | 1990 | 2000 |
|----------------|------|------|
| Drive alone    | 33   | 36   |
| Carpool        | 13   | 12   |
| Transit        | 5    | 5    |
| Taxi           | 0    | 0    |
| Motorcycle     | 0    | 0    |
| Bicycle        | 0    | 0    |
| Other          | 1    | 1    |
| Walked only    | 4    | 3    |
| Worked at home | 3    | 3    |

Source: 2000 U.S. Census, Journey to Work Statistics.

Immigration to the U.S. — 1993-1999

Between 1990 and 2000, average commute lengthened by four minutes nationally, to 25.5 minutes. The fact that this increase was limited to four minutes, even though 35 million new commuters were added, is a tribute to our transportation system's flexibility. However, it is also evidence that we are reaching the upper limits of what the present system is capable of absorbing. While household size declined during this period, all major household-related growth measures — vehicles, drivers, and workers — continued to grow.

America in the coming decades will be an aging society operating in a global economy. This will be a world in which skilled workers will have strong leverage in the marketplace. It will be a challenged affluent society in which mobility will be central to meeting our social and economic goals. Transportation investment must recognize these patterns and trends.

## TRANSPORTATION AND COMMUNITY

In a nation as vast as the United States in area, population and economic productivity, "community" is defined in many ways. But whether we speak of the national community of American citizens, or the neighborhood communities in which we live and work, transportation helps define them and enables our participation.

### Metropolitan Communities

Metropolitan areas are the economic engines of the nation with an even greater share of jobs and GDP, at 84 percent, than even their share of the population. Continuing to improve community connectivity to metropolitan areas means making public transportation a more convenient and affordable alternative. It also means making automobile use in metropolitan areas more efficient. Efforts to do so include intelligent transportation system investments such as "911" telephone-access traveler information systems, high-occupancy vehicle lanes and policies encouraging ride-sharing, bicycle use, and walking.

### Rural Communities

For many rural regions, access to transportation networks can mean the difference between isolation and inclusion. Highways connect rural residents to jobs, shopping, health care and educational opportunities. For example, the Appalachian Development Highway System, a six-decade project now under construction, is providing rural portions of 13 southern and mid-Atlantic states with improved links between communities and access to other regions. These highways are more than roads — they are lifelines.

### Environmental Stewardship Role for State DOTs

ISTEA forged the link between transportation and the environment. That linkage was reinforced in TEA-21. Both laws have facilitated the evolution of a new role for state DOTs as environmental stewards. Such stewardship is an agency-wide commitment to integrating environmental values into all transportation work as a core business value. It means improving environmental conditions when possible, not just to comply with regulations.

The states — including their transportation departments — are proud of the progress made over the past three decades in cleaning America's air of pollutants. Over that period, emissions from motor vehicles have dropped considerably, EPA notes, including volatile organic compounds (down 59 percent) and carbon monoxide emissions (down 43 percent) despite a 143 percent growth over the same period in vehicle miles traveled.<sup>1</sup> Cleaner vehicles, cleanness of traffic-congestion hotspots and other operations steps, and strong emissions inspection and enforcement — often administered through state DOTs — have had a positive impact.

Many state DOTs go beyond merely securing the necessary permits from federal environmental resource agencies to partnering with communities and environmental stakeholders to achieve multiple objectives. In addition to solving a transportation problem, a transportation project may also address environmental issues through wetland restoration or address social issues by including features such as historic-style streetlights, hotspots, and plantings to create a park-like gateway to an historic neighborhood.

### Transportation Investment can yield Environmental Benefits

While the ribbon cuttings of new transportation projects generally focus on mobility, reliability and safety benefits, we often overlook the 3 percent to 20 percent of project cost that is invested in environmental factors. Examples of environmental benefits are as follows:

- The federal-aid highway program is creating 2.5 acres of wetlands for every acre it takes for road construction.
- Since 1970, 44 states and Puerto Rico have constructed over 1,600 miles of noise barriers at a cost of over \$1.9 billion, in 1998 dollars.
- Highways are among the biggest recyclers in America, through re-using pavements, use of fly ash in concrete, and the use of crumb rubber as a component of road surfaces.
- Over the past 11 years, \$4.9 billion in rehabilitation projects — such as bike paths and the preservation of historic bridges and train stations — have been built in more than 34,000 communities.

<sup>1</sup> U.S. Department of Transportation, Federal Highway Administration, "Transportation Air Quality — Selected Facts and Figures," January 2002, page 6.

#### Community Compatibility and Transportation

Integrating transportation and land-use planning can result in less traffic and more livable communities. Such programs as the Transportation and Community and System Preservation Pilot Program, established under TEA-21, identify pedestrian and traffic linkages, urban-design strategies and zoning changes that will better integrate planned transportation improvements with existing neighborhoods and new developments.

#### Transportation and Healthy Communities

Many casual observers of transportation are surprised to learn that trips to non-work destinations comprise the largest segment of travel today. Trips for medical care, while comparatively low in number, are significant because of their impact on health. However, affordable alternatives to driving are often limited. In areas of urban poverty, public transportation is often unreliable, inconvenient and underfunded. In many rural areas, public transportation is non-existent.

As a result of these constraints, 9 percent of children in American families with incomes under \$15,000 are unable to access routine medical care because of a lack of transportation resources. For children in families with incomes at or below the poverty level, one in five misses routine visits to the doctor because of transportation problems.

## TOURISM

### The Power of Tourism

Travel and tourism are vital to our economy. In 2000, 51 million foreign visitors came to the United States, spending \$120 billion, generating more than 1.1 million jobs and making tourism America's fourth largest export. But domestic travel and tourism dwarf international visits. Americans visiting America spent \$481 billion and generated an additional 6.5 million jobs during 2000.

However, the United States saw six million fewer international visitors in 2001, a 12 percent decrease from the previous year as tourists were deterred by the September 11 terrorist attacks in New York and Washington. The long-term impacts of these attacks on tourism are only now becoming apparent, and could include lower-than-expected tourist visits for the next several years.

### International Travel and Tourism and Transportation

Travelers to the United States from outside North America spend an estimated \$220 per visitor on transportation. Although many use transit or tour buses initially, significant numbers shift to private cars on second and third visits. This is especially true of Canadians and Mexicans, who frequently travel to the United States.

### Federal Transportation Programs Supporting Tourism

Several federal transportation programs support tourism, including:

Roads that have outstanding scenic, historic, cultural, natural, recreational, or archeological qualities can be designated as All-American Roads or National Scenic Byways and receive federal funding for projects to enhance the travel experience.

- The Appalachian Development Highway System has opened up that region for the development of tourism.
- The National Historic Covered Bridge Preservation program assists states in rehabilitating or repairing and preserving historic covered bridges.
- The Federal Land Highways program is a major source of support for travel on public lands such as national parks and national forests.
- The Recreational Trails Program helps develop and maintain recreational trails.

### Transportation and Recreation

Recreation is one of the fastest-growing sectors in the U.S. economy, expanding at 5 percent a year. The American Recreation Coalition warns that there are 9.6 million recreation vehicle-owning households now and 10.4 million expected by 2010. In addition, there are some 9 million towable boats, 1.7 million snowmobiles, nearly 1 million recreational horses, and 5 million all-terrain vehicles. The recreation sector is heavily dependent on federally owned lands that comprise 650 million acres, or about 29 percent of the total land area of the U.S. National Park Service areas get more than 271 million visitors annually, who bring more than \$5.5 billion in spending a year to

rural communities. U.S. Forest Service lands and campgrounds see even more visitors. The use of forest-service roads, which total over 400,000 miles, has increased 15-fold over the past 20 years. Their use now is 90 percent recreation-related. Recreation industries such as skiing have now become one of the prime economic drivers to rural communities previously dependent on timber, mining and agriculture.

#### TRANSPORTATION AND NATIONAL DEFENSE

The U.S. highway system plays a critical role in the movement of military equipment and personnel, particularly in wartime. In the event of a national military or security emergency, heavy military equipment, including oversized cargo vehicles and personnel may be deployed expeditiously with personnel from military installations to various weapons and airports. The ability to rapidly get to installation ports is critical to our nation's defense. The strategic routes used for these movements are defined as Strategic Highway Network (STRAHNET) routes and corridors.

STRAHNET is a system of public highways identified as crucial to U.S. strategic defense policy. The 81,000-mile system, designated by the Federal Highway Administration in partnership with the Department of Defense, comprises about 40,600 miles of Interstate and defense highways and 13,600 miles of other public highways. STRAHNET is complemented by about 1,700 miles of connectors — additional highway routes linking more than 200 military installations and ports to the network.

#### Transportation and Emergency Evacuation

The capability of the highway system to manage massive amounts of traffic in major emergency evacuations is critical to the safety and survival of threatened populations. Our national highway system — coupled with a coordinated roadway-information system to manage traffic and provide traveler information — is essential to rapid, efficient, and safe evacuations.

# NATIONAL SURFACE TRANSPORTATION INVESTMENT REQUIREMENTS

## HIGHWAYS

### INTRODUCTION

In preparing a rigorous, quantitative evaluation of the nation's surface transportation needs, AASHTO worked in cooperation with the Federal Highway Administration, the Federal Transit Administration and the Transportation Research Board to address prior information gaps and expand existing capabilities.

This effort incorporated the FHWA/FTA Condition and Performance process and other analytical tools developed by federal agencies to assess the needs of the highway, bridge and transit systems, supplementing them with the knowledge and experience of state transportation agencies. This analysis incorporates methods and assumptions used by federal transportation agencies, with at least two notable differences:

- The federal Condition and Performance process employs a 20-year time frame divided into five five-year periods. Because this analysis is focused on reauthorization, it uses a six-year time frame, set in a 20-year context.
- The Condition and Performance process takes its time frame starting from an historical base. Therefore, the next Condition and Performance report, to be issued in 2002, will take a 20-year perspective starting from the year 2001. This report is focused on the next reauthorization time frame, beginning in 2004 and ending in 2009.

Based on these differences, it would be expected that AASHTO's assessment of needs, starting from a base point in the future with higher traffic volumes, a more deteriorated system and a greater backlog of investments to be made, would show greater investment requirements than the FHWA report.

Cost estimates in this report are expressed in year-2000 dollars.

### The Backlog

Much of the growth in investment needs results from the aging of the transportation system. Over time, weather, wear and age take their toll on roads, bridges and transit facilities. The repairs, replacements and upgrades needed to bring the existing system up to standard have created a huge backlog of needed investment. These investments are justified immediately to capture benefits (reducing congestion, saving lives) or to prevent further deterioration that results in greater future investment needs.

### Travel Trends

The forecasts of vehicle miles traveled growth and here are derived from state and local projections. In addition to the traditional forces of change in travel, such as population, incomes, household composition, freight trends, etc., the changes in vehicle miles of travel employed are designed to be sensitive to the changes in the services provided by the system. The estimates employed here indicate that the annual growth in the six-year period from 2004 to 2009 will average between one percent and 2.2 percent, 50 percent over 20 years. Freight movement will be an increasingly significant factor because of growing NAFTA and other international trade, and the importance of just-in-time delivery to business production.

### THE BASELINE FOR FUTURE SCENARIOS

#### System Physical Condition

Expanded funding under ISTEA and TEA-21 has improved the nation's highways in recent years, but much remains to be done. The percentage of roads rated "good" and "fair" has grown, but largely seems to be the result of roads rated "very good" deteriorating. More important is that more than 80 percent of all roads are in the "very good/good/fair" range.

Rural roads, which comprise the great majority of roads, but a much smaller share of travel, have been able to hold their condition relatively steady. Urban roads, in poorer condition to begin with, have deteriorated further. There is continuing improvement in the condition of interstate pavements, both rural and urban.

#### System Performance

Although statistical measuring of highway system performance is lacking, anecdotal evidence and specialized studies make it clear that congestion and declining performance is common.

- Average commute times, after a 40-second increase in the 1980s, jumped by more than three minutes during the 1990s to a national average of 25.5 minutes.
- Congestion is increasing not only in the major cities but in all areas of metropolitan areas. The cost per peak period traveler is estimated at over \$1,120 annually.
- 5.7 billion gallons of fuel are consumed by congestion annually, not only wasting money but adding to air pollution.

### A Scenarios Approach to Future Investment

Two scenarios were designed to provide a comprehensive sense of the scale of investment needs and to help evaluate investments needed to support goals for the system.

The scenarios are:

#### Maintain Condition and Performance Scenario

- Hold user costs constant as travel demands grow.
- Assure that travelers experience no new delays.
- Maintain system physical condition and prevent further degradation.

#### Improve Condition and Performance Scenario

Make all economically justifiable investments that:

- Improve pavement conditions.
- Increase average speeds.
- Reduce delay, and
- Reduce user cost.

#### Condition and Performance in 2004

To set a baseline to measure performance of alternative investment scenarios, highway conditions in 2000 were projected to 2004 using FHWA's Highway Economic Requirements System model, applying actual and projected spending.

#### 2004 Baseline Conditions

| Measures   | 2004 Value | Notes  |
|--|------------|--|
| Physical Condition:<br>Average International Roughness Index | 125        | A range of 95 to 170 is "fair"   |
| Performance:<br>Total Hours of Delay per 1,000 VMT           | 4.3        | VMT = Vehicle Miles of Travel  |
| Average Speed  | 40.6       | Miles per hour   |
| Costs:<br>Total User Costs \$/1,000 VMT                      | \$937      | Includes operating, safety and travel time costs for both passenger vehicles and trucks. |

### SCENARIO ASSUMPTIONS

- The scenarios have 20-year perspectives, but focus on a six-year timeframe with a 10 percent travel growth.
- Reflect total capital program estimates by all levels of government for all highways and bridges.
- Both scenarios incorporate the costs for such as new rights-of-way, as well as capacity expansions that are accomplished by lane additions within existing facilities.
- Only projects with benefits exceeding costs are included.

The scenario seeks to maintain conditions and performance for the reauthorization period, 2004–2009, and then considers the effects of the scenario out to 2023. The table above shows that this funding level succeeds broadly as defined by our measures and generates improvements in all of the measures in the year 2023.

The investments hold user costs at less than a 1 percent increase in the reauthorization period. Both rural and urban areas increase less than 1 percent in user costs, with rural areas rising somewhat faster in VMT growth. Pavement roughness and delay are also held relatively constant. Levels of system reliability remain about the same as well.

**An Improve Conditions and Performance Scenario**

An annual investment of \$125.6 billion by all levels of government for highways and bridges is necessary to improve both physical condition and performance characteristics of the system over 20 years and explicitly during the next reauthorization cycle. This scenario, analogous to the Maximum Economic Investment scenario in the FHWA Condition and Performance Report of recent years, identifies investments with a benefit-to-cost ratio greater than 1 that can be made within the constraints of the modeling process, and describes the resulting performance characteristics.

This level of investment substantially improves the system by the end of the reauthorization period. Pavement condition improves by almost 15 percent from the base period. Much of this improvement occurs in urban areas, which are currently much poorer in quality than rural areas, reducing, but not eliminating, the disparity between urban pavement conditions and rural.

**Improve Conditions and Performance Scenario Effects and Costs — 20-year Perspective**

| Measure                                | 2004       | 2009                                | 2023  |
|--|------------|-------------------------------------|-------|
|  | Base Value | Maintain Conditions and Performance |       |
| Average International Roughness Index  | 125        | 100                                 | 90    |
| Average Speed                          | 40.8       | 42.02                               | 44.74 |
| Total hours of Delay /1000 VMT         | 4.2        | 3.89                                | 3.58  |
| Total User Costs \$/1000 Vehicle Miles | 937        | 913                                 | 882   |

The investments reduce delay by almost 15 percent despite the expected VMT growth. The investments focus heavily on reducing delays in urban systems, where most of the delay exists, although they also reduce, but not eliminate, delay in rural areas. Urban delay remains five times that of rural areas per mile of road.

Average speeds also improve considerably with gains in both rural and urban areas.

There is a significant improvement in user costs, generating impressive benefits. The drop from \$937 per 1000 miles of travel to \$913 represents a 1.5 percent reduction. While this percentage seems small, when applied to 3 trillion miles of travel per year, a \$20 per 1000 miles saving equates to roughly a \$60 billion a year saving for users, more than compensating for the incremental costs of this scenario. The user savings made its increased productivity and job growth.

The expanded levels of investment have even a greater impact over a full 20-year span including:

- A more than 20 percent improvement in pavement conditions
- A greater than 10 percent improvement in average speeds
- A greater than 10 percent improvement in delay
- An almost 6 percent improvement in user costs, saving over \$200 billion per year in user costs by 2009

All of this is attained despite at least 50 percent growth in travel over the 20-year period.

#### The Price of Inaction

To put the effects of these two scenarios in perspective, their benefits must be measured on a scale against current spending and what the future effects of that level of spending would be. The following numbers express the state of the system at the end of the next nonauthorization period if spending has been maintained at the current levels. By every measure, the quality of the current system will deteriorate, resulting in poorer pavement, slower speeds, increased driver delay and increased costs to the user.

FHWA reports that as of 2000, highway capital outlays by all levels of government were \$64.6 billion.

#### Scenario Effects — Current Spending

| Measure                                | Base Value<br>2004 | New Value<br>2009 | Change<br>2004-2009 |
|--|--------------------|-------------------|---------------------|
| Average International Roughness Index  | 125                | 147               | 18% degradation     |
| Average Speed                          | 40.6               | 35.9              | 12% degradation     |
| Total hours of Delay /1000 VMT         | 4.3                | 4.64              | 8% degradation      |
| Total User Costs \$/1000 Vehicle Miles | 937                | 1014              | 8% degradation      |

**Factors Not Included in the Cost Estimates Produced through HERS Modeling**

In addition to the costs estimated produced by the HERS modeling analysis, which included costs for highways, bridges and transit), there are other cost factors that must be considered. These include cost estimates for Safety, Security, Interstate Interchanges, and Increasing Program Delivery Costs, which together may equal as much as \$11 billion annually.

**Safety**

Implementing AASHTO's Strategic Highway Safety Plan to save 5,000 to 7,000 lives annually is estimated at \$3 billion annually in capital costs and \$1 billion annually for operating costs.

**Security**

Enhancing highway and transit security is estimated to cost \$2 billion annually in capital costs and \$1 billion annually in operating costs.

**Interstate Interchanges**

If future Interstate interchanges constitute 30 percent of project costs in the next six years, rather than 32 percent as at present, this is estimated to increase capital costs by \$1 billion annually.

**Increasing Program Delivery Costs**

The combination of environmental reviews, mitigation and right of way acquisition is adding time and cost to transportation projects. The increase nationally is conservatively estimated at \$1 billion annually.

**THE INTERSTATE HIGHWAY SYSTEM**

The 46,677-mile Dwight D. Eisenhower System of Interstate and Defense Highways is the crown jewel of America's roads. From its inception in 1956, it has been transformational, connecting our nation as never before, opening up communities to new opportunities and truly nationalizing our economy.

The importance of the Interstate highways to transportation and the economy cannot be exaggerated. Comprising only a little more than one percent of our nation's roads, they carry more than 24 percent of travel, including 41 percent of total truck miles traveled. As the following table makes clear, the Interstates have value far out of proportion to their modest size.

**Interstate Highway System — Key Statistics**

|                    | Interstate System | Total Highway System | Interstate System Share (%) |
|--------------------|-------------------|----------------------|-----------------------------|
| <b>Interstates</b> |                   |                      |                             |
| Road Miles         | 46,677            | 3,881,898            | 1.2                         |
| Lane Miles         | 229,650           | 9,328,898            | 2.5                         |
| VMT (billions)     | 887               | 2,787                | 24.1                        |

Although the Interstates have always played a key role in interstate connectivity, military support and efficient long-distance travel, they increasingly are seen as also supporting local economic growth, moving freight within metropolitan areas, providing access to airports and speeding other metropolitan travel. Reflecting the evolving expectations that state and local officials have for the Interstates, growth in travel on their urban segments has been greater than on the rural portions, with a 41 percent overall increase during the 1990s.

Travel per lane mile in urban areas – perhaps the best indicator of potential congestion – has grown by roughly 25 percent during the same period. Urban Interstate congestion is currently high in nearly half of the states, and 41 states in a recent General Accounting Office survey predicted that it would be high or very high a decade from now.

#### **Pavement Quality**

While total travel on the road system increased by about 35 percent during the 1990s, axle loadings increased by more than 88 percent, indicating the ever-growing importance of the Interstates for freight movement. Given a projected doubling of freight movement over the next 20 years, this indicates the potential for significant wear and tear on the system.

Despite this increasing load, the condition of pavement has actually improved in recent years, reflecting both greater federal funding and state commitment to maintaining these vital roads. In spite of the progress, 18 percent of Interstate pavements are in poor or mediocre condition, requiring immediate investment. The remainder of the system, because of increasingly heavy use, requires substantial routine maintenance to ensure that it remains in acceptable condition.

#### **Safety**

Investment in the Interstate system buys not only better performance, but also superior safety. Safety-related improvements have dropped the fatality rate on the Interstates by half during the past 20 years, to 0.85 per 100 million VMT. The Interstates typically carry 26 times the traffic per mile as the rest of the system and so, even with a fatality rate roughly half that of other roads, share traffic volume means that the Interstates still see too many deaths.

#### **Federal Rules Prevent Documentation of Actual Interstate Needs**

At the request of the House Transportation and Infrastructure Committee, the General Accounting Office completed a report in May, 2002, on the *Status of the Interstate Highway System*. GAO noted that because of the fiscal constraint restrictions imposed by current federal planning statutes, "state plans might not identify the funding needed to address all of the problems states expect on their Interstate highways." These statutes, which found a way to spare their true needs in spite of these restrictions, "showed a gap between expected revenue and what states would like to invest."

#### **The Special Case of Interstate Interchanges**

Many Interstate highway interchanges are coming due for renewal. Rebuilding them can be very costly, in part because interchanges often involve major safety and efficiency improvements. This is particularly true when Interstate facilities meet, where HOV lanes are operating, when substantial traffic growth has occurred or where there is heavy truck traffic.

Historically, interchanges have consumed about 10 percent of capital spending on Interstate highways. After seeing evidence that costs actually are higher, AASHTO and the National Cooperative Highway Research Program collaborated on a study to determine whether traditional budgeting for interchange improvements was still valid. Analysis showed that complex new interchanges are costing far more than in the past, and are consuming about 20 percent of Interstate capital spending. This is true even without the impact of megaprojects that are expected to cost well over a billion dollars.

A survey of the 12 states included in the analysis showed that the number of interchange megaprojects planned for the next 10 years is substantial and clearly more than in the '90s.

These findings have enormous implications for interchange project planning. States will need to allocate larger portions of their budgets to interchanges, which means that more funding will be needed overall to complete projects.

The survey showed that the 12 states planned to spend an average of 20 percent of total Interstate capital investment on interchanges in the next decade. But in some cases, the survey shows such numbers may rise as high as 30 percent. Past spending on interchanges has averaged about 10 percent of Interstate capital investment, but has rapidly risen in recent years. As a result, current models may underestimate such needs by as much as \$5 billion annually.

**BRIDGES**

**Progress to Date**

The success of recent investments in our nation's highway bridges is clear. Increased investment has improved the structural condition of our bridges, making them safer and increasing their value and lifespan. A decade ago, 200,000 of America's 575,000 bridges were deficient. Of the 200,000 deficient bridges, about 100,000 were structurally deficient and 80,000 were functionally obsolete. In the years since, the nation has added fewer than 15,000 bridges. Instead of new construction, additional investment made possible through ISTEA and TEA-21 has been focused on rehabilitating bridges to meet safety and functional standards.

Investments made possible by ISTEA and TEA-21 have permitted great progress in reducing the number of deficient bridges from 35 percent of the total inventory down to about 26 percent. Today, the number of deficient bridges is down to 143,000 out of a total inventory of 590,000.

However, about half of the nation's 590,000 bridges were built before 1965, and a quarter are more than 50 years old. While properly cared-for bridges can be considered to be virtually permanent, their age at the very least means they need significant maintenance and may be functionally obsolete.

**Highway Bridges by Year Built**

#### Condition of Bridges

|                        | 1992    | 2002    |
|------------------------|---------|---------|
| Structurally Deficient | 123,000 | 83,000  |
| Functionally Deficient | 80,000  | 88,000  |
| Acceptable             | 371,000 | 427,000 |
| Total                  | 574,000 | 598,000 |

#### Addressing the Backlog of Bridge Needs

The investment costs needed to address the backlog of bridges needing repair has fallen in tandem with the reduction in bridge deficiencies. The bridge backlog now stands at \$52 billion, based on an evaluation employing the new National Bridge Investment Analysis System.

#### No Name for this Table

| Type of Investment   | Costs (Billions) |
|--|------------------|
| Bridge Replacement Needs                                       | \$37.2           |
| Bridge Improvement Needs<br>(widening, raising, strengthening) | \$3.1            |
| Maintenance, Rehabilitation and<br>Reconstruction Needs        | \$11.6           |
| Total  | \$51.9           |

The \$52 billion represents a considerable reduction from past assessments of the bridge investment backlog — in part because of progress made possible by the increased funding levels under ISTEA and TIA-21, partly due to priorities set at the state and other levels and partly due to the reduced levels of investment needs that meet economic analysis criteria.

Examining the investment alternatives through the National Bridge Investment Analysis System indicates that an investment of \$46 billion (\$7.9 billion per year) can reduce the backlog by close to half by the conclusion of the next monetization cycle in 2005.

Alternatively, a base investment of \$43 billion (\$7.2 billion per year) would be sufficient to maintain the backlog at present levels. Investments below that level actually begin to create an increase in the backlog over time.

## LOCAL ROADS AND BRIDGES

### Road Networks

The 160,000-mile National Highway System, which includes the interstates and principal state routes, carries 40 percent of traffic nationally. A significant portion of the remaining traffic is carried on the three million mile network of arterials, collectors and local roads owned and operated by counties, cities and townships. These roads link rural and urban areas, carry freight, food, health care and other goods and services to our citizens, and provide access to the homes and communities in which we live. Seventy-eight percent of this national road network is in rural areas, and the remaining 22 percent is in urban areas.

### Travel Volumes

Local roads and streets are the beginning and ending links for most trips, but these trips generally shift to the collector roads and, eventually, concentrate at the arterial system that carries over 72 percent of the total urban and rural traffic. Even though there are more rural miles of road, the urban roads carry approximately 61 percent of the traffic.

### Safety on Local Roads

The General Accounting Office recently reported that, "Although only about 40 percent of all vehicle miles are traveled on rural roads, about 60 percent of the traffic accident fatalities that occurred in 1999 occurred on rural roads." This is even more pronounced on two-lane rural roads, which have fatality rates on times greater than those of urban interstate highways. There are approximately twice as many fatal accidents on state rural roads than local rural roads, largely because of the higher traffic volumes on state highways.

### Bridges

Most of the 590,000 bridges in the United States are under local jurisdiction. Local bridges comprise 51 percent of the total, and counties own 78 percent of local bridges. Of the country bridges, 22 percent are structurally deficient and 13 percent are functionally obsolete. Cities have 13 percent of bridges structurally deficient and 20 percent that are functionally obsolete.

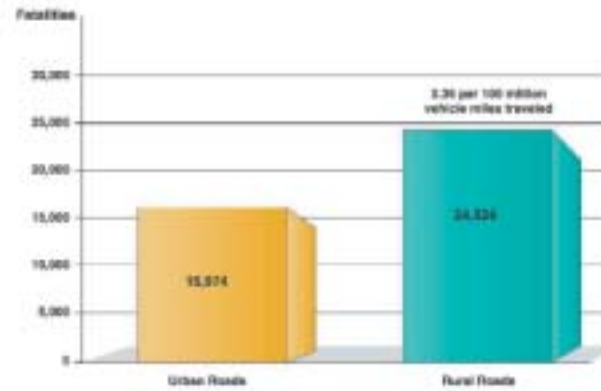

### Expenditures on Local Roads

Across the country, states spend a least 60 percent of their federal funds on urban roads and bridges and the remainder on rural facilities. Roads under local jurisdiction often receive a share of federal road funds, but a significant portion of local funding comes from state and local taxes, not federal aid. Approximately 32 percent of all disbursements for highways are spent on locally owned roads.

## PRESERVATION AND ASSET MANAGEMENT

### The Importance of Preserving Transportation Assets

Previous generations have made a tremendous investment in our transportation system. The total value of our roads and bridges has been estimated by U.S. DOT at \$1.4 trillion, and transit assets are estimated to be at least \$500 billion. This includes 8.2 million lane miles of highway, 390,000 bridges, approximately 130,000 transit vehicles, 50,000 miles of track, and 2,800 transit stations. If these facilities are to serve future generations, they must be preserved and modernized.

Expenditures for highway maintenance in 2000, after accounting for inflation, were 47.6 percent above the 1970 level, while capital expenditures were 33.7 percent above the 1970 level. GAO's May 2002, Report on Highway Infrastructure, notes with regard to Interstate Payment Projects from 1992 through 2000, "the kinds of projects undertaken after 1991 show a shift from construction to maintenance ... 93 percent was for projects to reconstruct, relocate, restore and rehabilitate, or resurface pavement." According to the analysis done by the FHWA in 1999, the cost to preserve just the 47,000 mile U.S. Interstate Highway System is \$10 billion annually beyond current funding.

The timing of preservation investments over the life cycle of an asset is also critical. The right maintenance treatment at the right time can sustain the system in satisfactory condition. If funds are not made available for preventive maintenance, the facility will continue to deteriorate and ultimately fail. Replacement costs are often five to ten times greater than the amount required for timely preservation.

### Asset Management

To help make more systematic management decisions in this area, state DOTs are partnering with industry to advance the concept of "Asset Managers." Asset management is a systematic process for maintaining physical assets cost-effectively. Most states and local governments already use a series of management systems to support investment decisions for bridges, pavements, maintenance, congestion, transit and safety. Asset management takes concepts inherent in those individual management systems and raises them to a new level that integrates them and evaluates tradeoffs among asset classes.

The need to include the preparation of budgets for state legislatures, counties, cities, and transit authorities which systematically explains what needs to be done, where, on what schedule, how much it will cost, and what the benefits will be. Better decisions are made which channel more resources to asset preservation. The useful life of many transportation assets can be extended at a lower cost.

## INCREASING PROGRAM DELIVERY COSTS

### Project Costs

The combination of environmental reviews and mitigation and the need to be responsive to community concerns is adding time and cost to transportation projects. The costs of preliminary engineering, to move a project from the planning stage through the environmental analysis process, including the associated public involvement, to the record of decision are not well-documented.\* However, there are already indications of the challenges transportation officials face.

The best evidence: Only 16 percent of transportation projects required to complete an environmental impact statement completed the environmental review process in less than three years while 32 percent of projects took seven or more years.

### The Environmental Review Process

In order to move from the planning phase to final design, all federally funded highway projects must go through one of three environmental review processes under the National Environmental Protection Act (NEPA): categorical exclusions, environmental assessments, or environmental impact statements. Until the process is complete, final design cannot begin, rights-of-way cannot be acquired and construction materials and transit rolling stock cannot be purchased. Once the NEPA process is complete, permits may also be required from federal agencies, such as Section 404 wetlands permits from EPA and the U.S. Army Corps of Engineers. These add additional time to the project approval process.

As October, 2005, AASHTO National Cooperative Highway Research Program (NCHRP) study showed that 91 percent of federally-funded highway projects qualify for categorical exclusions, 7 percent qualify for environmental assessments and 2 percent require full-blown environmental impact statements. For those requiring an impact statement, an FHWA analysis prepared in 2001 by the Louis Berger Group shows that the average time to complete an EIS takes over five years, and for projects involving an EIS, the time from the inception of planning to the completion of construction averages 13 years.

For the 7 percent of projects requiring environmental assessments, AASHTO's NCHRP study of 32 state DOTs showed the review time to average 18 months. However, when delayed by Section 401 or 106 historical reviews, for example, the average processing time increased to 42 months.

And contrary to the assumption that the 95 percent of projects which qualify for categorical exclusions require little to no review, the NCHRP study found that the review time for these projects — like parks, transmission improvements, bridge replacements, and the like — averaged eight months. For the 40 percent subject to delays due to historical and other reviews, project approvals averaged 22 months.

### Public Involvement

All federally funded highway and transit projects must coordinate an extensive public involvement process. It must provide early and continuing opportunities for the public to be involved in the

\*NCHRP Study 20-24 (Task 25), currently underway, is attempting to document the costs associated with the preliminary design phase of highway projects. Its results should be instructive. Other methods is being done on right-of-way acquisition and the costs of environmental mitigation.

identification of social, economic, and environmental impacts and mitigation issues. Through an emerging field called "context-sensitive design," state DOTs are attempting to be more responsive to a broader range of community concerns including those for preserving historic values, neighborhood character, and aesthetics.

The sheer complexity of the process by itself requires substantially more resources than it did 20 years ago. The states have found that it is better to commit the resources necessary to do the job well, than to attempt and be told by the courts to start over again. The point to be made is that the time and resources this extensive review requires has added substantially to project delivery costs. This must be factored into any comprehensive cost estimate.

#### **Mitigation and Right-of-Way Costs**

Wetland mitigation is among many types of mitigation that may be required for a project to proceed. Others include the construction of noise walls and replacement of wildlife habitat. A systematic study is required to update estimates of the costs mitigation typically adds to a project.

### **MANAGING THE SYSTEM**

Over the past 20 years, growth in travel on the nation's highways has far exceeded growth in highway capacity. As a result, congestion is a critical problem for metro areas nationwide. Cities of all sizes are experiencing more severe congestion for longer periods of the day. Between 1992 and 1999, the average delay per person due to congestion jumped from 11 hours to 36 hours per year. As a result, traffic flow is the aspect of the nation's highway system that the public is least satisfied with, according to the FHWA Traveler's Satisfaction Survey.

More than 60 percent of all delays are the result of non-occurring congestion caused by crashes, weather, or other incidents. Such congestion is especially disruptive because drivers cannot fully anticipate or plan for it. Efficient management and operation strategies can reduce delays and improve reliability, while also providing such benefits to quicker response by emergency vehicles.

#### **A Systems Management and Operation Approach**

Systems management and operations covers a wide array of strategies including: incident detection and response; snow and ice management; emergency and disaster response; planned construction disruption; traffic and transit operations and management; and traveler/shopper information. Both capital and operating investments are needed to achieve the benefits of system management. Such investments are eligible for TEA-21 funding, and are an important element for authorization.

#### **Benefits of Management/Operations Strategies**

Investments in systems management and operations can be low cost and yield high benefits for travelers in reduced congestion, increased safety and improved quality of the travel experience. For example, improvements in routine traffic operations can efficiently improve travel time and reduce delays; signal improvements can reduce travel time eight to 25 percent; and ramp metering in Minnesota has increased travel speeds 16 percent, with fewer crashes.

Incident management strategies to identify and clear crashes more quickly can significantly reduce non-occurring congestion, as well as help prevent additional crashes. Evidence suggests that delays

due to crashes and other incidents can be reduced by up to 52 percent with active detection and response techniques, and may be the most effective stand-alone strategy for improving traffic flow.

Managing the transportation system at peak performance cannot eliminate congestion, but it can reduce delay, improve reliability, reduce injuries and fatalities and restore a sense of control to travelers.

## TRANSIT

The nation's extensive public transportation network provides access to jobs, mobility for the young, elderly or disabled and helps reduce congestion, conserve fuel, enhance the efficiency of highway transportation, reduce air pollution and support security and emergency preparedness activities. An efficient, safe and environmentally sound public transportation system is essential to moving people in both rural and urban areas.

### SYSTEM OVERVIEW

Public transportation services are currently available in 319 urbanized areas, and every state has some level of public transportation service available to its rural areas. There are:

- 556 public transportation operators in urban areas
- 1,180 organizations that provide public transportation services in rural areas and
- 5,660 organizations that provide public transportation services to the elderly and people with disabilities.

### Ridership

Increased federal, state and local investment in transit has helped spur a 22 percent ridership increase during the past six years, with the 9.5 billion passenger trips during 2001 being the highest level in 42 years. Continued ridership growth at levels comparable to those actually observed over the last six years would result in an average increase in passenger trips of approximately 3.5 percent annually, or a 100 percent increase over the next two decades.

### CURRENT SYSTEM PHYSICAL CONDITION AND PERFORMANCE

Texas, 22 percent of the nation's buses and 43 percent of its rail rolling stock exceed their recommended service life. An additional 47 percent of buses, and 11 percent of rail rolling stock, will exceed their recommended service life within the next six years.

Stable infrastructure investment is required to accommodate increased ridership demands, including the construction of new transit systems and expansion of existing fixed-guideway transit systems. Underinvestment in rural and specialized transit services has resulted in substantial unmet needs and underserved areas.

More than 54 percent of all public transportation trips in the nation are reported to be work-related, confirming transit's importance to the economy.

#### Transit Trips by Purpose

| Type of Trip      | Percent of Total |
|-------------------|------------------|
| Employment/Work   | 54               |
| School            | 15               |
| Shopping          | 9                |
| Recreation/Social | 9                |
| Medical           | 6                |
| Other             | 8                |

#### Average Weekday Transit Ridership by Mode (2000)

| Mode            | Average Weekday Unlinked Trips | Percentage of All Transit Trips |
|-----------------|--------------------------------|---------------------------------|
| Bus             | 19,788,000                     | 61.8                            |
| Heavy Rail      | 8,895,000                      | 27.1                            |
| Commuter Rail   | 1,445,000                      | 4.5                             |
| Light Rail      | 1,034,000                      | 3.2                             |
| Trolleybus      | 380,000                        | 1.2                             |
| Demand Response | 372,000                        | 1.2                             |
| Ferryboat       | 164,000                        | 0.5                             |
| Other Rail      | 78,000                         | 0.2                             |
| Vanpool         | 55,000                         | 0.2                             |
| Totals          | 32,005,000                     | 100.0                           |

**Urban Bus Systems**

The nation's public transportation bus fleet now exceeds 80,000 vehicles, 69 percent of which are currently over-age or which will exceed their federally recommended replacement age during the next six years. Continuing to use over-age buses will affect passenger comfort, service reliability and maintenance costs. More, if not all, of the remaining fleet will require a mid-life rehabilitation to maintain a proper and safe condition. Replacement of the entire fleet, at today's prices, would cost \$20 billion.

**Rail Systems**

In many large and even mid-sized cities across the country, fixed-guideway rail operations play a significant role in providing public transportation service. Today, 75 urban public rail systems are in place in 26 states and the District of Columbia.

The transit rail system has more than 10,000 track miles, almost 3,000 stations and more than 17,000 vehicles in revenue service.

**Existing Public Transportation Rail Systems, by Mode**

|               | Number of Systems | One-Way Track Miles | Number of Stations |
|---------------|-------------------|---------------------|--------------------|
| Heavy Rail    | 14                | 2,177.8             | 1,008              |
| Light Rail    | 28                | 1,915.8             | 931                |
| Commuter Rail | 20                | 7,294.4             | 1,153              |
| Other Rail    | 13                | 43.2                | 71                 |
| <b>Total</b>  | <b>75</b>         | <b>11,531.2</b>     | <b>2,864</b>       |

Just as with the nation's bus fleet, the average age and percentage of aging and rolling stock indicates that transit systems have not been able to keep pace with the federally recommended replacement cycle. Fifty-four percent of all of the rail vehicles currently being operated in revenue service have exceeded their service life or will do so in the next six years. Almost all rail vehicle categories have an average age that exceeds the midpoint of their scheduled replacement cycle. Again as with buses, the continued use of over-age vehicles can be associated with passenger discomfort, less reliability and higher operating and maintenance costs.

**Rural Public Transportation Systems**

Rural public transportation assistance programs can receive direct federal assistance, and currently 1,280 programs using 49,500 vehicles provide such services in rural America. An estimated 55 percent of the existing fleet has already exceeded the federally stated service life. Within the next reauthorization period, almost all of the nation's rural transit vehicles will need to be replaced.

**States with Existing Transit Rail Service**

About 9,200 vehicles per year will need replacement on an ongoing basis.

**Rural Transit Fleet**

**System Expansion Needs**

Meeting public transportation needs associated with projected ridership growth will require significant investment in system expansion beyond what will be needed for replacement. Much of the need for new service will be the result of continuing increased use of existing systems.

| Fleet Segment               | Estimated Fleet |
|-----------------------------|-----------------|
| Rural General Public        | 19,000          |
| Rural Specialized Operators | 28,800          |
| Rural Intercity             | 1,700           |
| <b>Total Fleet</b>          | <b>49,500</b>   |

throughout the country. Systems will be required to add vehicles, stations, maintenance facilities, and numerous supporting elements to meet this increasing demand.

#### Core Capacity of Existing Systems

In many of the nation's largest cities, transit ridership has significantly increased during the last six years. As a result, existing rail systems are operating near to or in excess of their physical capacity and above a level that provides acceptable passenger comfort and safety. Without significant capital investment to expand the core capacity of these systems, many of them will be unable to meet this demand. Among the kinds of upgrades that will be necessary are: new signal systems to allow more throughput of rail vehicles, double tracking of existing rail lines to provide for additional system capacity, and station platform extensions.

#### New Starts

Many metropolitan areas across the country have recently completed or are pursuing major rail transit capital improvements under the federal "New Starts" program. Between 1996 and 2001 alone, more than 150 miles of rail transit service were added in 20 cities, including Atlanta, Baltimore, Chicago, Dallas, Denver, Jacksonville, Los Angeles, Memphis, New York, New Jersey, Pittsburgh, Portland (Oregon), Sacramento, Salt Lake City, San Francisco, San Jose, Stockton, Seattle, St. Louis and Washington, D.C.

Currently, the New Starts program includes more than 70 projects in 26 states and the District of Columbia that have moved beyond initial stages of study, at an estimated \$47 billion cost. In addition, more than 150 studies are underway around the country.

Many additional communities are exploring the possibility of meeting their transit needs through "low speed transit."

#### Rural Public Transportation Needs

Although limited data are available to estimate senior rural transit needs, studies that have studied the issue have identified substantial unmet needs. The proportional increase in capital costs needed is high — ranging from about 80 percent in Minnesota to nearly 300 percent in Montana. This suggests that approximately a doubling is needed of the existing level of investment in the rural public transportation system.

#### Rural Transit Estimates

Rural transit needs consist of two major components — the maintenance of the existing system and the expansion of the system to address unmet needs. The total estimated annual need for rural transit is:

- Replacement/rehabilitation of existing general public vehicles — \$191 million.
- Replacement/rehabilitation of specialized vehicles — \$194 million.

### New Starts Projects

- Replacement/rehabilitation of agency vehicles — \$50 million.
- Replacement/expansion of Rural General Public and Rural Specialized Maintenance and Administrative Facilities — \$61 million.
- Expansion of Rural General Public, Rural Specialized, and Rural Facilities to improve service — \$495 million.

In total, rural public transportation needs are estimated at \$2.5 billion annually for the maintain conditions and performance scenario and \$1.0 billion annually for the improve service performance scenario.

### TRANSIT NEEDS ASSESSMENT

#### Types of Transit Capital Needs

- Replacement of bus and rail vehicles (at the end of federally determined useful life).
- Major rehabilitation of bus and rail vehicles (mid-life rebuild).
- Eliminate the backlog of vehicle yards to bring the nation's fleet into a state-of-good-repair.
- Replacement or rehabilitation of bus and rail maintenance and yard facilities, stations and tracks.
- Fleet expansion to accommodate increased ridership demands.
- Expansion of new rail systems to meet demand.

