The NASA STI Program Office ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA's counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- CONTRACTOR REPORT. Scientific and technical findings by NASA-sponsored contractors and grantees.

- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.
- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.
- TECHNICAL TRANSLATION. English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

BOREAS RSS-3 Atmospheric Measurements from a Helicopter-Mounted Sunphotometer

Charles L. Walthall, Sara Loechel, Rangasayi Halthore

Summary

The BOREAS RSS-3 team collected and processed helicopter-based measurements of atmospheric conditions to estimates of aerosol optical thickness and atmospheric water vapor. The automatic sun-tracking photometer for helicopters was deployed during all three 1994 IFCs at numerous tower and auxiliary sites in both the NSA and the SSA. Six spectral channels (440, 540, 613, 670, 870, and 1030 nm) were chosen to span the visible and NIR wavelengths and to avoid gaseous absorption. One additional channel, 940 nm, was selected to measure the water column abundance above the helicopter platform. The data are stored in tabular ASCII files.

Note: An extensive helicopter log (in Acrobat format) is available for the 1994 IFC's. Environmental, technical, instrumental, and operational conditions are noted for each observation where applicable. It is strongly recommended that any researcher doing extended work with this data set review this helicopter log.

1. Data Set Overview

1.1 Data Set Identification

BOREAS RSS-03 Atmospheric Measurements from a Helicopter-Mounted Sunphotometer

1.2 Data Set Introduction

The Remote Sensing Science (RSS)-03 helicopter-based optical depth measurements are used to perform atmospheric corrections to radiance to obtain at-ground reflectance estimates from the helicopter-mounted radiometers. Sunphotometer measurements were taken from a helicopter platform at BOReal Ecosystem-Atmosphere Study (BOREAS) forested tower and auxiliary sites simultaneously

with radiometric ground measurements from the same platform. The instrumentation used was designed and developed at National Aeronautics and Space Administration's (NASA) Goddard Space Flight Center (GSFC). The data were collected during the green-up, peak, and senescent stages of the growing season at numerous tower and auxiliary sites in both the Northern Study Area (NSA) and the Southern Study Area (SSA). The data derived from the sunphotometer cover the three Intensive Field Campaigns (IFCs) in 1994:

- 31-May 10-Jun (IFC-1)
- 21-Jul 08-Aug (IFC-2)
- 06-Sep 16-Sep (IFC-3)

1.3 Objective/Purpose

The objective was to acquire atmospheric optical depth data of the study sites for assessments of spectral, spatial, and temporal variability of atmospheric aerosols and water vapor, and assessments of the impacts of these variability's on atmospheric correction of surface reflectance and vegetation indices. A helicopter with a pointable, stabilized mount was used to carry a spectrometer (visible and near-infrared (NIR)), a spectroradiometer, an infrared thermometer, and a video camera. The automatic sun-tracking photometer for helicopters (ASTPH) was deployed to provide data for calculations of irradiance for atmospheric correction of the other sensors.

1.4 Summary of Parameters

Helicopter-based, optical depth measurements during all three IFCs in 1994 at tower and auxiliary sites. Aerosol optical depths (ranging from 440 to 1030 nm) and atmospheric water vapor are reported.

1.5 Discussion

These measurements were collected as part of the effort to evaluate models that estimate surface biophysical characteristics from remotely measured optical signatures.

Successful use of a helicopter-mounted sunphotometer is demonstrated. Due to the rapid response time of the silicon detector and the associated electronics, the passage of the rotor blade is a nuisance that can be removed during data analysis. Sufficiently accurate values of the aerosol optical thickness are obtained in all channels. Variability in the measured voltages translates directly to variability in derived aerosol optical thickness.

The addition of an onboard automatic sun-tracking sunphotometer system has made the helicopter optical remote sensing system a self-contained mobile unit that can be used to acquire calibrated remote measurements of surface parameters. Initial experience with this system shows that accurate and reliable measurements of surface irradiance, surface reflectance, and temperature can be made in remote areas where surface access is difficult or impractical.

3. Theory of Measurements

Radiation striking a vegetative canopy interacts with individual phytoelements (leaves, stems, branches) and the underlying substrate. The interaction depends on light quality, radiative form (direct or diffuse), illumination incidence angle, vegetative component optical properties, and canopy architecture. Radiation is reflected, transmitted, or absorbed.

