

Making Jacob Rubin's Vision a Reality:

**New Contributions to Ground-Water Science from the
National Water-Quality Assessment Program**

Jack Barbash

National Water-Quality Assessment Program (NAWQA)

Pesticide National Synthesis Project

U.S. Geological Survey

GSA National Meeting (October 2008, Houston TX)

New Contributions to Ground-Water Science from the NAWQA Program

- **Nationwide summaries of existing information**
- **Nationwide study design** → **Occurrence** → **Prediction**
- **Investigation of previously un(der)examined contaminants**
- **Nationwide investigation of trends**
- **Effects of environmental factors (e.g., reduction-oxidation, or redox conditions) on water quality**
- **Use of solute transport-and-fate models to predict ground-water quality in multiple settings around the Nation**

Nationwide Summaries of Existing Information

Nationwide Summaries of Existing Information

Sources, transport, occurrence, fate, and effects of major
contaminant groups — Examples

Nationwide Summaries of Existing Information

Sources, transport, occurrence, fate, and effects of major contaminant groups — Examples

- Nutrients in the Nation's Waters – Too Much of a Good Thing?

Nationwide Summaries of Existing Information

Sources, transport, occurrence, fate, and effects of major contaminant groups — Examples

- Nutrients in the Nation's Waters – Too Much of a Good Thing?

- Pesticides in the Hydrologic System series

Atmosphere

Ground water

Surface water

Aquatic biota & sediments

Nationwide Summaries of Existing Information

Sources, transport, occurrence, fate, and effects of major contaminant groups — Examples

Environmental chemistry

Occurrence in ground water

Nationwide Summaries of Existing Information

Summaries of environmental characteristics, ground-water quality and contaminant sources in 52 major hydrologic basins (Study Units) across the Nation — A few examples

Nationwide Summaries of Existing Information

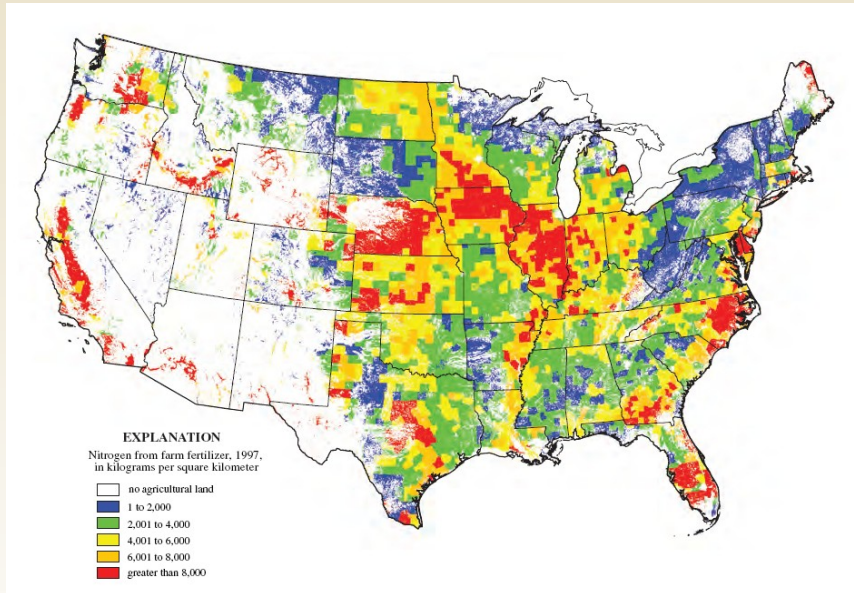

Ancillary data to support data interpretation - Examples

- Topography and watershed boundaries
- Geology
- Climate
- Soil properties
- Hydrology (e.g., runoff, recharge, streamflow, base-flow, etc.)
- Ecoregions
- Geochemistry
- Population
- Land use
- Water use
- Contaminant releases (e.g., pesticides, nutrients, MTBE, etc.)