**TRANSIT INVESTMENT SCENARIOS**

Urban area capital investment needs were calculated using several alternative investment scenarios, then narrowed to two:

**Maintain Physical Conditions and Performance, Constrained Rate of Growth**

Assumes that transit capital assets will continue to be replaced as they are today, often later than is recommended, that service will be provided at existing levels with increases in service only to accommodate new riders and not to reduce crowding. Constrained rate of growth: 1.8 percent Annual Ridership Increase (42 percent over 20 years), and

**Improve Physical Conditions and Service Performance, Current Rate of Growth**

Assumes that transit capital assets will be replaced according to recommended cycles, resulting in an overall improvement in conditions that improvements are made to both reduce passenger densities on the most crowded systems and to improve the speed of service for systems where the average speed falls well below the national average. 3.5 percent annual ridership increase (80 percent over 20 years) based on growth rates since 1995; assumes 12.5 billion passenger by 2020.

**TRANSIT CAPITAL INVESTMENT SCENARIOS**

Alternative investment scenarios were identified by applying combinations of system physical conditions and performance. If the nation's urban and rural transit systems only maintain physical

**Scenario 1: Average Annual Capital Cost — Maintain Physical Conditions, Maintain Service Performance, Constrained Rate of Growth**

| Transit Needs Component   | Annual Cost (\$Billions) |
|---|--------------------------|
| Replacement/rehabilitation of existing vehicle fleet                                | \$3.8                    |
| Replacement/rehabilitation of other transit assets                                  | \$4.8                    |
| Expansion of vehicle fleet and other transit assets to accommodate ridership growth | \$8.8                    |
| Rural/small urban   | \$8.8                    |
| <b>Total Need</b>   | <b>\$16.2</b>            |

conditions and service performance at the levels that are being observed today, annual capital investment needs will be about \$19 billion — assuming 1.6 percent annual ridership growth. If the decision is made to improve both the existing physical conditions and improve service performance at the current ridership growth rate of 3.3 percent, the annual transit capital need is about **\$44 billion**.

The need estimates imply a growing gap between historic levels of transit capital expenditures and required investment needs. Much of this increased need is a result of substantial and continuing transit ridership gains across the country.

Transit operating and capital expenditures from all sources totaled \$15.8 billion in 2000, a 32 percent increase from 1995. Capital expenditures totaled \$9.5 billion in 2000, representing half of the projected annual needs associated with the cost-to-maintain scenario and 33 percent of the projected annual needs associated with the cost-to-improve scenario. Federal transit assistance reached \$7.2 billion in FY 2002.

State and local governments have already shouldered much of the burden for financing transit operations and more are reaching their limits, especially with budget shortfalls. Without increased levels of federal, state or local funding or new and innovative approaches to finance, the only way to pay for future transit costs is the fare box and other system revenue. However, without an increase in government assistance, transit fares would have to nearly double over the next five years alone to address projected currently unmet operating deficits — much less additional capital needs. This does not appear to be viable.

**Scenario 2: Average Annual Capital Cost — Improve Physical Conditions, Improve Service Performance, Current Rate of Growth**

| Transit Needs Component   | Annual Cost (Billions) |
|---|------------------------|
| Replacement/rehabilitation of existing vehicle fleet                                | \$5.6                  |
| Replacement/rehabilitation of other transit assets                                  | \$5.1                  |
| Expansion of vehicle fleet and other transit assets to accommodate ridership growth | \$32.2                 |
| Rural/small urban   | \$1.0                  |
| <b>Total Need</b>   | <b>\$43.9</b>          |

## TRANSPORTATION AND SAFETY

### TRENDS

During the past decade, the highway fatality rate per 100 million vehicle miles traveled has been reduced from 2.1 fatalities to 1.5. Unfortunately, the fact that more people traveled more miles — 2.75 trillion in 2000 versus 2.15 trillion in 1990 — means that, overall, fatalities remain high. About 42,000 Americans die on our highways each year.

Highway fatalities are not limited to the occupants of cars and trucks. There were 299 motor fatalities in 1999, the most recent year for which data are available. In 2000, 4,270 pedestrians, 2,861 motorcycle riders, and 690 bicyclists were killed on the nation's roads.

Young adults, ages 16 to 24, represented 28 percent of all traffic fatalities in 2000, and drivers under 25 had the highest rate of involvement in fatal crashes of any age group. The highest involvement rate was for drivers 21 to 24 years old. Passenger vehicle occupants 30 to 34 years old involved in fatal crashes had the lowest survival rate — just 49 percent.

From 1990 to 2000, the population over age 70 grew twice as fast as the rest of the population. Based on current levels of learning, the population of older drivers is expected to quadruple in coming decades. Older drivers have a higher crash risk than other drivers because of vision problems, cognitive limitations, medication side effects, slower reaction time, muscular difficulties, and disease.

It is likely that older drivers will “age in place,” meaning that they will generally remain in their pre-retirement housing. With the suburbanization of America, this means that older Americans will drive more. Between 1983 and 1995, older Americans had the largest increase in travel of any age group, and even drivers aged 85 or older continue to prefer driving their own vehicles. Unless alternatives, such as demand-responsive transit, are made available, this trend will continue.

### The AASHTO Strategic Highway Safety Plan

The AASHTO Strategic Highway Safety Plan sets an ambitious goal: save 5,000 to 7,000 lives each year and substantially reduce health-care costs due to vehicle-related injuries. The plan identifies 22 key emphasis areas targeted at drivers, vehicles, highways, enforcement, emergency medical services, and management. Implementing AASHTO's Strategic Highway Safety Plan would cost at least \$10 billion in capital costs over six years, and require an additional \$1 billion per year for operating costs.\*

Strategies aimed at reducing impaired driving, encouraging use of seatbelts and child restraints, targeting or encouraging the use of helmets by motorcyclists and bicyclists and improving licensing procedures and reviews could save thousands of lives annually if legislation and policy actions are applied across the nation and effective public information and enforcement campaigns are implemented.

AASHTO believes each state should develop a goal-oriented, performance-based comprehensive highway safety component incorporating education and enforcement as part of their long-range

\*\$10 billion is required for highway infrastructure aspects of just six of the 22 goal areas. Capital costs for the nation enforcement, medical services, driver and pedestrian areas have not been estimated, and are not included.

transportation planning process and be given the flexibility to invest resources where the most lives can be saved. To do this, the overall federal-aid highway program must be increased. Each comprehensive state highway safety plan should reflect the conditions that exist in the state and could include:

- Programs aimed at changing driver behavior;
- Reducing crashes involving running off the road, hazards from trees and utility poles and dangerous intersections;
- Roadway-safety improvements such as rumble strips, brighter pavement markings, safer work zones and ITS technologies.

## HIGHWAY AND TRANSIT SECURITY

The terrorist attacks of September 11, 2001 have compelled us to consider how to secure America's highway and transit assets from such acts. Since then highway and transit agencies have mobilized to improve their abilities to protect the traveling public. They have done so in partnership with FHWA, FTA, and IHSVA, and through the resources of THB. They have built upon current work in operations technologies and natural disaster emergency planning, with added concern for the physical protection of key facilities.

States and local governments have conducted vulnerability assessments to define critical infrastructure to need of priority attention, such as bridges, tunnels, highway interchange structures and transit stations.

### HIGHWAY SYSTEM SECURITY

System redundancy has proven to be a key planning factor. Current military and engineering judgments indicate that the complete protection of key facilities from destruction is not feasible or cost effective. In protecting assets states have been encouraged to follow the Department of Defense "4-D" approach: "denial, detect, defend and design." The overall practical objective of the counter-terrorism measures being pursued is not to provide full protection, but to reduce exposure through techniques such as:

- Denial of access to key structures through barriers and fencing.
- Minimizing time-on-target through surveillance cameras and patrolling.
- Hardening key facilities through blast shielding and strengthening of structures and.
- Reducing access to tunnel vents to protect them from biological/chemical attack.

Of the close to 600,000 bridges and tunnels nationwide, some 500 have been identified as critical based on facility size, traffic volume, and strategic importance.

### ENHANCEMENT OF HIGHWAY EVACUATION AND EMERGENCY RESPONSE CAPABILITIES

The proposed overall security program has focused on the protection of threatened populations as well as assets. Improving the evacuation and emergency response capabilities of the urban roadway system is a key component of the national highway-related security program.

An evacuation network has been defined for the 78 largest metropolitan areas of the United States. This network incorporates about 10,500 miles of freeway and approximately 16,000 miles of arterials. An additional 600 miles of key higher volume Strategic Highway Network (STREAMNET) urban and rural routes identified by the Department of Defense would also be covered.

States and local governments managing these routes must be given the ability to track system use, performance, and incidents through accelerated deployment of vehicle detection technology.

including closed circuit TV surveillance. Variable message sign installation will improve communication with the traveling public as will deployment of "511" traveler information systems.

The September 11 experience has indicated the need to update "all-hazard" statewide emergency response plans to include terrorism, and to train officials in their use. Interoperable and reliable communications capabilities need to be funded to link transportation agencies with the military, law enforcement, rescue services and the public.

The capital cost of upgrading highway security, for both hardening as well as emergency response capabilities is estimated at \$6.1 billion for the next six years, with \$576 million required annually for operating expenses.

**Annual and Six Year Total Costs Summary for Highway-Related Security Program**

| Strategy                                    | Elements                                       | Capital Costs (in millions) |         |         |         |        |         | Total 6 Year Capital Costs (in millions) | Total Operating Costs (in millions)     | Average Annual O & M Costs (in millions)  |
|---|--|-----------------------------|---------|---------|---------|--------|---------|--|---|---|
|   |  | Year 1                      | Year 2  | Year 3  | Year 4  | Year 5 | Year 6  |  |   |   |
| Protection of Critical Mobility Assets      | Rebuild Bridges                                | \$245                       | \$245   | \$245   | \$245   |        |         | \$980                                    | \$980                                   | \$163 per year                            |
|   | New Bridge Security-related Costs              | \$70                        | \$70    | \$70    | \$70    | \$70   | \$70    | \$420                                    | \$70                                    | \$12 per year                             |
|   | Tunnels  |                             | \$20    | \$20    |         |        |         | \$40                                     |   | No cost attributable directly to security |
|   | TMCs   |                             | \$20    | \$20    |         |        |         | \$40                                     |   | No cost attributable directly to security |
| Enhancement of Emergency Management Systems | Detection, Surveillance, VMS & Dynamic Routing | \$600                       | \$600   | \$600   | \$600   | \$600  | \$3,600 | \$600                                    | \$100 per year attributable to security |   |

| <b>TOTAL</b>                                |  | \$1,110                     | \$1,135 | \$1,080 | \$1,080 | \$920  | \$6,125 | \$6,126                                  | \$1,471 over six years                  | \$276 per year                            |

**TRANSIT SYSTEM SECURITY**

In both New York and Washington, transit played a crucial role in the safe evacuation of millions of people directly affected by the terrorist attacks on September 11. In New York City, emergency ferry service provided a critical link to replace access that was cut when the PATH station at the World Trade Center was destroyed and the Holland, Lincoln, and Brooklyn-Battery Tunnels were closed for several days after the attack. The availability of transit service allowed New York City officials to impose a ban on single occupancy vehicles in midtown and downtown Manhattan for several months, greatly facilitating the recovery effort in lower Manhattan.

Transit systems are also particularly vulnerable to terrorist attacks. Especially in large urban transit systems, large numbers of people are concentrated in relatively small spaces. Transit systems have been an inviting target for terrorists in other countries, such as the chemical attacks in the Tokyo subway in the early 1990s and the recent rash of bus bombings in the Middle East.

**PROTECTION OF CRITICAL TRANSIT ASSETS AND IMPROVED EMERGENCY RESPONSE**

The needs for critical transit facilities and structural structures and critical transit assets are similar in nature to highway needs. Capital costs, for both asset protection and emergency response capabilities, include detection and surveillance systems, such as closed-circuit TV in stations, and traveler information systems. The ongoing operations costs include staffing for increased security planning, surveillance, patrols, and response to alerts. Transit agencies must also improve their ability to respond in the event of a terrorist attack. Plans need to be developed, training provided, personal protective and detection equipment secured, and communications capabilities upgraded.

The capital cost of upgrading transit security is estimated at \$6.1 billion for the next six years, with \$500 million required annually for operating expenses.

**Annual and Six-Year Total Costs Summary for Transit-Related Security Program**

| Strategy                                | Elements  | Capital Costs (in millions) |         |        |        |        |        | Total 6 Year Capital Costs (in millions) | Average Annual O & M Costs (in millions) |
|---|---|-----------------------------|---------|--------|--------|--------|--------|--|--|
|   |   | Year 1                      | Year 2  | Year 3 | Year 4 | Year 5 | Year 6 |  |  |
| Protection of Critical Mobility Assets* | Infrastructure and Rolling Stock Security             | \$1,700                     | \$1,700 | \$000  | \$000  |        |        | \$0,000                                  | \$ per year                              |
| Enhancement of Protective Capabilities  | Detection, Surveillance, Traveler Information Systems | \$250                       | \$250   |        |        |        |        | \$500                                    | \$ 200 per year                          |
| Improvement of Emergency Response*      | Planning, Training, O & M, Communications             | \$150                       | \$150   | \$00   | \$00   | \$00   | \$00   | \$600                                    | \$ per year                              |
| <b>TOTAL</b>                            |   | \$2,100                     | \$2,100 | \$000  | \$000  | \$00   | \$00   | \$6,100                                  | \$600 per year or \$2,000 over six years |

## LINKAGE TO OTHER MODES

Highways and transit do not exist and operate in isolation from each other or other modes of transportation. Passenger trips and freight deliveries frequently involve more than one mode and often there are choices of modes for both passenger and freight trips between two points.

Most transit commuter trips start with a trip on the highway by either car or bus. Virtually all passenger trips by rail or air require connections involving car, cab, transit or rail. For many travelers, congestion on the highways is preceded by congestion on the highways.

Merchandise manufactured and packed in a container in China may be imported to the U.S. through the Port of Long Beach, stacked in a nearby Intermodal Container Transfer Facility (or moved by rail through the Alameda Corridor), loaded onto a double-stack unit-train, moved by rail to Chicago, transferred across town by truck from a Western railroad to an Eastern railroad, moved by rail to New Jersey, transferred to a truck, taken to a nearby distribution center where the contents are transferred to smaller trucks, and finally delivered by van to a customer in Brooklyn. At every point in this chain delays and disruptions create costs for producers, transporters, shippers and consumers and the volume of freight movement may, in turn, cause delays and disruptions for passenger travel.

### PASSENGER TRANSPORTATION LINKAGES

In the implementation of transportation programs, modal linkages are being developed in a much more systematic manner than was the case in the past, as illustrated by the following examples:

#### Intermodal Facility, Huntington, West Virginia

Huntington, West Virginia's TEA-21-funded Intermodal Transportation Facility will be in the center of the city, as a transfer point for local and interstate buses, taxis, private cars and bicycles. A new shuttle service will link the center with Marshall University. Financed with \$26 million in federal funding, the facility will reduce traffic and increase economic development in the downtown.

#### JFK AirTrain, New York

AirTrain, a light-rail system being built by the Port Authority of New York and New Jersey using funding from passenger facility charges, will provide fast, convenient and dependable surface access to and within John F. Kennedy International Airport. The 8.1-mile system will link JFK's airline terminals, car rental agencies and parking with commuter rail and subways.

#### California Capital Corridor

The passenger rail corridor running from San Jose, California, to Auburn, California, through Sacramento, which has had a 400-644 increase in ridership over one decade, benefits significantly from a feeder-bus network, which 29 percent of passengers utilize on one or both ends of their train ride.

The events of September 11 highlighted the importance of multiple modes of transportation and the need for a resilient system with built-in redundancy critical in times of emergency and necessary to the "new normal" era. While the airlines were out of operation, intensity passenger rail picked up

the dock. When evacuation from lower Manhattan was impossible by car or transit, the passenger ferry system moved more people than anyone could have predicted.

### FREIGHT INTERMODAL LINKAGES

Intermodal terminals for freight modes may be highly specialized depending on the commodities being moved, or their packaging, e.g. containers, bulk grain, petroleum, vehicles, whereas on the passenger side the constant is that the commodity shipped is people and only small variations exist in their handling, typically a function of length of stay at the terminal, baggage requirements, border formalities, etc.

In 2001 the Intermodal Association of North America, IANA, reported detailed intermodal linkages that involved containerization, a rapidly growing and increasingly significant component of truck-rail linkages. In a down year in the aftermath of September 11 they measured over 10 million container moves in rail intermodal flows, up dramatically over 20 years from about 3 million containers in 1980. Of those, slightly more than half involved international container movement; the remaining half involved domestic movements, divided almost equally between containers and truck trailers on flat cars. The Association of American Railroads (AAR) has stated that intermodal flows are their industry's fastest-growing segment, constituting 20 percent of industry revenues. The AAR reported further that in the year ending in July, intermodal traffic has risen over 10 percent.

It is clear that the intermodal flows of goods over road, rail and other modes are increasingly central to key parts of the US and world economies and a major component of U.S. road activity.

Intermodal connections, often called "the last mile," are a critical element of the freight transportation system. As part of the National Highway System designation process arising from ISTEA,

#### Passenger and Freight Intermodal Connectors

| Connector Type                          | Number |
|---|--------|
| <b>Passenger only</b>                   |        |
| Public Transit Stations                 | 369    |
| Intercity Bus Stations                  | 99     |
| Amtrak Stations                         | 71     |
| Ferry Terminals                         | 59     |
| Multimodal Passenger Sites <sup>1</sup> | 42     |
| <b>Joint Terminal<sup>2</sup></b>       |        |
| Maritime Facilities                     | 247    |
| Airports                                | 228    |
| <b>Freight Only</b>                     |        |
| Truck/Rail Terminals                    | 211    |
| Pipeline/Truck Terminals                | 81     |

52 TRANSPORTATION — INVEST IN AMERICA

criteria were developed in 1995 to identify key freight hubs, terminals and their NIBS intermodal connector routes, those segments of road that connect the hub to the core highway system. Over 1,400 connectors to terminals were identified and provided to the Congress in 1996 as summarized below, for both passenger and freight connectors.

In the category of freight connectors, the FHWA identified 616 freight terminals served by 1,222 miles of highway connectors as shown in the following table:

#### Freight Intermodal Connectors

| Connector Type                                | Terminals  | Miles        |
|---|------------|--------------|
| Ports (ocean and river)                       | 253        | 532          |
| Airports                                      | 99         | 231          |
| Truck/Rail Terminals                          | 203        | 354          |
| Pipeline/Truck Terminals                      | 61         | 115          |
| <b>Total Number of NIBS Freight Terminals</b> | <b>616</b> | <b>1,222</b> |

The FHWA survey found that pavement conditions on these connectors were more likely to be poor or very poor than were the full NIBS system, particularly at ports and at truck/rail facilities and that relatively modest investment would yield substantial returns in terms of safety, freight movement speed and schedules, and reduced traffic disruptions for passenger cars, trucks and rail.

#### Rail-Highway Grade Crossings

The many intersection points between the rail and highway networks generate a special case of intermodal interaction. These points of interaction have been a serious concern for many years in regard to their potential threat to safety. As both rail and highway traffic increases rail-highway crossings become important barriers to the smooth flow of freight and passengers and the fuller utilization of available capacity. The Institute for Transportation Research and Education at North Carolina State University surveyed rail-safety needs in 2002, focusing on highway-rail at-grade crossings and identified needs covering freight- and passenger-rail lines totaling \$11.8 billion. The needs ranged from new installations and upgrades of existing warning systems to grade separations and track relocations.

#### Modal Interactions

Congestion and capacity problems in other modes have direct impacts on highway congestion and capacity. To the degree that other modes — passenger and freight rail and the marine transportation system — can carry their weight, the burden on highways will be lessened. AASHTO's Freight Rail Bottom Line Report, for example, estimates that minimal investment and no growth in the freight rail industry between now and 2012 would "shift about 900 million tons of freight and 31 billion truck miles of travel to the highways." The business case to shippers is estimated at

\$326 billion; the cost in travel time, operating, and accident costs to highway users is pegged at \$462 billion, and the cost in added highway maintenance is \$21 billion over the 20-year period.

In one state — Kansas — changes over the last 10 years, such as the construction of grain-train loading facilities on Class I main lines, the introduction of 290,000 grain-lift grain loader cars, the emergence of fewer and larger farms with increased scale of operations, and the increased farmer ownership of semi-trailer trailer trails, have resulted in a shift from transporting grain via short-line railroads serving country elevators to increased trucking of grain.

While there has been a modal shift in the transportation of grain in Kansas, and Kansas short-line railroads have abandoned non-profitable line segments within the system, the remaining Kansas short-line infrastructure continues to play a vital role in the state's freight transportation infrastructure. According to *Impact of Kansas Grain Transportation on Kansas Highway Damage Costs (IJKM)* for the area studied, "the short-line rail system saves the state of Kansas \$49.5 million in pavement damage costs annually, with the average damage cost of incremental truck traffic costing approximately \$2.17 cents per track mile."

Similarly, AASHTO's analysis of intercity passenger rail service shows benefits in reduced congestion for both highway and air transportation from increases in passenger rail ridership.

### AASHTO PREPARING OTHER MODAL INVESTMENT REPORTS

- To address the investment needs of other transportation modes, AASHTO is preparing the following reports:
- **Intercity Passenger Rail Report** documents investment needs for existing and planned intercity passenger rail corridors.
- **Freight Rail Business Line Report** estimates freight rail investment needs.
- **Airport Business Line Report** estimates future investment needs to maintain and expand the air transportation system.
- **Ports and Waterways Business Line Report** documents the investment needs for the nation's ports and waterways.

## FUNDING ISSUES

### FEDERAL STATE AND LOCAL FUNDING ROLES:

Total highway expenditures by all units of government reached \$127.3 billion in 2000 — \$44.6 billion in capital outlays. Federal assistance was \$33.8 billion in FY 2000, and in FY 2003, will wind up somewhere between the figure of \$27.7 billion pending in the U.S. House of Representatives, and \$31.8 billion currently before the U.S. Senate.

In 2000, states, at 51.7 percent, provided the largest share of funding. Local governments were second at 24.5 percent and the federal government a close third, at 24 percent. Total funding of the highway program rose by 70 percent between 1990 and 2000, an increase of \$53.3 billion to reach a level of \$127.3 billion. As a result of enhanced ISTEA and TEA-21 funding, federal funding grew the fastest in percentage terms in the period, producing an increase in the federal share. However, the states grew the fastest in dollar terms, supplying half the increase in the period, with local governments providing 30 percent of the increase and the federal government, the remaining 20 percent.

With 46 out of 50 states facing a severe fiscal crisis in 2002, it is not clear what their abilities will be to increase funding for transportation over the next six years. There are some hopeful signs, however. In 2002, Maine joined 11 other states by indexing its fuel taxes to the Consumer Price Index. Kansas raised its gas tax by two cents. Indiana increased its fuel tax by three cents. Finally, transportation funding referendums will be voted on in Virginia and Washington State this year.

Total transit expenditures from all sources reached \$33.8 billion in 2000 — \$9.5 billion in capital outlays. Federal transit assistance increased from \$5.8 billion in FY 2000 to \$7.2 billion in FY 2003. FTA reports that \$1.8 billion in federal highway funds were flexed to transit in FY 2000. Considerably from FY 1992 to FY 2001, \$7.7 billion was flexed from highways to transit. In addition to flexing federal funds to transit, many states provide a substantial amount of state funds to public transportation. State transit funding increased from \$8 billion in 1999 to more than \$6.8 billion in 2000. For example, last year, at the request of Governor Gray Davis, the California Legislature approved a \$6.8 billion "Congestion Relief" program that channeled \$3.5 billion to transit and transit-related activities.

FY2000 Federal Highway Trust Fund receipts were \$34.9 billion. \$4.6 billion of this went to the Mass Transit Account and the remaining \$30.3 billion to highways.

**Federal Highway Trust Fund Net Receipts — FY2000**

| Source                    | Receipts (\$1,000,000) | Percent of Total |
|---------------------------|------------------------|------------------|
| Motor Fuel                | \$30,288*              | 86.6             |
| Gasoline                  | 20,882                 |                  |
| Gasohol                   | 1,609                  |                  |
| Diesel and Other          | 7,877                  |                  |
| Trucks and Trailers       | 3,321                  | 9.5              |
| Heavy Vehicle Use         | 921                    | 2.6              |
| Tires                     | 442                    | 1.3              |
| <b>Total Tax Receipts</b> | <b>34,972</b>          | <b>100.0</b>     |

\*Includes transfers of \$421,401,000 to the Mass Transit Account.  
 \*Includes no funds credited to the Mass Transit Account.

**State Disbursements for Highways 2000**

### Financing Opportunities

The tradition in American highway finance has been heavy reliance on pay-as-you-go, tying the rate of highway improvement to the rate of revenue generation from users. In the 1990s this expanded. New public toll roads were built. Public-private ventures were initiated such as the 15-mile Dulles Corridorway, in northern Virginia and the Orange County, California Transportation Corridor Authority Project. The use of federal funds to pay debt service costs was permitted. GARVEE bonds, state infrastructure bonds, and TIFIA were authorized. As a result states, counties and cities have made use of these and other forms of highway debt finance on an increasing basis.

To get a better handle on developments in this area, a National Cooperative Highway Research Program (NCHRP) study was conducted among 18 states to review how state DOTs were using debt finance to better meet their needs. Some of the results are displayed in the following table.

Among the survey findings general-obligation bond issues declined, as did toll revenue and sales tax revenue bonds. On the other hand, bonding activity backed by highway revenues increased by 16 percent annually.

### 1990s Federal Program Changes Expanded Debt Financing Options

In 1994, FHWA spearheaded an initiative to introduce new flexibility into financing the Federal-aid Highway Program. The test and evaluation research initiative TE-045 allowed states to submit proposals for alternatives to conventional pay-as-you-go, grant-based funding strategies.<sup>7</sup> As of fall 2001, 322 projects had been approved in 42 states.<sup>8</sup> More than 60 of these projects ultimately advanced to construction using various innovative models approved for general use under the Federal-aid Highway program. The combined value of these 60 projects is approximately \$4 billion.<sup>9</sup>

Further diversification of debt financing in the 1990s was due to enactment of the National Highway System Designation Act (NHS) (1995) and TEA-21 (1998). The NHS Act authorized the use of federal funds to pay debt service costs and the establishment of the State Infrastructure Bank Program. TEA-21 gave states the opportunity to access federal loans and credit enhancements for projects meeting specific criteria.

SIBs are revolving fund mechanisms designed to finance a wide variety of highway and transit projects through loans and credit enhancements. Since 1996, 32 states have financed over 245 highway and transit projects with project costs of \$2.9 billion.<sup>10</sup>

### GARVEE Bonds

Grant Anticipation Revenue Vehicles - can be used for any Federal-aid highway or transit project. From 1996 to present, six states have issued over \$1 billion in GARVEE bonds directly repaid by Federal funds.<sup>11</sup>

### TIFIA

The Transportation Infrastructure Finance and Innovation Act, authorized loans and credit enhancements for major projects at a low cost to the government. Total program activity from TIFIA's inception includes five highway and bridge projects and six other projects with capital costs totaling more than \$35 billion.<sup>12</sup>

Transportation Bond Activity Summary — 1998-2001 in millions

| Bond Type                       | 1998        | 1999        | 2000         | 2001        | Total        |
|---------------------------------|-------------|-------------|--------------|-------------|--------------|
| <b>Advancing Funds</b>          |             |             |              |             |              |
| General Obligation Bond         | 878         | 888         | 887          | 238         | 2723         |
| Highway Revenue Bond            | 1648        | 1811        | 2068         | 2718        | 8239         |
| Federal Grant Anticipation Bond | 814         | 28          | 1891         | 1282        | 3076         |
| Lease Payment Bond              | 298         | 8           | 224          | 204         | 830          |

| Issues Under \$10 Million       | 807         | 448         | 482          | 813         | 1927         |
| <b>GRAND TOTAL<sup>1</sup></b>  | <b>9041</b> | <b>7012</b> | <b>10251</b> | <b>9167</b> | <b>33726</b> |

<sup>1</sup> Does not include refundings of MATB for the four-year period.

### Future Opportunities

Expansion of these financing techniques and development of new approaches will depend on three factors: resources, tools and institutional readiness. First, there is no free lunch with innovative financing — revenue sources, be they tolls, dedicated sales, fuel or property taxes, must be available to meet debt service requirements. Second, the transportation community must continue to push the envelope and stretch available resources through the development of new financial tools.

Thirdly, institutional readiness needs to be improved. Some states have statutory limitations on the use of debt financing. In many other states, there are few in DOT management with the skills and experience in debt financing needed. AASHTO and FHWA, in partnership with the University of Southern California (USC) Graduate School of Finance, have created a Project Finance Institute. It will provide state and local transportation agencies the special training and technical assistance needed to improve their ability to master and implement the growing array of financial tools now available.

### Private Sector Roles

There are at least two ways the private sector plays a significant role in adding to the stock of the nation's highways.

The first is in the development of toll roads and bridges. According to the International Bridge, Tunnel and Turnpike Association (IBTTA), there are currently 122 toll road and bridge authorities in the U.S. generating annual receipts of \$11 billion. They manage 4,600 miles of roadways and 108 bridges. In 1999, total capital raised for toll roads, bridges and tunnels was \$3.8 billion.

The second is the construction of roads by developers of homes and commercial facilities. These improvements are divided into two classes:

- **On-site** — consisting of streets produced as part of a housing complex or commercial site to serve their buildings.
- **Off-site** — consisting of roads produced or improved to offset the transportation impacts of new developments.

These roads are typically built according to specifications provided and then turned over to local or state governments.

With 1.6 million units of new housing being produced per year, it is estimated that \$5 billion annually is being invested by developers constructing almost 12,000 lane miles of road. With regard to commercial developments, it is estimated that \$2 billion annually is being invested, accounting for 11,000 lane-miles.

It is clear that the private sector plays a major role in road development in America.

## Appendix A

### COMPARISON OF AASHTO'S NEEDS ASSESSMENT WITH FHWA'S CONDITION AND PERFORMANCE REPORTS

All US assessments of national highway need draw their fundamental understanding from the Condition and Performance Reports of the FHWA, and the data and modeling systems that support it. Typically conducted every two years, these studies provide the fundamental grounding in the state of the system and the state of travel that guides all such efforts. The FHWA is to be commended for the comprehensive and responsibility with which it approaches this undertaking. All those who are interested in a rational and quantified approach to investment analysis are in debt.

The statements of investment needs that appear here are strongly grounded in the methods and information content of the C&P process. They utilize the same data and models as made available by FHWA and their research activities. Many of the improvements and corrections in analytical capabilities outlined here are products of FHWA/AASHTO/TKO joint research.

It should be recognized that these AASHTO statements of need are being prepared in parallel with FHWA's preparation of its forthcoming 2002 Condition and Performance Report, and will not have the benefit of that report in our efforts.

In that the AASHTO and FHWA statements of investment needs utilize the same data sets and models they should have similar results. There are significant differences between what is being reported by the two agencies that must be noted:

- The C&P takes its vantage starting from an historical base, e.g. the 1999 report began from 1997 and looked out 20 years into the future. Their coming report will take a 20-year perspective starting from the year 2000. The Bottom Line Report is focused on the next reauthorization time frame, beginning in 2004 and ending in 2009, but outside that near-term focus in the context of a 20-year view as well.
- The C&P will describe its results in terms of an average value over 20 years; the AASHTO results are described in terms of an average over the six years of the next reauthorization.
- If it is accepted, as both the AASHTO and the C&P will show, that present investment levels fall short of meeting needs to maintain conditions, then it is to be expected that the AASHTO starting point of four years later would start in tandem with the need to address a more deteriorated system, a greater backlog of investment requirements with greater traffic volumes and therefore needs levels that would have become greater over the period.
- Recognizing all these factors we would expect that the AASHTO levels of investment needs would be greater than those identified by FHWA in its report.

In order to compare the highway needs estimates contained in this report with estimates made in prior years by the Federal Highway Administration, the following factors must be considered:

#### **Cost to Maintain**

In 1999, FHWA chose to feature a "cost to maintain" figure of \$56.6 billion per year, in 1997 dollars which maintained physical condition, but not performance.<sup>14</sup> It also showed a value of \$60.7 billion for maintaining user costs which is more analogous to their present approach. In addition to report stated that, "turning on the high cost lane feature," of the HHS model as had been done, "in previous C&P reports ... to add additional lanes to congested areas ... would increase the cost to maintain highways and bridges by 28.7 percent" (or \$7.7 billion per year).

When these values are brought forward to 2009 using appropriate inflation adjustments, and then extrapolated to 2004 using HHS model cost factors recognizing continued annual increases in need and levels of funding below that needed to meet needs, this figure would be highly comparable to AASHTO's "cost to maintain" estimate of \$92 billion.

Because of widespread concern over congestion, AASHTO found it necessary for 2004-2009, to use a scenario which addressed preserving both condition and performance, rather than just condition as FHWA chose to do in 1999. FHWA's customer survey in 2004, found "traffic flow" to be the biggest source of dissatisfaction nationally, and the Texas Transportation Institute's 2002 report on congestion shows it increasing in nearly every region.

#### **Cost to Improve**

FHWA's 1999, "cost to improve" figure was \$94 billion. Its report stated that, "Turning on the high-cost lane feature would increase the cost to improve highways and bridges by 39 percent. This feature allows HHS to add additional lanes in areas where existing right-of-way is constrained. While these lanes are expensive, the model would consider them to be cost-beneficial in many situations." This change would increase FHWA's 1999 "cost to improve" figure to \$129.7 billion. This is comparable in structure and in the same range as AASHTO's 2004-2009 cost to improve estimate of \$125.6 billion.

STATEMENT OF JAYETTA HECKER, DIRECTOR, PHYSICAL INFRASTRUCTURE ISSUE,  
GENERAL ACCOUNTING OFFICE

Mr. Chairman and members of the committee: We appreciate the opportunity to testify on the challenges faced by the surface and maritime transportation systems in maintaining and improving mobility. Your hearing today focuses on important issues about the physical condition, performance, and future investment requirements of the nation's roadways and bridges.<sup>1</sup> Our remarks will focus on the performance of the transportation systems. More specifically, we will discuss the ulti-

<sup>1</sup>We have not had an opportunity to review the Department of Transportation's Conditions and Performance Report that is expected to be released at today's hearing.

mate desired outcome of transportation infrastructure improvements—enhanced mobility—and the possible strategies for achieving that outcome.<sup>2</sup>

The scope of the U.S. surface and maritime transportation systems—which primarily includes roads, mass transit systems, railroads, and ports and waterways<sup>3</sup>—is vast. One of the major goals of these systems is to provide and enhance mobility. Mobility provides people with access to goods, services, recreation, and jobs; provides businesses with access to materials, markets, and people; and promotes the movement of personnel and material to meet national defense needs. However, the U.S. surface and maritime transportation systems have become congested and concerns have been raised about the burden they impose on the nation's quality of life through wasted energy, time, and money; increased pollution; and threats to public safety. Barriers to transportation accessibility for certain population groups and the level of financial resources available to address transportation problems are also major concerns. Balancing the goal of improving mobility with other social goals, such as environmental preservation, will present challenges.

Our statement is based on a report that we are releasing today on surface and maritime transportation mobility.<sup>4</sup> We will discuss (1) key challenges in maintaining and improving mobility and (2) key strategies for addressing the challenges. Our report is primarily based on expert opinion drawn from two panels of surface and maritime transportation experts that we convened in April 2002. Our work also included a review of reports prepared by Federal agencies, academics, and industry groups. Appendix I provides further information on our scope and methodology and appendix II contains a list of relevant GAO products.

In summary:

- With increasing passenger and freight travel, the surface and maritime transportation systems face a number of challenges in ensuring continued mobility. These challenges include:

- Preventing congestion from overwhelming the transportation system. Increasing passenger and freight travel has already led to increasing levels of congestion at bottlenecks and peak travel times in some areas. For example, the amount of traffic experiencing congestion during peak travel periods doubled from 33 percent in 1982 to 66 percent in 2000 in 75 metropolitan areas studied by the Texas Transportation Institute.<sup>5</sup> Freight mobility is also affected by increasing congestion within specific heavily used corridors and at specific bottlenecks that tend to involve intermodal connections, such as border crossings, and road and rail connections at major seaports within metropolitan areas. Furthermore, congestion is increasing at aging and increasing unreliable locks on the inland waterways.

- Ensuring access to transportation for certain underserved populations (including some elderly, poor, and rural populations that have restricted mobility) and achieving a balance between enhancing mobility and giving due regard to environmental and other social goals. Policies and patterns of development that encourage automobile dependence and favor provision of transit services with inflexible routes and schedules—such as subway or bus—may disadvantage some groups by limiting their access to needed services or jobs. The surface and maritime transportation systems also face the challenge of effectively addressing pollution problems caused by increased travel levels. Emissions from passenger and freight vehicles, shipping waste disposal practices, and excessive noise levels have contributed to the degradation of air quality, disruption of ecosystems, and other problems.

There is no one solution for the mobility challenges facing the Nation, and our expert panelists indicated that numerous approaches are needed to address these

<sup>2</sup>In a July 2001 testimony before the former Subcommittee on Transportation and Infrastructure, Senate Committee on Environment and Public Works, we reviewed the infrastructure investment estimates of seven Federal agencies and found that they focus mostly on the condition of the infrastructure rather than the desired outcomes (e.g., less traffic congestion) that can be expected from additional infrastructure investments. We cautioned against relying mainly on measures of need based primarily on the condition of existing infrastructure and instead suggested comparing the costs and benefits of alternative approaches for reaching outcomes, including noncapital alternatives (such as strategies to manage demand rather than build new infrastructure). See U.S. General Accounting Office, U.S. Infrastructure: Funding Trends and Federal Agencies' Investment Estimates, GAO-01-986T (Washington, DC.: July 23, 2001).

<sup>3</sup>In this testimony, we define the surface transportation modes to include highways, mass transit systems, and railroads; and the maritime transportation modes to include ports, inland waterways, and the intermodal connections leading to them. Pipelines were not part of our review.

<sup>4</sup>U.S. General Accounting Office, Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge, GAO-02-775 (Washington, DC.: Aug. 30, 2002).

<sup>5</sup>David Shrank and Tim Lomax, 2002 Urban Mobility Report (College Station, Tex.: Texas Transportation Institute, June 2002).

challenges. From these discussions, we believe that the wide range of approaches can be clustered into three key strategies that may help transportation decision-makers at all levels of government address mobility challenges. These strategies include the following:

- Focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes. Transportation agencies at the Federal, State, and local level might shift focus from their current emphasis on single modes to consider performance outcomes of all modes in addressing mobility challenges, and to recognize interactions across modes between passenger and freight traffic, and between public and private interests. This is important because addressing the mobility challenges outlined above can involve a scope beyond a local jurisdiction or a State line, and may require coordination across multiple modes, types of travel, or types of transportation providers and planners.
- Use a full range of techniques to achieve desired mobility outcomes. Using various techniques-such as new construction, corrective and preventive maintenance, rehabilitation, operations and system management, and pricing-to address complex mobility challenges, may be more effective than placing emphasis on any one technique.
- Provide more options for financing mobility improvements and consider additional sources of revenue. This strategy-which involves providing more flexibility in funding across modes, expanding financial support for alternative financing mechanisms (e.g., credit assistance to State and local governments), and considering various revenue-raising methods-may offer promise for addressing key mobility problems.

#### *Background*

The U.S. surface and maritime transportation systems facilitate mobility through an extensive network of infrastructure and operators, as well as through the vehicles and vessels that permit passengers and freight to move within the systems. The systems include 3.9 million miles of public roads, 121,000 miles of major private railroad networks, and 25,000 miles of commercially navigable waterways. They also include over 500 major urban public transit operators in addition to numerous private transit operators, and more than 300 ports on the coasts, Great Lakes, and inland waterways.

Maintaining transportation systems is critical to sustaining America's economic growth. Efficient mobility systems significantly affect economic development: cities could not exist and global trade could not occur without systems to transport people and goods. The pressures on the existing transportation system are mounting, however, as both passenger and freight travel are expected to increase over the next 10 years, according to Department of Transportation (DOT) projections. Passenger vehicle travel on public roads is expected to grow by 24.7 percent from 2000 to 2010. Passenger travel on transit systems is expected to increase by 17.2 percent over the same period. Amtrak has estimated that intercity passenger rail ridership will increase by 25.9 percent from 2001 to 2010. Preliminary estimates by DOT indicate that tons of freight moved on all surface and maritime modes-truck, rail, and water-are expected to increase by 43 percent from 1998 through 2010, with the largest increase expected to be in the truck sector. The key factors behind increases in passenger travel, and the modes travelers choose, are expected to be population growth, the aging of the population, and rising affluence. For freight movements, economic growth, increasing international trade, and the increasing value of cargo shipped may affect future travel levels and the modes used to move freight.

The relative roles of each sector involved in surface and maritime transportation activities-including the Federal Government, other levels of government, and the private sector-vary across modes. For public roads, the Federal Government owns few roads but has played a major role in funding the nation's highways. With the completion of the interstate highway system in the 1980's-and continuing with passage of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA)<sup>6</sup> and its successor legislation, the Transportation Equity Act for the 21st Century (TEA-21)<sup>7</sup>, in 1998-the Federal Government shifted its focus toward preserving and enhancing the capacity of the system. While the Federal Government's primary role has been to provide capital funding for the interstate system and other highway projects, State and local governments provide the bulk of the funding for public

<sup>6</sup>P.L. 102-240 (Dec. 18, 1991).

<sup>7</sup>P.L. 105-178 (June 9, 1998).

roads in the United States and are responsible for operating and maintaining all non-Federal roads, including the interstate system.

For transit systems—which include a variety of multiple-occupancy vehicle services designed to transport passengers on local and regional routes—the Federal Government provides financial assistance to State and local transit operators to develop new transit systems and improve, maintain, and operate existing systems. The largest portion of capital funding for transit comes from the Federal Government, while the primary source for operating funds comes from passenger fares.

The respective roles of the public and private sector and the revenue sources vary for passenger as compared with freight railroads. For passenger railroads, the Rail Passenger Service Act of 1970 created Amtrak to provide intercity passenger rail service because existing railroads found such service unprofitable. Since its founding, Amtrak has rebuilt rail equipment and benefited from significant public investment in track and stations, especially in the Northeast corridor, which runs between Boston and Washington, DC. The role of the Federal Government in providing financial support to Amtrak is currently under review amid concerns about the corporation's financial viability and discussions about the future direction of Federal policy toward intercity rail service. For freight railroads, the private sector owns, operates, and provides almost all of the financing for freight railroads. Currently, the Federal Government plays a relatively small role in financing freight railroad infrastructure by offering some credit assistance to State and local governments and railroads for capital improvements.

The U.S. maritime transportation system primarily consists of waterways, ports, the intermodal connections (e.g., inland rail and roadways) that permit passengers and cargo to reach marine facilities, and the vessels and vehicles that move cargo and people within the system. The maritime infrastructure is owned and operated by an aggregation of State and local agencies and private companies, with some Federal funding provided by the Corps of Engineers, the U.S. Coast Guard, and DOT's Maritime Administration.

Funding authorization for several key Federal surface transportation programs will expire soon. For example, TEA-21's authorization of appropriations expires in fiscal year 2003 and the Amtrak Reform and Accountability Act of 1997<sup>8</sup> authorized Federal appropriations for Amtrak through the end of fiscal year 2002. In addition, the Federal funding processes and mechanisms for the maritime transportation system are currently under review by two interagency groups.<sup>9</sup>

#### *Key Mobility Challenges Include Growing Congestion and Other Problems*

There are several challenges to mobility. Three of the most significant are growing congestion, ensuring access to transportation for certain underserved populations, and addressing the transportation system's negative effects on the environment and communities.

