## Contacts

The *Fuel Oil and Kerosene Sales 1997* report is prepared by the Energy Information Administration (EIA) under the general direction of John Cook (202) 586-5214, Petroleum Division, Office of Oil and Gas.

Detailed, technical questions about tables referencing the form EIA-821 may be directed to:

Alice Lippert (202) 586-9600

### **Fuel Oil and Kerosene Data Available Through Electronic Access**

Annual petroleum marketing data are available through electronic access that contains statistics from the *Fuel Oil and Kerosene Sales 1997* report. Included are annual sales data on petroleum volumes of kerosene, distillate fuel oils, and residual fuel oils by State. Annual historical data at the national level are provided in summary tables.

For ***Fuel Oil and Kerosene Sales on the Internet***, access EIA's home page at <http://www.eia.doe.gov>.

# Introduction

The *Fuel Oil and Kerosene Sales 1997* report provides information, illustrations and State-level statistical data on end-use sales of kerosene; No. 1, No. 2, and No. 4 distillate fuel oil; and residual fuel oil. State-level kerosene sales include volumes for residential, commercial, industrial, farm, and all other uses. State-level distillate sales include volumes for residential, commercial, industrial, oil company, railroad, vessel bunkering, military, electric utility, farm, on-highway, off highway construction, and other uses. State-level residual fuel sales include volumes for commercial, industrial, oil company, vessel bunkering, military, electric utility, and other uses. The Petroleum Division, Office of Oil and Gas, Energy Information Administration ensures the accuracy, quality, and confidentiality of the published data in the *Fuel Oil and Kerosene Sales 1997*.

Except for the kerosene and on-highway diesel information, data presented in Tables 1 through 12 (Sales of Fuel Oil and Kerosene) present results of the EIA-821 survey. Tables 13 through 24 (Adjusted Sales of Fuel Oil and Kerosene) include volumes that are based on the EIA-821 survey but have been adjusted to equal the products supplied volumes published in the *Petroleum Supply Annual* (PSA).

Tables 1 through 12 contain sales estimates resulting from the EIA-821 survey for all categories except kerosene and on-highway diesel. For on-highway diesel the survey was not expected to yield valid statistics because the sampling frame does not include a comprehensive listing of all truck stops. Hence, State-level data obtained from the Federal Highway Administration were used instead.

Kerosene sales data were not expected to be complete because a comprehensive listing of kerosene retailers was not available to serve as a sampling frame. It was thought that a complete frame would be expensive to construct because many kerosene retailers are convenience stores or other small businesses. Because of these concerns, kerosene sales data have been published only after adjusting the sales data so that they add to the U.S. total of kerosene product supplied from the PSA.

In Tables 13 through 24, estimates of distillate fuel oil are adjusted at the Petroleum Administration for Defense (PAD) district level to equal published PSA volume estimates of products supplied. For certain sales

categories, data obtained from alternate sources are used instead of the adjusted numbers. See "Technical Note 3" in Appendix A for further explanation.

Kerosene and residual fuel oil in Tables 13 through 24 are adjusted at the national level to equal published PSA products supplied estimates. Historically, kerosene estimates have always been adjusted at the PAD district level. However, in 1992, certain kerosene estimates at the PAD district level resulted in negative numbers. Hence, the adjustment procedure was changed to display positive sales volumes of kerosene for all PAD districts. Thus the kerosene figures in Tables 13 through 24 are identical to those shown in Tables 1 through 12.

The sales data (Tables 1 through 12) differ from the adjusted sales estimates (Tables 13 through 24) with the exception of kerosene and on-highway diesel for many reasons, including:

- Some products are interchangeable (fungible) and may be supplied as one product and sold as another product. For example, kerosene, low-sulfur kerosene-type jet fuel, and low-sulfur No. 1 fuel oil can be used interchangeably.
- Products supplied into a PAD district may be blended prior to final sale. For example, residual fuel and No. 2 distillate may be blended and sold as No. 4 fuel oil or, in colder climates, kerosene may be blended with distillate fuel oil and sold as heating oil.
- Geographic differences can be attributed to the transportation of product by truck or rail from the district of production. Inter-PAD district movements of products by these modes of transportation are not accounted for in Tables 13 through 24.
- Products may be supplied into a PAD district but the final sale may cross PAD district boundaries. For example, a fuel oil dealer in Ohio (PAD District II) may make retail sales into Pennsylvania (PAD District IB) and/or West Virginia (PAD District IC).
- Drawdowns or buildups in stocks will cause volumes supplied to differ from sales volumes.

## Highlights

# Sales of Fuel Oil and Kerosene in 1997

Benefiting from the robust economic growth, demand for distillate fuel increased in 1997 for the sixth consecutive year. Although the winter of 1997 was warmer than the previous year, distillate sales increased by 1.8 percent. Sales of residual fuel oil gained in some areas of the country, but declined overall by 5.7 percent. The decline in demand for residual fuel oil points to a resumption of the downward trend in sales that has, with the exception of 1996, characterized sales of this fuel for the past several years.