(http://water.usgs.gov/nawqa-only/gis/gis_data.html)

Nationwide Summaries of Existing Information

Chemical inputs – Nutrients (Ruddy and others, 2006)

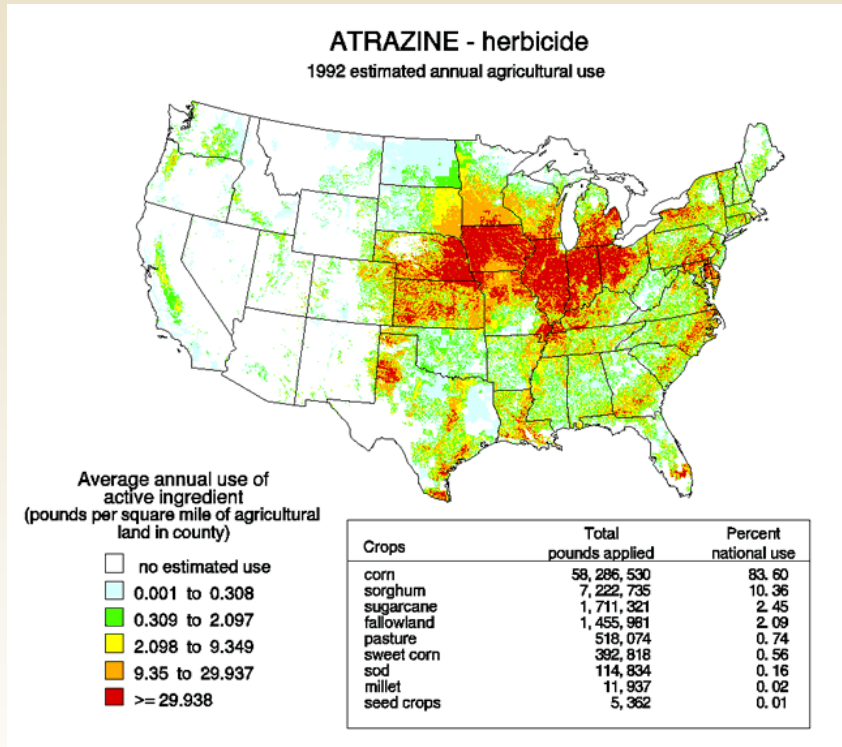

Nitrogen inputs from farms
(1997)

Annual inputs across the
United States (1945-2001)

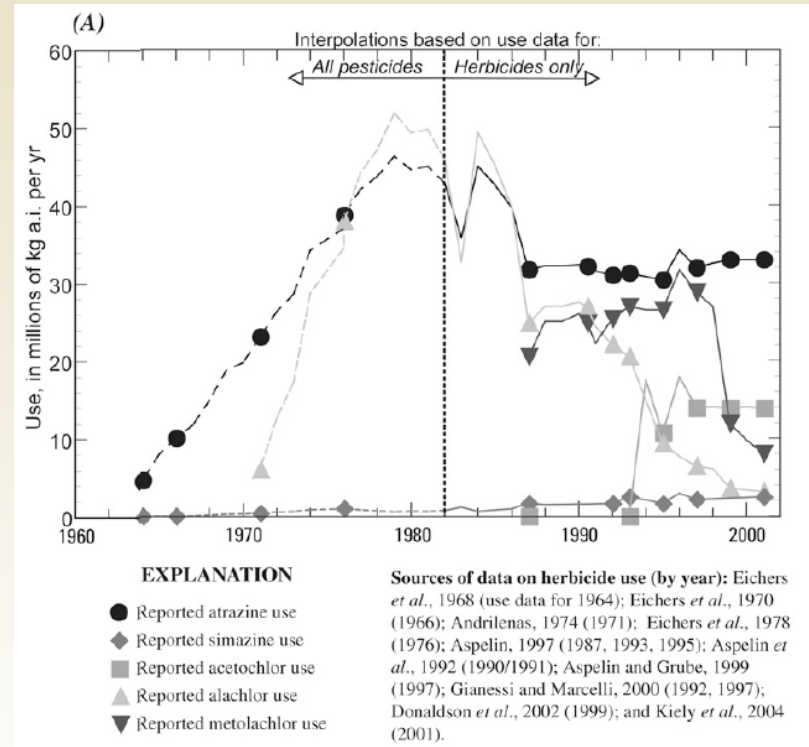

Nationwide Summaries of Existing Information

Chemical inputs – Pesticides

Atrazine use in agricultural settings, 1992

(<http://water.usgs.gov/nawqa/pnsp/usage/maps/>)