#### *Congestion*

Ensuring continued mobility involves preventing congestion from overwhelming the transportation system. Congestion is growing at localized bottlenecks (places where the capacity of the transportation system is most limited) and at peak travel times on public roads, transit systems, freight rail lines, and at freight hubs such as ports and borders where freight is transferred from one mode to another. In particular:

- For local urban travel, a study by the Texas Transportation Institute<sup>10</sup> showed that the amount of traffic experiencing congestion during peak travel periods doubled from 33 percent in 1982 to 66 percent in 2000 in the 75 metropolitan areas studied. In addition, the average time per day that roads were congested increased over this period, from about 4.5 hours in 1982 to about 7 hours in 2000. Increased road congestion can also affect public bus and other transit systems that operate on roads. Some transit systems are also experiencing increasing rail congestion at peak travel times.<sup>11</sup> In addition, concerns have been raised about how intercity and tourist travel interacts with local traffic in metropolitan areas and in smaller towns and rural areas, and how this interaction will evolve in the future. According to a

<sup>8</sup>P.L. 105–134 (Dec. 2, 1997).

<sup>9</sup>The two groups are the Interagency Committee on the Marine Transportation System and the Marine Transportation System National Advisory Council.

<sup>10</sup>Shrank and Lomax, 2002 Urban Mobility Report.

<sup>11</sup>For example, the Washington Metropolitan Area Transit Authority's studies on crowding found that, of the more than 200 peak morning rail trips observed over a recent 6-month period, on average, 23 percent were considered "uncomfortably crowded or crush loads." See U.S. General Accounting Office, *Mass Transit: Many Management Successes at WMATA, but Capital Planning Could Be Enhanced*, GAO-01-744 (Washington, DC.: July 2, 2001).

report sponsored by the World Business Council for Sustainable Development, *Mobility 2001*,<sup>12</sup> capacity problems for intercity travelers are severe in certain heavily traveled corridors, such as the Northeast corridor, which links Washington, DC, New York, and Boston. In addition, the study said that intercity travel may constitute a substantial proportion of total traffic passing through smaller towns and rural areas.

- Congestion is expected to increase on major freight transportation networks at specific bottlenecks, particularly where intermodal connections occur, and at peak travel times. This expectation raises concerns about how interactions between freight and passenger travel and how increases in both types of travel will affect mobility in the future. Trucks contribute to congestion in metropolitan and other areas where they generally move on the same roads and highways as personal vehicles, particularly during peak periods of travel. In addition, high demand for freight, particularly freight moved on trucks, exists in metropolitan areas where overall congestion tends to be the worst.

- With international trade an increasing part of the economy and with larger container ships being built, some panelists indicated that more pressure will be placed on the already congested road and rail connections to major U.S. seaports and at the border crossings with Canada and Mexico. According to a DOT report,<sup>13</sup> more than one-half of the ports responding to a 1997 survey of port access issues identified traffic impediments on local truck routes as the major infrastructure problem. This congestion has considerable implications for our economy given that 95 percent of our overseas trade tonnage moves by water, and the cargo moving through the U.S. marine transportation system contributes billions of dollars to the U.S. gross domestic product.<sup>14</sup>

- Railroads are beginning to experience more severe capacity constraints in particular heavily used corridors, such as the Northeast corridor, and within major metropolitan areas, especially where commuter and intercity passenger rail services share tracks with freight railroads. Capacity constraints at these bottlenecks are expected to worsen in the future.

- On the inland waterways, congestion is increasing at aging and increasingly unreliable locks. According to the Corps of Engineers, the number of hours that locks were unavailable due to lock failures increased in recent years, from about 35,000 hours in 1991 to 55,000 hours in 1999, occurring primarily on the upper Mississippi and Illinois rivers. Also according to the Corps of Engineers, with expected growth in freight travel, 15 of 26 locks that they studied are expected to exceed 80 percent of their capacity by 2020, as compared to 4 that had reached that level in 1999.

Some of the systemic factors that contribute to congestion include (1) barriers to building enough capacity to accommodate growing levels of travel; (2) challenges to effectively managing and operating transportation systems; and (3) barriers to effectively managing how, and the extent to which, transportation systems are used. First, there is insufficient capacity at bottlenecks and during peak travel times to accommodate traffic levels for a variety of reasons. For example, transportation infrastructure (which is generally provided by the public sector, except for freight railroads) takes a long time to plan and build, is often costly, and can conflict with other social goals such as environmental preservation and community maintenance. Furthermore, funding and planning rigidities in the public institutions responsible for providing transportation infrastructure tend to promote one mode of transportation, rather than a combination of balanced transportation choices, making it more difficult to deal effectively with congestion. In addition, some bottlenecks occur where modes connect, and because funding is generally mode-specific, dealing with congestion at these intermodal connections is not easily addressed.

Second, many factors related to the management and operation of transportation systems can contribute to increasing congestion. Congestion on highways is in part due to poor management of traffic flows on the connectors between highways and poor management in clearing roads that are blocked due to accidents, inclement weather, or construction. For example, in the 75 metropolitan areas studied by the Texas Transportation Institute, 54 percent of annual vehicle delays in 2000 were due to incidents such as breakdowns or crashes. In addition, the Oak Ridge Na-

<sup>12</sup>Massachusetts Institute of Technology and Charles River Associates, Inc., *Mobility 2001: World Mobility at the End of the Twentieth Century and Its Sustainability* (World Business Council for Sustainable Development, Aug. 2001).

<sup>14</sup>U.S. General Accounting Office, *Marine Transportation: Federal Financing and a Framework for Infrastructure Investments*, GAO-02-1033 (Washington, DC.: Sept. 9, 2002).

tional Laboratory reported that, nationwide, significant delays are caused by work zones on highways; poorly timed traffic signals; and snow, ice, and fog.<sup>15</sup>

Third, some panelists said that congestion on transportation systems is also due in part to inefficient pricing of the infrastructure because users—whether they are drivers on a highway or barge operators moving through a lock—do not pay the full costs they impose on the system and on other users for their use of the system. If travelers and freight carriers had to pay a higher cost for using transportation systems during peak periods to reflect the full costs they impose, they might have an incentive to avoid or reschedule some trips and to load vehicles more fully, possibly resulting in less congestion.

Panelists also noted that the types of congestion problems that are expected to worsen involve interactions between long-distance and local traffic and between passengers and freight. Existing institutions may not have the capacity or the authority to address them. For example, some local bottlenecks may hinder traffic that has regional or national significance, such as national freight flows from major coastal ports, or can affect the economies and traffic in more than one State. Current State and local planning organizations may have difficulty considering all the costs and benefits related to national or international traffic flows that affect other jurisdictions as well as their own. Furthermore, in our recent survey of States, most States reported that the increasing volume of both car and truck traffic over the next decade would negatively affect the physical condition of pavement and bridges and the safety of their interstate highways.<sup>16</sup>

#### *Other Mobility Challenges*

Besides dealing with the challenge of congestion, ensuring mobility also involves ensuring access to transportation for certain underserved populations. Settlement patterns and dependence on automobiles limit access to transportation systems for some elderly people and low-income households, and in rural areas where populations are expected to expand.

The elderly have different mobility challenges than other populations because they are less likely to have drivers' licenses, have more serious health problems, and may require special services and facilities, according to the Department of Transportation's 1999 Conditions and Performance report.<sup>17</sup> People who cannot drive themselves tend to rely on family, others caregivers, or friends to drive them, or find alternative means of transportation. Many of the elderly also may have difficulty using public transportation due to physical ailments. As a result, according to the 1999 Conditions and Performance report and a 1998 report about mobility for older drivers,<sup>18</sup> they experience increased waiting times, uncertainty, and inconvenience, and they are required to do more advance trip planning. These factors can lead to fewer trips taken for necessary business and for recreation, as well as restrictions on times and places that healthcare can be obtained. As the population of elderly individuals increases over the next 10 years, issues pertaining to access are expected to become more prominent in society.

Lower income levels can also be a significant barrier to transportation access. The cost of purchasing, insuring, and maintaining a car is prohibitive to some households, and 26 percent of low-income households do not own a car, compared with 4 percent of other households, according to the 1999 Conditions and Performance report. Among all low-income households, about 8 percent of trips are made in cars that are owned by others as compared to 1 percent for other income groups. Furthermore, similar uncertainties and inconveniences apply to this group as to the elderly regarding relying on others for transportation. In addition, in case studies of access to jobs for low-income populations, Federal Transit Administration (FTA) researchers found that transportation barriers to job access included gaps in transit

<sup>15</sup>S.M. Chin, O. Franzese, D.L. Greene, H.L. Hwang, and R. Gibson, Temporary Losses of Capacity Study and Impacts on Performance, Report No. ORNL/TM-2002/3 (Oak Ridge, Tenn.: Oak Ridge National Laboratory, May 2002).

service, lack of knowledge of where transit services are provided, and high transportation costs resulting from multiple transfers and long distances traveled.<sup>19</sup>

Rural populations, which according to the 2000 Census grew by 10 percent over the last 10 years, also face access problems. Access to some form of transportation is necessary to connect rural populations to jobs and other amenities in city centers or, increasingly, in the suburbs. Trips by rural residents tend to be longer due to lower population densities and the relative isolation of small communities. Therefore, transportation can be a challenge to provide in rural areas, especially for persons without access to private automobiles. A report prepared for the FTA in 2001<sup>20</sup> found that 1 in 13 rural residents lives in a household without a personal vehicle. In addition, according to a report by the Coordinating Council on Access and Mobility,<sup>21</sup> while almost 60 percent of all nonmetropolitan counties had some public transportation services in 2000, many of these operations were small and offered services only to limited geographic areas during limited times.

Finally, transportation can also negatively affect the environment and communities by increasing the levels of air and water pollution. As a result of the negative consequences of transportation, tradeoffs must be made between facilitating increased mobility and giving due regard to environmental and other social goals. For example, transportation vehicles are major sources of local, urban, and regional air pollution because they depend on fossil fuels to operate. Emissions from vehicles include sulfur dioxide, lead, carbon monoxide, volatile organic compounds, particulate matter, and nitrous oxides. Vehicle emissions in congested areas can trigger respiratory and other illnesses, and runoff from impervious surfaces, such as highways, can carry pollutants into lakes, streams, and rivers, thus threatening aquatic environments.<sup>22</sup>

Freight transportation also has significant environmental effects. Trucks are significant contributors to air pollution. According to the American Trucking Association, trucks were responsible for 18.5 percent of nitrous oxide emissions and 27.5 percent of other particulate emissions from mobile sources in the United States. The Mobility 2001 report states that freight trains also contribute to emissions of hydrocarbons, carbon monoxide, and nitrous oxide, although generally at levels considerably lower than trucks. In addition, while large shipping vessels are more energy efficient than trucks or trains, they are also major sources of nitrogen, sulfur dioxide, and diesel particulate emissions. According to the International Maritime Organization, ocean shipping is responsible for 22 percent of the wastes dumped into the sea on an annual basis.

*Three Strategies for Addressing Mobility Challenges Include Focusing on Systemwide Outcomes, Using a Full Range of Techniques, and Providing Options for Financing Surface and Maritime Transportation*

The experts we consulted presented numerous approaches for addressing the types of challenges discussed throughout this statement, but they emphasized that no single strategy would be sufficient. From these discussions and our literature review, we have identified three key strategies that may help transportation decision-makers at all levels of government address mobility challenges and the institutional barriers that contribute to them.

*Focus on the Entire Surface and Maritime Transportation System Rather Than on Specific Modes or Types of Travel to Achieve Desired Mobility Outcomes.*

Shifting the focus of government transportation agencies at the Federal, State, and local levels to consider all modes and types of travel in addressing mobility challenges—as opposed to focusing on a specific mode or type of travel in planning and implementing mobility improvements—could help achieve enhanced mobility. Addressing the types of mobility challenges discussed earlier in this statement can require a scope beyond a local jurisdiction, State line, or one mode or type of travel. For example, congestion challenges often occur where modes connect or should connect—such as ports or freight hubs where freight is transferred from one mode to another, or airports that passengers need to access by car, bus, or rail. These connec-

<sup>19</sup>Federal Transit Administration, *Access to Jobs: Planning Case Studies* (Washington, D.C.: U.S. Department of Transportation, Sept. 2001).

<sup>20</sup>Community Transportation Association of America, *Status of Rural Public Transportation—2000* (April 2001).

<sup>21</sup>Coordinating Council on Access and Mobility, *Planning Guidelines for Coordinated State and Local Specialized Transportation Services* (Washington, D.C.: U.S. Department of Transportation, Dec. 20, 2000).

<sup>22</sup>See U.S. General Accounting Office, *Environmental Protection: Federal Incentives Could Help Promote Land Use That Protects Air and Water Quality*, GAO-02-12 (Washington, DC, Oct. 31, 2001).

tions require coordination of more than one mode of transportation and cooperation among multiple transportation providers and planners, such as port authorities, metropolitan planning organizations (MPO),<sup>23</sup> and private freight railroads. Therefore, a systemwide approach to transportation planning and funding, as opposed to focus on a single mode or type of travel, could improve focus on outcomes related to user or community needs. The experts we consulted provided a number of examples of alternative transportation planning and funding systems that might better focus on outcomes that users and communities desire, including the following:

- Performance-oriented funding system. The Federal Government would first define certain national interests of the transportation system—such as maintaining the entire interstate highway system or identifying freight corridors of importance to the national economy—then set national performance standards for those systems that States and localities must meet. Federal funds would be distributed to those entities that address national interests and meeting the established standards. Any Federal funds remaining after meeting the performance standards could then be used for whatever transportation purpose the State or locality deems most appropriate to achieve State or local mobility goals.
- Federal financial reward-based system. Federal support would reward those States or localities that apply Federal money to gain efficiencies in their transportation systems, or tie transportation projects to land use and other local policies to achieve community and environmental goals, as well as mobility goals.
- System with different Federal matching criteria for different types of expenditures that might reflect Federal priorities. For example, if infrastructure preservation became a higher national priority than building new capacity, matching requirements could be changed to a 50 percent Federal share for building new physical capacity and an 80 percent Federal share for preservation.
- System in which State and local governments pay for a larger share of transportation projects, which might provide them with incentives to invest in more cost-effective projects. Reducing the Federal match for projects in all modes may give States and localities more fiscal responsibility for projects they are planning. If cost savings resulted, these entities might have more funds available to address other mobility challenges. Making Federal matching requirements equal for all modes may avoid creating incentives to pursue projects in one mode that might be less effective than projects in other modes.

In addition, we recently reported on the need to view various transportation modes, and freight movement in particular, from an integrated standpoint, particularly for the purposes of developing a Federal investment strategy and considering alternative funding approaches.<sup>24</sup> We identified four key components of a systematic framework to guide transportation investment decisions including (1) establishing national goals for the system, (2) clearly defining the Federal role relative to other stakeholders, (3) determining the funding tools and other approaches that will maximize the impact of any Federal investment, and (4) ensuring that a process is in place for evaluating performance and accountability.

#### *Use a Full Range of Techniques to Address Mobility Challenges*

Using a range of techniques to address mobility challenges may help control congestion and improve access. This approach involves a strategic mix of construction, corrective and preventive maintenance, rehabilitation, operations and system management, and managing system use through pricing or other techniques. No one type of technique would be sufficient to address mobility challenges. Although these techniques are currently in use, the experts we consulted indicated that planners should more consistently consider a full range of techniques, as follows:

- Build new infrastructure. Building additional infrastructure is perhaps the most familiar technique for addressing congestion and improving access to surface and maritime transportation. Although there is a lot of unused capacity in the transportation system, certain bottlenecks and key corridors require new infrastructure.
- Increase infrastructure maintenance and rehabilitation. An emphasis on enhancing capacity from existing infrastructure through increased corrective and preventive maintenance and rehabilitation is an important supplement to, and sometimes a substitute for, building new infrastructure. Maintaining and rehabilitating transportation systems can improve the speed and reliability of passenger and freight travel, thereby optimizing capital investments.

<sup>23</sup>MPOs are organizations of city, county, State, and Federal officials that provide a regional forum for transportation planning.

<sup>24</sup>GAO-02-1033.

- Improve management and operations. Better management and operation of existing surface and maritime transportation infrastructure is another technique for enhancing mobility because it may allow the existing transportation system to accommodate additional travel without having to add new infrastructure. For example, the Texas Transportation Institute reported that coordinating traffic signal timing with changing traffic conditions could improve flow on congested roadways. One panelist noted that shifting the focus of transportation planning from building capital facilities to an “operations mindset” will require a cultural shift in many transportation institutions, particularly in the public sector, so that the organizational structure, hierarchy, and rewards and incentives are all focused on improving transportation management and operations.<sup>25</sup>

- Increase investment in technology. Increasing public sector investment in Intelligent Transportation System (ITS) technologies that are designed to enhance the safety, efficiency, and effectiveness of the transportation network, can serve as a way of increasing capacity and mobility without making major capital investments. ITS includes technologies that improve traffic flow by adjusting signals, facilitating traffic flow at toll plazas, alerting emergency management services to the locations of crashes, increasing the efficiency of transit fare payment systems, and other actions. Other technological improvements include increasing information available to users of the transportation system to help people avoid congested areas and to improve customer satisfaction with the system.

- Use demand management techniques. Another approach to reducing congestion without making major capital investments is to use demand management techniques to reduce the number of vehicles traveling at the most congested times and on the most congested routes. One type of demand management for travel on public roads is to make greater use of pricing incentives. In particular, some economists have proposed using congestion pricing that involves charging surcharges or tolls to drivers who choose to travel during peak periods when their use of the roads increases congestion. These surcharges might help reduce congestion by providing incentives for travelers to share rides, use transit, travel at less congested (generally off-peak) times and on less congested routes, or make other adjustments—and at the same time, generate more revenues that can be targeted to alleviating congestion in those specific corridors.

In addition to pricing incentives, other demand management techniques that encourage ride-sharing may be useful in reducing congestion. Ride-sharing can be encouraged by establishing carpool and vanpool staging areas, providing free or preferred parking for carpools and vanpools, subsidizing transit fares, and designating certain highway lanes as high occupancy vehicle (HOV) lanes that can only be used by vehicles with a specified number of people in them (i.e., two or more).

Demand management techniques on roads, particularly those involving pricing, often provoke strong political opposition. The panelists cited a number of concerns about pricing strategies including (1) the difficulty in instituting charges to use roads that previously had been available “free”, (2) the equity issues that arise from the potentially regressive nature of these charges (i.e., the surcharges constitute a larger portion of the earnings of lower income households and therefore impose a greater financial burden on them), and (3) the concern that restricting lanes or roads to people who pay to use them is elitist because that approach allows people who can afford to pay the tolls to avoid congestion that others must endure.

*Provide Options for Financing Mobility Improvements and Consider Additional Sources of Revenue*

More options for financing surface and maritime transportation projects and more sources of revenue may be needed to achieve desired mobility outcomes and address those segments of transportation systems that are most congested. Our panelists suggested three financing strategies:

- Increase funding flexibility. The current system of financing surface and maritime transportation projects limits options for addressing mobility challenges. For example, separate funding for each mode at the Federal, State, and local level can make it difficult to consider possible efficient and effective ways for enhancing mobility. Providing more flexibility in funding across modes could help address this limitation.

- Expand support for alternative financing mechanisms. The public sector could also expand its financial support for alternative financing mechanisms to access new sources of capital and stimulate additional investment in surface and maritime

<sup>25</sup>Joseph M. Sussman, “Transitions in the World of Transportation: A Systems View,” *Transportation Quarterly* 56 (2002): 21–22.

transportation infrastructure. These mechanisms include both newly emerging and existing financing techniques such as providing credit assistance to State and local governments for capital projects and using tax policy to provide incentives to the private sector for investing in surface and maritime transportation infrastructure. These mechanisms currently provide a small portion of the total funding that is needed for capital investment and some of them could create future funding difficulties for State and local agencies because they involve greater borrowing from the private sector.<sup>26</sup>

- Consider new revenue sources. A possible future shortage of revenues may limit efforts to address mobility challenges, according to many of the panelists. For example, some panelists said that because of the increasing use of alternative fuels, revenues from the gas tax are expected to decrease, possibly limiting funds available to finance future transportation projects.

One method of raising revenue is for counties and other regional authorities to impose sales taxes for funding transportation projects. A number of counties have already passed such taxes and more are being considered nationwide. However, several panelists expressed concerns that this method might not be the best option for addressing mobility challenges because (1) moving away from transportation user charges to sales taxes that are not directly tied to the use of transportation systems weakens the ties between transportation planning and finance and (2) counties and other taxing authorities may be able to bypass traditional State and metropolitan planning processes because sales taxes provide them with their own funding sources for transportation.

New or increased taxes or other fees imposed on the freight sector could also help fund mobility improvements, for example, by increasing taxes on freight trucking. The Joint Committee on Taxation estimated that raising the ceiling on the tax paid by heavy vehicles to \$1,900 could generate about \$100 million per year.<sup>27</sup> Another revenue raising method would be to dedicate more of the revenues from taxes on alternative fuels, such as gasohol, to the Highway Trust Fund rather than to Treasury's general fund, as currently happens. However, this would decrease the amount of funds available for other Federal programs. Finally, pricing strategies, mentioned earlier in this statement as a technique to reduce congestion, are also possible additional sources of revenue for transportation purposes.

In summary, the Nation faces significant challenges in maintaining and enhancing mobility on its surface and maritime transportation systems, particularly with the growing congestion that accompanies increased passenger and freight travel. However, as the Congress considers reauthorizing surface transportation legislation and weighs the structure, nature, and level of Federal investment it will provide in future years to support surface and other transportation activities-it has an opportunity to consider new strategies for dealing with congestion and promoting enhanced mobility. While no single approach is sufficient, the key strategies that we have outlined today may help transportation decisionmakers at all levels of government address mobility challenges and the institutional barriers that contribute to them.

Mr. Chairman, this concludes my prepared statement. I would be pleased to respond to any questions you or other members of the committee may have at this time.

## APPENDIX I

### *Scope and Methodology*

Our work covered major modes of surface and maritime transportation for passengers and freight, including public roads, public transit, railways, and ports and inland waterways. To identify mobility challenges and strategies for addressing those challenges, we primarily relied upon expert opinion, as well as a review of pertinent literature. In particular, we convened two panels of surface and maritime transportation experts to identify mobility issues and gather views about alternative

<sup>26</sup>See U.S. General Accounting Office, *Transportation Infrastructure: Alternative Financing Mechanisms for Surface Transportation*, GAO-02-1126T (Washington, DC: Sept. 25, 2002).

<sup>27</sup>See U.S. General Accounting Office, *Highway Financing: Factors Affecting Highway Trust Fund Revenues*, GAO-02-667T (Washington, DC, May 9, 2002).

strategies for addressing the issues and challenges to implementing those strategies. We contracted with the National Academy of Sciences (NAS) and its Transportation Research Board (TRB) to provide technical assistance in identifying and scheduling the two panels that were held on April 1 and 3, 2002. TRB officials selected a total of 22 panelists with input from us, including a cross-section of representatives from all surface and maritime modes and from various occupations involved in transportation planning. In keeping with NAS policy, the panelists were invited to provide their individual views and the panels were not designed to build consensus on any of the issues discussed. We analyzed the content of all of the comments made by the panelists to identify common themes about key mobility challenges and strategies for addressing those challenges. Where applicable, we also identified the opposing points of view about the strategies.

The names and affiliations of the panelists are as follows. We also note that two of the panelists served as moderators for the sessions, Dr. Joseph M. Sussman of the Massachusetts Institute of Technology and Dr. Damian J. Kulash of the Eno Foundation, Inc.

- Benjamin J. Allen is Interim Vice President for External Affairs and Distinguished Professor of Business at Iowa State University.
- Daniel Brand is Vice President of Charles River Associates, Inc., in Boston, Mass.
- Jon E. Burkhardt is the Senior Study Director at Westat, Inc., in Rockville, Md.
- Sarah C. Campbell is the President of TransManagement, Inc., in Washington, DC.
- Christina S. Casgar is the Executive Director of the Foundation for Intermodal Research and Education in Greenbelt, Md.
- Anthony Downs is a Senior Fellow at the Brookings Institution.
- Thomas R. Hickey served until recently as the General Manager of the Port Authority Transit Corporation in Lindenwold, N.J.
- Ronald F. Kirby is the Director of Transportation Planning at the Metropolitan Washington Council of Governments.
- Damian J. Kulash is the President and Chief Executive Officer of the Eno Transportation Foundation, Inc., in Washington, DC.
- Charles A. Lave is a Professor of Economics (Emeritus) at the University of California, Irvine where he served as Chair of the Economics Department.
- Stephen Lockwood is Vice President of Parsons Corporation, an international firm that provides transportation planning, design, construction, engineering, and project management services.
- Timothy J. Lomax is a Research Engineer at the Texas Transportation Institute at Texas A&M University.
- James R. McCarville is the Executive Director of the Port of Pittsburgh Commission.
- James W. McClellan is Senior Vice President for Strategic Planning at the Norfolk Southern Corporation in Norfolk, Va.
- Michael D. Meyer is a Professor in the School of Civil and Environmental Engineering at the Georgia Institute of Technology and was the Chair of the school from 1995 to 2000.
- William W. Millar is President of the American Public Transportation Association (APTA).
- Alan E. Pisarski is an independent transportation consultant in Falls Church, Va., providing services to public and private sector clients in the United States and abroad in the areas of transport policy, travel behavior, and data analysis and development.
- Craig E. Philip is President and Chief Executive Officer of the Ingram Barge Company in Nashville, Tenn.
- Arlee T. Reno is a consultant with Cambridge Systematics in Washington, DC.
- Joseph M. Sussman is the JR East Professor in the Department of Civil and Environmental Engineering and the Engineering Systems Division at the Massachusetts Institute of Technology.
- Louis S. Thompson is a Railways Advisor for the World Bank where he consults on all of the Bank's railway lending activities.
- Martin Wachs is the Director of the Institute of Transportation Studies at the University of California, Berkeley and he holds faculty appointments in the departments of City and Regional Planning and Civil and Environmental Engineering at the university.

RESPONSES OF JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* In your testimony, you stated that shifting the focus of government transportation agencies to consider all modes and types of travel in addressing mobility challenges could help achieve enhanced mobility. What stands in the way of transportation agencies looking comprehensively at all modes and types of transportation to address their mobility issues? What mode or type of transportation is most often considered at the expense of other modes and why? What mode or type of transportation is least often considered and why?

Response. In our report and testimony on surface and transportation mobility<sup>1</sup>, we describe a number of barriers that stand in the way of transportation agencies looking comprehensively at all modes and types of transportation, including:

- Mode-Specific Funding: Provisions of the Transportation Equity Act for the 21st Century (TEA-21) have broadened the flexibility of Federal funds to be used across modes, such as the flexibility to use highway funds for transit or pedestrian projects afforded by the Surface Transportation Program. However, according to the experts we consulted and the Transportation Research Board's Critical Issues in

---

<sup>1</sup>See U.S. General Accounting Office, Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge, GAO-02-775 (Washington, DC.: Aug. 30, 2002) and U.S. General Accounting Office, Surface and Maritime Transportation: Challenges and Strategies for Enhancing Mobility, GAO-02-1132T (Washington, DC.: Sept. 30, 2002).

Transportation 2002,<sup>2</sup> the broad array of agencies responsible for various portions of the transportation network remain uncoordinated and unconnected. No single agency or funding mechanism has authority over the system as a whole (i.e., freight and passenger travel on all modes), making it difficult for the various public agencies and the private sector to plan and coordinate mobility improvements that affect more than one mode. For example, a channel improvement at a port may necessitate improvements to connecting road and rail networks and will affect freight and passenger travel on those systems. However, channel improvements go through a Corps of Engineers planning process for approval and then a congressional appropriation process for funding, whereas road improvements would go through the appropriate State and Metropolitan Planning Organization's (MPO) process for approval, and rail improvements would most likely be financed privately by the railroad. These different processes administered by various agencies with differing priorities, time lines, and access to resources are one type of barrier that make it difficult for agencies to look comprehensively at all modes and types of travel.

- **Incentives in Project Selection Processes:** According to the expert panelists we consulted and our other work, existing Federal matching requirements and increasing designation by the Congress of Federal funds create incentives for states and MPOs to pursue particular types of projects, thereby distorting the planning process. The non-Federal matching shares for public transit capital projects have effectively approached 50 percent of the total project cost, although Federal legislation requires only 10 or 20 percent. This is because projects that propose higher non-Federal matches are scored higher and are more likely to receive the limited Federal funds than projects that propose lower non-Federal matches. In contrast, the effective non-Federal matching shares for highway projects are closer to the 20 percent required under most highway programs. This imbalance between the Federal support for transit and highway programs can create incentives for transportation agencies to get "more bang for their buck" by pursuing projects that provide high Federal contributions rather than those projects that make a significant improvement to mobility. Some of our panelists also pointed out that designation of transportation funds for particular projects could result in bypassing the traditional planning processes, which may lead to logical connections or interconnections between projects being overlooked.

- **Shortage of Personnel with Intermodal Expertise:** A number of our panelists said that many State and local transportation agencies have a shortage of personnel with expertise in and across some modes and types of travel, resulting in barriers to identifying and planning projects across modes and types of travel. One panelist explained that there is a particular shortage of expertise in freight mobility within transportation agencies.

With regard to the relative consideration of one mode over another, while our report contained information on funding levels for each mode, it did not address how funding levels compare to estimated investment needs in each mode. The Federal funding approaches differ across the modes in that the funding for the highway and aviation systems relies almost exclusively on dedicated trust funds that are financed with collections from users of those systems while the funding for the maritime and rail systems relies heavily on general fund revenues. Total funding for each mode varied widely—during fiscal years 1999 through 2001, Federal agencies expended an average of \$25 billion each year on the highway system, \$10 billion each year on the aviation system, and \$3.9 billion each year on the maritime system. Our work has shown that there is growing awareness of the need to view various transportation modes, and freight movement in particular, from an integrated standpoint, particularly for the purposes of developing and implementing a Federal investment strategy and considering alternative funding approaches.

*Question 2.* Based on your work, what is the greatest challenge we face in enhancing mobility? What strategy (or strategies) is most often suggested to help address mobility challenges nationwide?

*Response.* With increasing passenger and freight travel, the surface and maritime transportation systems face a number of challenges in ensuring continued mobility. These challenges include preventing congestion from overwhelming the transportation system, ensuring access to transportation for certain underserved populations (including some elderly, poor, and rural populations that have restricted mobility), and achieving a balance between enhancing mobility and giving due regard to environmental and other social goals.

<sup>2</sup>Transportation Research Board, *Critical Issues in Transportation 2002* (Washington, DC.: The National Academies, November 2001).

There is no one solution for the mobility challenges facing the Nation, and our expert panelists indicated that numerous approaches are needed to address these challenges. We believe that the wide range of approaches can be clustered into three key strategies that may help transportation decisionmakers at all levels of government address mobility challenges. These strategies include the following:

- Focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes. Transportation agencies at the Federal, State, and local level might shift focus from their current emphasis on single modes to consider performance outcomes of all modes in addressing mobility challenges, and to recognize interactions across modes between passenger and freight traffic, and between public and private interests. This is important because addressing the mobility challenges outlined above can involve a scope beyond a local jurisdiction or a State line, and can require coordination across multiple modes, types of travel, or types of transportation providers and planners.
- Use a full range of techniques to achieve desired mobility outcomes. Using various techniques—such as new construction, corrective and preventive maintenance, rehabilitation, operations and system management, and pricing—to address complex mobility challenges, may be more effective than placing emphasis on any one technique.
- Provide more options for financing mobility improvements and consider additional sources of revenue. This strategy—which involves providing more flexibility in funding across modes, expanding financial support for alternative financing mechanisms (e.g., credit assistance to State and local governments), and considering various revenue-raising methods—may offer promise for addressing key mobility problems.

---

RESPONSES OF JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* In your testimony you mention there is a growing consensus that the modal funding mechanisms distort public decisionmaking. You also mentioned that these modal funding programs are an impediment for the best investment and the best decisionmaking in infrastructure and meeting mobility needs. What changes can be made to the current funding program structure to improve investment decisions and eliminate these “modal stovepipes”?

*Response.* An intermodal approach is vital in order to match the nation’s infrastructure with its diverse mobility needs. However, the current system of financing surface and maritime transportation projects limits options for addressing mobility challenges. Congestion often occurs where modes connect or should connect—such as ports or freight hubs where freight is transferred from one mode to another, or airports that passengers need to access by car, bus, or rail. These connections require coordination of more than one mode of transportation and cooperation among multiple transportation providers and planners. In addition, according to the panelists we consulted, designation by the Congress of Federal funds for particular transportation projects bypasses traditional planning processes used to identify the highest priority projects, thus potentially limiting transportation agencies’ options for addressing the most severe mobility challenges.

Overcoming such limitations involves taking a systemwide, rather than mode-specific, approach to transportation planning and funding. Transportation agencies at the Federal, State, and local level might shift focus from their current emphasis on single modes to consider performance outcomes of all modes in addressing mobility challenges, and to recognize interactions across modes between passenger and freight traffic, and between public and private interests.

The experts we consulted suggested several options for encouraging the development of transportation planning and funding systems that focus on the entire surface and maritime transportation system to achieve desired mobility outcomes. We have not evaluated these options, but we would be pleased to work with the committee if you wish to request a GAO study in this area. The options that panelists provided for alternative planning and funding systems include:

- Link funding to performance-based outcomes. This option focuses on mobility outcomes that users—both freight and passengers, for both intercity and local travel—desire from the transportation system. The Federal Government would first define certain national interests of the transportation system—such as increasing the reliability of commute times on all modes—then set national performance standards for those systems that States and localities must meet. Federal funds would be distributed to those entities that are addressing national interests and meeting the estab-

lished standards. Any Federal funds remaining after meeting the performance standards could then be used for whatever transportation purpose the State or locality deems most appropriate to achieve State or local mobility goals.

- Provide financial rewards for increasing efficiency or meeting other goals. Federal support would reward those States or localities that apply Federal money to gain efficiencies in their transportation systems, or tie transportation projects to land use and other local policies to achieve community and environmental goals, as well as mobility goals.
- Revise Federal matching requirements. There are several variations on this option, including the following:
  - Align Federal matching requirements with Federal priorities. In this case, Federal matching criteria would reflect priorities based on the type of project rather than the mode. For example, if infrastructure preservation became a higher national priority than building new capacity, matching requirements could be changed to a 50 percent Federal share for building new physical capacity and an 80 percent Federal share for preservation.
  - Equalize Federal matching requirements across modes. Making Federal matching requirements equal for all modes may avoid creating incentives to pursue projects in one mode that might be less effective than projects in other modes.
  - Reduce the Federal match for projects in all modes. This might give States and localities more fiscal responsibility for projects they are planning and provide them with incentives to invest in more cost-effective projects independent of Federal support for various modes. If cost savings resulted, these entities might have more funds available to address other mobility challenges.

---

#### RESPONSES OF JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* While DOT's Conditions and Performance report finds that the conditions of our highway system have improved somewhat, the operational performance of our highway system continues to deteriorate. This comes as no surprise to anyone who drives regularly. Each of you recommends an increased emphasis on operations, which is a theme that this subcommittee has addressed twice in the past year with a hearing on Intelligent Transportation Systems and a symposium on operational issues. I intend to address this issue in next year's transportation bill and would appreciate your thoughts on how we can encourage States and metropolitan areas to focus more attention to the operations and management of road systems.

Response. Better operations and management of existing transportation infrastructure is an important technique for enhancing mobility because it may allow the existing transportation system to accommodate additional travel without having to add new infrastructure. One of our expert panelists noted, however, that shifting the focus of transportation from building capital facilities to an "operations mindset" would require a cultural shift in many transportation institutions, particularly in the public sector, so that the organizational structure, hierarchy, and rewards and incentives are all focused on improving transportation management and operations.<sup>3</sup> As noted above, the expert panelists we consulted provided a number of ways in which the planning and funding systems can be modified to eliminate modal "stovepipes" and focus more attention on the operations and management of transportation systems, including the following:

- Performance-oriented funding system. The Federal Government would first define certain performance goals for the transportation system, such as improving commute times or improving on-time performance of transit systems. By linking funding to performance outcomes, transportation agencies would have a greater incentive to compare operations and management strategies with other strategies in determining how to best improve mobility.
- Federal financial reward-based system. Federal support would reward those States or localities that apply Federal money to gain efficiencies in their transportation systems. This could provide transportation agencies with an incentive to invest in operations and management to improve system efficiency.
- Different Federal matching criteria for different types of expenditures that might reflect Federal priorities. For example, if operations and management became a higher national priority than building new capacity, matching requirements could be changed to give State and local agencies more fiscal responsibility for building new capacity. This would provide an incentive to invest in operations and management improvements.

---

<sup>3</sup>Joseph M. Sussman, "Transitions in the World of Transportation: A Systems View," *Transportation Quarterly* 56 (2002): 21–22.

*Question 2.* In your testimony, you recommended that policymakers focus on the entire transportation system rather than on individual modes of transportation. I agree that we need to employ the full range of potential solutions if we are to improve the performance of our system. What can we do in the next transportation bill to encourage States and metropolitan areas to take an intermodal and broad-based view of solutions to transportation problems?

*Response.* In our report, we describe a number of barriers that stand in the way of transportation agencies looking comprehensively at all modes and types of transportation, including such things as mode-specific funding mechanisms, incentives in project selection processes, and a shortage of expertise in any one transportation agency for effectively identifying and implementing mobility improvements across multiple modes or types of travel. Our expert panelists discussed potential methods for modifying existing programs to shift the focus of States and Metropolitan Planning Organizations toward intermodal solutions to transportation problems, and there may be an opportunity in the next transportation bill to provide incentives to achieve this desired outcome. The methods included (1) focusing on system performance and outcomes related to customer service; (2) considering and using a full range of tools to address mobility challenges, and (3) providing more options for financing transportation improvements and considering additional sources of revenue.

- **Performance and Customer Service:** Our panelists described various types of systems that could focus on outcomes and customer service. All of these systems were focused on determining national performance goals based on customer service and mobility, regardless of mode. One panelist suggested a system where Federal support would reward those States or localities that apply Federal money to gain efficiencies or meet performance goals across the entire transportation system. For example, if the performance goal is to achieve a particular level of freight mobility in the area, the appropriate transportation agencies would then have an incentive to look at freight mobility across the entire system and determine improvements that would best meet that goal, regardless of mode. The improvements might focus on road connections to major ports of freight hubs, or on increasing throughput within the port or intermodal facility, or on rail capacity improvements such as eliminating grade crossings. Any Federal funds remaining could then be used to pursue local priorities.

- **Full Range of Tools:** Many panelists emphasized that transportation agencies need to consistently consider the full range of tools to address transportation problems and improve customer service and mobility. These tools range from investing in new capital, where appropriate, to infrastructure preservation, improving the management and operation of transportation systems, and employing various demand management techniques. Our panelists said that States and metropolitan areas experience some difficulties in using the full range of tools. For example, some of these techniques are politically contentious, such as demand management techniques that involve pricing or major capital projects that could have environmental impacts. Another factor is that the Federal Government's role as an investment partner in transportation systems is more focused on providing assistance for capital investments as opposed to providing funding for some of these other tools, although our panelists did not agree on whether the Federal Government should shift to providing more operating or other type of assistance. One panelist said that the appropriate Federal role was as a capital investment partner and that the operation of transportation systems is a local responsibility. Other panelists said that the Federal Government may be somewhat over invested in capital-intensive projects, and that the need for more balanced investment in management, maintenance, and operations calls for reevaluating the role of the Federal Government as an investment partner.

- **Additional Revenue and Financing Options:** While our panelists noted the need for funding flexibility, they stated that the possibility of a shortage of revenues in the future presents a fundamental limitation to addressing mobility challenges in all modes. Panelists said that due to such things as increasing use of alternative fuels, revenues from the gas tax are expected to decrease in the future. To combat the reduction of revenues available for transportation, panelists discussed various options for new sources of revenue and different ways to finance transportation projects. These options include the following:

- Raising additional revenues from users of the systems, such as raising the gas tax, raising fees on freight carriers, dedicating more revenues from taxes on alternative fuels, and expanding the use of pricing principles.
- Raising revenues from general taxes and dedicating a portion to transportation. Many local governments have passed or are considering passing such taxes, but this could result in local authorities bypassing traditional planning processes.

- Expanding alternative financing mechanisms and public/private partnerships. Alternative financing mechanisms, such as Grant Anticipation Revenue Vehicles (GARVEE) or State infrastructure banks (SIB), can help speed the completion of transportation projects and may stimulate additional investment in infrastructure. However, these mechanisms can pose difficulties for transportation agencies in the future because they rely on future Federal revenues. Many of our panelists also advocated providing incentives or opportunities for private sector investment in transportation systems.

*Question 3.* Your written testimony and AASHTO's Bottom Line Report both repeatedly refer to the Texas Transportation Institute's Mobility Study. Is this the only authoritative study available on system performance? Given the importance of having a reliable measurement of system performance how can we do a better job of ensuring that the relevant data is available?

Response. The Federal Highway Administration (FHWA) has expanded its traditional measures of tracking highway operational performance-how highways accommodate travel demand-in recent years. While still including measures of traffic density and volume during peak travel times, FHWA's 1999 Conditions and Performance report<sup>4</sup> also included measures of delay and several congestion measures developed by the Texas Transportation Institute (TTI).<sup>5</sup> In its most recent report, FHWA has added three additional TTI measures of congestion: percent of additional travel time, annual hours of delay, and percent of travel under congested conditions.<sup>6</sup>

Likewise, in its Performance Plan for Fiscal Year 2001, the Department of Transportation moved away from density-based measures in assessing progress toward the goal of reducing highway congestion. The Department replaced its goal of reducing hours of delay per 1,000 vehicle miles traveled with three new performance goals-reducing congested travel time, peak period travel time, and traveler delay. The Department made this change because it believed the original measure did not reflect the actual performance of the highway system in places where congestion regularly happens (e.g., congested, urban areas). The added measures, developed by TTI using FHWA data, reflect changing travel conditions more comprehensively by focusing on the different aspects of inefficient road performance in areas where congestion regularly occurs.<sup>7</sup> The Department continues to use these measures in its Performance Plan for Fiscal Year 2003 and Performance Report for Fiscal Year 2001.

GAO has not evaluated the congestion measures produced by TTI. However, in its 1999 Conditions and Performance report, FHWA called TTI's ongoing work on congestion "the most significant continuing study being done on congestion in the United States." FHWA commended TTI for its contribution to the knowledge base of congestion and said that the results of TTI's studies were useful measures of congestion's trends and costs in metropolitan areas. However, FHWA also noted that measuring congestion is difficult and that additional research is needed to determine optimal measures and data collection methods. Likewise, the Department of Transportation noted in its latest Performance Plan and Performance Report that the "proportion of congested travel" figures on which TTI's measures are based are computed rather than measured values, possibly resulting in an understatement of the level of congestion. The Department is working toward the development of an additional measure of traffic congestion reliability based on minute-by-minute data gathered through traffic monitoring systems, including those funded by the Intelligent Transportation Systems program.

*Question 4.* GAO has done some work reviewing the methodology DOT uses in compiling its Conditions and Performance Report. What were your conclusions on the reliability of the data provided?