Reflected radiation measurements were converted to radiances and reflectance factor values. The

reflectance factor is the ratio of the target reflected radiant flux to an ideal radiant flux reflected by a Lambertian standard surface irradiated in exactly the same way as the target. Reflected radiation from a field reference panel corrected for nonperfect reflectance and sun angle was used as an estimate of the ideal Lambertian standard surface (Walter-Shea and Biehl, 1990).

The BOREAS RSS-03 helicopter missions were designed to provide a rapid means of intensive spectral characterization of sites and to provide an intermediate scale of sampling between the surface measurements and the higher altitude aircraft and spacecraft multispectral imaging devices. The instruments onboard the helicopter were chosen to provide compatibility with surface-based radiometers and Thematic Mapper (TM) spaceborne sensors.

The RSS-03 helicopter-based optical depth measurements are used to perform atmospheric corrections to radiance to obtain at-ground reflectance estimates from the helicopter-mounted radiometers. The addition of an onboard automatic sun-tracking sunphotometer system has made the helicopter optical remote sensing system a self-contained mobile unit that can be used to acquire calibrated remote measurements of surface parameters. Initial experience with this system shows that accurate and reliable measurements of surface irradiance, surface reflectance, and temperature can be made in remote areas where surface access is difficult or impractical.

4. Equipment

4.1 Sensor/Instrument Description

The primary instruments for the BOREAS RSS-03 deployment were the SE-590, a Barnes Modular Multiband Radiometer (MMR), a color charge-coupled device (CCD)-based video camera, and a sun-tracking photometer.

Design, development, and fabrication of the automatic sun-tracking photometer for use with the helicopter took place during the year prior to the 1994 BOREAS field season. This activity was overseen by the Principal Investigator (PI). The principal design, software development, and management were performed by Mr. Greg Elman (Science Systems and Applications, Inc. (SSAI)). The engineering expertise of Mr. Max Strange, who had a major role in the development of the airborne tracking sunphotometer used on the NASA C-130 fixed-wing aircraft, was an important part of the system development. Dr. Steven Chan (SSAI), Ms. Needa Walsh (SSAI), and Mr. David Rosten (Ressler Assoc.) contributed software expertise, optics design, and bench-testing. Mr. John Schafer (SSAI) contributed to the system fabrication and provided hardware support in the field. Mr. Moon Kim (Univ. of Maryland) provided software support in the field.

The automatic sun-tracking photometer consists of an optical head containing the sensors for the eight spectral channels and a quad-detector, which is used for tracking the sun. The field of view (FOV) on the data channels is 2 degrees, while the FOV on the quad-detector is 30 degrees. The optical head is mounted on a motorized mount with azimuth and zenith axes. An off-the-shelf mount from Aerotech Corporation was used for time and cost savings. The entire optical sensor unit is mounted on the roof of the helicopter cabin on the starboard side, directly above the primary instrument operator. Data and control cables are fed down through a port in the helicopter cabin roof to the rear of the center instrument rack. The length of the cables and the location of the sunphotometer with respect to the helicopter main rotor mast create a zone of azimuthal occlusion. The usable azimuth range is roughly 0 to 150 degrees on the starboard side of the aircraft, with 0 degrees being the direction of the aircraft nose.

The two-axis mount controls are handled by a controller with electronics that are isolated from the data collection system. Operator inputs for moving the mount in both the azimuthal and vertical directions are via a joystick. Both the detector system and the mount controller system are located in the center equipment rack. The laptop computer used for data logging is mounted on a small shelf in the center rack.

Analog voltages from the detectors are sent to a circuit that performs the analog-to-digital (A/D) conversion and performs the quad-detector operations for solar tracking. The digital data streams from this device are then sent to the port of a 486-based PC laptop computer. Data logging and real-time readout of sensor voltages are accomplished with a DOS Windows version of Labtech software. An

LED readout is positioned on the front panel of the sensor system box with a rotary switch for selection of the detector channel to be displayed there. The temperature of the detector assembly is also recorded with the detector data.