Distillate sales dominated the fuel oil market, accounting for 80.1 percent of the total sales. Residual fuel oil sales accounted for 18.4 percent of the total. The remaining 1.5 percent consisted of sales of kerosene.

### Distillate Fuel Oil

Dominated by the transportation sector, distillate sales continued to increase in 1997 and reached an all-time high of 54.4 billion gallons. Sales increased 1.8 percent, nearly 1.0 billion gallons above the 1996 total.

The transportation sector continued to dominate distillate fuel oil sales accounting for more than half of total sales. In addition, the increase in sales of on-highway diesel accounted for more than 86 percent of the increases among those sectors where distillate sales went up. In large measure, the growth reflected continued overall economic strength of the country. Gross Domestic Product (GDP) increased by 3.8 percent in 1997.<sup>1</sup> The demand for durable goods increased even more, 8.1 percent.<sup>2</sup> Sales of on-highway distillate increased to keep pace with the increased flow of goods to markets and consumers.

Not all elements of the transportation sector fared so well. Sales of distillate fuel oil to railroads declined by 4.9 percent. Prolonged congestion on one major carrier and the resulting delivery problems not only contributed to the decline in distillate sales, but also impacted both the demand and prices for coal, residual fuel oil, and natural gas as well.

Weather in the form of the relatively mild winter, a wetter than normal situation in much of the farm belt,

<sup>2</sup>*Economic Indicators*, April 1998, Washington D.C. US Government Printing Office, p.12.

and other unusual conditions associated with the severity of the El Niño undermined much of the gain in distillate sales. Sales from the transportation sector and direct oil company markets increased by 1.9 billion gallons. However, the combined drop in sales from the residential, commercial, farm, electric utility, railroad, and military sectors amounted to nearly 1 billion gallons resulting in a net increase of just under 1 billion gallons in total distillate sales.

Distillate sales also benefited from lower prices. In particular, sales of vessel bunker fuel increased as a glut of distillate developed, principally in the Gulf Coast region. The glut developed as stock levels (already at their highest level in several years because of the mild winter) continued to build into the summer with an upsurge in summer gasoline demand of 2.4 percent compared to 1996.<sup>3</sup> Refinery production of distillate increased in part as a function of the increased demand for gasoline. In addition, a large East Coast refinery not in operation in 1996 reopened and returned to production in 1997.<sup>4</sup>

Oil company direct use of distillate fuel oil increased sharply as companies increased drilling activity. Prompted by higher crude oil and natural gas prices in the closing months of 1996 and first quarter of 1997,<sup>5</sup> the number of rotary rigs in operation climbed steadily through the first three-quarters of 1997, surging 21.1 percent.<sup>6</sup> Other than in PAD District I, the East Coast, where direct oil company use is essentially limited to refinery processing, direct oil company demand increased throughout the U.S.

The largest drop in distillate sales occurred in the residential sector where the impact of the relatively mild winter was the strongest. The drop in sales was most pronounced in the northeast portion of PAD District I (the East Coast) and in parts of PAD District II (the Midwest) where the market for home heating oil is concentrated. Distillate sales to the residential market dropped 4.7 percent in PAD District I and 12.1 percent in PAD District II.

Sales to the commercial sector were flat or declined generally throughout the country. The overall drop in commercial sales amounted to 8.0 percent. Led by the

solid gain in the demand for durable goods, distillate sales to the industrial sector increased by 0.9 percent. The modest increase developed despite a drop in distillate demand for heating purposes. Industrial sales generally increased in the mid-section of the country from the Gulf Coast northward through the Mississippi River Valley and west to the Rocky Mountains. However, sales fell in portions of PAD District I (the East Coast) as well as in PAD District V (the West Coast).

The impact of the slump in sales to the residential and commercial markets was exacerbated by two factors external to domestic markets. The mild winter was responsible for lower demand throughout the Atlantic Basin. As a result, sales of heating oil were flat or declined and stock levels built in Europe as well as in the U.S. In addition, the economic downturn in Asia began to have a negative impact on demand, particularly during the fourth quarter of 1997, further contributing to the high levels of stocks (particularly of high sulfur distillates).

Although the number of acres planted by farmers was essentially unchanged in 1997, the number of acres harvested increased slightly from the level in 1996.<sup>7</sup> Nonetheless distillate sales to the farm sector fell generally East of the Rocky Mountains. Increases occurred in the Western U.S. but were insufficient to offset declines elsewhere. Overall sales of distillate to the farm sector declined by 1.2 percent.

Wetter than normal weather in the farm belt delayed planting, and crops were ready for harvesting later than is typical. Warm and dry conditions at harvest time, enabled farmers to cut expenses by leaving crops in the ground even longer and reducing the need for crop drying typically required for such crops as corn and tobacco. As late as October, reports in trade press indicated that crop-drying requirements were only 20.0 percent of normal in some areas.<sup>8</sup> Sales of propane (the principal crop-drying fuel) fell and prices plunged as demand remained weak even with the onset of winter. Propane stocks built to their highest level in several years.<sup>9</sup>

<sup>9</sup>MER, June 1998, Table 3.9, p.67.

