CSS is an encryption scheme that the MPAA claims is used to prevent someone from making fraudulent copies of a DVD movie. Well apparently the MPAA doesn't realize that no one wants to pirate a DVD, simply based on the fact that to make bootleg copies of DVD movies costs more than simply buying a copy. That said, it becomes clear that the MPAA is simply angry that people have found a way to play movies on any device, whether it is sanctioned by them or not.

The use of CSS by the MPAA to ensure that movies are played only on players that have the MPAA's "permission". I equate this to only being able to play my music on a SONY cd player, or a VHS cassette on an RCA VCR. Since these mediums are not regulated in this manner, then why should DVD's?

It is apparent that the MPAA is so in search of the almighty dollar, that it has lost sight of what is really important: It's customers. If everyone knew of what they were doing, they would have a difficult time giving DVD's away, let alone selling them….