Sampling rate considerations were key issues in the design of the instrument. A major problem of mounting a sunphotometer on a helicopter is that the system must acquire data and stay locked on the solar disk while viewing between the moving rotor blades. Reduction of irradiance beneath moving rotor blades can be considerable. A sampling rate programmable up to 333 ks/sec can be obtained, but was not necessary with the rotor blade frequency of 9 Hz for a complete rotation (18 Hz for blade-to-blade rotation). The sampling of the solar irradiance through the main rotor blades was fast enough to plot the chopping motion of the blades. A filtering procedure was used to separate the higher, unobstructed data from the sun from chopper-interfered signal.

The band centers chosen for 7 of the possible 10 channels of the system were 0.440, 0.540, 0.613, 0.670, 0.870, 0.940, and 1.030 µm. Each spectral band was approximately 0.10 µm wide. These bands were chosen because of their compatibility with the spectral channels of the Cimel surface-based supphotometers being used by other BOREAS teams at various sites within the BOREAS study areas.

Computer control of the instruments provides precise, automatic control and ensures proper timing of data collection. The radiometric instruments are configured such that all sensors except the photographic camera can be triggered near-simultaneously with a single computer keyboard keystroke. The command sent from the keyboard is first sent to the SE-590, then to the A/D systems. Raw data from each of the instruments are displayed via graphics and tabular listings on the main computer screen immediately after scanning.

4.1.1 Collection Environment

In general, the helicopter was flown during relatively clear days when possible. Data collection was attempted during conditions of highest possible solar elevation. All observations were attempted from a nadir observation point and usually at 300 m above ground level (AGL). Exceptions are noted in the helicopter log.

4.1.2 Source/Platform

A Bell UH-1H "Iroquois" helicopter, operated by NASA's Wallops Flight Facility (WFF), was used as the airborne platform during BOREAS. This particular aircraft, call number N415, was built in 1965 and was acquired by WFF in 1993. Upon acquisition, the aircraft was slightly modified for use as a scientific platform.

Helicopter N415 operates with standard or low-mount, rear-leaning skids. The engine is a Lycoming T53/L13, which provides 1,400 shaft HP with 1,290 transmission HP. The fuel capacity provides 2.0 hours of flying time with a 20-minute fuel reserve under normal modes of operation. The addition of an auxiliary fuel tank in the port-side door crewman's position provided an additional 15 minutes of flight time during BOREAS given optimum flight conditions. The weight of the entire helicopter system with full instrumentation, full fuel, and crew members was 9,500 lbs.

4.1.3 Source/Platform Mission Objectives

One solution for atmospheric correction and calibration of remotely sensed data from airborne platforms is the use of radiometrically calibrated instruments, sunphotometers, and an atmospheric radiative transfer model. Sunphotometers are used to measure the direct solar irradiance at the level at which they are operating and the data are used in the computation of atmospheric optical depth. Atmospheric optical depth is an input to atmospheric correction algorithms that convert at-sensor radiance to required surface properties such as reflectance and temperature. Airborne sunphotometry has thus far seen limited use and has not been used before with a helicopter platform. The addition of the sunphotometer to the helicopter system adds another tool for monitoring the environment and makes the helicopter remote sensing system capable of collecting calibrated, atmospherically corrected data independent of the need for measurements from other systems.

Although the primary motivation for development of the helicopter automatic sun-tracking photometer was to provide data for calibration and correction of remotely sensed measurements, the

system is also useful for the acquisition of measurements in support of atmospheric research. Optical thickness as a function of height in the boundary layer, which an airborne sunphotometer easily provides, is necessary to better understand vertical aerosol distributions.

4.1.4 Key Variables

Aerosol optical thickness and atmospheric water vapor.

4.1.5 Principles of Operation

Computer control of the instruments provides precise, automatic control and ensures proper timing of data collection. The radiometric instruments are configured such that all sensors except the photographic camera can be triggered near-simultaneously with a single computer keyboard keystroke. The command sent from the keyboard is first sent to the SE-590, then to the A/D systems. Raw data from each of the instruments are displayed via graphics and tabular listings on the main computer screen immediately after scanning.

The system is configured for multiple sensor data collection. The MMR, SE-590, infrared thermometer, auto-tracking sunphotometer, and video sensor were the primary payload during BOREAS.

4.1.6 Sensor/Instrument Measurement Geometry

The NASA GSFC/WFF helicopter-based optical remote sensing system was deployed to acquire canopy multispectral data simultaneously with atmospheric properties while hovering approximately 300 meters AGL (Walthall et al., 1996).