Response. We reviewed the model FHWA uses to estimate investment requirements for the nation's highways, including the estimates FHWA presented in its 1999 Conditions and Performance report, and found it reasonable. FHWA used the same model, with some modifications, to arrive at its 2002 highway investment requirement estimates. In June 2000, we reported that the model's strengths included:

<sup>4</sup>Federal Highway Administration and Federal Transit Administration, 1999 Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance (Washington, DC: U.S. Department of Transportation, 2000).

<sup>5</sup>David Shrank and Tim Lomax, 2002 Urban Mobility Report (College Station, TX: Texas Transportation Institute, June 2002).

<sup>6</sup>Federal Highway Administration and Federal Transit Administration, 2002 Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance (forthcoming).

<sup>7</sup>U.S. General Accounting Office, Department of Transportation: Status of Achieving Key Outcomes and Addressing Major Management Challenges, GAO-01-834, (Washington, DC: June 2001).

(1) its contribution to a comprehensive assessment of investment needs to meet results-oriented agency goals and (2) the independent reviews that showed FHWA had made improvements to the model. However, we reported that the model had some limitations. For example, the model could not estimate the full range of uncertainties within which its estimates vary. In addition, FHWA used its model combined with other less reliable techniques to reach its estimate of highway investment requirements, so the total investment requirement estimates in the Conditions and Performance report included a combination of estimates with varying levels of rigor. We did not comprehensively review the data that feeds the administration's model, although we had previously reported that data used in the model are subject to some uncertainties.

We also compared the infrastructure investment estimates of a number of Federal agencies, and, in July 2001, reported that FHWA's approach met some of the leading practices GAO identified for capital investment decisionmaking including (1) using a benefit-cost analysis and (2) using results-oriented estimates of the amounts needed to maintain or improve the performance of highways.

Since we last reviewed FHWA's highway needs forecasting model, the Administration has modified its highway and bridge models for estimating future investment needs. These modifications should improve the quality of the highway investment needs forecasts, according to an FHWA official. To improve the model used to estimate highway investment requirements, FHWA made technical improvements in four cost areas: delay, air pollution, benefit-cost analysis procedures, and traveler response to changes in user costs. The new bridge model's advantages are that it filters out improvements that are not cost beneficial, and, compared to the prior model, it more accurately forecasts routine costs and bridge owners' management strategies.

August 30, 2002

The Honorable James Jeffords  
 Chairman  
 The Honorable Robert Smith  
 Ranking Member  
 Committee on Environment and Public Works  
 United States Senate

The scope of the U.S. surface and maritime transportation systems—which primarily include roads, mass transit systems, railroads, and ports and waterways<sup>1</sup>—is vast. One of the major goals of these systems is to provide and enhance mobility, that is, the free flow of passengers and goods. Mobility provides people with access to goods, services, recreation, and jobs; provides businesses with access to materials, markets, and people; and promotes the movement of personnel and material to meet national defense needs. Among the social and economic benefits of enhanced mobility are improved economies and, for some, better quality of life and access to job opportunities. In 2000, the surface and maritime transportation systems carried 2.7 trillion miles of travel by passenger vehicles and trucks, 8.7 billion trips on public transit, 22.5 million trips on intercity passenger rail (Amtrak), and in 1998, about 13.5 billion tons of freight on all modes.

While the U.S. surface and maritime transportation systems provide many benefits, they have also generated some concerns about congestion and the burden they impose on the nation's quality of life through wasted energy, time, and money; increased pollution and threats to public safety; barriers to transportation accessibility for certain population groups; and the level of financial resources available to address transportation problems. Several key pieces of legislation that authorize funding for federal surface transportation programs will expire soon. For example, the Transportation Equity Act for the 21st Century (TEA-21)<sup>2</sup>—which authorizes federal funding for highways, mass transit, and a variety of other surface transportation programs—expires in fiscal year 2003 and the Amtrak

<sup>1</sup>In this report, we define the surface transportation system as highways, mass transit systems, and railroads and the maritime transportation system as ports, inland waterways, and the intermodal connections leading to them. Pipelines were not part of our review.

<sup>2</sup>PL 107-175 (June 9, 2000).

---

Reform and Accountability Act of 1997<sup>3</sup> that authorizes federal appropriations for Amtrak expires at the end of fiscal year 2002. In addition, the federal funding processes and mechanisms for the maritime transportation system are currently under review by two interagency groups.<sup>4</sup> As the Congress considers reauthorizing surface transportation legislation, it will weigh the structure, nature, and level of federal investment it will provide in future years to enhance mobility and support other surface and maritime transportation activities.

Given the social and economic importance of the surface and maritime transportation systems and to inform the Congress in its reauthorization deliberations, you asked us to provide information on the following questions:

1. What have been the trends over the past 10 years in surface and maritime transportation expenditures made by the public sector?
2. What are the projected trends in the levels of passenger and freight travel on surface and maritime transportation modes over the next 10 years and what are the key factors that influence those trends?
3. What key challenges in maintaining and improving mobility have experts and other sources identified?
4. What are some key strategies for addressing the challenges?

In addressing the first two questions, we analyzed databases and other information obtained from the U.S. Department of Transportation (DOT) and the U.S. Army Corps of Engineers (Corps of Engineers).<sup>5</sup> We did not verify the accuracy of these data. In addressing the third and fourth questions, we relied upon the results of two panels of surface and maritime transportation experts that we convened in April 2002. The 22 experts were selected by the National Academy of Sciences (NAS) and its Transportation Research Board with input from us; they included a cross-section of

---

<sup>3</sup>PL 105-104 (Dec. 2, 1987).

<sup>4</sup>The two groups are the Interagency Committee on the Marine Transportation System and the Marine Transportation System National Advisory Council.

<sup>5</sup>The DOT data on expenditures included spending by the U.S. Coast Guard and the St. Lawrence Seaway Development Corporation for transportation.

---

representatives from all surface and maritime modes and from various occupations involved in transportation planning. We also reviewed reports prepared by federal agencies, academics, and industry groups to address the third and fourth questions. Appendix VI provides further information on our scope and methodology.

In this report we discuss three types of travel that have important distinctions: local passenger travel, intercity passenger travel, and freight travel. Local travel includes commuting trips to and from work, shopping trips, and other personal trips such as for school, social, or recreational purposes. The main types of vehicles and modes of transportation used for local trips include automobiles and mass transit, including city buses, commuter rail, subways, and ferries. Intercity passenger travel is different from local travel because it represents longer distances traveled, and it occurs on some different modes of transportation, primarily automobile, air service, intercity bus, and intercity rail. Freight generally moves by trucks on public roads; by barges and various cargo ships on the inland, intra-coastal, coastal, and Great Lakes waterways; by trains on rail on private right-of-way; and by airplane. The choice of mode is influenced by the type, weight, and value of goods being shipped; available modes of transportation in the region; and cost, speed, and other service requirements.

---

## Results in Brief

During the past decade, total public sector spending (in 1999 dollars)<sup>6</sup> increased for public roads and transit, remained constant for waterways, and decreased for rail. Federal expenditures for public roads have substantially increased since the passage of TEA-21 in 1998—from \$21.2 billion in 1998 to \$25.9 billion in 2000, an increase of 23.5 percent.<sup>7</sup> Federal spending for transit decreased slightly between 1991 and 1999 and then increased by 21.5 percent from \$4.3 billion in 1999 to \$5.2 billion in 2000. Federal spending stayed constant for waterways and decreased for rail during the period from 1991 to 2000. The state and local share of total public sector expenditures stayed relatively constant during fiscal years

---

<sup>6</sup>We adjusted the expenditure data to account for inflation using separate indexes for expenditures made by the federal government or state and local governments. We used price indexes from the U.S. Bureau of Economic Analysis' National Income and Products Accounts.

<sup>7</sup>Throughout this report, the percentage calculations are based on amounts that have not been rounded.

---

day in 1982 to about 7 hours in 2000 in 55 metropolitan areas that were studied. Freight mobility is affected by increasing congestion within specific heavily used corridors and at specific bottlenecks that tend to involve intermodal connections, such as border crossings, and road and rail connections at major seaports and within metropolitan areas. For example, one panelist said that railroads are beginning to experience more severe capacity constraints in areas where commuter and intercity passenger rail services share tracks with freight railroads.

- **Ensuring access to transportation for certain underserved populations, including some elderly, poor, and rural populations that have restricted mobility.** Policies and patterns of development that encourage automobile dependence and favor provision of transit services with inflexible routes and schedules—such as subway or bus—may disadvantage these groups by limiting their access to needed services and/or jobs.
- **Addressing the transportation system's negative effects on the environment and communities.** Increasing travel can lead to degradation of air quality and other negative externalities. Passenger and freight vehicle emissions contribute to air and water pollution, particularly in congested areas, and the accompanying noise is also a form of pollution.

There is no one solution for the mobility challenges facing the nation, and our expert panelists indicated that numerous approaches are needed to address these challenges. From these discussions, we believe that the wide range of approaches discussed can be clustered into three key strategies that may aid transportation decisionmakers at all levels of government in addressing mobility challenges. These strategies include the following:

1. **Focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes.** This strategy involves shifting the focus of transportation agencies at the federal, state, and local level from their current emphasis on single modes to consider performance outcomes of all modes in addressing mobility challenges, as well as recognizing interactions across modes, between passenger and freight traffic, and between public and private interests. This strategy offers promise to better target the specific mobility challenges identified above.
2. **Use a full range of tools to achieve desired mobility outcomes.** This strategy, which calls for using various tools—such as new construction,

---

corrective and preventive maintenance, rehabilitation, operations and system management, and pricing—to address complex mobility challenges, offers promise to be more effective than placing emphasis on any one technique. For example, building new infrastructure can ease congestion in bottlenecks but is not always a viable solution due to cost, land, regulatory, or administrative constraints. Also, performing needed maintenance on existing transportation systems can improve the speed and reliability of passenger and freight travel, while instituting tolls or fees during peak travel times may lead people to schedule recreational trips or more freight during less congested times or by alternate routes.

3. Provide more options for financing mobility improvements and consider additional sources of revenue. This strategy—which involves providing options for targeting the financing of transportation projects to achieve desired mobility outcomes and to address transportation systems that face the greatest challenges—suggests the value of identifying more options for raising and distributing funds for surface and maritime transportation.

---

## Background

The U.S. surface and maritime transportation systems facilitate mobility through an extensive network of infrastructure and operators, as well as through the vehicles and vessels that permit passengers and freight to move within the systems. The systems include 3.9 million miles of public roads, 121,000 miles of major private railroad networks, and 25,000 miles of commercially navigable waterways. They also include over 500 major urban public transit operators in addition to numerous private transit operators, and more than 300 ports on the coasts, Great Lakes, and inland waterways.

Maintaining the transportation system is critical to sustaining America's economic growth. Efficient mobility systems are essential facilitators of economic development—cities could not exist and global trade could not occur without systems to transport people and goods. DOT has adopted improved mobility—to “shape an accessible, affordable, reliable transportation system for all people, goods, and regions”—as one of its strategic goals. To achieve this goal, it has identified several desired outcomes, including (1) improving the physical condition of the transportation system, (2) reducing transportation time from origin to destination, (3) increasing the reliability of trip times, (4) increasing access

---

to transportation systems, and (5) reducing the cost of transportation services.

The relative roles, responsibilities, and revenue sources of each sector involved in surface and maritime transportation activities—including the federal government, other levels of government, and the private sector—vary across modes. For public roads, ownership is divided among federal, state, and local governments—over 71 percent of the roads are owned by local governments; 20 percent are owned by the states, including most of the Interstate Highway System; and 3 percent are owned by the federal government.<sup>22</sup> While the federal government owns few roads, it has played a major role in funding the nation's highways. For example, from 1954 through 2001, the federal government invested over \$570 billion (in constant 2001 dollars) in the Interstate Highway System.

With the completion of the interstate system in the 1980s—and continuing with passage of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA)<sup>23</sup> and its successor legislation, TEA-21, in 1996—the federal government shifted its focus toward preserving and enhancing the capacity of the system. Under the Federal Aid Highway Program, the Federal Highway Administration (FHWA) provides funds to states to construct, improve, and maintain the interstate highway system and other parts of the U.S. road network and to replace and rehabilitate bridges. TEA-21 established, among other things, a mechanism for ensuring that the level of federal highway program funds distributed to the states would be more closely linked than before to the highway user tax receipts credited to the Highway Account of the Highway Trust Fund. These user taxes include excise taxes on motor fuels (gasoline, alcohol, diesel, and special fuels) and truck-related taxes on truck tires, sales of trucks and trailers, and the use of heavy vehicles. FHWA distributes highway program funds to the states through annual apportionments according to statutory formulas that consider a variety of factors including vehicles miles traveled on the interstate system, motor fuel usage by each state's highway users, and other factors. The federal share for project funding is usually 80 percent but can vary among programs, road types, and states. State and local governments then “match” federal funds with funds from other sources, such as state or local revenues.

<sup>22</sup>These include roads in national forests and parks and on military and Indian reservations.

<sup>23</sup>PL 102-240 (Dec. 18, 1991).

---

While the federal government's primary role has been to provide capital funding for the interstate system and other highway projects, state and local governments provide the bulk of the funding for public roads in the United States and are responsible for operating and maintaining all nonfederal roads including the interstate system. The sources of state highway revenues include user charges, such as taxes on motor fuels and motor vehicles and tolls; proceeds of bond issues; General Fund appropriations; and other taxes and investment income. The sources of local highway revenues include many of the user charges and other sources used by state governments, as well as property taxes and assessments.

The U.S. transit system includes a variety of multiple-occupancy vehicle services designed to transport passengers on local and regional routes. Capital funding for transit came from the following sources in 2000: 47 percent of the total came from the federal government, 27 percent from transit agencies and other nongovernmental sources, 15 percent from local governments, and 11 percent from states. In that same year, the sources of operating funds for transit included passenger fares (36 percent of operating funds); state governments (20 percent); local governments (22 percent); other funds directly generated by transit agencies and local governments through taxes, advertising, and other sources (17 percent); and the federal government (5 percent).

The Federal Transit Administration (FTA) provides financial assistance to states and local transit operators to develop new transit systems and improve, maintain, and operate existing systems. This assistance includes (1) formula grants to provide capital and operating assistance to urbanized and nonurbanized areas and to organizations that provide specialized transit services to the elderly and disabled persons; (2) competitive capital investment grants for constructing new fixed guideway<sup>22</sup> systems and extensions to existing ones, modernizing fixed guideway systems, and investing in buses and bus-related facilities; (3) assistance for transit planning and research; and (4) grants to local governments and nonprofit organizations to connect low-income persons and welfare recipients to jobs and support services. Funding for federal transit programs is generally provided on an 80 percent/20 percent federal-to-local match basis. Federal

<sup>22</sup>Fixed guideway systems use and occupy a separate right-of-way for the exclusive use of public transportation services. They include fixed rail, exclusive lanes for buses and/or high-occupancy vehicles, and other systems.

---

support for transit projects comes from the Highway Trust Fund's highway and transit accounts and from the General Fund of the U.S. Treasury.<sup>15</sup>

The respective roles of the public and private sector and the revenue sources vary for passenger as compared with freight railroads. With regard to passengers, the Rail Passenger Service Act of 1970 created Amtrak to provide intercity passenger rail service because existing railroads found such service unprofitable. Since its founding, Amtrak has rebuilt rail equipment and benefited from significant public investment in track and stations, especially in the Northeast corridor, which runs between Boston, Mass., and Washington, D.C. The federal government, through the Federal Railroad Administration (FRA), has provided Amtrak with \$30 billion (in 2000 dollars)<sup>16</sup> for capital and operating expenses from 1971 through 2002. Federal payments are a significant revenue source for Amtrak's capital budget,<sup>17</sup> but not its operating budget. In fiscal year 2001, for example, the sources of Amtrak's capital funding were private sector debt financing (50 percent of total revenues), the federal government (30 percent), and state and local transportation agencies (5 percent). In that same year, the sources of funding for Amtrak's operating budget were passenger fares (50 percent of total revenues), other business activities and commuter railroads (34 percent), and the federal government and state governments (7 percent).<sup>18</sup> The role of the federal government in providing financial support to Amtrak is currently under review amid concerns about the corporation's financial viability and discussions about the future direction of federal policy toward intercity rail service.

With regard to freight, the private sector owns, operates, and provides almost all of the financing for freight railroads. Since the 1970s, the railroad industry has experienced many changes including deregulation and industry consolidation. Currently, the federal government plays a relatively small role in financing freight railroad infrastructure by offering some

---

<sup>15</sup>The General Fund contains receipts that are not earmarked by law for a specific purpose, such as almost all income tax receipts.

<sup>16</sup>In nominal dollars, the Congress provided Amtrak with about \$25 billion from 1971 through 2002.

<sup>17</sup>Amtrak's capital revenues are used to acquire property, plant, and equipment.

<sup>18</sup>In addition, Amtrak used a portion of its federal capital funding to pay for operating expenses related to overhauling equipment.

---

credit assistance to state and local governments and railroads for capital improvements.

The U.S. maritime transportation system primarily consists of waterways, ports, the intermodal connections (e.g., inland rail and roadways) that permit passengers and cargo to reach marine facilities, and the vessels and vehicles that move cargo and people within the system. The maritime infrastructure is owned and operated by an aggregation of state and local agencies and private companies, with some federal funding provided by the Corps of Engineers, the U.S. Coast Guard, and DOT's Maritime Administration. The Corps of Engineers provides funding for projects to deepen or otherwise improve navigation channels, maintain existing waterways, and construct and rehabilitate inland waterway infrastructure, primarily locks and dams. Funding for channel operations and maintenance generally comes from the Harbor Maintenance Trust Fund supported by a tax on imports, domestic commodities, and other types of port usage. The costs of deepening federal channels are shared by the federal government and nonfederal entities. The Inland Waterways Trust Fund, supported by a fuel tax, funds one-half of the inland and intra-coastal capital investments. Coast Guard funding promotes (1) mobility by providing aids to navigation, icebreaking services, bridge administration, and traffic management activities; (2) security through law enforcement and border control activities; and (3) safety through programs for prevention, response, and investigation. DOT's Maritime Administration provides loan guarantees for the construction, reconstruction, or reconditioning of eligible export vessels and for shipyard modernization and improvement. It also subsidizes the operating costs of some companies that provide maritime services and provides technical assistance to state and local port authorities, terminal operators, the private maritime industry, and others on a variety of topics (e.g., port, intermodal, and advanced cargo handling technologies; environmental compliance; and planning, management, and operations of ports).

### Trends in Public Expenditures for Surface and Maritime Transportation Vary by Mode

#### Public Sector Expenditures

Public sector spending (in 1999 dollars) has increased for public roads and transit between fiscal years 1991 and 1999, but stayed constant for waterways and decreased for rail, as shown in figure 1.

Figure 1: Total Public Sector Expenditures for Surface and Maritime Transportation by Mode, Fiscal Years 1991-1999

Source: U.S. Department of Transportation, Bureau of Transportation Statistics (2002), Government Transportation Financial Statistics (Preliminary Data), Washington, D.C.

---

Total public sector spending for public roads increased by 18.4 percent between fiscal years 1991 and 1999,<sup>17</sup> from \$80.5 billion to \$95.5 billion (in 1990 dollars).<sup>18</sup> Of those totals, the relative shares contributed by the federal government and by state and local governments remained constant from 1991 to 1999, as shown in figure 2. Contributions from state and local governments' own funds—that is, independent of federal grants to state and local governments—were approximately 75 percent, with the federal government contributing the remaining 25 percent.<sup>19</sup>

---

<sup>17</sup>As of May 2001, state and local government expenditures were not available for fiscal years after 1999. Therefore, total public sector expenditures are only reported through fiscal year 1999. Federal expenditure data are available for fiscal year 2000, but only appropriations data are available for fiscal years 2001 and 2002.

<sup>18</sup>Throughout this report, the percentage calculations are based on amounts that have not been rounded.

<sup>19</sup>State and local governments' highway expenditures reported by the Bureau of Transportation Statistics are slightly lower than those reported in the FHWA's Highway Statistics, because data from the FHWA include outlays for activities—such as law enforcement and patrols and policing of streets and highways—not included in the Bureau of Transportation Statistics' data.

---

day in 1982 to about 7 hours in 2000 in 55 metropolitan areas that were studied. Freight mobility is affected by increasing congestion within specific heavily used corridors and at specific bottlenecks that tend to involve intermodal connections, such as border crossings, and road and rail connections at major seaports and within metropolitan areas. For example, one panelist said that railroads are beginning to experience more severe capacity constraints in areas where commuter and intercity passenger rail services share tracks with freight railroads.

- **Ensuring access to transportation for certain underserved populations, including some elderly, poor, and rural populations that have restricted mobility.** Policies and patterns of development that encourage automobile dependence and favor provision of transit services with inflexible routes and schedules—such as subway or bus—may disadvantage these groups by limiting their access to needed services and/or jobs.
- **Addressing the transportation system's negative effects on the environment and communities.** Increasing travel can lead to degradation of air quality and other negative externalities. Passenger and freight vehicle emissions contribute to air and water pollution, particularly in congested areas, and the accompanying noise is also a form of pollution.

There is no one solution for the mobility challenges facing the nation, and our expert panelists indicated that numerous approaches are needed to address these challenges. From these discussions, we believe that the wide range of approaches discussed can be clustered into three key strategies that may aid transportation decisionmakers at all levels of government in addressing mobility challenges. These strategies include the following:

1. **Focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes.** This strategy involves shifting the focus of transportation agencies at the federal, state, and local level from their current emphasis on single modes to consider performance outcomes of all modes in addressing mobility challenges, as well as recognizing interactions across modes, between passenger and freight traffic, and between public and private interests. This strategy offers promise to better target the specific mobility challenges identified above.
2. **Use a full range of tools to achieve desired mobility outcomes.** This strategy, which calls for using various tools—such as new construction,

**Figure 2: Federal Government and State and Local Government Shares of Expenditures on Public Roads (in billions of 1999 dollars)**

Source: U.S. Department of Transportation, Bureau of Transportation Statistics (2002), Government Transportation Financial Statistics (Preliminary Data), Washington, D.C.

The increases in total public spending for roads reflect federal programmatic spending increases resulting from ISTEA in 1992 and TEA-21 in 1995, as well as increases in total state and local spending. In particular, since the passage of TEA-21, the federal government's contribution to total public expenditures on roads increased by 25.8 percent (in 1999 dollars) from \$21.2 billion in fiscal year 1998 to \$26.9 billion in fiscal year 2000, the latest year for which federal expenditure data are available. Although data on federal expenditures are not currently available for fiscal years after 2000, federal appropriations for fiscal years 2001 and 2002 reached \$32.1 billion and \$33.3 billion, respectively.<sup>25</sup> Federal funding increases in those years largely resulted from adjustments required by the Revenue Aligned

<sup>25</sup>Appropriations are not directly comparable to expenditures. Appropriations provide the authority to make obligations, which eventually turn into expenditures. However, those expenditures might not be made in the same fiscal year as the appropriations.

---

Budget Authority (RABA) provisions in TEA-21.<sup>77</sup> Since TEA-21, the federal government has shifted its focus toward preserving and enhancing the capacity of public roads, while state and local government expenditures have been focused on maintaining and operating public roads. Appendix I contains additional information on the levels of capital investment and maintenance spending by the public sector.

Total public spending for transit increased by 34.8 percent between fiscal years 1991 and 1999 to just over \$29 billion (in 1999 dollars). This mainly reflects increases in state and local expenditures, as federal expenditures for transit actually decreased slightly over this period to \$4.3 billion in 1999. In fiscal year 2000, however, federal spending on transit increased by 21.5 percent from \$4.3 billion to \$5.2 billion (in 1999 dollars). Although federal data on expenditures are not currently available for fiscal years after 2000, appropriations for fiscal years 2001 and 2002 reached \$5.3 billion and \$6.8 billion, respectively. State and local expenditures, independent of federal grants, increased to over \$24 billion in 1999, accounting for over 85 percent of total public sector expenditures for transit, a share that has increased somewhat since 1991, as shown in figure 3.

<sup>77</sup>Under the EARA provision, the annual spending levels that are guaranteed for most federal highway programs are to be adjusted upward or downward during each fiscal year if the receipt levels in the Highway Account of the Highway Trust Fund increase or decrease from those projected in TEA-21.

**Figure 3: Federal Government and State and Local Government Shares of Expenditures on Public Transit (in billions of 1999 dollars)**

Source: U.S. Department of Transportation, Bureau of Transportation Statistics (2002), Government Transportation Financial Statistics (Preliminary Data), Washington, D.C.

Public sector spending on ports and waterways has remained between \$7.2 and \$7.9 billion (in 1999 dollars), between fiscal years 1991 and 1999. This spending pattern reflects fairly steady levels of federal spending by the Corps of Engineers, the Coast Guard, and the Maritime Administration for water transportation expenditures. Expenditures by the Corps of Engineers and the Coast Guard comprise the bulk of federal spending for water transportation, and have remained at about \$1.5 billion and \$2 billion (in 1999 dollars) per year, respectively. State and local expenditures, however, increased by 27.7 percent, from \$2.4 billion in fiscal year 1991 to \$3.1 billion in fiscal year 1999, and accounted for about 41 percent of total public water transportation expenditures in fiscal year 1999, having grown from about 34 percent of the total in fiscal year 1991, as shown in figure 4.

Figure 4: Federal Government and State and Local Government Shares of Expenditures on Interstate Transportation (in millions of 1996 dollars)

Source: U.S. Department of Transportation, Bureau of Transportation Statistics (2002), Government Transportation Financial Statistics (Preliminary Data), Washington, D.C.

The public sector's role in the funding of freight railroads is limited since the private sector owns, operates, and provides almost all of the financing for freight railroads. In addition, since public sector expenditures for commuter rail and subways are considered public transit expenditures, public expenditures discussed here for passenger rail are limited to funding for Amtrak. Federal support for Amtrak has fluctuated somewhat throughout the 1990s, but has dropped off substantially in recent years, with fiscal years 2001 and 2002 appropriations of \$520 and \$521 million, respectively. Sufficient data are not currently available to characterize trends in state and local governments' spending for intercity passenger rail.<sup>10</sup>

<sup>10</sup>However, Amtrak estimates that states will contribute \$253 million to Amtrak routes and infrastructure in 2002.

---

---

**Private Sector Expenditures**

The private sector plays an important role in the provision of transportation services in each mode. For example, while the private sector does not invest heavily in providing roads, it purchases and operates most of the vehicles for use on publicly provided roads. For freight rail, the private sector owns and operates most of the tracks as well as the freight trains that run on the tracks. In the maritime sector, many ports on the inland waterways are privately owned, as are freight vessels and towboats. Data on private sector expenditures on a national level are limited.

However, available data show that private expenditures for transportation on roads, rail, and waterways rose throughout the 1990s. According to the U.S. Bureau of Economic Analysis' Survey of Current Business,<sup>22</sup> individuals and businesses spent about \$397 billion in 2000 for the purchase of new cars, buses, trucks, and other motor vehicles, a 57-percent increase from 1992 levels (in 2000 dollars). In addition to the purchase of vehicles, the private sector also invests in and operates toll roads and lanes; however, data on these investments are not currently available on a national level. According to the Survey of Current Business, freight railroads and other businesses spent over \$11 billion for railroad infrastructure and rail cars in 2000, a 65-percent increase from 1991 (in 2000 dollars). In addition, private sector investment on ships and boats more than doubled between 1991 and 2000, to about \$3.7 billion (in 2000 dollars). However, private investment in waterways also includes port facilities for loading and unloading ships and for warehousing goods. Data on these investments are also currently not available on a national level.

---

**Passenger and Freight Travel Are Expected to Increase on All Modes**

Federal projections show passenger and freight travel increasing over the next 10 years on all modes,<sup>23</sup> due to population growth, increasing affluence, economic growth, and other factors. Passenger vehicle travel on public roads is expected to grow by 24.7 percent from 2000 to 2010. Passenger travel on transit systems is expected to increase by 17.2 percent over the same period. Intercity passenger rail ridership is expected to

<sup>22</sup>Data were compiled from issues of the survey released between 2004 and 2000 (Tables B-4, B-5, B-6, 5-0, and 5-8) and were adjusted for inflation using separate indexes from U.S. Bureau of Economic Analysis' National Income and Products Accounts for individual expenditures on new vehicles or business expenditures on transportation equipment. The survey data do not include overall private investment in transit systems.

<sup>23</sup>The projections used in this report were developed by the DOT modal administrations, the Corps of Engineers, and Amtrak. We did not verify the data used in making projections, and we do not endorse the projections as accurate.

increase by 25 percent from 2001 to 2010. Finally, preliminary estimates by DOT also indicate that tons of freight moved on all surface and maritime modes—truck, rail, and water—are expected to increase by about 43 percent from 1998 through 2010, with the largest increase expected to be in tons moved by truck.

However, several factors in the forecast methodologies limit their ability to capture the effects of changes in travel levels on the surface and maritime transportation systems as a whole (see app. B for more information about the travel forecast methodologies). For example, a key assumption underlying most of the national travel projections we obtained is that capacity will increase as levels of travel increase; that is, the projections are not limited by possible future constraints on capacity such as increasing congestion. On the other hand, if capacity does not increase, future travel levels may be lower than projected.<sup>20</sup> In addition, differences in travel measurements hinder direct comparisons between modes and types of travel. For example, intercity highway travel is not differentiated from local travel in FHWA's projections of travel on public roads, so projections of intercity highway travel cannot be directly compared to intercity passenger travel projections for other modes, such as rail. For freight travel, FHWA produces projections of future tonnage shipped on each mode; however, tonnage is only one measure of freight travel and does not capture important aspects of freight mobility, such as the distances over which freight moves or the value of the freight being moved.

#### Travel on Public Roads Is Projected to Grow Fairly Steadily

As shown in figure 5, vehicle miles traveled for passenger vehicles on public roads are projected to grow fairly steadily through 2010, by 24.7 percent over the 10-year period from 2000 through 2010, with an average annual increase of 2.2 percent. This is similar to the actual average annual rate of growth from 1991 to 2006, which was 2.3 percent. At the projected rate of growth, vehicle miles traveled would reach 3.2 trillion by 2010. The

<sup>20</sup>Other factors also influence travel but were not always included in travel projections. For example, growth in miles driven on public roads is influenced by shifts in population in less populated residential areas, transit ridership is affected by levels of immigration, and freight travel is affected by technological innovations that improve transportation efficiency, but the influence of these factors is not taken into account. In addition, investments in additional transportation capacity can stimulate corresponding increases in travel demand. Consequently, these national travel projections need to be used carefully in evaluating how capacity investments or other changes in one mode of transportation might affect travel across other modes and the transportation system as a whole.

20-year annual growth rate forecasts produced by individual states ranged from a low of 4.29 percent for Maine to a high of 3.43 percent for Utah.<sup>28</sup> (See app. B for more detailed information on state forecasts.)

**Figure 5: Historical and Projected Vehicle Miles Traveled for Passenger Vehicles on Public Roads, 1981-2010**

**Note:** Automobiles include all passenger cars plus motorcycles. Light trucks are defined as other 2- to 6-tire vehicles (such as vans, pickup trucks, and sport utility vehicles). Buses include commercial buses, school buses, and buses owned by federal, state, or local governments.  
**Source:** Federal Highway Administration.

In addition to passenger vehicles, trucks carrying freight contribute to the overall levels of travel on public roads. Vehicle miles traveled by freight trucks are also projected to increase by 2010, but such traffic makes up a relatively small share of total vehicle miles traveled. According to forecasts

<sup>28</sup>FHWA provided us with forecasts for total (passenger and freight) vehicle miles traveled from individual states, the District of Columbia, and Puerto Rico (see app. B). These project future travel through 2020 rather than through 2010.

by FHWA, freight truck vehicle miles are expected to grow by 32.5 percent from 2000 to 2010, but will constitute less than 18 percent of total vehicle miles traveled nationwide in 2010. However, within certain corridors, trucks may account for a more substantial portion of total traffic. The projected average annual growth rate for truck travel is 2.9 percent for 2000 to 2010, compared to an actual average annual growth rate of 3.9 percent from 1991 to 2000. We discuss freight travel in more detail later in this report, after the discussion of passenger travel.

**Transit Travel Is Projected to Increase**

For transit, FTA projects that the growth in passenger miles traveled between 2000 and 2010 will average 1.6 percent annually, for a total growth of 17.2 percent. Actual growth from 1991 through 2000 averaged 2.1 percent annually. (See fig. 6.) At the projected growth rate, annual passenger miles traveled on the nation's transit systems would be approximately 72.9 billion by 2010. The transit forecast is a national weighted average and the individual forecasts upon which it is based vary widely by metropolitan area. For example, transit forecasts for specific urbanized areas range from a -4.65 percent average annual decrease in Philadelphia to a 3.56 percent average annual increase in San Diego.

Figure 6. Historical and Projected Passenger Miles Traveled on Transit, 1991-2010

---

Note: Types of transit included in this figure are: automated guideway (guided, fully automated vehicle), cable car, commuter rail, demand response (vehicle operating in response to calls from passengers), light rail, heavy rail, inclined plane (vehicle operating up and down steps on rail via a cable mechanism), light rail, bus, monorail, public trolley, and airport.

---

### Intercity Passenger Travel Is Projected to Increase

Both DOT and Antrak project future increases in intercity passenger travel. Although automobiles dominate intercity travel, FHWA's projections of vehicle miles traveled do not separately report long-distance travel in cars on public roads. After automobiles, airplanes and intercity buses are the next most used modes and intercity passenger rail is the least used.<sup>27</sup> However, we do not report on air travel since it is outside the scope of this report, or on bus travel, because while FHWA projected increases in the number of miles traveled by all types of buses, we were unable to obtain specific projections of intercity ridership on buses. For intercity passenger rail, Antrak predicts a cumulative increase in total ridership of 25.0 percent from 23.5 million passengers in 2001 to 29.6 million passengers in 2010, a contrast with the relatively flat ridership of recent years, which has remained between 20 and 23 million passengers per year (see app. II for further details about Antrak's projections).<sup>28</sup>

---

### Factors Expected to Affect Future Passenger Travel Include Population Growth, Increasing Affluence, and Improved Communications

According to FHWA, FTA, and many of our panelists, a number of factors are likely to influence not only the amount of travel that will occur in the future, but also the modes travelers choose. First, the U.S. Census Bureau predicts that the country's population will reach almost 300 million by 2010, which will result in more travelers on all modes. This population growth, and the areas in which it is expected to occur, could have a variety of effects on mode choices. In particular, the population growth that is expected in suburban areas could lead to a larger increase in travel by private vehicles than by transit because suburban areas generally have lower population densities than inner cities, and also have more dispersed

<sup>27</sup>In 2000, the latest year for which comparable data are available, domestic airlines carried about 677 million passengers, intercity buses carried about 330 million passengers, and Antrak carried about 22.5 million passengers.

<sup>28</sup>The national Antrak ridership statistics, however, mask some regional trends. Cumulative ridership in the Northeast corridor and on the West Coast has grown by about 2 million passengers since 1994, while ridership on the rest of the intercity passenger rail system has generally decreased.

---

travel patterns, making them harder to serve through conventional public transit. Rural areas are also expected to experience high rates of population growth and persons living there, like suburban residents, are more reliant on private vehicles and are not easily served by conventional public transit. While these demographic trends tend to decrease transit's share of total passenger travel as compared to travel by private vehicle, the overall growth in population is expected to result in absolute increases in the level of travel on transit systems as well as by private vehicle. Another important factor that could affect mode choice is that the population aged 85 and over will increase 38 percent by 2030, according to data from the Census Bureau. The aging of the population might increase the market for demand-responsive transit services<sup>27</sup> and improved road safety features, such as enhanced signage.

Second, DOT officials and our panelists believed that the increasing affluence of the U.S. population would play a key role in future travel, both in overall levels and in the modes travelers choose. They noted that, as income rises, people tend to take more and longer trips, private vehicle ownership tends to increase, and public transit use generally decreases. Third, communication technology could affect local and intercity travel, but the direction and extent of the effect is uncertain. For example, telecommuting and videoconferencing are becoming more common, but are not expected to significantly replace face-to-face meetings unless the technology improves substantially. Finally, changes in the price (or perceived price), condition, and reliability of one modal choice as compared to another are also likely to affect levels of travel and mode choices. For example, changes in the petroleum market that affect fuel prices, or changes in government policy that affect the cost of driving or transit prices could result in shifts between personal vehicles and transit; however, it is difficult to predict the extent to which these changes would occur. Also, if road congestion increases, there could be a shift to transit or a decrease in overall travel. See appendix III for a more detailed discussion of these factors.

---

<sup>27</sup>According to the American Public Transportation Association, demand response modes are passenger cars, vans, or buses with fewer than 25 seats operating in response to calls from passengers or their agents to the transit operator, who then dispatches a vehicle to pick up the passengers and transport them to their destinations.

---

---

**The Amount of Freight Moved Is Expected to Increase to 19.3 Billion Tons by 2010**

Trucks move the majority of freight tonnage and are expected to continue moving the bulk of freight into the future. FHWA's preliminary forecasts<sup>20</sup> of international and domestic freight tonnage across all surface and maritime modes project that total freight moved will increase 43 percent, from 13.5 billion tons in 1998 to 19.3 billion tons in 2010. According to the forecasts, by 2010, 14.8 billion tons are projected to move by truck, a 47.6-percent increase; 3.1 billion tons by rail, a 31.8-percent increase; and 1.5 billion tons by water, a 26.6-percent increase, as shown in figure 7.<sup>21</sup> Trucks are expected to remain the dominant mode, in terms of tonnage, because production of the commodities that typically move by truck, such as manufactured goods, is expected to grow faster than the main commodities moved by rail or on water, such as coal and grain.

---

<sup>20</sup>Numerous projections of freight travel have been produced for particular modes, countries, or commodities. For example, the Corps of Engineers has produced projections for tons moving on the inland waterways, while the *Latin American Trade and Transportation Study* contains projections of trade patterns between the United States and Latin America. For this report, we relied on projections produced by FHWA, because these are the only projections that predict national freight travel on all modes.

<sup>21</sup>Some freight may be moved by more than one mode before reaching its destination, such as moving by rail for one segment of the trip, then by truck to its final destination. This may result in tons being counted on more than one mode in FHWA's projections. In addition, FHWA's maritime freight projections do not include internal local trade of bulk products and some inland domestic bulk shipments.

Figure 7: Freight Tons (in billions) in 1994 and Projected to 2010\* for Surface and Maritime<sup>†</sup> Modes

\*These forecasts are still in draft.

<sup>†</sup>FHWA's maritime freight projections do not include international trade of bulk products and some inland domestic bulk shipments.

Source: Federal Highway Administration.

Tonnage is only one measure of freight travel and does not capture important aspects of freight mobility, such as the distances over which freight moves or the value of the freight being moved. Ton-miles<sup>‡</sup> measure the amount of freight moved as well as the distance over which it moves, and historically, rail has been the dominant mode in terms of ton-miles for domestic freight. In 1998, the base year of FHWA's projections, domestic rail ton-miles totaled over 1.4 trillion, while intercity truck ton-miles totaled just over one trillion, and domestic ton-miles on the waterways totaled 672.8 billion. Air is the dominant mode in terms of value per ton according

<sup>‡</sup>Ton-miles are calculated by multiplying the total number of tons moved by the total miles traveled.

---

to DOT's *Transportation Statistics Annual Report 2006*,<sup>23</sup> at \$51,000 per ton (in 1997 dollars). However, in terms of total value, trucks are the dominant mode. According to the *Annual Report*, trucks moved nearly \$5 trillion (in 1997 dollars) in domestic goods, as opposed to \$320 billion by rail and less than \$100 billion by inland waterway.

International freight is an increasingly important aspect of the U.S. economy. For international freight, water is the dominant mode in terms of tonnage. According to a DOT report, more than 95 percent of all overseas products and materials that enter or leave the country move through ports and waterways.<sup>24</sup> More specifically, containers, which generally carry manufactured commodities such as consumer goods and electrical equipment and can be easily transferred to rail or truck, dominate in terms of value, accounting for 55 percent of total imports and exports, while only accounting for 12 percent of foreign tonnage. Containers are the fastest growing segment of the maritime sector. While FHWA predicts that total maritime freight tonnage will grow by 26.6 percent, the Corps of Engineers projects that volumes of freight moving in containers will increase by nearly 70 percent by 2010. In addition, ships designed to carry containers are the fastest growing segment of the maritime shipping fleet and are also increasing in size. Although freight vessels designed to carry bulk freight (e.g., coal, grain, or oil) are the largest sector of the freight vessel fleet, the number of containerhips is increasing by 8.8 percent annually, which is double the growth rate of any other type of vessel according to the Corps of Engineers. Also, most of the overall capacity of the containerhip fleet is now found in larger containerhips, with a capacity of more than 3,000 twenty-foot containers, and ships with capacities of three times that amount are currently on order.

---

**Factors Expected to Affect Freight Travel Include Increasing International Trade and Economic Growth**

According to reports by the Transportation Research Board and the Bureau of Transportation Statistics,<sup>20</sup> increasing international trade and economic growth are expected to influence volumes of future freight travel. In addition, the increasing value of cargo shipped and changes in policies affecting certain commodities can affect overall levels of freight traffic as well as the choice of mode for that traffic. The North American Free Trade Agreement has contributed to the increases in tonnage of imports by rail (24-percent increase) and by truck (20-percent increase), from Mexico and Canada between 1996 and 2000, while expanding trade with the Pacific Rim has increased maritime traffic at west coast container ports. With increasing affluence, economic growth often results in a greater volume of goods produced and consumed, leading to more freight moved, particularly higher-value cargo. In addition, the increasing value of cargo affects the modes on which that cargo is shipped. High-value cargo, such as electronics and office equipment, tends to be shipped by air or truck, while rail and barges generally carry lower-value bulk items like coal and grains. Changes in environmental regulations and other policies also affect the amount, cost, and mode choice for moving freight. For example, a change in demand for coal due to stricter environmental controls could affect rail and water transportation, the primary modes for shipping coal. See appendix III for a more detailed discussion of the factors that influence freight travel.

---

**Key Mobility Challenges Include Growing Congestion, Limited Access to the Transportation System for Certain Groups, and Effects on the Environment and Communities**

To identify key mobility challenges and the strategies for addressing those challenges that are discussed later in this report, we relied upon the results of two panels of surface and maritime transportation experts that we convened in April 2002, as well as reports prepared by federal and other government agencies, academics, and industry groups. According to our expert panelists and other sources, with increasing passenger and freight travel, the surface and maritime transportation systems face a number of challenges that involve ensuring continued mobility while maintaining a balance with other social goals, such as environmental preservation. Ensuring continued mobility involves preventing congestion from overwhelming the transportation system and ensuring access to transportation for certain underserved populations. In particular, more travel can lead to growing congestion at bottlenecks and at peak travel times on public roads, transit systems, freight rail lines, and at freight hubs such as ports and borders where freight is transferred from one mode to another. In addition, settlement patterns and dependence on the automobile limit access to transportation systems for some elderly people and low-income households, and in rural areas where populations are expected to expand. Increasing travel levels can also negatively affect the environment and communities by increasing the levels of air, water, and noise pollution.