Distillate sales to the electric utility sector fell by 3.3 percent. Distillate sales to the military fell for the third consecutive year. The drop of 4.8 percent reflects a continuation of changing emphasis in military operations.

## Residual Fuel Oil

The downward trend in residual fuel oil sales, interrupted in 1996, resumed in 1997 with a drop of 5.7 percent. (This downward trend has resulted in a drop in sales of more than 40.0 percent since 1987.) Sales in most areas of the country and for most market segments declined. Only sales to the electric utility market increased during 1997.

Residual fuel oil sales to electric utilities increased overall along the East Coast by 5.3 percent. However, the increase was confined to the Northeast where continued outages of a number of large power plants, including several nuclear plants, resulted in a surge in residual fuel oil demand. Several older plants were refurbished prior to the onset of summer to help meet peak demand. Purchases of fuel oil by electric utilities increased as a result by some 30,000 barrels per day during the period from February through June as utilities built inventory for use in the summer.<sup>5</sup>

Utility demand in New England resulted in a gain of more than 470 million gallons, a 50.4 percent increase compared to the prior year. However, demand in the Mid-Atlantic region of PAD District I declined sharply in comparison to the level of 1996 while demand was essentially unchanged in the South Eastern region. As a result, the overall gain in PAD District I amounted to approximately 192 million gallons for the year.

The other exception to the general pattern of decline was the Gulf Coast region. Demand from electric utilities in the region more than doubled, increasing by nearly 140 million gallons or nearly 180.0 percent. Sales in the region increased in part as the result of hot summer weather, but in large measure as the result of

delays in deliveries of coal as the result of the congestion affecting one of the major rail carriers in the region.

Sales of residual fuel oil to the commercial, industrial, and military sectors all declined in 1997. Commercial sales fell in most regions of the country and overall dropped by 14.9 percent. Industrial sales fell in every region of the country and overall dropped by 9.1 percent. Sales were down throughout the country reflecting a slowdown in activity.

The most precipitous drop in residual fuel oil sales occurred in the vessel bunkering market in PAD District V, the West Coast. Sales plunged by 28.2 percent, more than 656 million gallons. Sales were eroded in large measure as the result of events in Asia. Low bunker prices in the Singapore market boosted sales there at the expense of the West Coast market.<sup>6</sup> In addition, during the last quarter of the year, the economic slump in Asia worsened and spread to countries outside Southeast Asia, contributing to the downturn in bunker sales in PAD District V.