4.1.7 Manufacturer of Sensor/Instrument

The ASTPH was designed and built for the special environmental conditions of a helicopter platform. The sunphotometer is the latest of a series of modifications to a helicopter-based optical remote sensing system developed since 1984 by researchers at NASA's GSFC and WFF (Williams et al., 1984; Walthall et al., 1996). Design, development, and fabrication of the ASTPH took place in 1993 prior to the field deployment for BOREAS in 1994.

4.2 Calibration

The sunphotometers used during BOREAS were calibrated before and after the field season. The Cimel units had been extensively calibrated and were considered a source of calibration themselves. The helicopter sunphotometer was shipped to the calibration site without the thermal control boards operating prior to the field season. The thermal control boards were working in time for the field deployments and for the postseason calibration. Hence, the calibration values changed. It was decided to use data from comparisons of the voltages from the helicopter unit with nearby Cimel units as a means of calibration.

4.2.1 Specifications

Calibration of a sunphotometer involves determining the exoatmospheric voltage response in each of the channels. Langley plots and intercomparison methods that use the Bouguer law of atmospheric extinction were used for those channels that did not include discrete gaseous absorption.

The raw data were first screened for voltage dropouts caused by the passage of a rotor blade. The resulting "clear" data were then processed to obtain aerosol optical thickness. Calibration was performed by two methods. In April 1994, the sunphotometer was taken to Mount Lemmon (elevation 9167') to perform a Langley calibration (Halthore et al., 1992) for the non-water absorption channels. Because the instrument wiring was reconfigured after the calibration, it was felt that the Mount Lemon calibration may not be valid for flights in the BOREAS IFCs. Thus, a special effort was made to perform calibration by intercomparison with sunphotometers that were thought to be better calibrated.

During IFC-1 in May 1994, intercomparison was performed with the NASA Ames Research Center sunphotometer at Candle Lake (Wrigley, R., private communication). The resulting calibration coefficients differed from the Mount Lemmon calibrations by at most 3% and typically 2% in most channels, thus showing that the instrument response had not been drastically altered by the reconfiguration. However, it was decided that the Ames intercomparison coefficients for both IFC-1 and -2 would be used.

4.2.1.1 Tolerance

None given.

4.2.2 Frequency of Calibration

None given.

4.2.3 Other Calibration Information

Because of problems with data logging during IFC-3 in September 1994, the signals from three channels were lost (channels 2, 5, and 6). Calibration once again became a problem of utmost concern. Intercomparison with an eight-channel sunphotometer, commonly called SXM-2, was performed at the BOREAS SSA Operations Center near Candle Lake on a clear day (16-Sep). In the absence of a high mountain calibration, the NASA-built SXM-2 sunphotometer, with detector temperature control and automatic operation and data logging, was calibrated by comparison with a "standard" Cimel sunphotometer at GSFC in October following the conclusion of IFC-3. The transferred calibration shows deviations of less than 3% in all functioning channels. It was decided that the calibration from IFC-3 (16-Sep) would be sufficient for analyzing data.

The fact that different calibration methods yield coefficients within about 3% indicates that the uncertainty of the measured aerosol optical thickness will also be on the order of about 0.03; the actual uncertainty is probably a little higher than this because of variability in the data. Considering the conditions under which the helicopter supplotometer operated, this level of uncertainty is acceptable.

5. Data Acquisition Methods

See Walthall et al., 1996.

The UNIDEX-11 operates in two different modes: TRACK and REGULAR. The REGULAR mode is used to move the mount to the desired starting position (zenith and azimuth). The TRACK mode is used when the quad detectors are commanded to take control and track the sun.

The data collection process begins by moving the mount from the HOME (azimuth angle = solar noon, zenith angle = 0 degrees) to the desired zenith and azimuth angles as specified from operator input. This initial input must be within 30 degrees of the sun. The PC-486 then switches the UNIDEX-11 into the TRACK mode and the quad-detectors take control, "locking on" the sun. The analog output of the photodetectors is sampled for 10 cycles per ms and usually contains at least one blade passing in the data stream. The data are acquired from the hardware, and then all data are plotted on the operator screen. The digital raw solar irradiance data are saved to disk along with barometric pressure and altitude data, that are used later in the data processing sequence. Analog voltages from the seven photodetectors located in the optical head are digitized by an A/D converter.