---

**Congestion Is Growing at Bottlenecks and at Peak Travel Times**

Many panelists explained that congestion is generally growing for passenger and freight travel and will continue to increase at localized bottlenecks (places where the capacity of the transportation system is most limited), at peak travel times, and on all surface and maritime transportation modes to some extent. However, panelists pointed out that transportation systems as a whole have excess capacity and that communities may have different views on what constitutes congestion. Residents of small cities and towns may perceive significant congestion on their streets that may be considered insignificant to residents in major metropolitan areas. In addition, because of the relative nature of congestion, its severity is difficult to determine or to measure and while one measure may be appropriate for some situations, it may be inadequate for describing others.

---

**Congestion in Passenger Travel  
and on Freight Networks**

For local urban travel, a study by the Texas Transportation Institute<sup>26</sup> showed that the amount of traffic experiencing congestion in peak travel periods doubled from 22 percent in 1982 to 66 percent in 2000 in the 75 metropolitan areas studied. In addition, the average time per day that roads were congested increased over this period, from about 4.5 hours in 1982 to about 7 hours in 2000. Increased road congestion can also affect public bus and other transit systems that operate on roads. Some transit systems are also experiencing increasing rail congestion at peak travel times. For example, the Washington Metropolitan Area Transit Authority's (WMATA) recent studies on crowding found that rail travel demand has reached and, in some cases, exceeded scheduled capacity—an average of 140 passengers per car—during the peak morning and afternoon hours. Of the more than 200 peak morning rail trips that WMATA observed over a recent 6-month period, on average, 15 percent were considered “uncomfortably crowded” (125 to 140 passengers per car) and 8 percent had “crush loads” (150 or more passengers per car).<sup>27</sup>

In addition to local travel, concerns have been raised about how intercity and tourist travel interacts with local traffic in metropolitan areas and in smaller towns and rural areas, and how this interaction will evolve in the future. According to a report sponsored by the World Business Council for Sustainable Development, *Mobility 2000*,<sup>28</sup> capacity problems for intercity travelers are generally not severe outside of large cities, except in certain heavily traveled corridors, such as the Northeast corridor, which links Washington, D.C., New York, and Boston. However, at the beginning and end of trips, intercity bus and automobile traffic contribute to and suffer from urban congestion. In addition, the study said that intercity travel may constitute a substantial proportion of total traffic passing through smaller towns and rural areas. Also, according to a GAO survey of all states, state officials are increasingly concerned about traffic volumes on interstate

---

highways in rural areas, and high levels of rural congestion are expected in 18 states within 10 years.<sup>36</sup>

Congestion is also expected to increase on major freight transportation networks at specific bottlenecks, particularly where intermodal connections occur, and at peak travel times, according to the panelists. They expressed concern regarding interactions between freight and passenger travel and how increases in both types of travel will affect mobility in the future. Trucks contribute to congestion in metropolitan areas where they generally move on the same roads and highways as personal vehicles, particularly during peak periods of congestion. In addition, high demand for freight, particularly freight moved on trucks, exists in metropolitan areas where overall congestion tends to be the worst.

With international trade an increasing part of the economy and with larger container ships being built, some panelists indicated that more pressure will be placed on the already congested road and rail connections to major U.S. seaports and at the border crossings with Canada and Mexico. For example, according to a DOT report,<sup>37</sup> more than one-half of the ports responding to a 1997 survey of port access issues identified traffic impediments on local truck routes as the major infrastructure problem.

According to one panelist from the freight rail industry, there is ample capacity on most of the freight rail network. However, railroads are beginning to experience more severe capacity constraints in particular heavily used corridors, such as the Northeast corridor, and within major metropolitan areas, especially where commuter and intercity passenger rail services share tracks with freight railroads. Capacity constraints at these bottlenecks are expected to worsen in the future. The panelist explained that congestion on some freight rail segments where the tracks are also used for passenger rail service—for which there is growing demand—reduces the ability of freight railroads to expand service on the existing tracks to meet the growing demand for freight movements on those segments.

---

---

**Other Systemic Factors  
Contributing to Congestion**

On the inland waterways, according to two panelists from that industry, there is sufficient capacity on most of the inland waterway network, although congestion is increasing at small, aging, and increasingly unreliable locks. According to the Corps of Engineers, the number of hours that locks were unavailable due to lock failures increased in recent years, from about 35,000 hours in 1991 to 55,000 hours in 1999, occurring primarily on the upper Mississippi and Illinois rivers. In addition, according to a Corps of Engineers analysis of congestion on the inland waterways, with expected growth in freight travel, 15 locks would exceed 80 percent of their capacity by 2020, as compared to 4 that had reached that level in 1999.

According to our expert panelists, while increasing passenger and freight travel contribute to increasing congestion at bottlenecks and at peak travel times, other systemic factors contribute to congestion, including barriers to building enough capacity to accommodate growing levels of travel, challenges to effectively managing and operating transportation systems, and barriers to effectively managing how, and the extent to which, transportation systems are used.

At bottlenecks and at peak travel times, there is insufficient capacity to accommodate the levels of traffic attempting to use the infrastructure. One reason for the insufficient capacity is that transportation infrastructure, which is generally publicly provided (with the major exception of freight railroads), can take a long time to plan and build, and it may not be possible to build fast enough to keep pace with increasing and shifting travel patterns. In addition, constructing new capacity is often costly and can conflict with other social goals such as environmental preservation and community maintenance. As a result, approval of projects to build new capacity, which requires environmental impact statements and community outreach, generally takes a long time, if it is obtained at all.

In addition, a number of panelists indicated that funding and planning rigidities in the public institutions responsible for providing transportation infrastructure tend to promote one mode of transportation, rather than a set of balanced transportation choices. Focus on a single mode can result in difficulties dealing effectively with congestion. For example, as suburban expressways enable community developments to grow and move farther out from city centers, jobs and goods follow these developments. This results in increasing passenger and freight travel on the expressways, and a shifting of traffic flows that may not easily be accommodated by existing transportation choices. One panelist indicated that suburban expressways are among the least reliable in terms of travel times because,

---

if congestion occurs, there are fewer feasible alternative routes or modes of transportation. In addition, some bottlenecks occur where modes connect, because funding is generally mode-specific, and congestion at these intermodal connections is not easily addressed. According to FIFWA, public sector funding programs are generally focused on a primary mode of transportation, such as highways, or a primary purpose, such as improving air quality. This means that intermodal projects may require a broader range of funding than might be available under a single program.

Panelists also noted that the types of congestion problems that are expected to worsen in the future involve interactions between long-distance and local traffic and between passengers and freight, and existing institutions may not have the capacity or the authority to address them. For example, some local bottlenecks may hinder traffic that has regional or national significance, such as national freight flows from major coastal ports, or can affect the economies and traffic in more than one state. Current state and local planning organizations may have difficulty considering all the costs and benefits related to national or international traffic flows that affect other jurisdictions as well as their own.

The concept of capacity is broader than just the physical characteristics of the transportation network (e.g., the number of lane-miles of road). The capacity of transportation systems is also determined by how well they are managed and operated (particularly publicly owned and operated systems), and how the use of those systems is managed. Many factors related to the management and operation of transportation systems can contribute to increasing congestion. Many panelists said that congestion on highways was in part due to poor management of traffic flows on the connectors between highways and poor management in clearing roads that are blocked due to accidents, inclement weather, or construction. For example, in the 75 metropolitan areas studied by the Texas Transportation Institute, 54 percent of annual vehicle delays in 2000 were due to incidents such as breakdowns or crashes. In addition, the Oak Ridge National Laboratory reported that, nationwide, significant delays are caused by work zones on highways, poorly timed traffic signals, and snow, ice, and fog.<sup>18</sup>

<sup>18</sup>Several sources of nonrecurrent delays were not considered in this study, including special events, rain, rail crossings, and toll booths. S.M. Chin, C. Prastoso, D.L. Greene, H.S. Huang, and B. Gibson, *Responary Losses of Capacity Study and Impacts on Performance*, Report No. OBNL/TM-2002-01 Oak Ridge, TN: Oak Ridge National Laboratory, May 2002.

---

---

**Effects of Congestion**

In addition, according to a number of panelists, congestion on transportation systems is also in part due to inefficient pricing of the infrastructure because users—whether they are drivers on a highway or barge operators moving through a lock—do not pay the full costs they impose on the system and on other users for their use of the system. They further argued that if travelers and freight carriers had to pay a higher cost for using transportation systems during peak periods to reflect the full costs they impose, they would have an incentive to avoid or reschedule some trips and to load vehicles more fully, resulting in less congestion.

Congestion affects travel times and the reliability of transportation systems. As discussed earlier in this report, the Texas Transportation Institute found that 66 percent of peak period travel on roadways was congested in 2000, compared to 33 percent in 1982 in the 75 metropolitan areas studied. According to the study, this means that two of every three vehicles experience congestion in their morning or evening commute. In the aggregate, congestion results in thousands of hours of delay every day, which can translate into costs such as lost productivity and increased fuel consumption. In addition, a decrease in travel reliability imposes costs on the traveler in terms of arriving late to work or for other appointments, and in raising the cost of moving goods resulting in higher prices for consumers.

Some panelists noted that congestion, in some sense, reflects full use of transportation infrastructure, and is therefore not a problem. In addition, they explained that travelers adjust to congestion and adapt their travel routes and times, as well as housing and work choices, to avoid congestion. For example, according to the *Transportation Statistics Annual Report 2000*, median commute times increased about 2 minutes between 1985 and 1990, despite increases in the percentage of people driving to work alone and the average commuting distance. For freight travel, one panelist made a similar argument, citing that transportation costs related to managing business operations have decreased as a percentage of gross national product, indicating that producers and manufacturers adjust to transportation supply, by switching modes or altering delivery schedules to avoid delays and resulting cost increases.

However, the *Mobility 2001* report describes these adaptations by individuals and businesses as economic inefficiencies that can be very costly. According to the report, increasing congestion can cause avoidance of a substantial number of trips resulting in a corresponding loss of the benefits of those trips. In addition to negative economic effects, travelers'

---

---

|                              |   |
|------------------------------|---|
| <b>Low-Income Households</b> | <p>serve through transit systems; however, some barriers to providing these types of services exist. For example, according to one of our panelists, some paratransit<sup>26</sup> services are not permitted to carry able-bodied people, even if those people are on the route and are willing to pay for the service. As the elderly population increases over the next 10 years, issues pertaining to access are expected to become more prominent in society.</p> <p>Lower income levels can also be a significant barrier to transportation access. The cost of purchasing, insuring, and maintaining a car is prohibitive to some households, and 20 percent of low-income households do not own a car, compared with 4 percent of other households, according to the 1990 <i>Conditions and Performance</i> report. Among all low-income households, about 8 percent of trips are made in cars that are owned by others as compared to 1 percent for other income groups. Furthermore, the same uncertainties and inconveniences apply to this group as to the elderly regarding relying on others for transportation. Transportation access is important for employment opportunities to help increase income, yet this access is not always available. This is because growth in employment opportunities tends to occur in the suburbs and outlying areas, while many low-income populations are concentrated in the inner cities or in rural areas. In case studies of access to jobs for low-income populations, FTA researchers found that transportation barriers to job access included gaps in transit service, lack of knowledge of where transit services are provided, and high transportation costs resulting from multiple transfers and long distances traveled.<sup>27</sup> Another problem they noted was the difficulty in coordinating certain types of work shifts with the availability of public transportation service. Without sufficient access to jobs, families face more obstacles to achieving the goal of independence from government assistance. Limited transportation access can also reduce opportunities for affordable housing and restrict choices for shopping and other services.</p> <p>Rural populations, which according to the 2000 Census grew by 10 percent over the last 10 years, also face access problems. Access to some form of transportation is necessary to connect rural populations to jobs and other</p> |
|------------------------------|---|

<sup>26</sup>Paratransit is a service where individuals who are unable to use the regular transit system independently (because of a physical or mental impairment) are picked up and dropped off at their destinations.

<sup>27</sup>Federal Transit Administration, *Access to Jobs: Breaking Case Studies* (Washington, D.C.: U.S. Department of Transportation, September 2003).

---

amenities in city centers or, increasingly, in the suburbs. The *Mobility 2001* report states that automobiles offer greater flexibility in schedule and choice of destinations than other modes of transportation, and often also provide shorter travel times with lower out-of-pocket costs. The report also notes that conventional transit systems are best equipped to serve high levels of travel demand that is concentrated in a relatively limited area or along well-defined corridors, such as inner cities and corridors between those areas and suburbs. Trips by rural residents tend to be long due to low population densities and the relative isolation of small communities. Therefore, transportation can be a challenge to provide in rural areas, especially for persons without access to private automobiles. A report prepared for the FTA in 2001<sup>57</sup> found that 1 in 13 rural residents lives in a household without a personal vehicle. In addition, the elderly made 31 percent of all rural transit trips in 2000 and persons with disabilities made 23 percent. However, according to a report by the Coordinating Council on Access and Mobility,<sup>58</sup> while almost 60 percent of all nonmetropolitan counties had some public transportation services in 2000, many of these operations were small and offered services to limited geographic areas during limited times.

---

#### Transportation's Effects on the Environment and Communities Are a Growing Concern

While ISTEA and TEA-21 provided funds aimed at mitigating adverse effects of transportation, concerns persist about such effects on the environment and communities. As a result of the negative consequences of transportation, tradeoffs must be made between facilitating increased mobility and giving due regard to environmental and other social goals. For example, transportation vehicles are major sources of local, urban, and regional air pollution because they depend on fossil fuels to operate. Emissions from vehicles include sulfur dioxide, lead, carbon monoxide, volatile organic compounds, particulate matter, and nitrogen oxides. In addition, the emission of greenhouse gases such as carbon dioxide, methane, and nitrous oxide are increasing and greenhouse gases have been linked to reduction in atmospheric ozone and climate changes. According to *Mobility 2001*, improved technologies can help reduce per-vehicle emissions, but the increasing numbers of vehicles traveling and the total

<sup>58</sup>Coordinating Council on Access and Mobility, *Planning Guidelines for Coordinated State and Local Specialized Transportation Services* (Washington, D.C.: U.S. Department of Transportation, Dec. 20, 2000).

---

miles traveled may offset these gains. In addition, congested conditions on highways tend to exacerbate the problem because extra fuel is consumed due to increased acceleration, deceleration, and idling. Vehicle emissions in congested areas can trigger respiratory and other illnesses, and runoff from impervious surfaces can carry lawn chemicals and other pollutants into lakes, streams, and rivers, thus threatening aquatic environments.<sup>24</sup>

Freight transportation also has significant environmental effects. Trucks are significant contributors to air pollution. According to the American Trucking Association, trucks were responsible for 18.5 percent of nitrous oxide emissions and 27.5 percent of other particulate emissions from mobile sources in the United States. The *Mobility 2007* report states that freight trains also contribute to emissions of hydrocarbons, carbon monoxide, and nitrous oxide, although generally at levels considerably lower than trucks. In addition, while large shipping vessels are more energy efficient than trucks or trains, they are also major sources of nitrogen, sulfur dioxide, and diesel particulate emissions. According to the International Maritime Organization, ocean shipping is responsible for 22 percent of the wastes dumped into the sea on an annual basis. Barges moving freight on the inland waterway system are among the most energy efficient forms of freight transportation, contributing relatively lower amounts of noxious emissions compared with trucks and freight trains, according to the Corps of Engineers. However, the dredging and damming required to make rivers and harbors navigable can cause significant disruption to ecosystems.

Noise pollution is another factor exacerbated by increasing levels of transportation. While FHWA, FTA, and many cities have established criteria for different land uses close to highways and rail lines to protect against physically damaging noise levels, average noise levels caused by road traffic in some areas can still have adverse consequences on people's hearing. In addition, several studies have found that residential property values decrease as average noise levels rise above a certain threshold. Freight also contributes to noise pollution. According to *Mobility 2007*, shipping is the largest source of low-frequency, underwater noise, which may have adverse effects on marine life, although these effects are not yet fully understood. These noise levels are particularly serious on highly

<sup>24</sup>See U.S. General Accounting Office, *Environmental Protection: Federal Agencies Could Help Private Land Use That Protects Air and Water Quality*, GAO-03-12 (Washington, D.C.: Oct. 8, 2001).

---

trafficked shipping routes. In addition, dredging also contributes to noise pollution.

Growing awareness of the environmental and social costs of transportation projects is making it more difficult to pursue major transportation improvements. According to a number of panelists, the difficulty in quantifying and measuring the costs and benefits of increased mobility also hinders the ability of transportation planners to make a strong case to local decisionmakers for mobility improvements. In addition, transportation planning and funding is mode-specific and oriented toward passenger travel, which hinders transportation planners' ability to recognize systemwide and multi-modal strategies for addressing mobility needs and other social concerns.

---

### Strategies for Addressing Mobility Challenges Include Focusing on Systemwide Outcomes, Using a Full Range of Tools, and Providing Options for Financing Surface and Maritime Transportation

The panelists presented numerous approaches for addressing the types of challenges discussed throughout this report, but they emphasized that no single strategy would be sufficient. From these discussions and our other research, we have identified three key strategies that may aid transportation decisionmakers at all levels of government in addressing mobility challenges and the institutional barriers that contribute to them. These strategies include the following:

1. Focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes. A systemwide approach to transportation planning and funding, as opposed to focus on a single mode or type of travel, could improve focus on outcomes related to customer or community needs.
2. Use a full range of tools to achieve those desired outcomes. Controlling congestion and improving access will require a strategic mix of construction, corrective and preventive maintenance, rehabilitation, operations and system management, and managing system use through pricing and other techniques.
3. Provide more options for financing mobility improvements and consider additional sources of revenue. Targeting financing to transportation projects that will achieve desired mobility outcomes might require more options for raising and distributing funds for surface and maritime transportation. However, using revenue sources that are not directly tied to the use of transportation systems could allow decisionmakers to bypass transportation planning requirements.

---

which, in turn, could limit the ability of transportation agencies to focus on and achieve desired outcomes.

---

**Focus on the Entire Surface and Maritime Transportation System Rather Than on Specific Modes or Types of Travel to Achieve Desired Mobility Outcomes**

Some panelists said that mobility should be viewed on a systemwide basis across all modes and types of travel. Addressing the types of mobility challenges discussed earlier in this report can require a scope beyond a local jurisdiction or a state line and across more than one mode or type of travel. For example, congestion challenges often occur where modes connect or should connect—such as ports or freight hubs where freight is transferred from one mode to another, or airports that passengers need to access by car, bus, or rail. These connections require coordination of more than one mode of transportation and cooperation among multiple transportation providers and planners, such as port authorities, metropolitan planning organizations (MPO),<sup>25</sup> and private freight railroads. Some panelists therefore advocated shifting the focus of government transportation agencies at the federal, state, and local levels to consider all modes and types of travel in addressing mobility challenges—as opposed to focusing on a specific mode or type of travel in planning and implementing mobility improvements.

Some panelists said that current transportation planning institutions, such as state transportation departments, MPOs, or Corps of Engineers regional offices, may not have sufficient expertise, or in some cases, authority to effectively identify and implement mobility improvements across modes or types of travel. They suggested that transportation planning by all entities focus more closely on regional issues and highlighted the importance of cooperation and coordination among modal agencies at the federal, state, and local level, between public and private transportation providers, and between transportation planning organizations and other government and community agencies to address transportation issues. For example, several panelists said that the Alameda Corridor in Los Angeles is a good example of successful cooperation and coordination among agencies. This corridor is designed to improve freight mobility for cargo coming into the ports of Los Angeles and Long Beach and out to the rest of the country. Planning, financing, and building this corridor required cooperation among private railroads, the local port authorities, the cities of Los Angeles and Long

---

<sup>25</sup>MPOs are organizations of city, county, state, and federal officials that provide a regional focus for transportation planning.

---

Beach, community groups along the entire corridor, the state of California, and the federal government.

Several panelists said that a greater understanding of the full life-cycle costs and benefits of various mobility improvements is needed to take a more systemwide approach to transportation planning and funding. The panelists said the cost-benefit frameworks that transportation agencies currently use to evaluate various transportation projects could be more comprehensive in considering a wider array of social and economic costs and benefits, recognizing transportation systems' links to each other and to other social and financial systems.

Many panelists advocated a systemwide, rather than mode-specific, approach to transportation planning and funding that could also improve focus on outcomes that users and communities desire from the transportation system. For example, one panelist described a performance-oriented funding system, in which the federal government would first define certain national interests of the transportation system—such as maintaining the entire interstate highway system or identifying freight corridors of importance to the national economy—then set national performance standards for those systems that states and localities must meet. Federal funds would be distributed to those entities that are addressing national interests and meeting the established standards. Any federal funds remaining after meeting the performance standards could then be used for whatever transportation purpose the state or locality deems most appropriate to achieve state or local mobility goals. Another panelist expanded the notion of setting national performance standards to include a recognition of the interactions between transportation goals and local economic development and quality of life goals, and to allow localities to modify national performance goals given local conditions. For example, a national performance standard, such as average speeds of 45 miles per hour for highways, might be unattainable for some locations given local conditions, and might run contrary to other local goals related to economic development.

Some panelists described several other types of systems that could focus on outcomes. For example, one panelist suggested a system in which federal support would reward those states or localities that apply federal money to gain efficiencies in their transportation systems, or tie transportation projects to land use and other local policies to achieve community and environmental goals, as well as mobility goals. Another panelist described a system in which different federal matching criteria for

---

different types of expenditures might reflect federal priorities. For example, if infrastructure preservation became a higher national priority than building new capacity, matching requirements could be changed to a 50 percent federal share for building new physical capacity and an 80 percent federal share for preservation. Other panelists suggested that requiring state and local governments to pay for a larger share of transportation projects might provide them with incentives to invest in more cost-effective projects. If cost savings resulted, these entities might have more funds available to address other mobility challenges. Some of the panelists suggested reducing the federal match for projects in all modes to give states and localities more fiscal responsibility for projects they are planning. Other panelists also suggested that federal matching requirements should be equal for all modes to avoid creating incentives to pursue projects in one mode that might be less effective than projects in other modes.

---

**Use a Full Range of Tools to Address Mobility Challenges**

Many panelists emphasized that using a range of various tools to address mobility challenges may help control congestion and improve access. This involves a strategic mix of construction, corrective and preventive maintenance, rehabilitation, operations and system management, and managing system use through pricing or other techniques. Many of the panelists said that no one type of technique would be sufficient to address mobility challenges. Although these techniques are currently in use, panelists indicated that planners should more consistently consider a full range of techniques.

**Build New Infrastructure**

Building additional infrastructure is perhaps the most familiar technique for addressing congestion and improving access to surface and maritime transportation. Several panelists expressed the view that although there is a lot of unused capacity in the transportation system, certain bottlenecks and key corridors require new infrastructure. However, building new infrastructure cannot completely eliminate congestion. For example, according to the Texas Transportation Institute, it would require at least twice the level of current road expansion to keep traffic congestion levels constant, if that were the only strategy pursued. In addition, while adding lanes may be a useful tool to deal with highway congestion for states with relatively low population densities, this option may not be as useful or possible for states with relatively high population densities—particularly in urban areas, where the ability to add lanes is limited due to a shortage of available space. Furthermore, investments in additional transportation capacity can stimulate increases in travel demand, sometimes leading to

---

---

|   |  |
|---|--|
| <b>Increase Infrastructure Maintenance and Rehabilitation</b> | <p>congestion and slower travel speeds on the new or improved infrastructure.</p> <p>Other panelists said that an emphasis on enhancing capacity from existing infrastructure through increased corrective and preventive maintenance and rehabilitation is an important supplement to, and sometimes a substitute for, building new infrastructure. In 1999, the President's Commission to Study Capital Budgeting reported that, because infrastructure maintenance requires more rapid budgetary spending than new construction and has a lower visibility, it is less likely to be funded at a sufficient level.<sup>33</sup> However, one panelist said that for public roads, every dollar spent on preventive maintenance when the roads are in good condition saves \$4 to \$5 over what would have to be spent to maintain roads in fair condition or \$10 to maintain roads once they are in poor condition. Maintaining and rehabilitating transportation systems can improve the speed and reliability of passenger and freight travel, thereby optimizing capital investments.</p>  |
| <b>Improve Management and Operations</b>                      | <p>Better management and operation of existing surface and maritime transportation infrastructure is another technique for enhancing mobility advocated by some panelists. Improving management and operations may allow the existing transportation system to accommodate additional travel without having to add new infrastructure. For example, the Texas Transportation Institute reported that coordinating traffic signal timing with changing traffic conditions could improve flow on congested roadways. In addition, according to an FHWA survey, better management of work zones—which includes accelerating construction activities to minimize their effects on the public, coordinating planned and ongoing construction activities, and using more durable construction materials—can reduce traffic delays caused by work zones and improve traveler satisfaction.<sup>34</sup> Also, according to one panelist, automating the operation of locks and dams on the inland waterways could reduce congestion at these bottlenecks. Another panelist, in an article that he authored, noted that shifting the focus of transportation planning from building capital facilities</p> |

<sup>33</sup>Report of the President's Commission to Study Capital Budgeting, *President's Commission to Study Capital Budgeting* (Washington, D.C.: Government Printing Office, February 1999).

<sup>34</sup>Federal Highway Administration, *Moving Ahead: The American Public Speaks on Roadways and Transportation in Construction*, FHWA OP-01-017 (Washington, D.C.: U.S. Department of Transportation, February 2001).

---

to an "operations mindset" will require a cultural shift in many transportation institutions, particularly in the public sector, so that the organizational structure, hierarchy, and rewards and incentives are all focused on improving transportation management and operations.<sup>23</sup> He also commented on the need to improve performance measures related to operations and management so that both the quality and the reliability of transportation services are measured.

Several panelists suggested that contracting out a greater portion of operations and maintenance activities could allow public transportation agencies to focus their attention on improving overall management and developing policies to address mobility challenges. This practice could involve outsourcing operations and maintenance to private entities through competitive bidding, as is currently done for roads in the United Kingdom. In addition, by relieving public agencies of these functions, contracting could reduce the cost of operating transportation infrastructure and improve the level of service for each dollar invested for publicly owned transportation systems, according to one panelist.

Developing comprehensive strategies for reducing congestion caused by incidents is another way to improve management and operation of surface and maritime transportation modes. According to the Texas Transportation Institute, incidents such as traffic accidents and breakdowns cause significant delays on roadways. One panelist said that some local jurisdictions are developing common protocols for handling incidents that affect more than one mode and transportation agency, such as state transportation departments and state and local law enforcement, resulting in improved communications and coordination among police, firefighters, medical personnel, and operators of transportation systems. Examples of improvements to incident management include employing roving crews to quickly move accidents and other impediments off of roads and rail and implementing technological improvements that can help barges on the inland waterways navigate locks in inclement weather, thereby reducing delays on that system.

#### Increase Investment in Technology

Several panelists also suggested that increasing public sector investment in technologies—known as Intelligent Transportation Systems (ITS)—that are designed to enhance the safety, efficiency, and effectiveness of the

---

<sup>23</sup>Joseph M. Sussman, "Transition in the World of Transportation: A Systems View," *Transportation Quarterly* 56 (2002): 21–22.

---

transportation network, can serve as a way of increasing capacity and mobility without making major capital investments. DOT's ITS program has two major areas of emphasis: (1) deploying and integrating intelligent infrastructure and (2) testing and evaluating intelligent vehicles. ITS includes technologies that improve traffic flow by adjusting signals, facilitating traffic flow at toll plazas, alerting emergency management services to the locations of crashes, increasing the efficiency of transit fare payment systems, and other actions. Appendix IV describes the different systems that are part of DOT's ITS program.

Other technological improvements suggested by panelists included increasing information available to users of the transportation system to help people avoid congested areas and to improve customer satisfaction with the system. For example, up-to-the-minute traffic updates posted on electronic road signs or over the Internet help give drivers the information necessary to make choices about when and where to travel. It was suggested that the federal government could play a key role in facilitating the development and sharing of such innovations through training programs and research centers, such as the National Cooperative Highway Research Program, the Transit Cooperative Research Program, and possible similar programs for waterborne transportation. However, panelists cautioned that the federal government might need to deal with some barriers to investing in technology development and implementation. One panelist said that there are few incentives for agencies to take risks on new technologies. If an agency improves its efficiency, it may result in the agency receiving reduced funding rather than being able to reinvest the savings.

#### **Use Demand Management Techniques**

Finally, another approach to reducing congestion without making major capital investments is to use demand management techniques to reduce the number of vehicles traveling at the most congested times and on the most congested routes. For public roads, demand management generally means reducing the number of cars traveling on particularly congested routes toward downtown during the morning commuting period and away from downtown during the late afternoon commuting period. One panelist, in a book that he authored, said that "the most effective means of reducing

---

peak-hour congestion would be to persuade solo drivers to share vehicles.<sup>54</sup>

One type of demand management for travel on public roads is to make greater use of pricing incentives. In particular, many economists have proposed using congestion pricing that involves charging surcharges or tolls to drivers who choose to travel during peak periods when their use of the roads increases congestion. Economists generally believe that such surcharges or tolls enhance economic efficiency by making drivers take into account the external costs they impose on others in deciding when and where to drive. These costs include congestion, as well as pollution and other external effects. The goal of congestion pricing would be to charge a toll for travel during congested periods that would make the cost (including the toll) that a driver pays for such a trip equal or close to the total cost of that trip, including external costs. These surcharges could help reduce congestion by providing incentives for travelers to share rides, use transit, travel at less congested (generally off-peak) times and on less congested routes, or make other adjustments—and at the same time, generate more revenues that can be targeted to alleviating congestion in those specific corridors. According to a report issued by the Transportation Research Board, technologies that are currently used at some toll facilities to automatically charge users could also be used to electronically collect congestion surcharges without establishing additional toll booths that would cause delays.<sup>55</sup> Peak-period pricing also has applicability for other modes of transportation. Amtrak and some transit systems use peak-period pricing, which gives travelers incentives to make their trips at less congested times.

In addition to pricing incentives, other demand management techniques that encourage ride-sharing can be useful in reducing congestion. Ride-sharing can be encouraged by establishing carpool and vanpool staging areas, providing free or preferred parking for carpools and vanpools, subsidizing transit fares, and designating certain highway lanes as high occupancy vehicle (HOV) lanes that can only be used by vehicles with a specified number of people in them (two or more). HOV lanes can provide an incentive for sharing rides because they reduce the travel time for a

---

<sup>54</sup>Anthony Downs, *Stuck in Traffic: Coping with Peak-Hour Traffic Congestion* (The Brookings Institution, Washington, D.C.: 1992) p.84.

<sup>55</sup>National Research Council, Transportation Research Board, *Creating Gridlock: Peak-Period Fees to Reduce Traffic Congestion* (Washington, D.C.: 1994).

group traveling together relative to the time required to travel alone. This incentive is likely to be particularly strong when the regular lanes are heavily congested. Several panelists also recommended use of high occupancy toll (HOT) lanes, which combine pricing techniques with the HOV concept. Experiments with HOT lanes, which allow lower occupancy vehicles or solo drivers to pay a fee to use HOV lanes during peak traffic periods, are currently taking place in California. HOT lanes can provide motorists with a choice: if they are in a hurry, they may elect to pay to have less delay and an improved level of service compared to the regular lanes. When HOT lanes run parallel to regular lanes, congestion in regular lanes may be reduced more than would be achieved by HOV lanes.

Demand management techniques on roads, particularly those involving pricing, often provoke strong political opposition. Several panelists said that instituting charges to use roads that have been available "free" is particularly unpopular because many travelers believe that they have already paid for the roads through gasoline and other taxes and should not have to pay "twice." Other concerns about congestion pricing include equity issues because of the potentially regressive nature of these charges (i.e., the surcharges constitute a larger portion of the earnings of lower income households and therefore impose a greater financial burden on them).<sup>26</sup> In addition, some people find the concept of restricting lanes or roads to people who pay to use them to be elitist because that approach allows people who can afford to pay the tolls to avoid congestion that others must endure. Several of the panelists suggested that tolls might become more acceptable to the public if they were applied to new roads or lanes as a demonstration project so that the tolls' effectiveness in reducing congestion and increasing commuter choices could be evaluated.

---

**Provide Options for Financing Mobility Improvements and Consider Additional Sources of Revenue**

Several panelists indicated that targeting the financing of transportation to achieving desired mobility outcomes, and addressing those segments of transportation systems that are most congested, would require more options for financing surface and maritime transportation projects than are currently available, and might also require more sources of revenue in the future.

<sup>26</sup>Proponents of congestion pricing, however, such as the Committee for Study of Urban Transportation Congestion Pricing of the Transportation Research Board, have noted that all income groups can benefit if there is an appropriate distribution of the revenues obtained through congestion pricing.

---

|  |   |
|--|---|
| <b>Increase Funding Flexibility</b>                        | According to many panelists, the current system of financing surface and maritime transportation projects limits options for addressing mobility challenges. For example, several panelists said that separate funding for each mode at the federal, state, and local level can make it difficult to consider possible efficient and effective ways for enhancing mobility, and providing more flexibility in funding across modes could help address this limitation. In addition, some panelists argued that “varmarking” or designation by the Congress of federal funds for particular transportation projects bypasses traditional planning processes used to identify the highest priority projects, thus potentially limiting transportation agencies’ options for addressing the most severe mobility challenges. According to one panelist, bypassing transportation planning processes can also result in logical connections or interconnections between projects being overlooked.  |
| <b>Expand Support for Alternative Financing Mechanisms</b> | Several panelists acknowledged that the public sector could expand its financial support for alternative financing mechanisms to access new sources of capital and stimulate additional investment in surface and maritime transportation infrastructure. These mechanisms include both newly emerging and existing financing techniques such as providing credit assistance to state and local governments for capital projects and using tax policy to provide incentives to the private sector for investing in surface and maritime transportation infrastructure (see app. Y for a description of alternative financing methods). The panelists emphasized, however, that these mechanisms currently provide only a small portion of the total funding that is needed for capital investment and are not, by themselves, a major strategy for addressing mobility challenges. Furthermore, they cautioned that some of these mechanisms, such as Grant Anticipation Revenue Vehicles, <sup>27</sup> could create difficulties for state and local agencies to address future transportation problems, because agencies would be reliant on future federal revenues to repay the bonds. |
| <b>Consider New Revenue Sources</b>                        | Many panelists stated that a possible future shortage of revenues presents a fundamental limitation to addressing mobility challenges. <sup>28</sup> Some panelists   |

<sup>27</sup>Grant Anticipation Revenue Vehicles allow states to pay debt financing costs with future anticipated federal highway funds.

<sup>28</sup>However, one panelist believed that increased spending on transportation would never alleviate congestion and that such spending increases would reduce the funds available for dealing with other problems.

---

said that, because of the increasing use of alternative fuels, revenues from the gas tax are expected to decrease in the future, possibly hindering the public sector's ability to finance future transportation projects. In addition, one panelist explained that MPOs are required to produce financially constrained long-range plans, and the plans in the panelist's organization indicate that future projections of revenue do not cover the rising costs of planned transportation projects.

One method of raising revenue is for counties and other regional authorities to impose sales taxes for funding transportation projects. A number of counties have already passed such taxes and more are being considered nationwide. However, several panelists expressed concerns that this method might not be the best option for addressing mobility challenges. For example, one panelist stated that moving away from transportation user charges to sales taxes that are not directly tied to the use of transportation systems weakens the ties between transportation planning and finances. Counties and other authorities may be able to bypass traditional state and metropolitan planning processes because these sales taxes provide them with their own sources of funding for transportation.

A number of panelists suggested increasing current federal fuel taxes to raise additional revenue for surface transportation projects. In contrast, other panelists argued that the federal gas tax could be reduced. They said that, under the current system, states are receiving most of the revenue raised by the federal gas tax within their state lines and therefore there is little need for the federal government to be involved in collecting this revenue, except for projects that affect more than one state or are of national significance. However, other panelists said that this might lead to a decrease in gas tax revenues available for transportation, because states may have incentives to use this revenue for purposes other than transportation or may not collect as much as is currently collected.

Given that freight tonnage moved across all modes is expected to increase by 43 percent during the period from 2008 to 2019, new or increased taxes or other fees imposed on the freight sector could also help fund mobility improvements. For example, one panelist from the rail industry suggested modeling more projects on the Alameda Corridor in Los Angeles, where private rail freight carriers pay a fee to use infrastructure built with public financing. Another way to raise revenue for funding mobility improvements would be to increase taxes on freight trucking. According to FHWA, heavy trucks (weighing over 55,000 pounds) cause a disproportionate amount of damage to the nation's highways and have not paid a corresponding share

---

for the cost of pavement damage they cause. This situation will only be compounded by the large expected increases in freight tonnage moved by truck over the next 10 years. The Joint Committee on Taxation estimated that raising the ceiling on the tax paid by heavy vehicles to \$1,500 could generate about \$100 million per year.<sup>23</sup>

Another revenue raising strategy includes dedicating more of the revenues from taxes on alternative fuels, such as gasoline, to the Highway Trust Fund rather than to the U.S. Treasury's General Fund, as currently happens. Finally, panelists also said that pricing strategies, mentioned earlier in this report as a tool to reduce congestion, are also possible additional sources of revenue for transportation purposes.

---

### Agency Comments and Our Evaluation

We provided DOT, the Corps of Engineers, and Amtrak with draft copies of this report for their review and comment. We obtained oral comments from officials at DOT and the Corps of Engineers. These officials generally agreed with the report and provided technical comments that we incorporated as appropriate. In addition, officials from the Federal Railroad Administration within DOT commented that the report was timely and would be vital to the dialogue that occurs as the Congress considers the reauthorization of surface transportation legislation. Amtrak had no comments on the report.

Our work was primarily performed at the headquarters of DOT and the Corps of Engineers (see app. VI for a detailed description of our scope and methodology). We conducted our work from September 2001 through August 2002 in accordance with generally accepted government auditing standards.

---

As agreed with your offices, unless you publicly announce the contents of this report earlier, we plan no further distribution until 30 days after the date of this report. At that time, we will send copies of this report to the congressional committees with responsibilities for surface and maritime transportation programs; DOT officials, including the Secretary of Transportation, the administrators of the Federal Highway Administration,

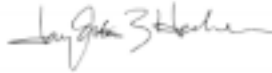

---

<sup>23</sup>See U.S. General Accounting Office, *Highway Financing: Factors Affecting Highway Trust Fund Revenues*, GAO-02-057 (Washington, D.C., May 9, 2002).

---

Federal Railroad Administration, Federal Transit Administration, and Maritime Administration, the Director of the Bureau of Transportation Statistics, and the Commandant of the U.S. Coast Guard; the Commander and Chief of Engineers, U.S. Army Corps of Engineers; the President of Amtrak, and the Director of the Office of Management and Budget. We will make copies available to others on request. This report will also be available on our home page at no charge at <http://www.gao.gov>.

If you have any questions about this report, please contact me at [heckerj@gao.gov](mailto:heckerj@gao.gov) or Kate Siggerud at [siggerudk@gao.gov](mailto:siggerudk@gao.gov). Alternatively, we can be reached at (202) 512-2834. GAO contacts and acknowledgments are listed in appendix VII.

## Expenditures for Capital, Operations, and Maintenance

---

Comparing the proportion of public spending devoted to various purposes across modes is difficult due to differences in the level of public sector involvement and in the definition of what constitutes capital versus operations and maintenance expenses in each mode. For example, the operation of public roads is essentially a function of private citizens operating their own vehicles, while operations for mass transit includes spending for bus drivers and subway operators, among other items. In addition, maintenance expenditures can differ greatly from one mode to another in their definition and scope. For example, maintenance for a public road involves activities such as patching, filling potholes, and fixing signage, while maintenance for channels and harbors involves routine dredging of built up sediment and disposal or storage of the dredged material. Given these significant differences in scope, different modes classify and report on maintenance expenses in different ways.

For public roads, capital expenditures (which includes new construction, resurfacing, rehabilitation, restoration, and reconstruction of roads) constituted about one-half of total annual public sector expenditures over the last 10 years, with small increases in recent years. Of total capital expenditures in fiscal year 2000, 52 percent was used for system preservation, such as resurfacing and rehabilitation, while 40 percent was used for construction of new roads and bridges and other system expansions. These percentages have fluctuated somewhat throughout the 1990s. However, as shown in figure 8, the percentage of capital outlays spent on system preservation expenses increased from 45 percent to 52 percent between fiscal years 1990 and 2000, while construction of new roads and bridges and other system expansions declined from 40 percent to 40 percent over the same period.

---

Appendix I  
Expenditures for Capital, Operations, and  
Maintenance

Figure 8: Purposes for Capital Outlays for Public Roads, Fiscal Years 1993 and 2000

Source: Federal Highway Administration.

For transit, capital expenditures accounted for about 25 percent of total annual public sector expenditures in 1999. The federal government spends more heavily on capital than on operations for transit. The federal share of capital expenditures fluctuated throughout the 1990s but in fiscal year 2000 stood at about 50 percent, the same as it was in fiscal year 1991. The federal share of total operating expenses declined from about 5 percent in fiscal year 1991 to about 2 percent in fiscal year 2000.<sup>19</sup>

Federal government support to Amtrak for operating expenses and capital expenditures has fluctuated throughout the 1990s. Annual operating grants fluctuated between \$300 and \$600 million and capital grants between \$300 and \$500 million. In addition to these grants, the Taxpayer Relief Act of

<sup>19</sup>Because some capital funds from the Federal 5 (shaded Area Formula) program were used to pay for operating expenses, the 2 percent operating expense figure may be somewhat understated and the 50 percent capital expenditure figure may be somewhat overstated.

Appendix I  
Expenditures for Capital, Operations, and  
Maintenance

1997<sup>11</sup> provided Amtrak with \$2.2 billion for capital and operating purposes in fiscal years 1998 and 1999. Federal support declined in fiscal years 2000 and 2001, however, with the federal government providing grants to Amtrak of \$571 and \$521 million, respectively.

For water transportation, spending by the U.S. Army Corps of Engineers (Corps of Engineers) for construction of locks and dams for inland waterway navigation<sup>12</sup> fell while expenditures for operations and maintenance remained at around \$350 to \$400 million, as shown in figure 9.

Figure 9: Federal Expenditures for Construction and Operations and Maintenance of Locks and Dams, Fiscal Years 1991-2000

Source: U.S. Department of Transportation, Bureau of Transportation Statistics (2002), Government Transportation Financial Statistics (Preliminary Data), Washington, D.C.

<sup>11</sup>PL 105-34 (Aug. 3, 1997).

<sup>12</sup>Locks and dams serve other purposes in addition to navigation, including irrigation, flood control, and recreation.

---

**Appendix I**  
**Expenditures for Capital, Operations, and**  
**Maintenance**

---

By contrast, Corps of Engineers expenditures for the construction, operations, and maintenance of federal channels and harbors have increased over the past decade. During fiscal years 1991 through 2000, construction expenditures increased from \$112 million to \$252 million (in 2000 dollars), while operations and maintenance expenditures increased from \$631 million to \$671 million (in 2000 dollars). In addition to the Corps of Engineers, the U.S. Coast Guard and the Maritime Administration also spend significant amounts for water transportation, although these agencies have limited responsibility for construction or maintenance of water transportation infrastructure.

---

 Appendix B  
 Travel Forecast Methodologies
 

---

While it is clear that travelers choose between modes of travel for reasons of convenience and cost, among other things, none of the FHWA travel forecasts consider the effects of changes in levels of travel on other modes, such as transit or rail. FHWA officials said that they would like to have a data system that projects intermodal travel, but for now such a system does not exist. The models also cannot reflect the impact of major shocks on the system, such as natural disasters or the terrorist attacks of September 2001.