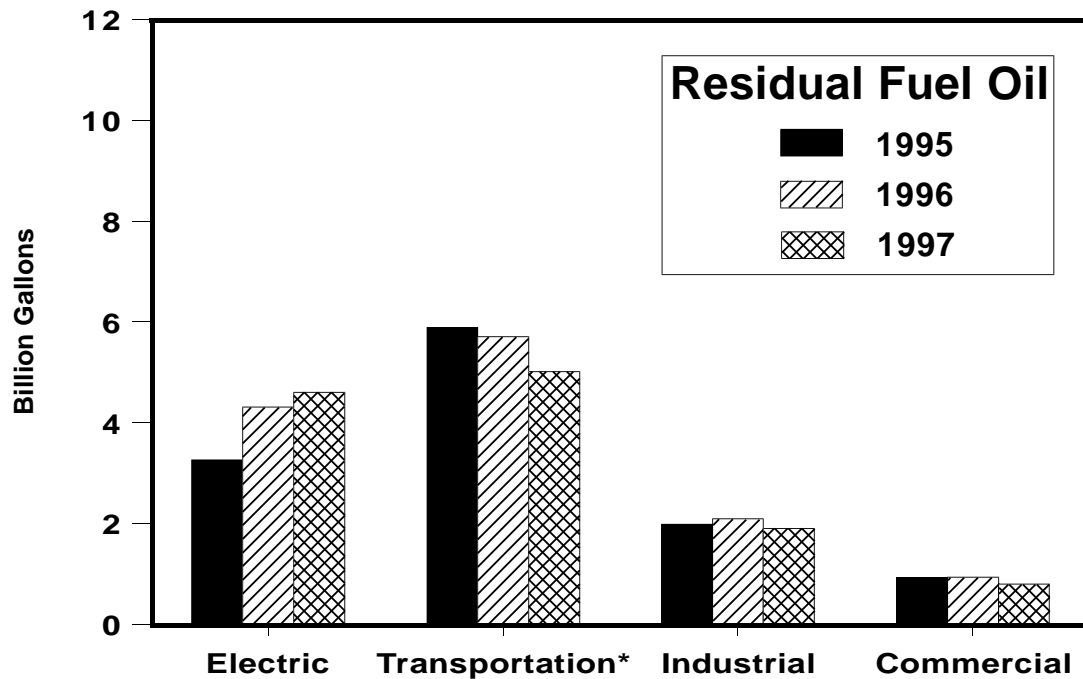

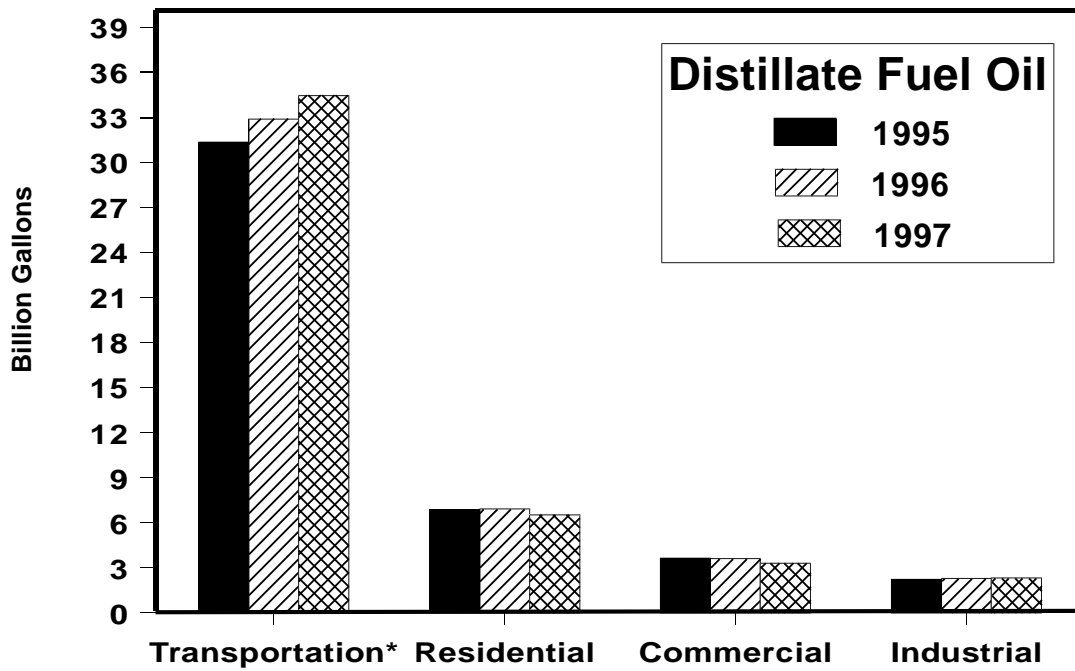

## Kerosene

Sales of kerosene increased 6.4 percent to exceed one billion gallons for the first time this decade. The kerosene market continued to be dominated by sales to residential consumers, which account for approximately two thirds of all kerosene sales. Reflecting the overall strength of the economy, kerosene sales to commercial and industrial sectors also increased by 17.2 percent and 8.2 percent respectively. The increases reflect the strength of the overall economy. Kerosene sales to the agricultural sector were down. Farm sales fell generally except in PAD District III, the Gulf Coast and in PAD District IV, the Rocky Mountain region.

<sup>E</sup> Estimated data.

Dashes (-) = No data reported.

Note: Totals may not equal sum of components due to independent rounding.

Sources: • Energy Information Administration Form EIA-821, "Annual Fuel Oil and Kerosene Sales Report," for 1996 and 1997.

• On-Highway Diesel data are derived from Federal Highway Administration statistics of highway special fuels use.

Sources: • Energy Information Administration Form EIA-821, "Annual Fuel Oil and Kerosene Sales Report," for 1997.

• Kerosene data are based on data from the Energy Information Administration's "Petroleum Supply Annual," Volume 1, 1997, (DOE/EIA-0340(97)/1).

# Adjusted Sales of Fuel Oil and Kerosene in 1997

The following tables contain estimates of distillate fuel oil that have been adjusted at the PAD district level to equal published EIA volume estimates of petroleum products supplied in the U.S. marketplace. The kerosene and residual fuel oil sales estimates have been adjusted at the national level. Historically, kerosene estimates have always been adjusted at the PAD district level.

The products supplied estimates can be found in the 1993 through 1997 issues of the *Petroleum Supply An-*

*nual*. For certain sales categories, data obtained from alternate sources are used instead of the adjusted numbers. See "Technical Note 3" in the Appendix for further explanation of data adjustments.

Total domestic adjusted sales of fuel oil and kerosene increased 0.3 percent from 65.7 billion gallons in 1996 to 65.9 billion gallons in 1997. While adjusted sales of distillate increased 1.8 percent in 1997, residual fuel oil dropped 6.8 percent. Kerosene adjusted sales increased by 6.4 percent.

## **Technical Notes**

## Technical Notes

### Note 1: EIA-821: Annual Fuel Oil and Kerosene Sales Report, 1997

#### Background

The EIA-821, "Annual Fuel Oil and Kerosene Sales Report" survey was implemented to meet Energy Information Administration (EIA) legislative mandates and data user needs. Form EIA-821 is used to gather data on the sales to end users of distillate fuel oil, residual fuel oil, and kerosene. The data are used to determine the level of demand by end-use category and product at the State, regional, and national levels. This mandatory report is authorized by the Federal Energy Administration Act of 1974 (P. L. 93-275).