6. Observations

6.1 Data Notes

None given.

6.2 Field Notes

An extensive helicopter log is available. Environmental, technical, instrumental, and operator conditions are noted for each observation where applicable.

7. Data Description

7.1 Spatial Characteristics

7.1.1 Spatial Coverage

The helicopter visited all of the NSA and SSA tower and category-1 auxiliary sites. Each site listed below was observed by the instrument at least once during the 1994 campaign at BOREAS. The coordinates in the table are based on the North American Datum of 1983 (NAD83).

7.1.2 Spatial Coverage Map Not available.

7.1.3 Spatial Resolution

The data channels of the ASTPH view the sun with a FOV of 2 degrees, while the FOV on the quad-detector is 30 degrees.

7.1.4 Projection Not applicable.

7.1.5 Grid Description

Not applicable.

7.2 Temporal Characteristics

7.2.1 Temporal Coverage

Observations were made during all three BOREAS 1994 IFCs, which occurred during the following periods:

IFC-1 24-May - 16-Jun IFC-2 19-Jul - 10-Aug IFC-3 30-Aug - 19-Sep

Measurements were made as conditions permitted during each IFC.

7.2.2 Temporal Coverage Map

Observations were made at several sites on the following dates:

Date	Study Area
31-May-1994 01-Jun-1994 04-Jun-1994 06-Jun-1994 07-Jun-1994 08-Jun-1994	SSA SSA SSA SSA SSA SSA NSA
10-Jun-1994 21-Jul-1994 22-Jul-1994 23-Jul-1994 24-Jul-1994 25-Jul-1994 28-Jul-1994	NSA NSA SSA SSA SSA SSA SSA NSA
04-Aug-1994 08-Aug-1994 06-Sep-1994 08-Sep-1994 09-Sep-1994 13-Sep-1994 15-Sep-1994 16-Sep-1994	NSA NSA NSA NSA NSA SSA SSA

7.2.3 Temporal Resolution

Measurements were collected as conditions permitted during each IFC. Each site was visited as often as possible during each IFC, with priority given to tower flux sites and category 1 auxiliary sites. Fuel constraints limited helicopter flight time to approximately 2 hours. As many sites as possible were visited during each flight.

The analog output of the photodetectors is sampled for 10C ms and usually contains at least one blade passing in the data stream. The data are acquired from the hardware every 5 milliseconds (which yields 20 data points), and then all data are plotted on the operator screen.

7.3 Data Characteristics

7.3.1 Parameter/Variable

The parameters contained in the data files on the CD-ROM are:

Column Name

_____ SITE NAME SUB SITE DATE OBS TIME OBS OP GRID ID NUM OBS MEAN PRESSURE AT PLATFORM MEAN OZONE AMOUNT MEAN AEROSOL OPT THICK 440 MEAN AEROSOL OPT THICK 540 MEAN AEROSOL_OPT_THICK_610 MEAN AEROSOL OPT THICK 670 MEAN AEROSOL OPT THICK 940 MEAN AEROSOL OPT THICK 1030 MEAN COLUMN WATER VAPOR ELEVATION PLATFORM ALTITUDE CRTFCN CODE REVISION DATE

7.3.2 Variable Description/Definition

The descriptions of the parameters contained in the data files on the CD-ROM are:

Column Name	Description
SITE_NAME	The identifier assigned to the site by BOREAS, in the format SSS-TTT-CCCCC, where SSS identifies the portion of the study area: NSA, SSA, REG, TRN, and TTT identifies the cover type for the site, 999 if unknown, and CCCCC is the identifier for site, exactly what it means will vary with site type.
SUB_SITE	The identifier assigned to the sub-site by BOREAS, in the format GGGGG-IIIII, where GGGGG is the group associated with the sub-site instrument e.g. HYD06 or STAFF, and IIIII is the identifier for sub-site, often this will refer to an instrument.
DATE OBS	The date on which the data were collected.
TIME_OBS	The Greenwich Mean Time (GMT) when the data were collected.
OP_GRID_ID	The identifier given to the BOREAS auxiliary and tower sites during the execution of field operations. An example of this is B9B7A.
NUM_OBS	Number of observations of the given sample used to calculate given values.
MEAN_PRESSURE_AT_PLATFORM	The mean atmospheric pressure measured at the