---

**Passenger Travel on Transit**

The Federal Transit Administration (FTA) makes national-level forecasts for growth in transit passenger miles traveled by collecting 15- to 25-year forecasts developed by metropolitan planning organizations (MPO)<sup>52</sup> in the 33 largest metropolitan areas in the country.<sup>53</sup> FTA calculates a national weighted average using the MPO forecasts and regional averages.<sup>54</sup> MPOs create their forecasts as part of their long-range planning process.<sup>55</sup> Unlike the first forecast for road travel discussed above, the 1999 *Conditions and Performance report*<sup>56</sup> stated that the MPO forecasts for vehicle miles traveled and passenger miles traveled incorporate the effects of actions that the MPOs are proposing to shape demand in their areas to attain air quality and other developmental goals. The MPO plans may include transit expansion, congestion pricing, parking constraints, capacity limits, and other local policy options. MPO forecasts also have to consider funding availability.

<sup>52</sup>MPOs are organizations of city, county, state, and federal officials that provide a regional focus for transportation planning.

<sup>53</sup>According to FTA, the 33 metropolitan areas account for approximately 80 percent of the nation's transit use, so they should provide a reasonable approximation of national level forecasts.

<sup>54</sup>There is no forecast for New York City, so FTA substituted the average growth rate for the other major east coast cities, which is 1.32 percent.

<sup>55</sup>Methodologies used by the MPOs to derive their forecasts vary, although officials at FTA told us that there are two common types. One type uses a standard four-step modeling process involving data on how many trips people make, where people are going, the modal split of trips, and actual routes. The second type is econometric, in which regional forecast data on income and demographics are fed into a model to derive travel projections.

<sup>56</sup>Federal Highway Administration and Federal Transit Administration, 2000 *Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance* (Washington, D.C.: U.S. Department of Transportation, 2000).

---

### Intercity Passenger Travel

Antrak provided us with systemwide forecasts of ridership, which are based on assumed annual economic growth of between 1 and 1.5 percent, fare increases equal to the national inflation rate, and projected ridership increases on particular routes, including new or changing service on certain routes scheduled to come on line over the forecast period. For short-distance routes, Antrak uses a model that estimates total travel over a route by any mode, based on economic and demographic growth. The model then estimates travel on each mode competing in the corridor based on cost and service factors in each mode. For long distance routes, Antrak uses a different model that projects future rail ridership using variables that have been determined to influence past rail ridership, such as population, employment, travel time for rail, and level of service for rail. This model does not consider conditions on other competing modes.

---

### Freight Travel Across Modes

In forecasting growth in national freight travel, models developed by FHWA and the U.S. Army Corps of Engineers (Corps of Engineers) use growth in trade and the economy as key factors driving freight travel. Projected growth in each particular mode is determined by growth in the production of the specific mix of commodities that historically are shipped on that mode. Therefore, any projected shift in freight movement from one mode to another is due to projected changes in the mix of commodities, or projected changes in where goods are produced and consumed.

Because current or future conditions and the capacity of the freight transportation system cannot be factored into the national forecasts, a number of factors—including growing congestion, as well as the benefits of specific projects that might relieve congestion—are not considered in the projections.<sup>50</sup> In addition, future trends in other factors that affect shippers' choices of freight modes—such as relative cost, time, or reliability—are not easily quantifiable and are also linked to each system's capacity and the congestion on each system. As such, these factors are not included in FHWA's or Corps of Engineers' national forecasting models.

Underlying the commodity forecasts used by FHWA and the Corps of Engineers are a number of standard macro-economic assumptions

<sup>50</sup>Local freight travel forecasts done by the Corps of Engineers' district offices for use in specific project feasibility studies do consider possible diversion to other alternative modes as a result of increasing congestion.

concerning primarily supply side factors, such as changes in the size of the labor force and real growth in exports due to trade liberalization. Changes in border, airport, and seaport security since September 11 may affect assumptions that are imbedded in these commodity forecasts. For example, increased delays and inspections at the border or at a port may create problems for shippers to meet just-in-time requirements, possibly resulting in a short-term shift to an alternative mode, or a limiting of trade.

Although current national freight forecasts are not capacity-constrained, FHWA is developing a "Freight Analysis Framework" to provide alternative analyses, assessing certain capacity limitations. The main impediment to developing this capability is determining capacity on each mode. There are commonly accepted measures of road capacity that are being incorporated, but rail and waterway capacity is not as easily measured.

---

### State Forecasts of Vehicle Miles Traveled

FHWA provided us with state-level forecasts of total vehicle miles traveled on public roads from 2000 to 2010, derived from data in the Highway Performance Monitoring System (HPMS) sample data set.<sup>5</sup> This data set contains state-reported data on average annual daily traffic for approximately 113,000 road segments nationwide. For each sample section, HPMS includes measures of average annual daily traffic for the reporting year and estimates of future traffic for a specified forecast year, which is generally 18 to 25 years after the reporting year. It should be noted that the HPMS sample data do not include sections on any roads classified as local roads or rural minor collectors.

Because the individual HPMS segment forecasts come from the states, we do not know exactly what models were used to develop them. According to officials at FHWA, the only national guidance comes from the HPMS Field Manual, which says that future average annual daily traffic should come from a technically supportable state procedure or data from MPOs or other local sources. The manual also says that HPMS forecasts for urbanized areas should be consistent with those developed by the MPO at the functional system and urbanized area level.

---

<sup>5</sup>HPMS also includes data from the District of Columbia and Puerto Rico.

## Factors Influencing Future Travel

---

---

### Local and Intercity Travel

For both local and intercity passenger travel, population growth is expected to be one of the key factors driving overall travel levels. Where that growth will occur will likely have a large effect on travel patterns and mode choices. According to the U.S. Census Bureau, the U.S. population will grow to almost 300 million by 2010.<sup>77</sup> Although this represents a slower growth rate than in the past, it would still add approximately 18.4 million people to the 2000 population, and will likely also substantially increase the number of vehicles on public roads as well as the number of passengers on transit and intercity rail.

The Census Bureau reported that since 1990, the greatest population growth has been in the South and West. According to one panelist, these regions' metropolitan areas traditionally have lower central city densities and higher suburban densities than the Midwest and East. These areas are therefore harder to serve through transit than metropolitan areas with higher population densities, where transit can be more feasible. However, according to some transportation experts, it may not be possible to build new transit infrastructure in these areas due to environmental or other concerns. The population growth that is expected in suburban areas could lead to a larger increase in travel by private vehicles than by transit because suburban areas generally have lower population densities than inner cities, and also have more dispersed travel patterns, making them less easy to serve through conventional public transit. Although overall population growth will likely be greatest in suburban parts of metropolitan areas, high rates of growth are also predicted for rural areas. As is the case in suburbs, these rural areas are difficult to serve with anything but private automobiles because of low population densities and geographical dispersion of travel patterns, so travel by private vehicle may increase. Immigration patterns are also expected to contribute to changes in travel levels, but the extent will depend on immigration policies. For example, according to a senior researcher with the American Public Transportation Association, higher rates of immigration tend to increase transit use.

In addition to overall population growth, another demographic trend that will likely affect mode choices is the aging of the population. According to data from the U.S. Census Bureau, the number of people aged 55 and over is projected to increase 26 percent between 2001 and 2010. The most rapidly growing broad age group is expected to be the population aged 85

---

<sup>77</sup>These projections have not yet been updated with data from the 2000 Census.

---

 Appendix III  
 Factors Influencing Future Travel
 

---

and older, which is projected to increase 30 percent by 2030. According to the Federal Highway Administration and Federal Transit Administration's 1990 *Conditions and Performance* report,<sup>25</sup> the elderly have different mobility issues than the nonelderly because they are less likely to have drivers' licenses, have more serious health problems, and may require special services and facilities. According to a report prepared for the World Business Council for Sustainable Development (*Mobility 2000*),<sup>26</sup> cars driven by the elderly will constitute an increasing proportion of traffic, especially in the suburbs and rural areas, where many elderly people tend to reside. Increases in the number of older drivers can pose safety problems, in that the elderly have a higher rate of crashes per mile driven than younger drivers, and that rate rises significantly after age 85. The *Mobility 2000* report also says that the driver fatality rate of drivers over 75 years of age is higher than any other age group except teenagers. Growth of the elderly population may therefore increase the importance of providing demand-responsive transit services<sup>27</sup> and improving signs on public roads to make them clearer and more visible.

Along with population growth, the increasing affluence of the U.S. population is expected to play a key role in local and intercity passenger travel levels and in the modes travelers choose. The 1990 *Conditions and Performance* report states that rates of vehicle ownership are lower in low-income households, leading those households to rely more on transit systems. According to Federal Transit Administration (FTA) officials and *Mobility 2000*, transit use—particularly use of buses—generally decreases as income increases. Increasing affluence also influences intercity travel levels. The 1990 *Conditions and Performance* report says that people with high incomes take approximately 30 percent more trips than people with low incomes, and the trips tend to be longer. Long-distance travel for business and recreation increases with income. Also, as income increases,

---

<sup>25</sup>Federal Highway Administration and Federal Transit Administration, 1990 *Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance* (Washington, D.C.: U.S. Department of Transportation, 1990).

<sup>26</sup>Massachusetts Institute of Technology and Charles River Associates, Inc., *Mobility 2000: World Mobility at the End of the Twentieth Century and Its Sustainability* (World Business Council for Sustainable Development, August 2000).

<sup>27</sup>According to the American Public Transportation Association, demand response modes are passenger cars, vans, or buses with fewer than 20 seats operating in response to calls from passengers or their agents to the transit operator, who then dispatches a vehicle to pick up the passengers and transport them to their destinations.

---

Appendix III  
Factors Influencing Future Travel

---

travel by faster modes, such as car and air, increases, and travel by intercity bus tends to decrease.

Several participants in our surface and maritime transportation panels (see app. VI) also indicated that improvements in communication technology will likely affect the amount and mode of intercity travel, but the direction and extent of the effect is uncertain. One panelist said that there is no additional cost to communicating over greater distances, so communications will replace travel to some extent, particularly as technologies improve. However, two other panelists said that communication technology might increase travel by making the benefit of travel more certain. For example, the Internet can provide people with current and extensive information about vacation destinations, potentially increasing the desire to travel. According to *Mobility 2000*, it is unclear whether telecommunications technology will substitute for the physical transportation of people and goods. Telecommuting and teleconferencing are becoming more common, but technological improvements would have to be significant before they can substitute for actual presence at work or in face-to-face meetings. In addition, while home-based workers do not have to commute, they tend to travel approximately the same amount as traditional workers, but differ in how their travel is distributed among trip purposes.

The terrorist attacks on the United States on September 11, 2001, are expected to have some effect on passenger travel levels and choices about which mode to use, but U.S. Department of Transportation (DOT) officials and participants in the panels did not believe the long-term changes would be significant, provided that no more attacks occur. Federal Highway Administration and Federal Railroad Administration officials speculated that increased delays in air travel due to stricter security procedures might shift some travel from air to other modes, such as car or rail, although they expected this effect to be negligible in the long term unless additional incidents occur.

Finally, changes in the price (or perceived price), condition, and reliability of one modal choice as compared with another are also likely to affect levels of travel and mode choices. For example, changes in the petroleum market that affect fuel prices, or changes in government policy that affect the cost of driving or transit prices, could result in shifts between personal vehicles and transit; however, it is difficult to predict the extent to which these changes will occur. According to *Mobility 2000*, automobiles offer greater flexibility in schedule and choice of destinations than other modes

---

 Appendix III  
 Factors Influencing Future Travel
 

---

of transportation, and often also provide shorter travel times with lower out-of-pocket costs. However, if heavy and unpredictable road congestion causes large variations in automobile travel time, there could be a shift to transit or a decrease in overall travel.

---

**Freight Travel**

According to several reports by DOT and transportation research organizations, increasing international trade, economic growth, the increasing value of cargo shipped, and changes in policies affecting certain commodities are expected to influence future volumes of freight travel and the choice of mode by which freight is shipped.

Increasing international trade and national trade policies are expected to affect commodity flows, volumes, and mode choice.<sup>76</sup> According to the *Transportation Statistics Annual Report 2000*,<sup>77</sup> the globalization of businesses can shift production of goods sold in the United States to locations outside of the country, increasing total ton-miles<sup>78</sup> and changing the average length of haul of shipments. This shift in production could also affect freight mode choice, with more commodities being shipped by multiple modes as distances increase. According to *Mobility 2007*, truck transportation tends to be cheaper, faster, and more energy efficient than rail and barges for shipping high-value cargo. However, as distances increase, rail and intermodal transportation (linking rail and truck travel) become more cost-efficient options. Various trade policies also affect freight flows and volumes. For example, the North American Free Trade Agreement has contributed to the increased volume of trade moving on rail and highways. According to data from the Bureau of Transportation Statistics' Transborder Surface Freight Database, between 1996 and 2000, tonnage of imports by rail from Mexico and Canada increased by about 25

---

<sup>76</sup>The U.S. economy has become increasingly integrated with the global economy, as domestic and foreign companies manage worldwide production and distribution systems. For example, auto manufacturers may locate their factories and warehouses in separate countries or continents from their retail outlets. See *Characteristics and Changes in Freight Transportation Demand: A Guidebook for Planners and Policy Analysis*, prepared for the National Cooperative Highway Research Program, Project 8-30 Phase II (Washington, D.C.: Transportation Research Board, June 20, 2003).

<sup>77</sup>Bureau of Transportation Statistics, *Transportation Statistics Annual Report 2000* (Washington, D.C.: U.S. Department of Transportation, 2003).

<sup>78</sup>Ton-miles are calculated by multiplying the tons of commerce being moved by the number of miles moved.

---

 Appendix III  
 Factors Influencing Future Travel
 

---

percent, and imports by truck increased 20 percent. In the maritime sector, expanding trade with the Pacific Rim increased traffic at west coast container ports.

According to the *Transportation Statistics Annual Report 2000*, economic growth results in a greater volume of goods produced and consumed, leading to more freight moved. As the economy grows, disposable income per capita increases and individual purchasing power rises, which can cause businesses to ship more freight per capita. According to the report, freight ton-miles per capita increased more than 30 percent, from 10,500 in 1975 to 14,000 in 1999.

The increasing value of cargo and the continuing shift toward a more service-oriented economy and more time-sensitive shipments has affected the volume of freight shipments and the choice of modes on which freight is shipped. According to the *Transportation Statistics Annual Report 2000*, there is a continuing shift toward production of high-value, low-weight products, which leads to changes in freight travel levels and mode choice. For example, it takes more ton-miles to ship \$1,000 worth of steel than it does to ship \$1,000 worth of cell phones. High-value cargo, such as electronics and office equipment, tends to be shipped by air or truck, while rail and barge generally carry lower-value bulk items, such as coal and grain.<sup>25</sup> According to *Mobility 2007*, the growth of e-commerce and just-in-time inventory practices depend upon the ability to deliver goods quickly and efficiently. A report prepared for the National Cooperative Highway Research Program<sup>26</sup> states that the effects of just-in-time inventory practices are to increase the number of individual shipments, decrease their length of haul, and increase the importance of on-time delivery. Both reports indicate that such practices may shift some freight from slower

<sup>25</sup>The *Mobility 2007* report states that inland waterways can move very large shipments of grain or lumber with a minimal expenditure of energy. For example, on the lower Mississippi River, 40 or more 10-ton barges can be lashed together into a single tow for movement down the river. But it is also cost-efficient for shipping low-value bulk commodities long distances. However, because both of these modes are slower than truck travel on highways, and are limited to fixed waterways or tracks, trucks are more often used for transporting high-value goods and for local deliveries. Ocean shipping is the dominant mode for oceanic freight tonnage because extremely large ships operating with small crews can move great tonnages vast distances at minimal costs.

<sup>26</sup>"Characteristics and Changes in Freight Transportation Demand: A Guidebook for Planners and Policy Analysts," prepared for the National Cooperative Highway Research Program, Project 8-30 Phase II (Washington, D.C.: Transportation Research Board, June 18, 1995).

Appendix III  
Factors Influencing Future Travel

---

modes, such as rail, to faster modes, such as truck or air. In addition, the *Mobility 2007* report states that as the demand for specialized goods and services grows, the demand for smaller, more specialized trucks increases. Items ordered from catalogs or on-line retailers are often delivered by specialized trucks.

Policies affecting particular commodities can have a large impact on the freight industry. For example, policies concerning greenhouse gas emissions can affect the amount of coal mined and shipped. Because coal is a primary good shipped by rail and water, reduction in coal mining would have a significant effect on tonnage for those modes. Changes in the type of coal mined as a result of environmental policies—such as an increase in mining of low-sulfur coal—can also affect the regional patterns of shipments, resulting in greater ton-miles of coal shipped. Also, increasing emissions controls and clean fuel requirements may raise the cost of operating trucks and result in a shift of freight from truck to rail or barge. For example, according to *Mobility 2007*, recently released rules from the Environmental Protection Agency implementing more stringent controls for emissions from heavy-duty vehicles are predicted to increase the purchase price of a truck by \$883. Other environmental regulations also affect the cost of shipping freight, as when controls on the disposal of material dredged from navigation channels increase the costs of expanding those channels. Policies regarding cargo security may also affect the flow of goods into and out of the United States. For example, several of our panels indicated that implementing stricter security measures will increase the cost of shipping freight as companies invest in the personnel and technology required. Tighter security measures could also increase time necessary to clear cargo through Customs or other inspection stations.

---

## Intelligent Transportation Systems

---

The U.S. Department of Transportation's (DOT) program of Intelligent Transportation Systems (ITS) offers technology-based systems intended to improve the safety, efficiency, and effectiveness of the surface transportation system. The ITS program applies proven and emerging technologies—drawn from computer hardware and software systems, telecommunications, navigation, and other systems—to surface transportation. DOT's ITS program has two areas of emphasis: (1) deploying and integrating intelligent infrastructure and (2) testing and evaluating intelligent vehicles. Under the first area of emphasis, the intelligent infrastructure program is composed of the family of technologies that can enhance operations in three types of infrastructure: (1) infrastructure in metropolitan areas, (2) infrastructure in rural areas, and (3) commercial vehicles. Under the ITS program, DOT provides grants to states to support ITS activities. In practice, the Congress has designated the locations and amounts of funding for ITS. DOT solicits the specific projects to be funded and ensures that those projects meet criteria established in the Transportation Equity Act for the 21st Century.

Metropolitan intelligent transportation systems focus on deployment and integration of technologies in urban and suburban geographic areas to improve mobility. These systems include:

- Arterial management systems that automate the process of adjusting signals to optimize traffic flow along arterial roadways;
- Freeway management systems that provide information to motorists and detect problems whose resolution will increase capacity and minimize congestion resulting from accidents;
- Transit management systems that enable new ways of monitoring and maintaining transit fleets to increase operational efficiencies through advanced vehicle locating devices, equipment monitoring systems, and fleet management;
- Incident management systems that enable authorities to identify and respond to vehicle crashes or breakdowns with the most appropriate and timely emergency services, thereby minimizing recovery times;
- Electronic toll collection systems that provide drivers and transportation agencies with convenient and reliable automated transactions to improve traffic flow at toll plazas and increase the operational efficiency of toll collection;

---

Appendix IV  
Intelligent Transportation Systems

---

- Electronic fare payment systems that use electronic communication, data processing, and data storage techniques in the process of fare collection and in subsequent recordkeeping and funds transfer;
- Highway-rail intersection systems that coordinate traffic signal operations and train movement and notify drivers of approaching trains using in-vehicle warning systems;
- Emergency management systems that enhance coordination to ensure the nearest and most appropriate emergency service units respond to a crash;
- Regional multimodal traveler information systems that provide road and transit information to travelers to enhance the effectiveness of trip planning and en-route alternatives;
- Information management systems that provide for the archiving of data generated by ITS devices to support planning and operations; and
- Integrated systems that are designed to deliver the optimal mix of services in response to transportation system demands.

Rural Intelligent Transportation Systems are designed to deploy high potential technologies in rural environments to satisfy the needs of a diverse population of users and operators. DOT has established seven categories of rural intelligent transportation projects. They are as follows:

- Surface Transportation Weather and Winter Mobility - technologies that alert drivers to hazardous conditions and dangers, including wide-area information dissemination of site-specific safety advisories and warnings;
- Emergency Services - systems that improve emergency response to serious crashes in rural areas, including technologies that automatically mobilize the closest police, ambulances, or fire fighters in cases of collisions or other emergencies;
- Statewide/Regional Traveler Information Infrastructure - system components that provide information to travelers who are unfamiliar with the local rural area and the operators of transportation services;

- **Rural Crash Prevention** – technologies and systems that are directed at preventing crashes before they occur, as well as reducing crash severity;
- **Rural Transit Mobility** – services designed to improve the efficiency of rural transit services and their accessibility to rural residents;
- **Rural Traffic Management** – services designed to identify and implement multi-jurisdictional coordination, mobile facilities, and simple solutions for small communities and operations in areas where utilities may not be available; and
- **Highway Operations and Maintenance** – systems designed to leverage technologies that improve the ability of highway workers to maintain and operate rural roads.

The Commercial Vehicle ITS program focuses on applying technologies to improve the safety and productivity of commercial vehicles and drivers, reduce commercial vehicles' operations costs, and facilitate regulatory processes for the trucking industry and government agencies. This is primarily accomplished through the Commercial Vehicle Information Systems and Networks—a program that links existing federal, state, and motor carrier information systems so that all entities can share information and communicate with each other in a more timely and accurate manner.

The second area of emphasis in DOT's ITS program—testing and evaluating intelligent vehicles—is designed to foster improvements in the safety and mobility of vehicles. This component of the ITS program is meant to promote traffic safety by expediting the commercial availability of advanced vehicle control and safety systems in four classes of vehicles: (1) light vehicles, including passenger cars, light trucks, vans, and sport utility vehicles; (2) commercial vehicles, including heavy trucks and interstate buses; (3) transit vehicles, including all nonrail vehicles operated by transit agencies; and (4) specialty vehicles, including those used for emergency response, law enforcement, and highway maintenance.

---

## Alternative Financing Methods

---

Transportation officials at all levels of government recognize that funding from traditional sources (i.e., state revenues and federal aid) does not always keep pace with demands for new, expanded, or improved surface and maritime transportation infrastructure. Accordingly, the U.S. Department of Transportation (DOT) has supported a broad spectrum of emerging or established alternative financing mechanisms that can be used to augment traditional funding sources, access new sources of capital and operating funds, and enable transportation providers to proceed with major projects sooner than they might otherwise. These mechanisms fall into several broad categories: (1) allowing states to pay debt financing costs with future anticipated federal highway funds, (2) providing federal credit assistance, and (3) establishing financing institutions at the state level. In addition, state, local, and regional governments engage in public/private partnerships to tap private sector resources for investment in transportation capital projects. The federal government helps subsidize public/private partnerships by providing them with tax exemptions.

The federal government allows states to tap into Federal-aid highway funds to repay debt-financing costs associated with highway projects through the use of Grant Anticipation Revenue Vehicles (GARVEE). Under this program, states can pledge a share of future obligations of federal highway funds toward repayment of bond-related expenses, including a portion of the principal and interest payments, insurance costs, and other costs. A project must be approved by DOT's Federal Highway Administration to be eligible for this type of assistance.

The federal government also provides credit assistance in the form of loans, loan guarantees, and lines of credit for a variety of surface and maritime transportation programs, as follows:

- Under the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA), the federal government provides direct loans, loan guarantees, and lines of credit aimed at leveraging federal funds to attract nonfederal coinvestment in infrastructure improvements. This program is designed to provide financing for highway, mass transit, rail, airport, and intermodal projects, including expansions of multi-state highway trade corridors; major rehabilitation and replacement of transit vehicles, facilities, and equipment; border crossing infrastructure; and other investments with regional and national benefits.
- Under the Rail Rehabilitation and Improvement Financing Program (RRIF), established by the Transportation Equity Act for the 21st

Century (TEA-21) in 1998, the federal government is authorized to provide direct loans and loan guarantees for railroad capital improvements. This type of credit assistance is made available to state and local governments, government-sponsored authorities, railroads, corporations, or joint ventures that include at least one railroad. However, as of June 2002, no loans or loan guarantees had been granted under this program.

- Under Title XI of the Merchant Marine Act of 1936, known as the Federal Ship Financing Guarantees Program, the federal government provides for a full faith and credit guarantee of debt obligations issued by (1) U.S. or foreign shipowners for the purpose of financing or refinancing U.S. or eligible export vessels that are constructed, reconstructed, or reconditioned in U.S. shipyards; and (2) U.S. shipyards for the purpose of financing advanced shipbuilding technology.

A third way that the federal government helps transportation providers finance capital projects is by supporting State Infrastructure Banks (SIB). SIBs are investment funds established at the state or regional level that can make loans and provide other types of credit assistance to public and private transportation project sponsors. Under this program, the federal government allows states to use federal grants as "seed" funds to finance capital investments in highway and transit construction projects. The federal government currently supports SIBs in 30 states.

In addition to these alternative financing mechanisms directly supported by the federal government, state, local, and regional governments sometimes engage in public/private partnerships to tap private sector resources for investment in transportation capital projects. The federal government also helps subsidize public/private partnerships by providing them with tax subsidies. One such subsidy is specifically targeted towards investment in ground transportation facilities—the tax exemption for interest earned on state and local bonds that are used to finance high-speed rail facilities and government-owned docks, wharves, and other facilities. In addition, a Department of the Treasury study indicates that the rates of tax

---

Appendix V  
Alternative Financing Methods

---

depreciation allowed for railroads, railroad equipment, ships, and boats are likely to provide some subsidy to investors in these assets.<sup>68</sup>

Partnerships between state and local governments and the private sector are formed for the purpose of sharing the risks, financing costs, and benefits of transportation projects. Such partnerships can be used to minimize cost by improving project quality, maintaining risk-management, improving efficiency, spurring innovation, and accessing expertise that may not be available within the agency. These partnerships can take many forms; some examples include:

- Partnerships formed to develop, finance, build, and operate new toll roads and other roadways;
- Joint development of transit assets whereby land and facilities that are owned by transit agencies are sold or leased to private firms and the proceeds are used for capital investment in, and operations of, transit systems;
- "Turnkey" contracts for transit construction projects whereby the contractor (1) accepts a lower price for the delivered product if the project is delayed or (2) receives a higher profit if the project is delivered earlier or under budget; and
- Cross-border leases that permit foreign investors to own assets used in the United States, lease them to an American entity, and receive tax benefits under the laws of their home country. This financing mechanism offers an "up front" cost savings to transit agencies that are acquiring vehicles or other assets from a foreign firm.

---

<sup>68</sup>A subsidy is provided when the tax deductions that investors are permitted to claim for depreciation of assets are larger (in present value terms) than the amount of true economic depreciation of those assets. Although economic depreciation is difficult to estimate, the Department of the Treasury study suggests that tax depreciation exceeds economic depreciation for certain transportation assets. (See Department of the Treasury, Report to the Congress on Depreciation Recovery Periods and Methods, July 2000.)

---

## Scope and Methodology

---

Our work covered major modes of surface and maritime transportation for passengers and freight, including public roads, public transit, railroads, and ports and inland waterways. To determine trends in public expenditures for surface and maritime transportation over the past 10 years, we relied on U.S. Department of Transportation (DOT) reports and databases that document annual spending levels in each mode of transportation. We analyzed trends in total public sector and federal expenditures across modes during the 10-year period covering fiscal years 1991 through 2000, and we compared the proportion of public expenditures devoted to capital activities versus operating and maintaining the existing infrastructure during that same time period. We adjusted the expenditure data to account for inflation using separate indexes for expenditures made by the federal government and state and local governments. We used price indexes from the Department of Commerce's Bureau of Economic Analysis' National Income and Products Accounts.

To determine projected levels of freight and passenger travel over the next 10 years, we identified projections made by DOT's modal administrations, the U.S. Army Corps of Engineers, and Amtrak for the period covering calendar years 2001 through 2010. We interviewed officials responsible for the projections and reviewed available documentation to identify the methodology used in preparing the projections and the key factors driving them. We also obtained data on past levels of freight and passenger travel, covering fiscal years 1991 through 2000, from DOT's modal administrations, the U.S. Army Corps of Engineers, and Amtrak. We analyzed the factors driving the trends for three types of travel—local, intercity, and freight—that have important distinctions in the types of vehicles and modes used for the travel.

To identify mobility challenges and strategies for addressing those challenges, we primarily relied upon expert opinion, as well as a review of pertinent literature. In particular, we convened two panels of surface and maritime transportation experts to identify mobility issues and gather views about alternative strategies for addressing the issues and challenges to implementing those strategies. We contracted with the National Academy of Sciences (NAS) and its Transportation Research Board (TRB) to provide technical assistance in identifying and scheduling the two panels that were held on April 1 and 3, 2002. TRB officials selected a total of 22 panelists with input from us, including a cross-section of representatives from all surface and maritime modes and from various occupations involved in transportation planning. In keeping with NAS policy, the panelists were invited to provide their individual views and the panels were

not designed to build consensus on any of the issues discussed. We analyzed the content of all of the comments made by the panelists to identify common themes about key mobility challenges and strategies for addressing those challenges. Where applicable, we also identified the opposing points of view about the challenges and strategies.

The names and backgrounds of the panelists are as follows. We also note that two of the panelists served as moderators for the sessions, Dr. Joseph M. Sussman of the Massachusetts Institute of Technology and Dr. Damien J. Kulash of the Eno Foundation, Inc.

- Benjamin J. Allen is Interim Vice President for External Affairs and Distinguished Professor of Business at Iowa State University. Dr. Allen serves on the editorial boards of the *Transportation Journal* and *Transport Logistics*, and he is currently Chair of the Committee for the Study of Freight Capacity for the Next Century at TRB. His expertise includes transportation regulation, resource allocation, income distribution, and managerial decisionmaking and his research has been published in numerous transportation journals.
- Daniel Brand is Vice President of Charles River Associates, Inc., in Boston, Mass. Mr. Brand has served as Undersecretary of the Massachusetts Department of Transportation, Associate Professor of City Planning at Harvard University, and Senior Lecturer in the Massachusetts Institute of Technology's Civil Engineering Department. Mr. Brand edited *Urban Transportation Innovation*, coedited *Urban Travel Demand Forecasting*, and is the author of numerous monographs and articles on transportation.
- Jon E. Burkhardt is the Senior Study Director at Westat, Inc., in Rockville, Md. His expertise is in the transit needs of rural and small urban areas, in particular, the needs of the elderly population in such areas. He has directed studies on the ways in which advanced technology can aid rural public transit systems, the mobility challenges for older persons, and the economic impacts of rural public transportation.
- Sarah C. Campbell is the President of TransManagement, Inc., in Washington, D.C., where she advises transportation agencies at all levels of government, nonprofit organizations, and private foundations on transportation issues. Ms. Campbell is currently a member of the Executive Committee of the TRB. She was a founding director of the

---

Appendix VI  
Scope and Methodology

---

Surface Transportation Policy Project and currently serves as chairman of its board of directors.

- Christina S. Casgar is the Executive Director of the Foundation for Intermodal Research and Education in Greenbelt, Md. Ms. Casgar's expertise is in transportation and logistics policies of federal, state, and local levels of government, particularly in issues involving port authorities. She has also worked with the TRB as an industry investigator to identify key issues and areas of research regarding the motor carrier industry.
- Anthony Downs is a Senior Fellow at the Brookings Institution. Mr. Downs's research interests are in the areas of democracy, demographics, housing, metropolitan policy, real estate, real estate finance, "smart growth," suburban sprawl, and urban policy. He is the author of *New Visions for Metropolitan America* (1994), *Stuck in Traffic: Coping with Peak-Hour Traffic Congestion* (1992), and several policy briefs published by the Brookings Institution.
- Thomas R. Hickey served until recently as the General Manager of the Port Authority Transit Corporation in Lindenwold, N.J. Mr. Hickey has 23 years of public transit experience, and he is a nationally recognized authority in the field of passenger rail operations and the design of intermodal facilities.
- Ronald F. Kirby is the Director of Transportation Planning at the Metropolitan Washington Council of Governments. Dr. Kirby is responsible for conducting long-range planning of the highway and public transportation systems in the Washington, D.C., region, assessing the air quality implications of transportation plans and programs, implementing a regional ridesharing program, and participating in airport systems planning in the region. Prior to joining the Council of Governments, he conducted transportation studies for the Urban Institute and the World Bank.
- Damian J. Kulash is the President and Chief Executive Officer of the Eno Transportation Foundation, Inc., in Washington, D.C. Dr. Kulash established a series of forums at the Foundation addressing major issues affecting all transportation modes including economic returns on transportation investment, coordination of intermodal freight operations in Europe and the United States, and development of a U.S. transportation strategy that is compatible with national global climate

change objectives. He has published numerous articles in transportation journals and directed studies at the Congressional Budget Office and the TRB.

- Charles A. Lave is a Professor of Economics (Emeritus) at the University of California, Irvine where he served as Chair of the Economics Department. Dr. Lave has been a visiting scholar at the Massachusetts Institute of Technology and Harvard University, and he served on the Board of Directors of the National Bureau of Economic Research from 1961 through 1967. He has published numerous articles on transportation pricing and other topics.
- Stephen Lockwood is Vice President of Parsons Corporation, an international firm that provides transportation planning, design, construction, engineering, and project management services. Mr. Lockwood is also a consultant to the American Association of State Highway and Transportation Officials (AASHTO), the Federal Highway Administration (FHWA), and other transportation organizations. Prior to joining Parsons, he served as Associate Administrator for Policy at FHWA.
- Timothy J. Loman is a Research Engineer at the Texas Transportation Institute at Texas A&M University. Dr. Loman has published extensively on urban mobility issues and he developed a methodology used to assess congestion levels and costs in major cities throughout the United States. He is currently conducting research, funded by nine state transportation departments, to improve mobility measuring capabilities.
- James R. McCarville is the Executive Director of the Port of Pittsburgh Commission. He also serves as the President of the trade association, Inland Rivers' Ports and Terminals, Inc., and is a member of the Marine Transportation System National Advisory Council, a group sponsored by the U.S. Secretary of Transportation. Mr. McCarville previously served as a consultant to the governments of Brazil, Uruguay, and Mexico on matters of port organization, operational efficiency, and privatization.
- James W. McChellan is Senior Vice President for Strategic Planning at the Norfolk Southern Corporation in Norfolk, Va., where he previously held positions in corporate planning and development. Prior to joining Norfolk Southern, he served in various marketing and planning positions with the New York Central Railroad, DOT's Federal Railroad Administration, and the Association of American Railroads.

- Michael D. Meyer is a Professor in the School of Civil and Environmental Engineering at the Georgia Institute of Technology and was the Chair of the school from 1995 to 2006. He previously served as Director of Transportation Planning for the state of Massachusetts. Dr. Meyer's expertise includes transportation planning, public works economics and finance, public policy analysis, and environmental impact assessments. He has written over 120 technical articles and has authored or co-authored numerous texts on transportation planning and policy.
- William W. Miller is President of the American Public Transportation Association (APTA). Prior to joining APTA, he was executive director of the Port Authority of Allegheny County in Pittsburgh, Pa. Mr. Miller is a nationally recognized leader in public transit and has served on or as Chair of the executive committees of TRB, the Transit Development Corporation, APTA, and the Pennsylvania Association of Municipal Transportation Authorities.
- Alan E. Pisarski is an independent transportation consultant in Falls Church, Va., providing services to public and private sector clients in the United States and abroad in the areas of transport policy, travel behavior, and data analysis and development. He has served as an advisor to numerous transportation and statistics agencies and transportation trade associations. He has also conducted surface transportation reviews for AASHTO and FHWA.
- Craig E. Philip is President and Chief Executive Officer of the Ingram Bergs Company in Nashville, Tenn. He has served in various professional and senior management capacities in the maritime, rail, and intermodal industries and has held adjunct faculty positions at Princeton University and Vanderbilt University. Dr. Philip serves on the Executive Committee of the American Waterways Operators Association, the Marine Transportation System National Advisory Council, and the National Academy of Sciences' Marine Board, and he is immediate past Chairman of the National Waterways Conference.
- Arlee T. Reno is a consultant with Cambridge Systematics in Washington, D.C. Mr. Reno has expertise in performance-based planning and measurement, multimodal investment analysis, urban transportation costs, alternative tax sources, and revenue forecasting for highway agencies. He has conducted reviews for the FHWA, AASHTO, and numerous state transportation agencies.

---

Appendix VI  
Scope and Methodology

---

- Joseph M. Susman is the JH East Professor in the Department of Civil and Environmental Engineering and the Engineering Systems Division at the Massachusetts Institute of Technology. Dr. Susman is the author of *Introduction to Transportation Systems* (2000) and specializes in transportation systems and institutions, regional strategic transportation planning, intercity freight and passenger rail, intelligent transportation systems, simulation and risk assessment methods, and complex systems and he has authored numerous publications in those areas. He has served as Chair of TRB committees and as the Chairman of its Executive Committee in 1994, and he serves on the Board of Directors of ITS America and ITS Massachusetts.
- Louis S. Thompson is a Railways Advisor for the World Bank where he consults on all of the Bank's railway lending activities. Prior to joining the Bank, Mr. Thompson held a number of senior positions in DOT's Federal Railroad Administration, including Acting Associate Administrator for Policy, Associate Administrator for Passenger and Freight Services, Associate Administrator for Intercity Services, and Director of the Northeast Corridor Improvement Project. He has also served as an economics and engineering consultant.
- Martin Wachs is the Director of the Institute of Transportation Studies at the University of California, Berkeley and he holds faculty appointments in the departments of City and Regional Planning and Civil and Environmental Engineering at the university. Dr. Wachs has published extensively in the areas of transportation planning and policy, especially as related to elderly populations, fare and subsidy policies, crime in public transit, ethics, and forecasting. He currently serves as Chairman of the TRB and has served on various transportation committees for the state of California.

## GAO Contacts and Acknowledgments

---

### GAO Contacts

JoyElla K. Hecker (202) 512-2834  
Katherine Siggerud (202) 512-2834

---

### Acknowledgments

In addition to the above, Christine Borham, Jay Chenkov, Helen DeSaulniers, Colin Fallon, Rita Grieco, Brandon Haller, David Hooper, Jessica Lucas, Sara Ann Moosbauer, Jobenia Odum, and Andrew Yon Ah of GAO, as well as the experts identified in appendix VI, made key contributions to this report.

---

**GAO's Mission**

The General Accounting Office, the investigative arm of Congress, exists to support Congress in meeting its constitutional responsibilities and to help improve the performance and accountability of the federal government for the American people. GAO examines the use of public funds; evaluates federal programs and policies; and provides analyses, recommendations, and other assistance to help Congress make informed oversight, policy, and funding decisions. GAO's commitment to good government is reflected in its core values of accountability, integrity, and reliability.

**Obtaining Copies of  
GAO Reports and  
Testimony**

The fastest and easiest way to obtain copies of GAO documents at no cost is through the Internet. GAO's Web site ([www.gao.gov](http://www.gao.gov)) contains abstracts and full-text files of current reports and testimony and an expanding archive of older products. The Web site features a search engine to help you locate documents using key words and phrases. You can print these documents in their entirety, including charts and other graphics.

Each day, GAO issues a list of newly released reports, testimony, and correspondence. GAO posts this list, known as "Today's Reports," on its Web site daily. The list contains links to the full-text document files. To have GAO e-mail this list to you every afternoon, go to [www.gao.gov](http://www.gao.gov) and select "Subscribe to daily E-mail alert for newly released products" under the GAO Reports heading.

**Order by Mail or Phone**

The first copy of each printed report is free. Additional copies are \$2 each. A check or money order should be made out to the Superintendent of Documents. GAO also accepts VISA and Mastercard. Orders for 100 or more copies mailed to a single address are discounted 25 percent. Orders should be sent to:

U.S. General Accounting Office  
441 G Street NW, Room LM  
Washington, D.C. 20545

To order by Phone:   Voice: (202) 512-6000

PRINTED ON  RECYCLED PAPER

---

STATEMENT OF GORDON PROCTOR, DIRECTOR OF THE OHIO DEPARTMENT OF  
TRANSPORTATION

Mr. Chairman, members of the committee, I am Gordon Proctor, Director of the Ohio Department of Transportation. On behalf of Ohio Governor Bob Taft, I thank you for this opportunity to testify and we especially would like to acknowledge the assistance of Sen. Voinovich in making this possible. His leadership on transportation has been greatly appreciated.

As you shape the next transportation act, I ask that you focus on the tremendous need to rebuild, reconstruct and rejuvenate the interstate highway system. This system will reach its 50th anniversary in 2006, mid-way through the next Act. The Interstate Highway System has served us well and today plays a vital and irreplaceable role in our transportation system. At the same time, this system is aging,

stressed and sorely in need of additional investment to ensure the safety, adequacy and competitiveness of our nation's transportation system.

Let me put the interstate system in context for you. It represents only 1.2 percent of the public road miles in the United States but it carries 24 percent of our country's traffic and 80 percent of all truck freight. Traffic volumes on the interstate system nationally have risen 41 percent in the past 10 years and truck volumes have grown by even more.

The advent of computerized inventory systems combined with the ease and access of the interstate highway network led to the creation of Just in Time Inventory. This strategy played a large role in dropping the nation's cost of logistics from 16 percent of the Gross Domestic Product in 1978 to only 10 percent of the Gross Domestic Product today.<sup>1</sup> That means that a substantial portion of America's rise in productivity in the past 20 years has been attributable to our Interstate Highway System. As Governor Taft has said, the interstates are the conveyor belt for America's Just In Time economy.

However, we are experiencing very troubling trends in Ohio and across the country. Ohio is a good microcosm because our interstate highway system is America's fourth largest and we estimate it carries the third greatest value of truck freight in the country.

In the past 25 years we have experienced an 89 percent increase in truck volumes on our interstate highways. Routinely, every day in almost every major Ohio city, truck volumes on our major interstate highways exceed 20,000 thousand trucks a day. We estimate, truck volumes will grow approximately 60 percent over the next 20 years, and some estimate the growth will be even higher. This means that within 20 years, 30,000 trucks a day will be the norm on the interstates in Cincinnati, in Dayton, in Springfield, in Toledo, in Cleveland, in Akron, in Canton, in Youngstown and in Columbus.

These routes used to be our safest and our most reliable routes. Severe congestion, outdated interchanges, poor geometrics and tremendous volumes have turned nearly every urban interstate route in Ohio into a high-congestion, high-accident bottleneck.

I-75 in Toledo carries 19,000 trucks a day. It is 43 percent over capacity and it averages 100 accidents per year per mile. A 17-mile stretch of I-75 in Cincinnati carries 184,000 vehicles a day, including 14,000 trucks and it averages 80 accidents per year per mile. I-75 in Dayton carries 20,000 trucks per day and averages 80 accidents per year per mile.

The most congested location in Ohio is the overlap of Interstate 70 and Interstate 71 in downtown Columbus, the figurative and literal crossroads of Ohio. At that location, the interstates are 114 percent over capacity and average 274 accidents per mile per year. That equals more than one accident for every business day of the year. Within a 2.5 mile radius of the junction, the routes experienced 2037 accidents over a 3-year period.

I will offer one final example from Dayton, Ohio, which I suspect is indicative of what is happening in dozens of American communities. We recently completed a conceptual analysis of alternatives to improve the unsafe and congested design on I-75 near downtown Dayton. The estimated cost to bring the corridor up to modern standards was \$750 million. Such costs are so far beyond the resources we have that we had no choice but to reject even an attempt to bring all aspects of the highway up to standard. Instead, we are opting for a much reduced project which will make the highway adequate for an estimated \$300 million. Three hundred million dollars equals an entire year's new construction budget for the Ohio Department of Transportation. While that one project may be feasible, multiply that project times 10 and you have an idea of the magnitude of the repairs needed in Cincinnati, Toledo, Cleveland, Akron, Canton, Youngstown and Columbus. If Ohio's needs are this great, the needs of other States also are enormous and represent a major challenge in the next transportation act.