The predecessor survey to the EIA-821 was the EIA-172, "Sales Report of Fuel Oil and Kerosene" survey. The EIA-172 was conducted for reference years 1979 through 1982. Due to a serious deterioration in the sample of respondents during the 4-year period, the Form EIA-172 data were not collected for 1983. Instead, estimates for 1983 were published and a new sample of respondents was designed and selected from an improved sampling frame. The EIA-821 survey commenced with reference year 1984.

#### Discussion of Sampling Frame

The target population for the fuel oil and kerosene sales survey is the universe of companies that sell fuel oil and kerosene to end users.

The EIA-863 data base provided the sampling frame for the EIA-821 survey. The EIA-863, "Petroleum Product Sales Identification Survey," was mailed to approximately 30,000 companies in January 1995 to collect 1994 State-level sales volume data for No. 2 distillate, residual fuel, motor gasoline, and propane. Companies also indicated if they sold kerosene. The No. 2 distillate data were further identified by residential and nonresidential end use, and non-end-use sales; the residual data were identified by end use and non-end-use; motor gasoline was identified by end use and non-end use and by conventional and oxygenated and/or reformulated; and propane was identified by residential, nonresidential, and non-end-use sales. The mailing list for the EIA-863 survey was con-

structed by merging and unduplicating the 1991 frame file and more than 50 State and commercial lists. In addition, company/State-level volumes for distillate fuel, residual fuel, motor gasoline, and propane from the 1994 EIA-821 survey were merged with the EIA-863 to yield a combined data file. The transformed and edited version of the frame was then used to design and select the 1995 EIA-821 sample.

It should be noted that truck stops selling No. 2 diesel fuel were not specifically included in the EIA-863 survey. Therefore, the EIA-821 survey does not include all sales of No. 2 distillate through retail truck stops. However, to compensate for this shortage in coverage, data from the Federal Highway Administration are presented in the tables for on-highway diesel sales.

The sampling frame also lacked full coverage of kerosene retailers, many of whom are hardware stores and service stations. To account for all kerosene volumes supplied to the marketplace, aggregate reported kerosene volumes are set equal to the products supplied volumes published in the *Petroleum Supply Annual*.

#### Discussion of the Sample Design

The purpose of the EIA-821 sample design was to produce State-level estimates of total sales for the following five target variables: (1) residential No. 2 distillate, (2) other retail No. 2 distillate, (3) wholesale No. 2 distillate, (4) retail residual, and (5) wholesale residual. A separate sample was initially designed for each target variable.

Companies were divided into two basic types of strata: certainty and noncertainty. Companies selected with certainty were:

- all refiners and gas plant operators
- companies doing business in four or more States
- companies accounting for 5 percent or more of the distillate or residual fuel oil volume for any target variable or particular end-use category sold in a State.
- companies accounting for 5 percent or more of the kerosene volume sold in a State in an earlier EIA-821 survey.

- augmented frame units, e.g., vessel bunkering, for which no attribute data were available.

Firms determined not to be selling distillate or residual fuel oil or kerosene were removed from the frame file. Volumes for nonrespondents to the EIA-863 who had reported in the previous frame survey or in a sample survey were imputed. The imputed nonrespondents and the noncertainty companies were stratified by sales volume for each target variable. Strata boundaries were determined using the Dalenius-Hodges procedures, allowing the number of strata and the strata boundaries to vary by State. Nonrespondents for whom no previous information was available were classified in a separate stratum and sampled with reduced probabilities of selection.

Neyman allocation was used to allocate the number of companies required for each strata to obtain the required levels of accuracy: a 2.5 percent coefficient of variation for residual fuel oil and a 5 percent coefficient of variation for distillate fuel oil. Sample selections were then performed simultaneously from the same random list for the five samples to produce a final linked sample of approximately 4,700 companies. This method reduced the total survey sample size while improving volume estimates. Selected companies were asked to report sales by end-use categories for distillate and residual fuel oil and kerosene.

## Imputation and Estimation

Survey data gathered from the respondents may contain incomplete reporting, total nonresponse, or values that fail editing. Missing data are estimated, or implicitly imputed for, using the strata means and treated the same as reported data. The weighted estimate is defined as follows:

$$\hat{V} = \sum_h N_h \left( \sum_i W_{hi} V_{hi} / \sum_i W_{hi} \right)$$

where:

- $\hat{V}$  = total estimated volume
- $\sum_h$  = denotes summation over strata
- $N_h$  = stratum population for stratum h
- $\sum_i$  = denotes summation over units within stratum h
- $V_{hi}$  = volume reported for unit i in stratum h
- $W_{hi}$  = weight attached to unit i in stratum h.

where:  $W_{hi}$  is inversely proportional to the probability of inclusion in the linked sample.

The degree of imputation by product and end use at the U.S. total level ranged as follows for the 1997 EIA-821 data: distillate, 1.1 percent for railroad use to 17.1 percent for off-highway use; residual fuel oil, 0.0 percent for all other uses to 1.2 percent for commercial use; and kerosene, 0.6 percent for all other uses to 2.8 percent for residential use.