	data collection platform.
MEAN_OZONE_AMOUNT	The mean measured ozone amount.
MEAN_AEROSOL_OPT_THICK_440	The mean aerosol optical thickness measured
	between 0.438 and 0.441 micrometers.
MEAN_AEROSOL_OPT_THICK_540	The mean aerosol optical thickness measured at .540 micrometers.
MEAN AEROSOL OPT THICK 610	The mean aerosol optical thickness measured
	between .610 and .613 micrometers.
MEAN_AEROSOL_OPT_THICK_670	The mean aerosol optical thickness measured at .670 micrometers.
MEAN_AEROSOL_OPT_THICK_940	The mean aerosol optical thickness measured at .940 micrometers.
MEAN_AEROSOL_OPT_THICK_1030	The mean aerosol optical thickness measured at 1.030 micrometers.
MEAN_COLUMN_WATER_VAPOR	The mean amount of precipitable water within a vertical column of air with a cross-section of l centimeter squared and a fixed depth (usually from the ground to the top of the atmosphere).
ELEVATION	The elevation of the site above mean sea level.
PLATFORM_ALTITUDE	The nominal altitude of the data collection platform above the target.
CRTFCN_CODE	The BOREAS certification level of the data. Examples are CPI (Checked by PI), CGR (Certified by Group), PRE (Preliminary), and CPI-??? (CPI but questionable).
REVISION_DATE	The most recent date when the information in the referenced data base table record was revised.

7.3.3 Unit of Measurement The measurement units for the parameters contained in the data files on the CD-ROM are:

Column Name	Units
SITE_NAME SUB_SITE DATE_OBS TIME_OBS OP_GRID_ID NUM OBS	[none] [none] [DD-MON-YY] [HHMM GMT] [none] [counts]
MEAN_PRESSURE_AT_PLATFORM MEAN_OZONE_AMOUNT MEAN_AEROSOL_OPT_THICK_440 MEAN_AEROSOL_OPT_THICK_540 MEAN_AEROSOL_OPT_THICK_610 MEAN_AEROSOL_OPT_THICK_670 MEAN_AEROSOL_OPT_THICK_940 MEAN_AEROSOL_OPT_THICK_1030 MEAN_COLUMN_WATER_VAPOR ELEVATION PLATFORM_ALTITUDE CRTFCN_CODE REVISION_DATE	[kiloPascals] [Dobson] [unitless] [unitless] [unitless] [unitless]

7.3.4 Data Source

The sources of the parameter values contained in the data files on the CD-ROM are:

Column Name	Data Source
SITE NAME	[Assigned by BORIS]
SUB SITE	[Assigned by BORIS]
DATE OBS	[Controller]
TIME_OBS	[Controller]
OP_GRID_ID	[Provided by RSS03 team]
NUM_OBS	[ASTPH]

```

8. Data Organization

8.1 Data Granularity

The smallest unit of data tracked by BOREAS Information System (BORIS) is all of the measurements for a given site on a given day.

8.2 Data Format(s)

The Compact Disk-Read-Only Memory (CD-ROM) files contain American Standard Code for Information Interchange (ASCII) numerical and character fields of varying length separated by commas. The character fields are enclosed with single apostrophe marks. There are no spaces between the fields.

Each data file on the CD-ROM has four header lines of Hyper-Text Markup Language (HTML) code at the top. When viewed with a Web browser, this code displays header information (data set title, location, date, acknowledgments, etc.) and a series of HTML links to associated data files and related data sets. Line 5 of each data file is a list of the column names, and line 6 and following lines contain the actual data.

9. Data Manipulations

9.1 Formulae

See reference list.

9.1.1 Derivation Techniques and Algorithms

See reference list.

9.2 Data Processing Sequence

9.2.1 Processing Steps

After data collection, the data set and relevant location and condition information were used to transform the at-sensor Digital Numbers (DNs) to atmospheric optical depths and water vapor column estimates as described in Halthore et al. (1997). In order to eliminate the rotor blade swipes, an "unobstructed" value was calculated for each site/time. This was achieved in the optical thickness data set by calculating the minimum value for the data collected over a given site. For the water vapor column estimates, a median value was given. In addition, the number of observations used in calculating the minimum or median is reported; those values calculated from a larger source data set are more reliable.

9.2.2 Processing Changes

None.

9.3 Calculations

See reference list.

9.3.1 Special Corrections/Adjustments None given.

9.3.2 Calculated Variables

See reference list.

9.4 Graphs and Plots None.

10. Errors

10.1 Sources of Error

None given.

10.2 Quality Assessment

Visual quality assessment was made during data collection. Also see reference list and helicopter logs.

10.2.1 Data Validation by Source

None given.

- **10.2.2 Confidence Level/Accuracy Judgment** None given.
- **10.2.3 Measurement Error for Parameters** None given.
- **10.2.4 Additional Quality Assessments** See helicopter logs.

10.2.5 Data Verification by Data Center

BORIS staff performed some quality checks of the data in the process of loading the data into the data base.

11. Notes

11.1 Limitations of the Data None given.

11.2 Known Problems with the Data

None given.

11.3 Usage Guidance

The RSS-03 helicopter-based optical depth measurements are relevant primarily to the helicopter-borne optical measurements, unless one is interested in the spatial distribution of atmospheric particulates over the boreal forest.

11.4 Other Relevant Information

None.

12. Application of the Data Set

The RSS-03 helicopter-based optical depth measurements are used to perform atmospheric corrections to radiance to obtain at-ground reflectance estimates from the helicopter-mounted radiometers.

Although the primary motivation for development of the helicopter automatic sun-tracking photometer was to provide data for calibration and correction of remotely sensed measurements, the system is also useful for the acquisition of measurements in support of atmospheric research. Optical thickness as a function of height in the boundary layer, which an airborne sunphotometer easily provides, is necessary to better understand vertical aerosol distributions.

13. Future Modifications and Plans

None.

14. Software

14.1 Software Description

Labtech.

14.2 Software Access

Labtech software is commercially available. Software developed specifically for the ASTPH is not available for distribution.

15. Data Access

The ASTPH data are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).

15.1 Contact Information

For BOREAS data and documentation please contact:

ORNL DAAC User Services Oak Ridge National Laboratory P.O. Box 2008 MS-6407 Oak Ridge, TN 37831-6407 Phone: (423) 241-3952 Fax: (423) 574-4665 E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov

15.2 Data Center Identification

Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics http://www-eosdis.ornl.gov/.

15.3 Procedures for Obtaining Data

Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

15.4 Data Center Status/Plans

The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

16. Output Products and Availability

16.1 Tape Products

None.

16.2 Film Products

None.

16.3 Other Products

These data are available on the BOREAS CD-ROM series.

17. References

17.1 Platform/Sensor/Instrument/Data Processing Documentation None.

17.3 Archive/DBMS Usage Documentation

None.

18. Glossary of Terms

None.

19. List of Acronyms

A/D	_	Analog-to-Digital
AGL	_	Above Ground Level
ASCII	_	American Standard Code for Information Interchange
ASTPH		Automatic Sun Tracking Photometer for Helicopter
BOREAS	_	BOReal Ecosystem-Atmosphere Study
BORIS	_	BOREAS Information System
CCD	-	Charge-Coupled Device
CD-ROM	-	Compact Disk-Read-Only Memory
DAAC	-	Distributed Active Archive Center
DN	-	Digital Number
FOV	-	Field of View
GIS	-	Geographic Information System
GSFC	-	Goddard Space Flight Center
HTML	-	HyperText Markup Language
IFC	-	Intensive Field Campaign
MMR	_	Modular Multiband Radiometer
NASA	-	National Aeronautics and Space Administration
NIR	-	Near-Infrared
NSA	-	Northern Study Area
OA	-	Old Aspen
OBS	-	Old Black Spruce
OJP	-	Old Jack Pine
ORNL	-	Oak Ridge National Laboratory
PANP	-	Prince Albert National Park
RSS	-	Remote Sensing Science
SE-590	-	Spectron Engineering spectroradiometer
SSA	-	Southern Study Area
SSAI	-	Science Systems and Applications, Inc.
TM	-	Thematic Mapper
URL	-	Uniform Resource Locator
UTM	-	Universal Transverse Mercator
WFF		Wallops Flight Facility
YA		Young Aspen
YJP	-	Young Jack Pine