What can Congress do about this? First, please do not dilute the core, basic highway funding formulas which are essential to maintaining the backbone of our system. Special set asides and narrowly focused programs may be popular with certain groups. However, full funding of the basic core highway programs will do the most to rebuild our interstates.

Second, as the interstates approach their 50th year, do not let them be treated as historical artifacts subject to preservation in their current outmoded state under the nation's historic preservation statutes.

Third, please recognize that the Nation needs to restore the capacity of these critical bottlenecks and do not allow any agencies to promulgate new rules to slow down or impede our progress in repairing these locations.

Finally, we support an idea suggested by Administrator Peters that a national study or national commission is needed to evaluate the future of our interstate highway system. This system is so important to our transportation network that its future must be secure.

Mr. Chairman, Senator Voinovich, members of the committee, thank you for this opportunity and I would be happy to answer any questions.

RESPONSES OF GORDON PROCTOR TO ADDITIONAL QUESTIONS FROM SENATOR  
VOINOVICH

*Question 1.* You stated during the hearing that truck volumes on Ohio's major Interstate highways approach 20,000 trucks per day. How does the truck volume compare to passenger car volume on the same roadways? Has the ratio of passenger cars to trucks increased or decreased in Ohio?

Response. As I stated in my testimony, the I-70/I-71 split in downtown Columbus carries 20,000 trucks per day. That section of roadways also carries 130,000 cars a day. In 1977, trucks comprised nearly 11 percent of the total traffic volume on Ohio's highway system. Today, that figure has increased to 13 percent. This might not seem like a significant increase at face value, but truck volumes in Ohio have doubled during that same period. Total truck volumes have increased from 12 billion to 24 billion trucks annually. Passenger car volumes are keeping pace with the dramatic truck volumes our State is enduring.

*Question 2.* In your testimony, you indicated that 7 percent of Interstate pavements in Ohio will require replacement by 2008. In what areas of Ohio are Interstate pavement replacements needed and how much do you estimate it will cost? What is the status of these projects and have funds been identified?

Response. We have an aggressive pavement reconstruction program beginning in 2005 through 2008. Approximately \$400 million in State and Federal maintenance and preservation funds will be used to repair some of the State's worst highway conditions. The following is a list of the projects scheduled for rehabilitation:

- I-71 in Morrow and Richland counties
- I-70 in Clark, Madison and Montgomery counties
- I-71 and SR 83 in Medina County
- I-80 in Mahoning County
- I-71 in Wayne County
- SR 2 and I-90 in Lake County
- I-75 in Wood and Lucas counties
- I-480 in Cuyahoga County
- I-75 in Warren County
- I-90 in Ashtabula County
- I-275 in Hamilton County

*Question 3.* You stated during the hearing that the number of traffic accidents and fatalities has stalled in recent years. What do you believe is the most important thing we can do to reduce traffic accidents and fatalities in Ohio?

Response. The most important factor in reducing traffic accidents and fatalities in Ohio is proper maintenance and repair of our highways. Some examples of important maintenance and repair items include capacity additions for alleviating congestion, remedying outdated geometrics, leveling grades, improving skid resistance, and improving shoulders. By making our roadways safer by fully funding all of these items, we feel strongly that accidents can be reduced.

*Question 4.* You indicated in your statement that Congress should not dilute the basic core highway programs with special set asides or narrowly focused programs. What are the basic core programs and why are they so important to helping Ohio meet its transportation needs? What would you recommend be done to address special transportation project needs without "diluting" the basic core highway programs?

Response. The basic core funding programs, in our opinion, are the Interstate Maintenance Program, the Bridge Rehabilitation Program and the other Surface Transportation Programs. The Congestion Mitigation/Air Quality Program is also important but additional flexibility should be given for the expenditure of these funds. To truly address congestion, capacity expansions are sometimes necessary. CMAQ funding should be made available for projects of that type.

Additional flexibility in all programs would be beneficial so that each individual State can use Federal funds to address any special needs it may have. Stringent guidelines and multiple programs would only dilute the core highway programs and result in special projects remaining unfunded.

*Question 5.* You stated in your testimony that Congress should not allow any agencies to promulgate new rules to slow down or impede progress in repairing critical bottlenecks to improve capacity. Are there such rules already in place that slow down or impede States' ability to improve the condition and performance of highways and bridges? Are there any rules that are being considered which might impact the ability of States to meet their needs?

Response. At this time, we are unaware of any pending rules that may be considered that might impact our ability to deliver important transportation projects. The Streamlining rules proposed during the previous Administration were of great concern to us. We were very pleased to learn of their withdrawal and of President Bush's recent Executive Order on this issue. We strongly support the actions that Secretary Mineta and Administrator Peters have taken since issuance of the Order. In fact, Ohio has submitted 4 projects to be considered by the Transportation Infrastructure Streamlining Task Force as priority projects. We will closely monitor and participate in this process.

*Question 6.* Federal Highway Administrator Mary Peters has called for the creation of a blue-ribbon commission to study and make recommendations for addressing the needs of the Interstate highway system. How could this blue-ribbon commission be most helpful in informing the debate for next year's highway bill?

Response. The interstate is the most important part of our nation's transportation system. Ohio, like many States, is facing a massive reconstruction and rehabilitation of its Interstate system. The magnitude of national Interstate reconstruction needs is unknown. We feel that in order for Congress to be truly knowledgeable on this issue, a forum should be established that focuses solely on Interstate needs and concerns. The building of the Interstate system was a national effort. A clear, concise national plan should be identified for the massive reconstruction and rehabilitation that will be necessary in the upcoming years.

---

RESPONSES OF GORDON PROCTOR TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Mr. Proctor, I appreciate your testimony about the looming reconstruction needs of the interstate highway system. Are these needs taken into account in DOT's Conditions and Performance Report or AASHTO's Bottom Line Report?

Response. Yes, the Ohio Department of Transportation participated with USDOT and AASHTO in the completion of their respective reports.

*Question 2.* How has the steady growth of truck traffic impacted the physical condition and useful life of the Interstate system and National Highway System?

Response. Truck volumes in Ohio have grown from 12 billion annually to 24 billion annually. As a result our pavements and bridges are sustaining increasing loadings. A large, legally loaded truck weighing 80,000 pounds puts about the same wear and tear on a road as 9,000 to 10,000 cars. Moreover, a large truck causes as much congestion as 2.5 to 3.5 cars on flat terrain and as much as 15 cars on uphill grades. As a result, we have seen bridges and pavements deteriorate more rapidly in those areas of the State that carry high volumes of trucks.

---

STATEMENT OF THOMAS L. JACKSON, P.E., PRESIDENT-ELECT, AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

The American Society of Civil Engineers (ASCE) is pleased to provide this statement on "The State of America's Highway Infrastructure" for the record as the Environment and Public Works Committee examines the reauthorization of the nation's surface transportation program.

ASCE, founded in 1852, is the country's oldest national civil engineering organization representing more than 125,000 civil engineers in private practice, government, industry and academia who are dedicated to the advancement of the science and profession of civil engineering. ASCE is a 501(c) (3) non-profit educational and professional society.

ASCE believes the reauthorization of the nation's surface transportation programs should focus on three goals:<sup>1</sup>

- Expanding infrastructure investment
- Enhancing infrastructure delivery
- Maximizing infrastructure effectiveness

---

<sup>1</sup>To read ASCE's "Reauthorizing the Nation's Surface Transportation Program: A Blueprint for Success," visit [www.asce.org/govrel/tea3](http://www.asce.org/govrel/tea3)

In 2001, ASCE released the Report Card for America's Infrastructure, which gave the nation's infrastructure a grade of "D+" based on 12 categories. Roads received a grade of "D," bridges a "C," and transit a "C-."

The nation's surface transportation programs have benefited from an increase in Federal and local funding currently allocated to ease road congestion, to repair decaying bridges, and to add transit miles. In our role as stewards of the infrastructure, ASCE developed its first Report Card for America's Infrastructure in 1998, and the infrastructure scored an overall grade of "D."

Although many Americans were alarmed by these report cards, few were surprised. Their daily experience had prepared them. They were coping with traffic congestion and crumbling pavement. Their children and grandchildren were attending schools so overcrowded the first lunch shift started at 10:15 a.m. or so old and neglected that the roof leaked whenever it rained.

Indeed, ASCE's first report card in 1998 did help to prompt action. Soon after its release, Congress passed the Transportation Equity Act for the 21st Century (TEA-21), P.L. 105-178, providing record levels of authorized funding for roads, bridges, and transit. Voters in communities throughout the United States passed bond initiatives to provide desperately needed funds to build and restore school facilities.

At the same time, however, growing frustration with worsening traffic congestion, school overcrowding and the other burdens placed on our overtaxed infrastructure has led voters to put the brakes on development by passing initiatives to limit growth.

#### *A. The State of the Nation's Surface Transportation Infrastructure*

##### ROADS

According to ASCE's 2001 Report Card, the nation's roads earned a D+, up from a D-in 1998. The major reason for this is that the Congress and State and local governments have begun to address the investment crisis and crumbling infrastructure through the enactment of TEA-21, which provided \$218 billion for the nation's highway and transit programs, and additional State and local programs to fund surface transportation infrastructure. But even at these increased funding levels, capital investments fall short of needs by 43 billion dollars a year.

On our highways, nearly 70 percent of peak-hour traffic experiences congested conditions. And, according to a study by the Texas Transportation Institute the total congestion "bill" for the 75 areas studied in 2000 came to \$67.5 billion, which is the value of 3.6 billion hours of delay and 5.7 billion gallons of excess fuel consumed.<sup>2</sup> To keep congestion from increasing between 1999 and 2000 would have required 1,780 new lane-miles of freeway and 2,590 new lane-miles of streets—OR—an average of 6.2 million additional new trips per day taken by either carpool or transit, or perhaps satisfied by some electronic means—OR operational improvements that allowed 3 percent more travel to be handled on the existing systems—OR—some combination of these actions.<sup>3</sup> None of this took place and congestion increased.

TEA-21 funds, combined with additional revenues from State and local governments, have begun to make an impact on road projects in all 50 States. Total highway expenditures by all levels of government and all expenditure types (including capital outlays; maintenance; and research, policing and administrative) have increased from \$93.5 billion in 1995, before TEA-21 was enacted, to \$111.9 billion in 1999. Additionally, the obligation of Federal funds for roadway projects has almost doubled during this same period from \$8.6 billion in 1995 to \$16.3 billion in 1999. Another good measure of the increased attention to our nation's highways is the miles of Federal-aid roadway projects underway. This number has also increased dramatically from 16,654 miles in 1995 to 29,030 miles in 1999.

Even with TEA-21's commitment, our nation must increase annual investment by \$27 billion at all levels to improve conditions and performance adequately, according to the Federal Highway Administration (FHWA). An FHWA report concludes that the Nation should be investing \$94 billion a year in its road and bridge system over the next 20 years. However, this investment level refers only to capital investment and does not include maintenance, research, policing or administrative expenditures.

In 1999, the total capital investment by all levels of government was \$59.4 billion, well short of the needed \$94 billion.

<sup>2</sup>"2002 Urban Mobility Report," Texas Transportation Institute, Texas A&M University, <http://mobility.tamu.edu>

<sup>3</sup>Ibid.

Yet even with this added attention, 58 percent of America's urban and rural roadways are in poor, mediocre or fair condition, according to the FHWA.<sup>4</sup> Although this is a slight improvement from previous years, conditions remain at substandard levels.

The FHWA ranks "poor" roads as those in need of immediate improvement. "Mediocre" roads need improvement in the near future to preserve usability. "Fair" roads will likely need improvement. "Good" roads are in decent condition and will not require improvement in the near future. "Very good" roads have new or almost new pavement.

Substandard road conditions are dangerous. Outdated and substandard road and bridge design, pavement conditions, and safety features are factors in 30 percent of all fatal highway accidents, according to the FHWA.

Americans' personal and commercial highway travel continues to increase at a faster rate than highway capacity and our highways cannot sufficiently support our current or projected travel needs. Between 1970 and 1995, passenger travel nearly doubled in the U.S. and road use is expected to increase by nearly two-thirds in the next 20 years. Growth can be attributed to changes in the labor force, income, make-up of metropolitan areas and other factors.

While passenger and commercial travel on our highways has increased dramatically in the past 10 years, America has been seriously under-investing in needed road and bridge repairs and has failed to even maintain the substandard conditions we currently have. This is a dangerous trend that is affecting highway safety, as well as the health of the American economy.

#### BRIDGES

According to ASCE's 2001 Report Card, the nation's bridges received a grade of C, an improvement from a C minus in 1998. Almost a third of America's bridges are rated structurally deficient or functionally obsolete.

In one example from Alabama, a school bus bringing students to one Washington County school had to stop at a structurally deficient bridge, let all the kids get off and walk across so the empty—and therefore lighter—bus could safely cross the bridge. The children then climbed back on the bus and continued their trip. Naturally, this ritual was repeated on the way home. To avoid this, that bus now drives 15 miles out of the way.

According to the FHWA, 10.6 billion dollars are required per year for 20 years to eliminate the current backlog of bridge deficiencies and ensure acceptable levels of safety.<sup>5</sup>

In 1998, 29 percent of the nation's bridges were rated structurally deficient or functionally obsolete by the Federal Highway Administration.<sup>6</sup>

While this number remains high, it is a slight improvement over previous years. In fact, over the last 10 years the number of bridge deficiencies steadily declined from 34.6 percent in 1992 to 29.6 percent in 1998. FHWA's strategic plan states that by 2008 less than 25 percent of the nation's bridges should be classified as deficient.<sup>7</sup>

A structurally deficient bridge is closed or restricted to light vehicles because of its deteriorated structural components. While not necessarily unsafe, these bridges must have limits for speed and weight. A functionally obsolete bridge has older design features and while it is not unsafe for all vehicles, it cannot safely accommodate current traffic volumes, and vehicle sizes and weights.

#### TRANSIT

Though transit is not within the jurisdiction of the Senate Environment and Public Works Committee, it is difficult to completely discuss the problems facing the nation's surface transportation program without mentioning it.

According to ASCE's 2001 Report Card, the grade for transit declined from a C to a C minus. While transit bus and rail facilities have improved in recent years and new systems are being built, those improvements can't keep up with the heavy strain placed on the system by rapidly increasing ridership, which has increased by 15 percent since 1995—even faster than aviation or highway transportation.

Capital spending must increase 41 percent just to maintain our transit system at its present level of service. But we need to do more than that. Many transit systems

<sup>4</sup>U.S. Dept. of Transportation (DOT), 1999 Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance, 2000.

<sup>5</sup>Ibid.

<sup>6</sup>Ibid.

<sup>7</sup>Ibid.

were designed to transport workers from the suburbs to jobs in urban centers—a pattern that has now shifted to include suburb-to-suburb commutes as well. In order to reduce highway congestion and the associated pollution, we need to build a flexible, coordinated transportation system. Improvements like that will require up to 16 billion dollars annually.

For transit there is both good news and bad news. The bad news is that while investments at both the Federal and State/local levels are increasing, ridership demand is increasing at an even faster rate. The good news is that increased ridership means increased fare box revenues. However, it means additional public investment is needed. Yet, the question remains, can investment keep pace with demand?

In 2000 Americans took more than 9 billion trips on transit, and transit ridership increased by 4.5 percent over 1998. This continued a trend that marked the fourth straight year of ridership increases, and amounted to a 15 percent increase since 1995.

Transit funding is growing, but at a slower pace. Total spending for mass transit in 1997 was \$25.1 billion. The Federal share was \$4.4 billion, State and local governments contributed \$13.2 billion and operating revenue provided the rest. For fiscal year 2000, the Federal investment increased to \$4.56 billion and to \$6.2 billion for fiscal year 2001. Total spending from all sources on transit capital projects for fiscal year 1997 was \$7.6 billion.

The Federal Government invests \$7.66 billion annually in mass transit capital improvements. However, according to the Federal Transit Administration an additional \$10.8 billion is needed to maintain current conditions and \$16 billion to eliminate identified deficiencies. Capital spending on transit needs to increase 41 percent to reach \$10.8 billion annually.

Even with the increased investment, many people in the U.S. have little or no access to transit at all. The Federal Transit Administration reports that 25 percent of the nation's urban population does not have pedestrian access to transit. In addition, 30 percent of the nation's non-metropolitan counties have no transit service at all. This can prevent those without motor vehicles from participating in the economy, places the financial burden of automobile ownership on many low income families, and adds unnecessary automobile trips to our nation's congested streets and highways.

There are substantial benefits to the taxpayer in exchange for public investment in transit infrastructure. Transit provides basic mobility for those lacking a motor vehicle or who are unable to drive. It promotes location efficiency and reduces other infrastructure costs by encouraging dense, multi-purpose, pedestrian-oriented urban development. Transit is more energy efficient on a per-person basis than the automobile. Finally, and perhaps most important, it provides an environmental benefit. By reducing passenger car traffic transit reduces air, noise, and water pollution precisely where those reductions are needed most, in major urban areas.

The U.S. Department of Transportation reports that:<sup>8</sup>

- Investment in transit continues to increase, including increased Federal funding through TEA-21. Transit system route miles show a 10-year increase of 44.2 percent in rail service and 10.4 percent in non-rail service.
- In 1997, there were 149,468 transit vehicles; 9,922 miles of track; 2,681 stations; and 1,179 transit maintenance facilities in the U.S.
- There were 156,733 non-rail route miles of transit service in 1997.
- Transit system capacity, measured in vehicle revenue miles, increased by 19.7 percent from 1987 to 1997, while non-rail increased 17.1 percent.
- The average condition of urban bus vehicles was 3.1 on a scale of 5.0 or adequate, largely unchanged for the past 10 years. Sixty-three percent of urban bus vehicles are full-sized buses whose average condition has remained steady at 3.0 for the last decade.
- The average condition of rail vehicles was 4.0 or good. This is down slightly and caused by heavy ridership in major urban areas.

According to the Department of Transportation, the estimated average annual investment required to maintain the same physical conditions and operating performance of the nation's transit systems as in 1997, by replacing and rehabilitating deteriorated assets and expanding capacity to accommodate expected transit passenger growth, is \$10.8 billion. The cost to improve conditions and performance is estimated to be \$16 billion.<sup>9</sup>

<sup>8</sup>U.S. Department of Transportation, 1999 Status of the Nation's Highways, Bridges, and Transit: Conditions and Performance, May 2000.

<sup>9</sup>Ibid.

*B. Expanding the Investment in the Nation's Surface Transportation Programs*

Establishing a sound financial foundation for future surface transportation improvements is an essential part of the reauthorization of the surface transportation program. TEA-21 provided record funding levels to the States and significant improvements have been made to our nation's infrastructure. In spite of these notable efforts, the nation's surface transportation system will require an even more substantial investment. United States Department of Transportation (DOT) data reflects the fact that an investment of \$50 billion per year would be needed just to preserve the system in its current condition. With funding as the cornerstone of any attempt to reauthorize TEA-21 it is imperative that a variety of funding issues be advanced as part of ASCE's overall strategy.

ASCE supports total annual funding of \$40 billion to \$50 billion for the Federal-aid highway program. To achieve this level, ASCE supports an increase of six cents per gallon in the Federal user fee on gasoline. This would raise approximately \$10.2 billion a year, of which an estimated \$8.4 billion in new revenues would be available in direct financing for Federal-aid highway projects annually. The remainder—approximately \$1.8 billion annually—would be directed to Federal transit programs. These increases are desperately needed.

ASCE supports the following goals for increasing our infrastructure investment.

- A 6 cent increase in the user fee with one cent dedicated to infrastructure safety and security. These new funds should be distributed between highways and transit using the formula approved in TEA-21.
- The user fee on gasoline should be indexed to the Consumer Price Index (CPI) to preserve the purchasing power of the fee.
- The Transportation Trust Fund balances should be managed to maximize investment in the nation's infrastructure.
- Congress should preserve the current firewalls to allow for full use of trust fund revenues for investment in the nation's surface transportation system.
- The reauthorization should maintain the current funding guarantees.
- Congress should stop diverting 2.5 cents of the user fee on ethanol to the General Fund, and put it back into the Highway Trust Fund.
- Make the necessary changes to alter the Revenue Aligned Budget Authority (RABA) to decrease the volatility of the estimates from year to year and ensure a stable user fee based source of funding.
- The current flexibility provisions found in TEA-21 should be maintained. The goal of the flexibility should be to establish a truly multi-modal transportation system for the Nation.

First to be addressed is the issue of raising the user fee on motor fuels. While the gas tax is an important element of the current revenue stream feeding the Federal Highway Trust Fund, it continues to erode in value due to its inherent inelastic nature. Two strategies must be advanced to remedy this condition. First, raise the gasoline user fee by six cents. This would provide a much needed infusion of funding toward the \$50 billion per year need. In tandem with raising the motor fuel tax, ASCE believes that it is important to shore up the weakness of the motor fuel tax and its inability to retain value over the long term by adding a provision to the law that would index it based on the Consumer Price Index (CPI). This would allow the rate to adjust and reflect the current economic conditions of the Nation.

As the needs of the users change so must the priorities of the nation's transportation owners and operators. Safety and security have always been important but have been driven to the top of the priority list by events of the last year. In response to this important need, ASCE is advancing the position that one cent of the proposed six cent increase in the motor fuel tax be directed toward safety and security projects as deemed appropriate by the transportation agencies administering the funds.

Important provisions of TEA-21 are embodied in the principles of Revenue Aligned Budget Authority (RABA) and firewalls. RABA was established to ensure that the Federal Highway Trust Fund revenues would be spent in accordance with the rate at which they were deposited into the fund. Over the life of TEA-21 it has allowed States to construct many projects with these additional moneys that would have otherwise languished in the trust fund. In addition, with the establishment of firewalls on the Federal Highway Trust Fund, a condition was created wherein the States could count on their funds in a long term investment strategy. This has eliminated the fear that some major projects would fall victim to various budget strategies at the national level.

Any transportation legislation must have two fundamental philosophies to build upon. First is the issue of equity. Some measure of equity was accomplished through the establishment of minimum guarantees. This provision of TEA-21 raised

the return to the States to a minimum level in order to bring greater equity to the donor/donee situation that exists across the country. In addition, a commitment to spend the maximum amount possible from the Federal Highway Trust Fund was an important part of this legislation. Positive, proactive management of the trust fund balance will be essential to addressing the critical transportation needs facing our nation today.

#### *Innovative Financing*

Even with increases in the gasoline user-fee, it is likely that tax-based revenues will not be sufficient to keep pace with the nation's transportation needs.

There is a compelling need for enhanced funding, to a large extent through user-oriented fees that have been demonstrated to be a well-accepted and equitable source of infrastructure financing. In the case of surface transportation, federally sponsored studies demonstrate the need for higher levels of investment. An additional challenge is to convince our citizens and our elected leaders that we must either "pay now" or "pay later", and that paying now is much more cost-effective and prudent in the long run.

Innovative financing techniques can greatly accelerate infrastructure development and can have a powerful economic stimulus effect compared to conventional methods. This is the current approach in South Carolina, Georgia, Louisiana, Florida, and Texas, where expanded and accelerated transportation investment programs have been announced. Innovative financing techniques, including toll road-based funding, figure heavily in several of these State programs.

The innovative programs in TEA-21 have been a good start, but more needs to be done to expand their scope, and new programs or approaches must be introduced. We must find new and innovative ways to finance the critical transportation infrastructure needs of the Nation.

ASCE supports the innovative financing programs and advocates making programs available to all States where appropriate. Additionally, the Federal Government should make every effort to develop new programs.

ASCE supports the following changes to enhance the existing programs:

#### *Transportation Infrastructure Finance and Innovation Act (TIFIA)*

- The TIFIA process for review, approval and negotiation is regarded as burdensome, and could be streamlined.
- TIFIA projects have a minimum eligibility threshold of \$100 million and consideration could be given to lowering this to \$50 million to expand the pool of projects.
- TIFIA loans could be "fully subordinated". Current TIFIA legislation is written to subordinate TIFIA loans to other creditors. However, in the event of liquidation/default, the TIFIA loan advances to parity status with other creditors. This is known as the "springing lien" provision. It is thought by some that this has limited the availability of other credit. The issue is controversial, with pros and cons on both sides, but reform should be seriously considered.

#### *State Infrastructure Banks (SIBs)*

- With the exception of five States (Texas, Rhode Island, Florida, Missouri, and California), TEA-21 did not permit further capitalization of SIBs with Federal funds. It is felt that this has suppressed SIB activity.
- Federal regulations still apply to loan funds that are repaid to the bank, encumbering SIB funded projects with Federal regulatory requirements.

#### *Grant Anticipation Revenue Vehicles (GARVEEs)*

- Increase the flexibility of GARVEE bond repayment methods. For example, utilize the total apportionment amount as a source of repayment (i.e., all funding categories), so that no particular funding category is overburdened.

New programs for consideration as part of the next reauthorization are:

- Increased use of user fees, tolls, value pricing, and HOT lanes.
- Possible indexing of highway trust fund motor fuels tax to inflation.
- Establishing a true multimodal funding program (i.e., funds can be used interchangeably for rail, highway, freight, intermodal facilities, etc.).
- Tax credit bonds, private activity bonds, and tax-exempt bonds for privately developed projects.

#### *Long-term Viability of Fuel Taxes for Transportation Finance*

ASCE supports the need to address impacts on future surface transportation funding and believes that provision should be made in the next surface transportation authorizing legislation to explore the viability of the most promising options to strengthen this funding. In particular, the impacts of fuel cell technology should

be studied as well as how to create a mileage based system for funding our nation's surface transportation system as this technology comes to market and lessens the nation's dependence on gasoline as a fuel source for automobiles.

Fuel taxes have long been the mainstay of transportation infrastructure finance, but their future is now uncertain. In many States, there is a strong reluctance to raise fuel taxes, and some State legislatures have even reduced taxes to compensate for the sharp increase in average gasoline prices over the last 2 years. Many localities and States are supplementing or replacing fuel taxes with other sources, such as sales taxes and other general revenue sources. There is also a growing trend to use additives to gasoline for environmental reasons. The most prominent additive, ethanol, enjoys a Federal exemption from fuel taxes that reduces Federal and State trust fund revenues by some several billion dollars annually. Looking ahead, a slow but steady increase in fleet efficiency—perhaps due to increased market penetration by electric, fuel cell, or hybrid technologies—would reduce the revenue per mile of use generated by users. Whereas cleaner-burning fuels and increased fuel efficiency are desirable policy goals in their own right, particularly in regard to global warming, they may reduce the reliability of fuel taxes in the future.

A helpful first step in this process will be the Transportation Research Board's recently initiated Study on Future Funding of the National Highway System, which will describe the current policy framework of transportation finance and evaluate options for a long-term transition to sources other than fuel taxes. The goals of the study are to: (1) determine the extent to which alternatives to fuel taxes will be needed in the next two decades or so; (2) analyze the pros and cons of different alternatives in terms of political feasibility, fairness, and cost; (3) suggest ways in which barriers to these alternatives might be overcome; (4) recommend ways in which the efficiency and fairness of the fuel tax could be enhanced, and (5) recommend, as necessary, a transition strategy to other revenue sources. The study's first task, to be summarized in an interim report, will provide one or more scenarios to illustrate the time span during which petroleum-based gasoline availability and cost might reduce fuel tax revenues. The interim report has been requested to provide insight to those parties involved in the development of the surface transportation reauthorization legislation, particularly with regard to projections of fuel tax revenues during the next reauthorization cycle. The study will also provide estimates of trends in expenditures for transportation infrastructure from sources other than the fuel tax.

#### *C. Life Cycle Cost & Surface Transportation Design*

The use of Life-Cycle Cost Analysis (LCCA) principles will raise the awareness of clients of the total cost of projects and promote quality engineering. Short-term design cost savings which lead to high future costs will be exposed as a result of the analysis. In the short-term the cost of projects will increase; however, the useful life of a project will increase, and there may be cost savings in operations and maintenance over the long term.

When the cost of a project is estimated only for design and construction, the long-term costs associated with maintenance, operation, and retiring a project, as well as the cost to the public due to delays, inconvenience and lost commerce are overlooked. The increasing use of bidding to select the design team has resulted in a pattern of reducing engineering effort to remain competitive, with the result of higher construction and life cycle costs.

ASCE encourages the use of Life-Cycle Cost Analysis (LCCA) principles in the design process to evaluate the total cost of projects. The analysis should include initial construction, operation, maintenance, environmental, safety and all other costs reasonably anticipated during the life of the project, whether borne by the project owner or those otherwise affected.<sup>10</sup>

#### *D. Integrated Truck and Highway Design<sup>11</sup>*

Truck sizes and weights need to be viewed in the context of major changes in cargo movement caused by the deregulation of the truck, railroad and aviation industries. Changes are continuing and will have profound impacts on the highway industry. Thus, while the use of larger and heavier trucks improves the productivity of the trucking industry and reduces the cost of transporting commodities, such ve-

<sup>10</sup>American Society of Civil Engineers, Policy Statement 451, "Life-Cycle Cost Analysis," 1999.

<sup>11</sup>For a more technical discussion of the truck weight issue please see: Ghosn, Michael, "Development of Truck Weight Regulations Using Bridge Reliability Model," *Journal of Bridge Engineering*, American Society of Civil Engineers, November 2000, and Ghosn, Michael, and Moses, Fred, "Effect of Changing Truck Weight Regulations on U.S. Bridge Network," *Journal of Bridge Engineering*, American Society of Civil Engineers, November 2000.

hicles also affect highway safety and accelerate deterioration of highway pavements and bridges.

History documents a continuing trend toward larger trucks and smaller passenger vehicles along with significantly increasing truck volumes. The safety issue and highway pavement and geometric design aspects of mixing large trucks and smaller passenger vehicles will continue to be a subject of importance to highway administrators and designers.

State limits for weights may not differ from the Federal maximums on the Interstate system except where "grandfather" provisions allow heavier combinations. Realistically, these trucks must also use highways which are not a part of the Interstate system for access. Many miles on the National Highway System do not meet the standards to qualify for the designated highway network. There are many miles of State and local roads which are even more deficient in meeting the standards of geometric and structural capability. States should balance the need for access to widely dispersed industrial and commercial sites with the need to protect inadequate road segments.

Increases in truck sizes and weights impact negatively on the structural life and geometric adequacy of the present road network. Users of the transportation system, both the general public and the trucking industry, will experience reduced service levels, delays, increased vehicle wear and operation costs and reduced safety. These negative impacts must be balanced against productivity gains and reduced commodity costs. Highways can be designed and constructed to accommodate various truck sizes and weights. Additional maintenance can be provided to sustain the pavements, capacity and safety of the system. Trucks can be designed to reduce axle loadings, enhance productivity and improve safety. Truck safety can also be enhanced through improved inspection, enforcement and operator safety programs.

Thus, highways and trucks can be designed and operated to improve their interaction, protect the highway investment and enhance safety. Industry and government cooperation in research, testing and evaluation can identify ways to improve trucking efficiency and safety while protecting the public investment in the highway system.

*The American Society of Civil Engineers (ASCE) supports a program where<sup>12</sup>:*

- Truck and highway design should be coordinated through joint research activities, such as in the National Cooperative Highway Research Program (NCHRP), and others. ASCE urges Congress, the Federal Highway Administration, the Federal Motor Carrier Safety Administration, the State transportation agencies, and the trucking industry to form these strong cooperative relationships.
- New and reconstructed roadways should be structurally, geometrically, and environmentally designed to support modern truck sizes and weights, and to insure the safe operation of the system.
- Truck designers should consider the effects of vehicle configuration and suspension systems on pavement and bridge performance. Manufacturers should also consider the effects of these factors on the safe operation of the vehicle in mixed traffic.
- Industry and government should ensure that trucks meet legal size and weight limitations and are safely maintained and operated.

#### *E. Intermodal Facilities*

TEA-21 continues a surface transportation program with flexible funding for highway, transit and other modal facilities. Traditional transportation practice inhibits attainment of a truly intermodal process because of customary approaches and philosophies that support the modal orientation of agencies, the lack of connections among modes, the inequities in Federal matching ratios for different modes, and the consolidation of funding for multimodal projects.

A primary emphasis of passenger intermodalism is to facilitate connections between the private automobile and other access modes and public transportation systems. For example, park-and ride facilities provide critical connections for mass transit commuters using automobiles for a portion of their trips.

The movement of freight from origin to destination is increasingly multimodal. Most freight is carried by trucks for final delivery, making planning the connections between highways and other modes critical to efficient freight movement.

TEA-21 continues to highlight intermodalism. Increased intermodalism is accomplished by statewide and metropolitan planning organizations, management systems and compliance with the Clean Air Act Amendments of 1990 (CAAA). Federal regu-

<sup>12</sup>American Society of Civil Engineers, Policy Statement 276, "Integrated Truck and Highway Design," 2000.

lations explicitly state that “each State . . . carry out a continuing, comprehensive, and intermodal statewide transportation planning process,” and that metropolitan transportation plans and programs shall “lead to the development and operation of an integrated intermodal transportation system that facilitates the efficient, economic movement of people and goods.”

TEA-21 and the CAAA have changed the way transportation plans have been developed from a mode by mode to an intermodal basis.

Programs of the Federal, State and local governments should maintain and strengthen the TEA-21 provisions and funding mechanisms to consider a wide range of multimodal options and new technologies in the development of transportation plans, programs and projects.

The American Society of Civil Engineers (ASCE) supports the vision of the Transportation Equity Act for the 21st Century (TEA-21) in the development of “a National Intermodal Transportation System that is economically efficient, environmentally sound, provides the foundation for the Nation to compete in the global economy and will move people and freight in an energy efficient manner.” Support for partnerships among the Federal, State and local governments, with various citizens, groups and firms from the private sector are essential to further the intermodal goals of TEA-21.<sup>13</sup>

#### *F. Operations and Maintenance of the Nation’s Surface Transportation Infrastructure*

There is a clear and present need for an increased focus on transportation operations and maintenance at all levels—Federal, State, regional, and local. This need is based on several factors:

- An aging transportation infrastructure.
- Growing congestion and incident problems are causing transportation system performance to be a top priority in many areas of the country.
- Capacity constraints and costs of new construction are forcing us to look at alternative solutions and place a premium on maintaining and improving the existing transportation system.
- Customers desire travel choices, better information, and increased reliability to meet their mobility needs.
- An efficient and responsive transportation system is critical to meeting homeland security priorities.

An increased focus on transportation operations functions can enhance performance of the transportation system, for example:

- Routine traffic and transit operations;
- Public safety responses;
- Planned construction disruptions;
- Incident management;
- Network and facility management;
- Traveler and shipper information; and
- Bicycle and pedestrian mobility.

The Department of Transportation should encourage local matching and innovative funding. The Federal Government has a role in exploring and promoting best practices related to innovative funding for operations and maintenance.

ASCE supports a strong Federal role in the nation’s transportation system and strongly endorses Federal leadership in increasing the focus on transportation operations and maintenance, thereby enhancing the performance of and preserving our investment in the transportation system. Reauthorization of TEA-21 should accomplish the following regarding Operations and Maintenance:<sup>14</sup>

- Support and assist homeland security initiatives. Transportation operations and homeland security share many of the same goals and functions. Resource sharing (e.g. communications infrastructure, traffic control centers) and joint planning are appropriate. Transit security and preparedness, international border security, asset security and tracking, vulnerability assessment, planning, and creation of system redundancy are important transportation priorities for homeland security.

• Support and assist State and local agencies. Beyond establishing transportation operations and maintenance as a national priority, the Federal role should be to support and assist State and local entities in accomplishing related goals. This

<sup>13</sup>American Society of Civil Engineers, Policy Statement 149, “Intermodal Transportation Systems,” 2002.

<sup>14</sup>American Society of Civil Engineers, Policy Statement 495, “Operations and Maintenance of Transportation Systems,” 2002.

includes support of research and development, provision of tools, promotion of best practices, and enhancement of education and training at all levels.

- Provide flexible funding. Flexible funding approaches are important components to supporting operations and maintenance needs. Expanding funding eligibility for operations and maintenance programs, enabling direct funding to local and regional operating agencies, public-private partnerships or outsourcing, and simplifying and clarifying Federal funding processes are important actions.
- Recognize that the private sector has much to offer in management and technical skills in operations and maintenance. Public-private partnerships may provide enhanced operations and management programs.
- Specific programs. In addition to flexible funding, several programs should be considered for targeted funding:
  - Homeland security initiatives related to transportation
  - Incident management programs
  - Implementation of infostructure for data collection and management
  - Provision of real-time information to and from customers
  - Support for regional cooperation and partnerships
  - Programs to alleviate bottlenecks.

#### G. Conclusion

As Congress grapples with the reauthorization of the nation's surface transportation program ASCE recommends that the following concepts guide the process:

- Expanding infrastructure investment.
- Enhancing infrastructure delivery.
- Maximizing infrastructure effectiveness.

Unless we act now, the problem will only get worse because road use is expected to increase by nearly two-thirds in the next 20 years.

The lack of adequate investment in America's infrastructure has left us with a vast backlog of deteriorated facilities that no longer meet our nation's increasing demands.

To remedy America's current and looming problem, ASCE estimated in 2001 a \$ 1.3 trillion investment in all categories of infrastructure over the next 5 years and called for a renewed partnership among citizens, local, State and Federal Governments, and the private sector.

---

#### RESPONSES OF THOMAS JACKSON TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* In your testimony, you proposed a 6 cent per gallon increase in the Federal gas tax. If the gas tax cannot be increased, how much more do you think we need to generate from other financing mechanisms to invest in our nation's transportation system? How crucial is a user fee increase to meeting our future transportation needs?

Response. ASCE supports total annual funding of \$40 billion to \$50 billion for the Federal-aid highway program. Currently, we are investing nearly \$32 billion a year in the Federal-aid highway program. It will be nearly impossible to reach the \$40–50 billion investment level without an increase in the user fee on gasoline.

ASCE does support the following policy changes to increase the funds available to the Federal-aid highway program:

- The user fee on gasoline should be indexed to the Consumer Price Index (CPI) to preserve the purchasing power of the fee.
- The Transportation Trust Fund balances should be managed to maximize investment in the nation's infrastructure, including spending down the trust fund balance.
- Congress should stop diverting 2.5 cents of the user fee on ethanol to the General Fund, and put it back into the Highway Trust Fund.
- Congress should preserve the current firewalls to allow for full use of trust fund revenues for investment in the nation's surface transportation system.
- The reauthorization should maintain the current funding guarantees.

If all of these revenue enhancements were enacted by Congress, they would add \$5 billion to projected Highway Account revenues in fiscal year 2004. This would gradually rise to \$9 billion in fiscal year 2009. This would allow the program to grow to \$44 billion by fiscal year 2009, far short of the \$60 billion needed just to maintain current structural, safety and traffic conditions.

This illustrates that to maintain a minimally adequate Federal highway program after TEA-21 the Federal user fee on gasoline must be raised. ASCE supports an

increase of six cents per gallon in the Federal user fee on gasoline. This would raise approximately \$10.2 billion a year, of which an estimated \$8.4 billion in new revenues would be available in direct financing for Federal-aid highway projects annually. The remainder—approximately \$1.8 billion annually—would be directed to Federal transit programs. These increases are desperately needed.

United States Department of Transportation (DOT) data reflects the fact that an investment of \$60 billion per year would be needed just to preserve the system in its current condition. With funding as the cornerstone of any attempt to reauthorize TEA-21 it is imperative that a variety of funding issues be advanced as part of the overall strategy to improve the nation's surface transportation program.

*Question 2.* As Highway Trust Fund revenues decrease in the future due to increased fuel efficiency and use of alternative fuels, what can we do to maintain a reliable source of highway funding and still rely on a user fee based system that pays its own way?

Response. ASCE supports the need to address impacts on future surface transportation funding and believes that provision should be made in the next surface transportation authorizing legislation to explore the viability of the most promising options to strengthen this funding. In particular, the impacts of fuel cell technology should be studied as well as how to create a mileage based system for funding our nation's surface transportation system as this technology comes to market and lessens the nation's dependence on gasoline as a fuel source for automobiles.

Fuel taxes have long been the mainstay of transportation infrastructure finance, but their future is now uncertain. In many States, there is a strong reluctance to raise fuel taxes, and some State legislatures have even reduced taxes to compensate for the sharp increase in average gasoline prices over the last 2 years. Many localities and States are supplementing or replacing fuel taxes with other sources, such as sales taxes and other general revenue sources. There is also a growing trend to use additives to gasoline for environmental reasons. The most prominent additive, ethanol, enjoys a Federal exemption from fuel taxes that reduces Federal and State trust fund revenues by some several billion dollars annually. Looking ahead, a slow but steady increase in fleet efficiency—perhaps due to increased market penetration by electric, fuel cell, or hybrid technologies—would reduce the revenue per mile of use generated by users.

A helpful first step in this process will be the Transportation Research Board's recently initiated Study on Future Funding of the National Highway System, which will describe the current policy framework of transportation finance and evaluate options for a long-term transition to sources other than fuel taxes. The goals of the study are to: (1) determine the extent to which alternatives to fuel taxes will be needed in the next two decades or so; (2) analyze the pros and cons of different alternatives in terms of political feasibility, fairness, and cost; (3) suggest ways in which barriers to these alternatives might be overcome; (4) recommend ways in which the efficiency and fairness of the fuel tax could be enhanced, and (5) recommend, as necessary, a transition strategy to other revenue sources. The study's first task, to be summarized in an interim report, will provide one or more scenarios to illustrate the time span during which petroleum-based gasoline availability and cost might reduce fuel tax revenues. The interim report has been requested to provide insight to those parties involved in the development of the surface transportation reauthorization legislation, particularly with regard to projections of fuel tax revenues during the next reauthorization cycle. The study will also provide estimates of trends in expenditures for transportation infrastructure from sources other than the fuel tax.

#### RESPONSES OF THOMAS JACKSON TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* We have heard numerous times today about expected increases in truck traffic in the next ten to 20 years. What impact will this increased traffic have on our ability to maintain our highways?

Response. History documents a continuing trend toward larger trucks and smaller passenger vehicles along with significantly increasing truck volumes. The safety issue and highway pavement and geometric design aspects of mixing large trucks and smaller passenger vehicles will continue to be a subject of importance to highway administrators and designers.

Increases in truck sizes and weights impact negatively on the structural life and geometric adequacy of the present road network. Users of the transportation system, both the general public and the trucking industry, will experience reduced service levels, delays, increased vehicle wear and operation costs and reduced safety. These negative impacts must be balanced against productivity gains and reduced commodity costs.

*Question 2.* If trucks that are heavier than currently allowed are permitted to travel our highways, what will be the consequences with respect to the condition and performance of existing highways and bridges?

Response. Increases in truck sizes and weights impact negatively on the structural life and geometric adequacy of the present road network. Users of the transportation system, both the general public and the trucking industry, will experience reduced service levels, delays, increased vehicle wear and operation costs and reduced safety.

In numerous instances bridges will need to be retrofitted or replaced to accommodate larger trucks and bigger loads, and this is the largest cost associated with allowing larger trucks on road system.

*Question 3.* If reconstruction projects and new infrastructure are built to withstand heavier trucks, what will that do to the costs of these projects?