## Collection Methods

The EIA-821 form was mailed in January 1998 to all companies selected for participation in the 1997 reference year survey. The completed form was due to EIA on March 2, 1998. A second request was sent by certified mail to nonrespondents approximately 1 month after the filing deadline. Follow-up telephone calls were made to collect outstanding data and to verify reported data. Late submissions and resubmissions were processed when received.

## Data Processing

As EIA-821 forms were received, they were logged into an automated Survey Control File that maintains company identification and survey form status information for each company selected to participate in the survey. The data were reviewed manually, entered onto the computer files, and then processed through an automated edit program which detected missing data and outlying values. Data that failed the edits were resolved through telephone calls to the data reporters and corrections were entered onto the computer files. Preliminary estimates were generated and processed through a series of validation procedures to flag and rectify potential misreporting of data. Statistical reports, including publication tables, were produced using only acceptable and verified data.

## Note 2: Reliability of the Data

Two types of errors are associated with data produced from a sample survey—sampling errors and nonsampling errors. Sampling errors occur because the estimates are based on a sample rather than on a census. The particular sample used for the EIA-821 survey is one of a large number of samples of equal size which could have been selected from the sampling frame using the same sample design. Each of these samples would produce a different estimate. If the estimates were averaged over all possible samples, the result would be the same as the estimate derived from a census of the sampling frame. The sampling error is a measure of variability among the estimates from all possible samples and, thus, is a measure of the preci-

sion with which an estimate from a particular sample approximates the results of a census.

Nonsampling errors and possibly biases can arise from a number of sources: (1) inability to obtain information about all cases in the sample, (2) response errors, (3) differences in the interpretation of questions or definitions, (4) mistakes in recording or coding of the data obtained, and (5) other errors of collection, response, coverage, and estimation for missing data. Bias is the difference between the average of the estimates over all possible samples of the same size and design, and the true value being estimated. It is not possible to estimate bias using the results of one sample.

Data obtained from alternate sources are not subject to sampling errors, but may be subject to nonsampling errors, the magnitudes of which are unknown. Nonsampling errors for survey estimates and estimates adjusted to alternate sources cannot be determined, but attempts are made throughout survey processing to minimize this type of error.

Data in Tables 1 through 12 are based on survey data which are subject to sampling errors. Coefficients of variation, which are estimates of sampling errors, are presented for the retail target variables in the following table for the 1995 survey. The coefficients of variation (CV) were estimated by:

$$C V(\hat{V}) = \frac{\sqrt{V A R(\hat{V})}}{\hat{V}}$$

where:

$$V A R(\hat{V}) = \sum_h n_h \left( 1 - \frac{n_h}{N_h} \right) S_h^2$$

$$S_h^2 = \frac{\sum_{i=1}^{n_h} W_i^2 V_i^2 + \bar{V}_h^2 \sum_{i=1}^{n_h} W_i^2 - 2 \bar{V}_h \sum_{i=1}^{n_h} W_i^2 V_i}{n_h - 1}$$

$$\bar{V}_h = \frac{\sum_{i=1}^{n_h} W_i V_i}{\sum_{i=1}^{n_h} W_i}$$

$\hat{V}$  = total estimated volume,

$N_h$  = stratum population for stratum h,

$n_h$  = number of sample units in stratum h,

$V_i$  = volume for unit i,

$W_i$  = weight for unit i.

Response rates also offer some indication of the reliability and comprehensiveness of survey results. For the 1997 EIA-821 survey, the overall response rate (the number of submissions received, divided by the number of submissions solicited and expected, times 100) was 92.8 percent.

## Note 3: Data Adjustments

### Alternate Source Data

After all preliminary tabulations were verified, comparisons were made between the survey results and available alternate source data. The following end-use categories were replaced by alternate source data at the U.S., Petroleum Administration for Defense (PAD) district, or State level:

#### Tables 1 through 12:

**On-Highway Diesel.** Distillate fuel oil by State was calculated from the Federal Highway Administration data on highway use of special fuels. Of the 1993 through 1997 special fuels, more than 98 percent is diesel.

#### Tables 13 through 24:

**Electric Utility.** National-level distillate and residual fuel oil sales for electric utility use were calculated from annual aggregations of data collected on forms EIA-759, "Monthly Power Plant Report," and FERC-423, "Monthly Report of Cost and Quality of Fuels for Electric Plants." Form EIA-759 consumption data for light oils include No. 2 fuel oil, kerosene, and jet fuel; the heavy oils include No. 4 fuel oil, residual fuel oil, and crude oil. Using receipt data from Form FERC-423, the No. 4 fuel oil receipts were deleted from the heavy oil consumption data and added to the light oil consumption data. The resultant distillate (light oils) and residual (heavy oils) consumption data were added to the stock change of light oils and heavy oils, respectively, from Form EIA-759 to obtain the estimate of sales. Allocations at the State level were based on the EIA-821 survey.