Response. There will certainly be additional costs associated with increasing truck weights, but some of these costs can be borne early in the design and construction process which can minimize the final cost. This is especially true in bridge repair and replacement. It is well documented that increasing truck weights will necessitate more attention to bridge deficiencies, and this will require Federal highway funds. Some of these deficiencies can be addressed by FHWA's Bridge Program, but in some instances this will need to be accelerated. Highways can be designed and constructed to accommodate various truck sizes and weights. Additional maintenance can be provided to sustain the pavements, capacity and safety of the system. Trucks can be designed to reduce axle loadings, enhance productivity and improve safety. Truck safety can also be enhanced through improved inspection, enforcement and operator safety programs.

*Question 4.* You mention life cycle costs in your testimony. Can you explain the importance of looking at life cycle costs when selecting infrastructure projects?

Response. The use of Life-Cycle Cost Analysis (LCCA) principles will raise the awareness of clients of the total cost of projects and promote quality engineering. Short-term design cost savings which lead to high future costs will be exposed as a result of the analysis. In the short-term the cost of projects will increase; however, the useful life of a project will increase, and there may be cost savings in operations and maintenance over the long term.

When the cost of a project is estimated only for design and construction, the long-term costs associated with maintenance, operation, and retiring a project, as well as the cost to the public due to delays, inconvenience and lost commerce are overlooked. The increasing use of bidding to select the design team has resulted in a pattern of reducing engineering effort to remain competitive, with the result of higher construction and life cycle costs.

ASCE encourages the use of Life-Cycle Cost Analysis (LCCA) principles in the design process to evaluate the total cost of projects. The analysis should include initial construction, operation, maintenance, environmental, safety and all other costs reasonably anticipated during the life of the project, whether borne by the project owner or those otherwise affected.

*Question 5.* As a practicing engineer, have you seen highway pavement research results that have been practical and utilized in a beneficial way? How can research help improve the durability and life span of new and reconstructed roads?

Response. Research results have led to many benefits for the nation's surface transportation system including: materials that improve the performance and durability of pavements and structures; design methods that reduce scour (and consequent threat of collapse) of bridges; intelligent transportation systems technologies that improve safety and reduce travel delay; methods and materials that radically improve our ability to keep roads safely open in severe winter weather; innovative management approaches that save time and money; analytical and design approaches that reduce environmental impacts and improve the aesthetic and cultural aspects of transportation facilities; and many more.

In general, pavement research has led to longer lasting road surfaces which have lowered maintenance cost for many road systems. The following are a few recent examples of highway pavement research that has produced useable results.

- A flexible pavement life-cycle model has been developed to yield an optimum maintenance and rehabilitation plan. The model incorporates into the optimization process both performance and cost associated with a life-cycle analysis period for a given pavement structure project. A single life-cycle indicator called "life-cycle disutility" has been introduced and defined as the ratio of cost to performance. The optimum plan is the one associated with the minimum life-cycle disutility value. The model evaluates several potential maintenance and rehabilitation plans generated according to two defined decision policy options. The first decision policy option re-

quires a fixed analysis period, whereas the second one involves a variable analysis period. Both options require a specified number of major rehabilitation cycles. Pavement life-cycle cost includes initial construction, scheduled major rehabilitation cycles, and routine maintenance and added user cost. Pavement life-cycle performance is defined as the area under the life-cycle performance curve either generated from actual pavement distress data or based on an incremental analysis of the American Association of State Highway and Transportation Officials basic design equation of flexible pavement.

- Every year, large amounts of pavement deicing chemicals are used for snow and ice control on Canadian highways and airports. Until recently, urea had been the only pavement deicing chemical in use at Canadian airports, but due to recent concerns about the impact of this deicer on the environment, consideration has been given to replacing it with more environmentally friendly deicers. The test results showed that for all deicers the critical concentration, the one that caused the greatest damage to the aggregate, was in the 1–2 percent range, and for all deicers the quartzite aggregate suffered more damage than the limestone. It was also found that the road salt produced comparable damage to that caused by other deicers to quartzite, while the damage was significantly less for limestone aggregates. In case of asphalt concrete samples, it was found that conditioning asphalt samples using freeze-thaw cycles in the presence of a deicer solution caused a decrease in the indirect tensile strength and modulus of elasticity and an increase in the penetration values of the recovered asphalt cement. In addition, the test results showed that the maximum damage was caused by urea, while the damage due to the other deicers was comparable to that of distilled water.

- Because of the lack of formulas for evaluating the peak value of dynamic vehicle load on rigid pavement, the need to derive a simple closed-form solution to predict the peak load for pavement design is apparent. Researchers developed a theoretical solution for evaluating the probable peak vehicle load on rigid pavement due to the passage of a vehicle moving at constant speed along a rough road surface. Based on the proposed solutions, relations of design vehicle load and traffic volume for discrete risks are constructed for applications of pavement design.

*Question 6.* Your group's "Report Card on America" makes it easy for us non engineers to understand the State of our infrastructure. You have given our roads a D+ grade and bridges a C grade. Can you tell this committee more about this grader system and why our transportation system is scoring so low?

Response. Led by an 11-member advisory council, ASCE evaluated existing data reports for each infrastructure category. ASCE determined its grades by evaluating the infrastructure's condition, performance, capacity and funding. The grades reflect experts' views of the conditions and performance versus the current and anticipated funding level combined with the expected future needs.

According to ASCE's 2001 Report Card, the nation's roads earned a D+, up from a D- in 1998. According to ASCE's 2001 Report Card, the nation's bridges received a grade of C, an improvement from a C minus in 1998. Almost a third of America's bridges are rated structurally deficient or functionally obsolete.

The major reason for this improvement is that the Congress and State and local governments have begun to address the investment crisis and crumbling infrastructure through the enactment of TEA-21, which provided \$218 billion for the nation's highway and transit programs, and additional State and local programs to fund surface transportation infrastructure. But even at these increased funding levels, capital investments fall short of needs by 43 billion dollars a year.

STATEMENT OF WILLIAM BUECHNER, VICE PRESIDENT FOR ECONOMICS AND RESEARCH, AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION

"One of our great material blessings is the outstanding network of roads and highways that spreads across this vast continent. Freedom of travel and the romance of the road are vital parts of our heritage, and they helped to make America great. Four million miles of streets and roads make it possible for the average citizen to drive to virtually every corner of our country-to enjoy America in all its beauty and variety. They also form a vital commercial artery unequaled anywhere else in the world.

"Our interstate system has reduced by nearly a day and a half the time it takes to drive coast to coast. And more efficient roads mean lower transportation costs for the many products and goods that make our abundant way of life possible. But let's face it: Lately, driving isn't as much fun as it used to be. Time and wear have taken their toll on America's roads and highways. In some places the bad condition of the pavement does more to control speed than the speed limits.

“We simply cannot allow this magnificent system to deteriorate beyond repair. The time has come to preserve what past Americans spent so much time and effort to create, and that means a nationwide conservation effort in the best sense of the word. America can’t afford throwaway roads or disposable transit systems. The bridges and highways we fail to repair today will have to be rebuilt tomorrow at many times the cost.

“So I’m asking the Congress when it reconvenes next week to approve a new highway program that will enable us to complete construction of the interstate system and at the same time get on with the job of renovating existing highways. The program will not increase the Federal deficit or add to the taxes that you and I pay on April 15th. It’ll be paid for by those of us who use the system, and it will cost the average car owner only about \$30 a year. That’s less than the cost of a couple of shock absorbers. Most important of all, it’ll cost far less to act now than it would to delay until further damage is done . . .

“Common sense tells us that it’ll cost a lot less to keep the system we have in good repair than to let it crumble and then have to start all over again. Good tax policy decrees that wherever possible a fee for a service should be assessed against those who directly benefit from that service. Our highways were built largely with such a user fee—the gasoline tax. I think it makes sense to follow that principle in restoring them to the condition we all want them to be in.

“So, what we’re proposing is to add the equivalent of 5 cents per gallon to the existing Federal highway user fee, the gas tax. That hasn’t been increased for the last 23 years. The cost to the average motorist will be small, but the benefit to our transportation system will be immense. The program will also stimulate 170,000 jobs, not in make-work projects but in real, worthwhile work in the hard-hit construction industries, and an additional 150,000 jobs in related industries. It will improve safety on our highways and will make truck transportation more efficient and productive for years to come.

“Perhaps most important, we will be preserving for future generations of Americans a highway system that has long been the envy of the world and that has truly made the average American driver king of the road . . .”

PRESIDENT RONALD REAGAN

*Radio Address to the Nation on Proposed Legislation for a Highway and Bridge Repair Program, November 27, 1982*

---

Mr. Chairman, Senator Inhofe, members of the subcommittee, thank you very much for providing the American Road and Transportation Builders Association (ARTBA) an opportunity to testify on highway investment needs and to present its recommendations for the reauthorization of the Federal highway and mass transit programs.

I am Dr. William Buechner, ARTBA’s vice president for economics and research and chief economist. Prior to joining ARTBA in 1996, I served 22 years as a senior economist for the congressional Joint Economic Committee, and I have a doctorate in economics from Harvard University.

ARTBA marks its 100th anniversary this year. Over the past century, its core mission has remained focused on aggressively advocating Federal capital investments to meet the public and business community’s demand for safe and efficient transportation. The transportation construction industry ARTBA represents generates more than \$200 billion annually to the nation’s Gross Domestic Product and sustains more than 2.5 million American jobs. ARTBA’s more than 5,000 members come from all sectors of the transportation construction industry. Thus, its policy recommendations provide a consensus view.

Mr. Chairman, at the outset I want to express our deep appreciation to you personally and the bipartisan leadership of the committee for its work thus far to maintain the fiscal year 2003 highway program at the current year’s \$31.8 billion level.

Earlier this morning, the Federal Highway Administrator, Mary Peters, told this committee that an average annual investment of \$75.9 billion by all levels of government during the next 20 years would maintain current conditions on the nation’s highways and bridges. During the past 20 years, the Federal share of highway investment has averaged about 45–47 percent of the total, which implies that a Federal investment of about \$35 billion annually for the next 20 years would meet our highway investment requirements.

You don’t have to be an economist to recognize that, if we are currently investing \$32 billion at the Federal level, there is something odd about that assessment.

There are three reasons why the \$75.9 billion investment figure is understated.

1. The figure is stated in year 2000 constant dollars. Obviously, anyone planning a future investment would consider inflation, which will add significantly to the investment required. We recommend that the Senate mandate that future reports provide estimates that are in both constant and inflation-adjusted dollars.

2. The \$75.9 billion figure, as the administrator has stated, will not even maintain the status quo in terms of traffic congestion. Traffic congestion at that investment level would, not maybe, would get worse over the next 10 years. We can't let that happen because of its impact on productivity and the future economic growth of the Nation.

3. The findings of the report are based on the assumption that traffic growth will decline from 3 percent annually during the past 20 years to 2 percent annually over the next 20 years. This assumption reduces investment needs because less traffic means fewer highway and bridge repairs and less need for new capacity. Every Conditions and Performance report has underestimated travel growth. But over the next 20 years, the nation's work force must continue to grow. It will be fueled largely by immigration and upward mobility of lower-income Americans. Research shows that as incomes rise, so does auto ownership and vehicle miles traveled. The chart on the bottom of page A-9 of the Administrator's attachment shows that traditional travel growth would increase annual investment needs almost 50 percent to \$120 billion per year.

You will note that the American Association of State Highway and Transportation Officials upcoming 2002 "Bottom Line Report," which is based on the same economic model and data used by the U.S. DOT, concludes that an annual investment of \$92 billion in 2000 dollars by all government levels will be needed from fiscal year 2004—fiscal year 2009 just to maintain current conditions and performance. This is about \$16 billion more per year than in the figure Administrator Peters mentioned this morning.

When ARTBA analyzed the data in the 1999 Conditions and Performance report, and adjusted the data with conservative estimates of future inflation and VMT growth, we concluded that a Federal highway program averaging \$50 billion per year would be needed for fiscal year 2004 through fiscal year 2009 just to maintain existing structural, safety and travel performance conditions on the nation's highways and bridges.

When the new Conditions and Performance report is issued later this year, the data will inescapably show that it will take a Federal highway investment of at least \$50 billion per year just to stabilize congestion at its current level, and more likely a program of \$60 billion or even more.

Of course, we must also look at mass transit capital needs which are in addition to the highway investment needs reported by Administrator Peters.

ARTBA has developed a TEA-21 reauthorization funding proposal, which we call "Two Cents Makes Sense," that shows how the Federal share of highway investment requirements during the next 6 years can be substantially met. We are recommending a Federal highway program funded at \$35 billion in fiscal year 2004 and then increased by \$5 billion per year to \$60 billion by fiscal year 2009. This program would bring us to an investment level that would maintain current physical and safety conditions and assure that traffic congestion will not get materially worse over the next 10 years. It would also double mass transit investment to about \$14 billion by fiscal year 2009.

Our approach would result in a manageable program for both the State DOTs and the transportation construction industry. The funding levels we recommend should be guaranteed and firewall-protected just as under TEA-21. But we would recommend that there not be a RABA adjustment of the kind that caused the funding uncertainty and political problems we saw in fiscal year 2003.

We are suggesting a fundamental change in Highway Trust Fund cash management to assure that highway users pay no more into the trust fund each year than is needed to cover actual outlays from the trust fund. Under our recommended changes, we calculate that a small annual increase in the Federal highway user fee of about 2 cents per gallon would be needed at most to meet projected cash outlays from the Highway Trust Fund to fund the program we visualize.

About half a cent of this increase would come from permanently indexing the motor fuels tax to the Consumer Price Index, which would preserve the purchasing power of highway user fees even beyond the reauthorization period. The other 1.5 cents would have to be included in the reauthorization legislation.

To put a 2-cent annual increase in perspective, we have included a chart on page 9 below showing that the average weekly change in the retail price of gasoline during the past year and a half was almost 2.5 cents per gallon.

If Congress were to enact any other source of new revenues for the Highway Trust Fund, like transferring the 2.5 cents per gallon of the gasohol excise from the gen-

eral fund to the Highway Trust Fund, the necessary increase in the motor fuels user fee would be even smaller.

Finally, our proposal would include a revenue RABA provision to assure that the Federal highway program does not contribute to the Federal deficit. Under a revenue RABA, if the Highway Trust Fund were to run a deficit during any fiscal year, the user fee would be automatically increased the following year by just enough to make the trust fund whole. Conversely, if the trust fund ran a surplus, then the user fees would be automatically reduced the following year. This would assure that the Federal highway program would be completely budget-neutral and would have no impact on the Federal surplus or deficit.

*ARTBA Recommendations for Meeting Highway and Transit Investment Needs in TEA-21 Reauthorization*

In March 2001, the American Road and Transportation Builders Association published its detailed proposals for improving the Federal highway and mass transit programs in a 72-page report entitled “A Blueprint for Year 2003 Reauthorization of the Federal Surface Transportation Programs.” This report was the culmination of the work of a task force of over 100 ARTBA members. Our refined funding proposal for reauthorization, “Two Cents Makes Sense,” was released on July 16.

Mr. Chairman, ARTBA’s vision for TEA-21 reauthorization is centered on three goals:

First, cutting the number of deaths and injuries on America’s highways between 2004 and 2009 through targeted capital investments.

Second, ensuring that traffic congestion for the American public and business community does not get materially worse between now and 2009; and

Third, ensuring that the structural conditions of federally aided highways, bridges and transit systems do not get materially worse over that same period.

These goals can only be accomplished by providing the capital investments the data from the U.S. Department of Transportation and the American Association of State Highway and Transportation Officials (AASHTO) reports suggest are necessary to, at minimum, maintain existing system safety, physical conditions and performance.

*New Assessments of National Transportation Capital Investment Needs: AASHTO, USDOT, APTA*

The upcoming AASHTO “bottom line” report uses year 2000 data provided by the State transportation departments and the U.S. Department of Transportation’s HERS model to project highway and mass transit capital investment needs over the period 2000 to 2019. The report states that an annual capital investment of \$92.0 billion in 2000 dollars will be required during the next 20 years by all levels of government to maintain current conditions and performance on the nation’s highways and \$125.6 billion will be needed annually to make all of the economically beneficial improvements identified by the model.

The AASHTO report does not assign a Federal share to these needs estimates, nor does it factor in future price inflation. If one assumes the Federal share of total highway capital investment, fiscal year 2004–09, will continue to be about 47 percent<sup>2</sup>—the average share over the past 20 years—and that annual inflation will be 2.4 percent<sup>3</sup>—the estimate used in the president’s fy 2003 budget—the “bottom line” report suggests:

- The Federal share of the investment needed “just to maintain” year 2000 highway safety, structural and traffic congestion conditions would be \$47.7 billion in fiscal year 2004, rising to \$53.6 billion in fiscal year 2009.
- The Federal share of the investment needed to make all economically justifiable improvements to the highway system would be \$65.1 billion in year 2004, rising to \$73.2 billion in year 2009.

Figure 1 graphically depicts how the ARTBA “two cents makes sense” proposal addresses these investment needs estimates suggested by the AASHTO “bottom line” report.

<sup>2</sup>This is the average Federal share of total public highway capital investment over the past 20 years, including FHWA administrative costs, found in the U.S. Department of Transportation annual publication “Highway Statistics” Table HF-10 for 1995–2001 and “Highway Statistics Summary to 1995” Table HF210 for 1982–1994.

**Fig. 1 - How ARTBA's "Two Cents Makes Sense" TEA-21 Reauthorization Funding Proposal Addresses the Federal Share of the Highway System Capital Investment Needs Identified in the 2002 AASHTO "Bottom Line" Report**

The U.S. Department of Transportation is expected to soon release the biennial surface transportation conditions, performance and investment requirement report it is mandated to submit to Congress. The most recent report, issued in 2000 and utilizing 1997 data, suggested a minimum \$50 billion per year Federal investment requirement, when adjusted for inflation and historic traffic use. Annual inflation alone would be expected to drive that reported annual investment need beyond \$60 billion by fiscal year 2009.

The American Public Transportation Association (APTA) has stated that a \$14 billion per year annual Federal investment is necessary to meet minimum national transit needs.

#### *Existing Revenue Options*

Financing this level of investment will require more revenues than highway users are currently projected to pay into the Highway Trust Fund during the next 6 years. Based on information such as current highway user fees, expected population growth, number of drivers, vehicle miles traveled and other factors, the Congressional Budget Office and the U.S. Department of the Treasury currently project that revenues into the Highway Account will grow from \$30 billion in fiscal year 2004 to just under \$35 billion in fiscal year 2009. Projected revenue growth between now and fiscal year 2009 will thus be far less than needed to meet Federal highway investment requirements during the next 6 years.

Nearly 2 years ago, ARTBA proposed a number of options for enhancing Highway Account revenues. These include:

- spending down the current cash balance;
- indexing the motor fuels excise taxes for inflation;
- crediting the Highway Account with gasohol tax revenues that currently go into the General Fund;
- ending the gasohol subsidy or reimbursing the Highway Trust Fund from the General Fund for the cost of the subsidy;
- crediting interest on the Highway Trust Fund balances;
- eliminating fuel tax evasion; and
- expanding innovative financing programs.

Table 1 provides the latest revenue estimates for each of these options. These figures were computed by ARTBA's economics and research team based on the most recent available data from the U.S. Department of the Treasury, the Congressional Budget Office and other government agencies.

**Table 1 - Revenue Options for Financing the Federal-Aid Highway Program, FY 2004 - FY 2009**  
(millions of dollars)

|  | Fiscal year   |               |               |               |               |               |

Source: ARTBA analysis of data from U.S. Treasury Department, Congressional Budget Office and FY 2003 Budget of the U.S. Government.

If all of these revenue enhancements were enacted by Congress, they would add \$5 billion to projected Highway Account revenues in fiscal year 2004. This would gradually rise to \$9 billion in fiscal year 2009. This would allow the program to grow to \$44 billion by fiscal year 2009, far short of the \$60 billion needed just to maintain current structural, safety and traffic conditions.

Whether Congress will, in fact, adopt any, or all, of these options is at this point a matter of conjecture.

What is abundantly clear is that a minimally adequate Federal highway program after TEA-21 will require significant new revenues, beyond these seven options.

The main sources of funds for Federal highway investment are the fees paid by highway users in the form of excise taxes on motor fuels-gasoline, diesel fuel and gasohol. Each penny of the motor fuels excise taxes currently generates about \$1.7 billion per year, with about \$1.4 billion being deposited into the Highway Account of the Highway Trust Fund and \$260 million deposited into the Mass Transit Account.

ARTBA has endorsed an increase in highway user fees as needed to maintain current structural, safety and traffic mobility conditions on the nation's highways and bridges. But highway users should not be asked to pay any more than absolutely necessary. The proposal I want to outline this morning is designed to provide the necessary level of Federal highway investment during the next 6 years at the minimum cost to highway users

*“Two Cents Makes Sense”—A Funding Proposal to Meet the Investment Requirements Outlined by the U.S. Department of Transportation and AASHTO*

On July 16, 2002, ARTBA announced a needs based financing proposal for TEA-21 reauthorization—“Two Cents Makes Sense.” The financing plan is a refinement of the funding recommendations ARTBA published in March 2001.

The “Two Cents Makes Sense” plan would provide the revenue stream necessary to double the annual Federal investments in highways—to \$60 billion—and mass transit—to almost \$14 billion—by fiscal year 2009. This proposal is the only one currently being discussed that would grow Federal highway investment during the next authorization period to the level the U.S. Department of Transportation (USDOT), the American Association of State Highway and Transportation Officials (AASHTO) and the American Public Transportation Association (APTA) report is the minimum needed just to maintain current safety, traffic congestion and structural conditions.

The “Two Cents Makes Sense” plan would provide steady, predictable and manageable Federal highway program increases—in \$5 billion increments—from \$35 billion in fiscal 2004 to \$60 billion in fiscal 2009. Federal transit investment would increase under our proposal in \$1 billion annual increments. This would be achieved through:

- more efficient cash management of Highway Trust Fund (HTF) revenues; and
- a small, annual adjustment in the Federal motor fuels excise user fee rate to assure the revenue stream necessary to cover the government's cash outlay in that year for the highway and transit programs.

Our proposal is a logical evolution of the concept embraced by Congress in TEA-21 of directly linking annual highway investment to the user fee revenue stream.

Under our proposal, the TEA-21 budget firewalls and protections would be maintained. This would include annual funding guarantees in the authorization legislation and the budgetary protections for the highway and mass transit programs, including the separate budget categories and the point of order in the House Rules that can be raised against legislation that would reduce the guaranteed funding.

*More Efficient Cash Management of Highway Trust Fund Revenues*

Under TEA-21, as has been the case for several decades, the Federal Government has been collecting more highway user revenue each year than it actually needs to pay the annual bills—or outlays—for the highway and transit programs. As a result, this money is being “warehoused” for up to 7 years before it is actually spent. That's why the trust fund balance continues to balloon. Here's how it happens:

Based on years of analysis, the White House Office of Management & Budget and the Congressional Budget Office have determined Federal highway funds spend out over a period extending 7 years. This spend out rate is unique among Federal programs. Unlike the case with virtually every other Federal program, of every dollar obligated during a fiscal year for the Federal highway program, only 27 cents will actually have to be paid out of the HTF Highway Account during the first year. The next year, 42 cents will be paid, followed by 17 cents the third year and smaller amounts in following years (See Figure 2).

**Fig. 2 - Pace of Outlays Resulting from Obligation of Annual Highway Funds**

This “lag” between collection of user fee revenue from motorists and truckers to actual complete spend out of those revenues causes the significant annual growth in the Highway Trust Fund balance. Absent changes, the Highway Trust Fund’s Highway Account balance would grow steadily through fiscal year 2010.

ARTBA proposes to correct this inefficient money management by returning the Federal highway program to a true “pay-as-you-go” approach.

#### *Returning to a True “Pay-as-You-Go” Approach*

In the reauthorization, Congress would set annual investment targets to work toward accomplishing needs based performance results. This could be accomplished by starting with \$35 billion in fiscal year 2004 and ramping in \$5 billion increments annually thereafter to \$60 billion in fiscal year 2009. This would similarly be done for transit investment. Once these authorization levels are established, the Congressional Budget Office would determine the annual cash outlay needed to fund the new authorization, plus remaining past authorizations.

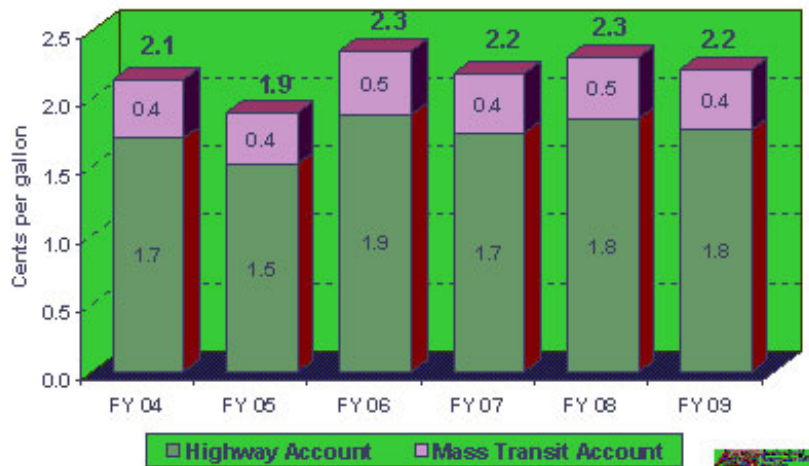

The reauthorization legislation would also include authority for an annual adjustment of the Federal motor fuels user fee excise rate to produce the amount of revenue to the HTF needed to meet the highway and transit program cash outlays for the year. This adjustment would have two parts: (1) a base adjustment to protect that purchasing power of the highway and transit programs that would be linked to the annual Consumer Price Index (indexing); and (2) depending on U.S. Treasury revenue projections for the Highway Trust Fund from all sources during the upcoming year (i.e., could include possible recapture of ethanol revenues, interest on the trust fund, prudent use of the existing HTF balance, revenues from innovative financing) an adjustment in the motor fuels rate above indexing that is necessary to provide the revenue needed to meet the outlay target.

By implementing these recommended changes, it is possible to increase Federal highway and transit investment significantly without a large, one time increase in the motor fuels excise user fee rate (which would also exacerbate the HTF balance buildup just discussed).

Funding the annual authorizations we have proposed, would, with implementation of the changes we have recommended, require at most an annual adjustment of the Federal motor fuels excise user fee rate of 2.2 cents per gallon. Approximately one-half cent of that increase would be the result of indexing to the CPI. If the HTF revenue stream were enhanced by redirection and equitable taxation of ethanol, use of the existing HTF balance, more revenues due to a robust economy-any or all-the annual adjustment in the motor fuels excise user fee rate would be lower than 2.2 cents per gallon (including indexing)! (See Figure 3)

**Fig. 3 - Maximum Annual Motor Fuel Excise Rate Adjustment Necessary To Finance a \$60 Billion Federal Highway Program and \$14 Billion Mass Transit Program by FY 2009**

*Revenue RABA Provision: An Approach that Eliminates Current RABA Political and Program Planning Problems.*

The "Two Cents Makes Sense" proposal would also replace the TEA-21's RABA (Revenue Aligned Budget Authority) adjustment with a "Revenue RABA Provision." The necessary user fee increases in Figure 3 were calculated using the most recent Highway Trust Fund projections by the U.S. Department of Treasury and the Congressional Budget Office. When TEA-21 is reauthorized, new calculations, based on the then current data, may indicate user fee increases slightly higher or lower than those in Figure 3.

Under a "Revenue RABA Provision," if revenues into the HTF during any given fiscal year were to fall short of outlays, then the following year the statutory motor fuels excise user fee rate would be automatically allowed (or certified) to increase by the amount required to offset the deficit and make the trust fund whole. This would eliminate the political problems and program disruptions that have occurred with the fiscal year 2003 transportation appropriation caused by the current RABA construct.

Conversely, if revenues to the HTF were to exceed required outlays during a fiscal year, then the following year the motor fuels excise user fee rate would be automatically decreased by the amount needed to offset the resulting surplus.

This "Revenue RABA Provision" would ensure that the highway and mass transit program does not contribute to the Federal deficit during the next 6 years.

*Looking Rationally at the Impact of an Annual Two Cent User Fee Adjustment: The Real World Gas Price Experience*

During the past year and a half, the retail price of gasoline has fluctuated by an average 2.5 cents per gallon per week! (See Figure 4). In 14 of the weeks, the average national retail price of gasoline either increased or decreased by 5 cents per gallon or more. In 39 of the 75 weeks shown in Figure 4-or more than half the time-the average retail price nationally fluctuated at least 2 cents per gallon from 1 week to the next.

**Fig. 4 - Weekly Change in Retail Price of Gasoline,  
January 2001 - September 2002**

What this means, of course, is motorists are used to paying each week the level of annual adjustment in the Federal motor fuels excise user fee rate proposed by ARTBA to support a \$60 billion Federal highway and \$14 billion Federal transit program by fiscal year 2009!

ARTBA commissioned Zogby International to conduct a national survey of likely voters July 9-12, 2002, which found almost 70 percent would support an annual 2 cent per gallon increase in the Federal motor fuels tax rate if the money it generated was used exclusively for transportation improvements. A 2-cent gas tax increase would cost the average driver \$12 per year, or 6 cents per day. That compares to the estimated \$259 each motorist pays per year in extra vehicle repair and operating costs driving on poor roads.

Tables 2 and 3, found at the end of this testimony, provide an analysis of how our "Two Cents Makes Sense" proposal would benefit individual State highway programs, based on both the existing apportionment formulas and in response to proposals to increase minimum State returns to 95 percent.

*Maintenance of Effort Provision to Ensure Program Growth in Every State*

A key component of financing highway, bridge and mass transit improvements is the partnership between Federal, State and local governments to develop and maintain the nation's surface transportation network. It is critical for all partners to make an appropriate commitment to transportation investment. Unfortunately, a number of States let their own funds for highway and bridge investment lag upon realizing the increased Federal funds they would receive under TEA-21.

To ensure increased Federal surface transportation investment actually results in more funds for transportation improvement projects, ARTBA believes the reauthorization of TEA-21 should include a "maintenance of effort" provision that makes increased apportioned Federal funds contingent on individual State highway and transit program investment levels consistent with, at least, their prior year investment.

Mr. Chairman, thank you again for the opportunity to testify before the subcommittee on this important subject.

I would be happy to respond to questions.

**Table 2 - Projected Apportionment of Federal Highway Funds Among the States with a Minimum 90.5 Percent Share under the ARTBA "Two Cents Makes Sense" Proposal**

RESPONSES OF WILLIAM BUECHNER QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* What level of funding could the Highway Trust Fund support over the life of the next highway bill if the Federal gas tax is not increased?

Response. The first line of the attached table shows the latest official estimate of revenues into the Highway Account of the Highway Trust Fund from the Congressional Budget Office and the U.S. Department of the Treasury. It shows that Highway Account revenues will grow by about \$1 billion annually, from just over \$30 billion in fiscal year 2004 to just under \$35 billion by fiscal year 2009. Under TEA-21, Congress established an arrangement where the funding level for the highway program each fiscal year is to be set equal to Highway Account revenues the previous fiscal year. If that arrangement were carried into the next authorization legislation, funding for the highway program would grow to about \$33.8 billion in fiscal year 2009, or about \$2 billion above the fiscal year 2002 level. Just to maintain fis-

cal year 2002 purchasing power would require program growth to \$37.5 billion by fiscal year 2009, assuming inflation matches the 2.4 percent annual increase projected by the President's Council of Economic Advisers. Failure to reach at least this funding level would result in a significant cut in the actual amount of highway construction and repair work that could be performed.

It is also important to note that the Federal motor fuels excise tax is, in fact, a user fee which ensures that the Federal investment in highways is funded solely by highway users. We agree with President Ronald Reagan, who said November 27, 1982 in his weekly radio address to the Nation that "good tax policy decrees that wherever possible a fee for a service should be assessed against those who directly benefit from the service. Our highways were built largely with such a user fee—the gasoline tax. I think it makes sense to follow that principle in restoring them to the condition we all want them to be in."

*Question 2.* Financing for the Highway Trust Fund is derived from a variety of Federal highway user taxes, including excise taxes on motor fuels (gasoline, gasohol, diesel, and special fuels) and truck-related taxes on truck tires, sales of trucks, and the use of heavy vehicles. Besides increasing the Federal gas tax by 2 cents per gallon, do you recommend any increases to any of the other Federal highway user fees?

*Response.* ARTBA's "Two Cents Makes Sense" proposal is a program that would increase Federal investment in highway improvements from \$35 billion in fiscal year 2004 to \$60 billion in fiscal year 2009 through an increase in the Federal motor fuels tax of just over 2 cents per gallon per year, if Congress does not provide for any other new revenue sources. The above table shows the potential revenue impact of some new revenue sources that have been identified. If Congress were to enact any of these, the required motor fuels tax increase would be smaller than 2 cents per year. ARTBA supports the options listed in the table. Increasing the truck use taxes would also be an option, but ARTBA has not examined the potential revenue effect. ARTBA supports the current policy of financing Federal highway investment through fees levied on highway users, including the truck use taxes. As the table makes clear, however, it will be impossible to increase funding for highway investment during the next 6 years without additional revenues. ARTBA's "Two Cents Makes Sense" proposal would fund the Federal highway program at a level that would meet the nation's highway investment needs during the next 6 years at the lowest cost to America's highway users, and we hope Congress will seriously consider it.

#### RESPONSES WILLIAM BUECHNER TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Questions 1.* Both your organization and the American Society of Civil Engineers propose raising the Federal gas tax to provide additional infrastructure investment. This hearing has made it clear that additional funding is necessary to improve the conditions and performance of our transportation system. As an economist can you elaborate on the economic benefits of increasing the level of investment in our highway, transit and rail infrastructures?

*Response.* There are a number of ways increased investment in transportation infrastructure would benefit the American economy.

*Jobs.*—According to the Federal Highway Administration, each \$1 billion of Federal investment in highways supports approximately 47,500 jobs throughout the U.S. economy. This includes onsite construction jobs, jobs in firms that provide products and services to highway contractors, jobs in Federal, State and local DOTs, and jobs induced in other parts of the economy as the resulting wage and salary income is spent for household goods and services. ARTBA has calculated that transportation construction annually supports more than 2.5 million jobs in the construction and supplier industries, and probably well over 4 million jobs when all of the induced jobs in other sectors of the economy are included. An increase in Federal investment in highway, transit and rail infrastructure would generate new jobs and help strengthen the recovery from the recent economic downturn. Standard and Poor's economists calculate that investment in infrastructure and defense procurement are the most stimulative forms of fiscal policy, including tax cuts.

*Productivity.*—The level of mobility provided by the U.S. transportation system to individuals and freight movements has a significant impact on the productivity and growth of the U.S. economy. Today, the nation's highways are its warehouse. During the 1980's and 1990's, the adoption of just-in-time delivery by manufacturing firms allowed billions of dollars of financial resources that had been tied up in inventories to be invested in more productive uses, which contributed to the strong growth of the economy during those decades. Growing congestion in the U.S., both urban and rural, however, impedes the use of just-in-time delivery. If firms are forced to protect their production schedules by warehousing inputs and products, this process

would be reversed, which would negatively affect productivity. Many service-producing industries also depend on mobility to get employees where they are needed. Time spent maneuvering employees through and around congestion is diverted from more productive uses and economic growth.

**Congestion costs.**—Congestion also costs households billions of dollars in wasted time and motor fuel, and impairs the quality of life. The annual report on Congestion in America by the Texas Transportation Institute documents the growing cost of congestion to American households. If the Federal highway program is funded at a level that fails to address congestion, the problem will continue to worsen during the next 6 years and the costs will continue to grow.

**International competitiveness.**—Improving the nation's transportation infrastructure and reducing transportation costs is critical to maintaining the nation's competitiveness in world markets. Other nations are well aware of this and have made significant improvements to their transportation systems to give their industries an edge. With the U.S. trade deficit growing each year, transportation investment becomes increasingly important to U.S. competitiveness, including investment in freight rail, water ports and intermodal connectors.

**Federal budget.**—As pointed out earlier, each \$1 billion of Federal investment in highways supports approximately 47,500 jobs. The average wage of highway construction workers is \$812 per week, according to the Bureau of Labor Statistics, or about \$42,000 per year. Workers in supplier industries, such as aggregates mining, asphalt and concrete production and equipment manufacturing, earn even more per year. Thus each \$1 billion of Federal highway investment supports almost \$2 billion of family earnings, and probably much more. According to the Fiscal Year 2002 Budget of the President of the United States, the marginal tax rate on earnings is about 27 percent, include both the personal income tax and both halves of the social security tax. This means \$1 billion of Federal highway investment generates about \$540 million of Federal income and social security tax receipts. The net budget cost of each \$1 billion of Federal highway program funding is thus less than \$500 million.

**Public health.**—Each year, there are more than 42,000 highway traffic fatalities. According to the National Highway Traffic Safety Administration, more than 15,000 of these fatalities involve poor road conditions or out-of-date highway alignments. In addition, more than 3,000,000 people are injured each year in highway crashes. The annual cost of motor vehicle crashes is over \$230 billion, including lost workplace and household productivity, medical costs and property damage. Many of the fatalities and costs could be avoided by improvements in highway infrastructure, such as improving shoulders, widening and straightening lanes, installing median barriers and guard rails, and installing traffic signs and signals. Increasing Federal highway investment would be a proven way to save American lives.

---

STATEMENT OF WILLIAM D. ANKNER, PH.D., DIRECTOR, RHODE ISLAND DEPARTMENT OF TRANSPORTATION

Thank you for the opportunity to submit this statement on an issue that has very serious implications for the quality of our highway infrastructure, and which I understand has already been discussed in previous hearings before this committee. I speak of the issue of truck size and weight and of the disproportionate amount of pavement and bridge damage caused by heavy trucks—and more specifically, of the huge increases in infrastructure damage we would experience if current truck size and weight limits are relaxed, as some are advocating.

Since 1996 I have had the honor of serving as Director of the Rhode Island Department of Transportation. I am also a past president of the Northeast Association of State Transportation Officials, a past member of the Executive Committee of the American Association of State Highway and Transportation Officials (AASHTO), and a member of the Transportation Research Board (TRB) Executive Committee.

I understand the compelling pressures at issue in the debate over truck sizes and weights, with some arguing forcefully that rapidly growing demand for freight transport necessitates legislation to permit the operation of longer and heavier trucks on our Interstate Highways.

While I appreciate the economic arguments for larger and heavier trucks, I could not disagree more strongly with the conclusion. While the advocates of lifting the current restrictions can cite studies, including a recent TRB report, which appear to support their arguments in favor of increased truck sizes and weights, other more authoritative studies and reports—and my own long experience—convince me that if anything, Congress should strengthen the existing limits.

The trucking industry has been masterful in shaping this issue. The incremental increases have been just enough for them to argue that their impact on safety and the infrastructure is similar to current conditions. The problem is that the total culmination of the increases poses a serious threat to safety and the infrastructure, particularly the aging and design-deficient infrastructure in the Northeast and Middle Atlantic States. Congress needs to examine this issue not solely on the basis of what these impacts are compared to current conditions, but where we have come from and where we want to go. In my judgment, the size and weight where we have come from has exceeded the structural and operational capacity of the highway system in Rhode Island. Similarly, I believe that longer and heavier trucks should not be our future in the Northeast.

There are three central reasons for maintaining or strengthening current Federal limits on truck size and weight: bigger trucks would cause massive increases in infrastructure damage, particularly to bridges; they do not fully pay for the damage they cause; and they would make our highways more dangerous both for motorists and for truck drivers.

Heavy trucks are already responsible for a disproportionate amount of pavement damage: at the current Federal limit of 80,000-pounds, a five-axle truck does as much damage as 9,600 cars. Adding weight to the same truck will sharply increase pavement damage: at 100,000 pounds the truck will do as much damage as 27,000 cars. (Calculations are based on AASHTO's Road Test.) Bigger trucks will also cause a massive increase in bridge costs. According to the 2000 US Department of Transportation Comprehensive Truck Size and Weight Study (US DOT Study), national operations of longer combination vehicles—long double and triple trailer trucks—would cost the country \$319 billion (\$53 billion in capital costs and \$266 billion in user delay costs). (US DOT Study, August 2000, Vol. III, p. VI-12.)

Even without building new highways, the US will need to spend \$1.132 trillion per year simply to maintain the condition of the current bridge and highway system. (US DOT, 1999 Status Report on the Nation's Highways, Bridges, and Transit, Exhibit 7-1, p. 7-5.) The infrastructure damage and new costs that would result from a weakening of current truck size and weight limits would add considerably to this already staggering figure.

In Rhode Island, 60 percent of our bridges are already structurally deficient or functionally obsolete. For fiscal year 2003, we are faced with \$110 million of bridge and highway restoration that we are unable to undertake. Most of my counterparts in other States are also suffering from a lack of funding to cover necessary road and bridge repairs.

Moreover, bigger trucks substantially underpay their share of highway costs, according to the Federal Highway Cost Allocation Study. For example, a five-axle truck registered at 80,000 pounds pays only 80 percent of its highway costs. Long double trailer trucks and triples pay 70 percent. Heavier trucks pay even less of their costs. For example, one 100,000-pound five-axle truck pays 40 percent of its costs. (2000 Addendum to the Federal Highway Cost Allocation Study, unpublished Table 3.)

In addition to these issues of infrastructure damage and cost underpayment, bigger trucks will be less safe.

In the Comprehensive Truck Size and Weight Study, USDOT compared the safety of multi-trailer trucks to single trailer trucks. It found that multi-trailer trucks "could be expected to experience an 11 percent higher overall fatal crash rate than single-trailer combinations." (p. VIII-5.) Heavier single trailer trucks will also be more dangerous. According to the University of Michigan Transportation Research Institute, there is a strong statistical link between higher weights and a greater risk of fatalities. (US DOT Study, Phase 1, Working Paper 1 & 2, 1995, p. 37.) One reason is that heavier singles will tend to have a higher center of gravity, making them more likely to roll over. (US DOT Study, p. VIII-8.)

For all of these reasons, I believe it is imperative that Congress retain jurisdiction over truck size and weight on the Federal System. Proponents of bigger trucks have asked for a "State option" plan whereby the States would be able to set their own truck size and weight limits on the most important part of the Federal system: the Interstate Highways. But any law regarding the national transportation system should have national oversight.

This State option ploy by the industry has been tried before. The trucking industry is only interested in a "State option" so that it can then come back and show how harmful States that have not increased size and weight are to the economy and interstate commerce, and unfair to the trucking industry that has invested 100's of millions of dollars in new equipment that they cannot optimally use. The industry will then call upon Congress to use the Interstate Commerce Clause to correct the

inequities and allow the bigger trucks. They did with doubles. They are trying to do it again.

Congress should reject any proposals to increase truck size and weight. But Congress should also take it one step further. There are loopholes in the current law that allow trucks to get longer and heavier, and weights on the National Highway System (NHS) are being ratcheted up. The Safe Highways and Infrastructure Preservation Act, H.R. 3132, which has been introduced in the House of Representatives, would put a stop to these backdoor increases. The bill would freeze truck size and weight limits on the National Highway System and close loopholes in the law that allow longer and heavier trucks. The Senate should consider a similar measure.

In Rhode Island as elsewhere in the Nation, highway users have grown all too accustomed to the delays and hazards that have become commonplace on our aging highway system. As the committee prepares to reauthorize the Transportation Equity Act for the 21st Century and to reinvest in maintaining and improving the highway infrastructure, I hope you will also maintain or strengthen the current, common sense limitations on truck size and weight.