**On-Highway Diesel.** Distillate fuel oil by State was calculated from the Federal Highway Administration data on highway use of special fuels. Of the 1993 through 1997 special fuels, more than 98 percent is diesel.

### 1993 through 1997 Adjustments

Kerosene volumes in Tables 1 through 24 are adjusted at the national level to equal products supplied volumes as published in the "Detailed Statistics" section

of the *Petroleum Supply Annual* (PSA). The 1997 survey resulted in 737,581 thousand gallons of kerosene at the national level. The products supplied volume at the national level for kerosene was 1,009,932 thousand gallons. Hence, the adjustment factor at the national level for 1997 was 1.37.

Volumes of distillate fuel oil in Tables 13 through 24 were adjusted at the PAD district level to equal products supplied volumes. The adjustment factors at the PAD district level for 1997 are as follows:

#### Distillate Fuel Oil

- PAD District I: 1.00
- PAD District II: 1.02
- PAD District III: .69
- PAD District IV: 1.28
- PAD District V: .76

For Tables 13 through 24, total sales at the PAD district level equal the products supplied volumes as reported in the PSA, 1993 through 1997. For example, the 1997 survey yielded a volume for distillate residential use in PAD District II of 794,206 thousand gallons. The total distillate volume for PAD District II was 6,339,992 from the survey, after subtracting the volume coming from alternate sources. The product supplied total distillate volume for PAD District II was 6,481,920 after removing alternate source volume. Hence, the adjusted 1997 estimate of distillate for residential use in PAD District II was  $(6,481,920/6,339,992) \times 794,206 = 811,985$ .

For distillate fuel oil in Tables 13 through 24, the PAD district adjustments were made to each State and product-use category except on-highway diesel use, and electric utility use.

Volumes of residual fuel oil in Tables 13 through 24 were adjusted at the national level to equal the products supplied estimate. The 1997 survey yielded 12,504,135 thousand gallons of residual fuel oil, while the products supplied volume at the national level was 12,213,390 thousand gallons. Thus, the adjustment factor at the national level for 1997 was .96, after subtracting the volumes coming from alternate sources. For residual fuel oil, the adjustments were made to each State and end-use category except electric utility use.

## Note 4: End-Use Descriptions and Petroleum Product Definitions

### End-Use Descriptions

**Residential Use.** Includes sales for use in private households for space heating, water heating, cooking, etc. Sales to farm houses are reported under "Farm Use."

**Commercial Use.** Includes sales for use in non-manufacturing establishments such as motels, apartment buildings, restaurants, retail stores, institutions, government buildings, schools, and laundries for space heating, water heating, and cooking.

**Industrial Use.** Includes sales to mines, smelters, and plants engaged in producing manufactured products, processing and assembling goods, etc. Also includes space heating. Excludes oil company use, as defined below.

**Oil Company Use.** Includes sales to drilling companies, pipelines or other related oil companies not engaged in the selling of petroleum products. Includes fuel oil that was purchased or produced and used by company facilities for the operation of drilling equipment, other field or refinery operations, and space heating at petroleum refineries, pipeline companies, and oil-drilling companies. Oil used to bunker vessels is counted under vessel bunkering. Sales to other oil companies for field use are included, but sales for use as refinery charging stocks are excluded.

**Farm Use.** Includes sales for use in tractors, irrigation pumps and other agricultural machinery, as well as that used for crop drying, smudge pot fuel, space heating of buildings (including farm houses), cooking, and any other use by the agriculture industry.

**Electric Utility Companies.** Includes sales to electric utility companies, including that used for the generation of electricity. Volumes imported and used directly by electric utility companies are also included.

**Railroad Use.** Includes sales to railroads, for any use, including that used for heating buildings operated by railroads.

**Vessel Bunkering.** Includes sales for the fueling of commercial or private boats, such as pleasure craft, fishing boats, tugboats, and ocean-going vessels, including vessels operated by oil companies. Excluded are volumes sold to the U.S. Armed Forces.

**On-Highway Diesel Use.** Includes sales for use in motor vehicles. Volumes used by companies in the marketing and distribution of petroleum products are also included.

**Military Use.** Includes sales to the Armed Forces, including volumes sold to the Defense Fuel Supply Center (DFSC) for use by all branches of the Department of Defense (DOD).

**Off-Highway Use.** Includes sales for use in:

1. **Construction.** Construction equipment including earthmoving equipment, cranes, stationary generators, air compressors, etc.
2. **Other.** Sales for off-highway uses other than construction. Sales for logging are included in this category. Volumes for off-highway use by the agriculture industry are reported under "Farm Use."

**All Other Uses.** Sales for all other uses not included in any other end-use category are reported here.

### Definitions of Petroleum Products and Other Related Terms

**ASTM.** The acronym for the American Society for Testing and Materials.

**Distillate Fuel Oil.** A general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation. Included are products known as No. 1, No. 2, and No. 4 fuel oils and No. 1, No. 2, and No. 4 diesel fuels.

1. **No. 1 Distillate.** A petroleum distillate which meets the specifications for No. 1 heating or fuel oil as defined in ASTM D 396 and/or the specifications for No. 1 diesel fuel as defined in ASTM Specification D 975.
  - a. **No. 1 Diesel Fuel.** A volatile distillate fuel oil with a boiling range between 300 and 575 degrees Fahrenheit and used in high-speed diesel engines generally operated under wide variations in speed and load. Includes type C-B diesel fuel used for city buses and similar operations. Properties are defined in ASTM Specification D 975.
  - b. **No. 1 Fuel Oil.** A light distillate fuel oil intended for use in vaporizing pot-type burn-

ers. ASTM Specification D 396 specifies for this grade maximum distillation temperatures of 400 degrees Fahrenheit at the 10-percent point and 550 degrees Fahrenheit at the 90-percent point, and kinematic viscosities between 1.4 and 2.2 centistokes at 100 degrees Fahrenheit.

2. **No. 2 Distillate.** A petroleum distillate which meets the specifications for No. 2 heating oil or fuel oil as defined in ASTM D 396 and/or the specifications for No. 2 diesel fuel as defined in ASTM Specification D 975.

a. **No. 2 Diesel Fuel.** A gas oil type distillate of lower volatility with distillation temperatures at the 90-percent point between 540 and 640 degrees Fahrenheit for use in high speed diesel engines generally operated under uniform speed and load conditions. Includes Type R-R diesel fuel used for railroad locomotive engines, and Type T-T for diesel-engine trucks. Properties are defined in ASTM Specification D 975.

(1) **No. 2 Diesel  $\leq$  .05% Sulfur.** The sulfur level does not exceed 0.05 percent by weight.

(2) **No. 2 Diesel  $>$  .05% Sulfur.** The sulfur level is above 0.05 percent by weight.

b. **No. 2 Fuel Oil.** A distillate fuel oil for use in atomizing type burners for domestic heating or for moderate capacity commercial-industrial burner units. ASTM Specification D 396 specifies for this grade distillation temperatures at the 90-percent point between 540 and 640 degrees Fahrenheit, and kinematic viscosities between 2.0 and 3.6 centistokes at 100 degrees Fahrenheit.

3. **No. 4 Fuel.** A fuel oil for commercial burner installations not equipped for preheating facilities. It is used extensively in industrial plants. This grade is a blend of distillate fuel oil and residual fuel oil stocks that conforms to ASTM Specification D 396 or Federal Specification VV-F-815C; its kinematic viscosity is between 5.8 and 26.4 centistokes at 100 degrees Fahrenheit. Also included is No. 4-D, a fuel oil for low- and medium-speed diesel engines that conforms to ASTM Specification D 975.

**NOTE:** Respondents to the EIA-821 survey were instructed to report all volumes in accordance with what the product was sold as, regardless of the actual specifications of that product. For example, if a No. 2 distillate was

sold as a heating oil or fuel oil, the volume would be reported in the category "No. 2 Fuel Oil" even if the product conformed to the higher specifications of a diesel fuel.

**Kerosene.** A petroleum distillate that boils at a temperature between 300 and 550 degrees Fahrenheit, that has a flash point higher than 100 degrees Fahrenheit by ASTM Method D 56, that has a gravity range from 40 to 46 degrees API, and that has a burning point in the range of 150 degrees to 175 degrees Fahrenheit. Included are the two classifications recognized by ASTM Specification D 3699: No. 1-K and No. 2-K, and all grades of kerosene called range or stove oil which have properties similar to No. 1 fuel oil, but with a gravity of about 43 degrees API and a maximum end-point of 625 degrees Fahrenheit. Kerosene is used in space heaters, cook stoves, and water heaters and is suitable for use as an illuminant when burned in wick lamps.

**PAD District.** Petroleum Administration for Defense Districts

#### **PAD District I:**

**Subdistrict IA.** Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont

**Subdistrict IB.** Delaware, District of Columbia, Maryland, New Jersey, New York, and Pennsylvania

**Subdistrict IC.** Florida, Georgia, North Carolina, South Carolina, Virginia, and West Virginia

#### **PAD District II:**

Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, Ohio, Oklahoma, Tennessee, and Wisconsin

#### **PAD District III:**

Alabama, Arkansas, Louisiana, Mississippi, New Mexico, and Texas

#### **PAD District IV:**

Colorado, Idaho, Montana, Utah, and Wyoming

#### **PAD District V:**

Alaska, Arizona, California, Hawaii, Nevada, Oregon, and Washington

**Residual Fuel Oils.** The topped crude of refinery operations, which includes No. 5 and No. 6 fuel oils, as defined in ASTM Specification D 396 and Federal Specification, VV-F-815C; Navy Special fuel oil as defined in Military Specification MIL-F-859E including Amendment 2 (NATO symbol F-77); and Bunker

C fuel oil. Residual fuel oil is used for the production of electric power, space heating, vessel bunkering, and various industrial purposes.

**United States.** The 50 States and the District of Columbia.