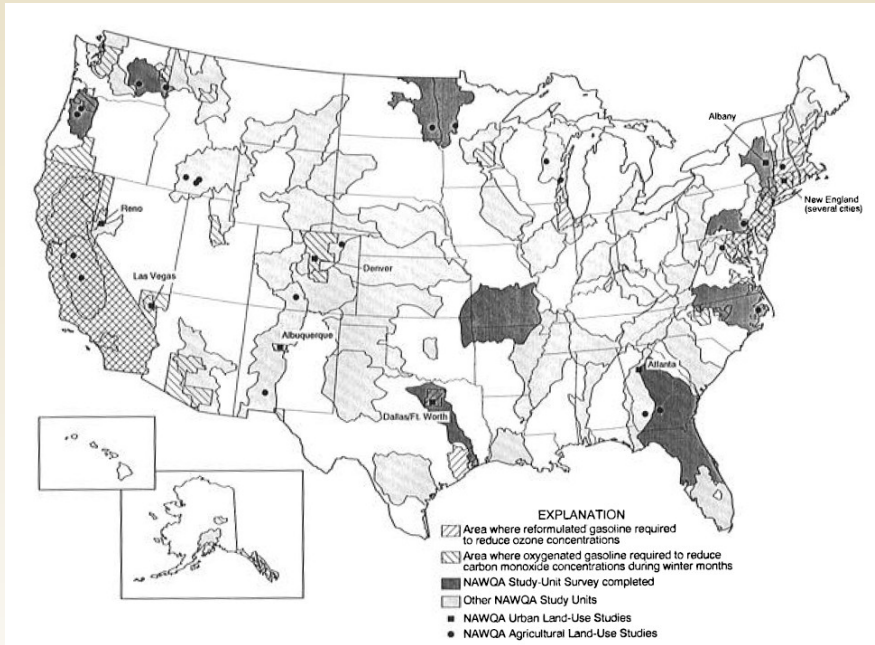

Herbicide inputs across the United States, 1964-2002

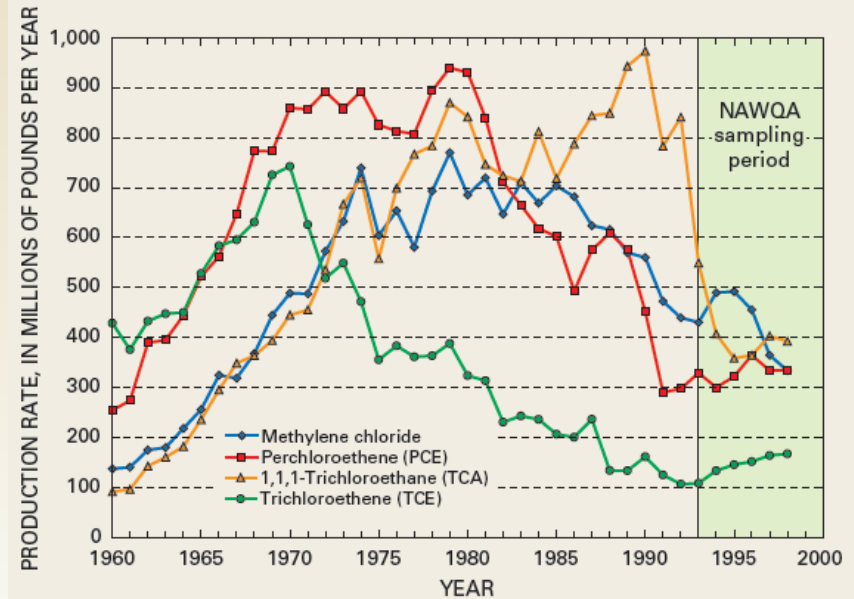

(Steele and others, 2008)

Nationwide Summaries of Existing Information

Chemical inputs – VOCs

Areas where use of oxygenated or reformulated gasoline is required (cross-hatched) relative to locations of NAWQA Study Units
(Squillace and others, 1996)

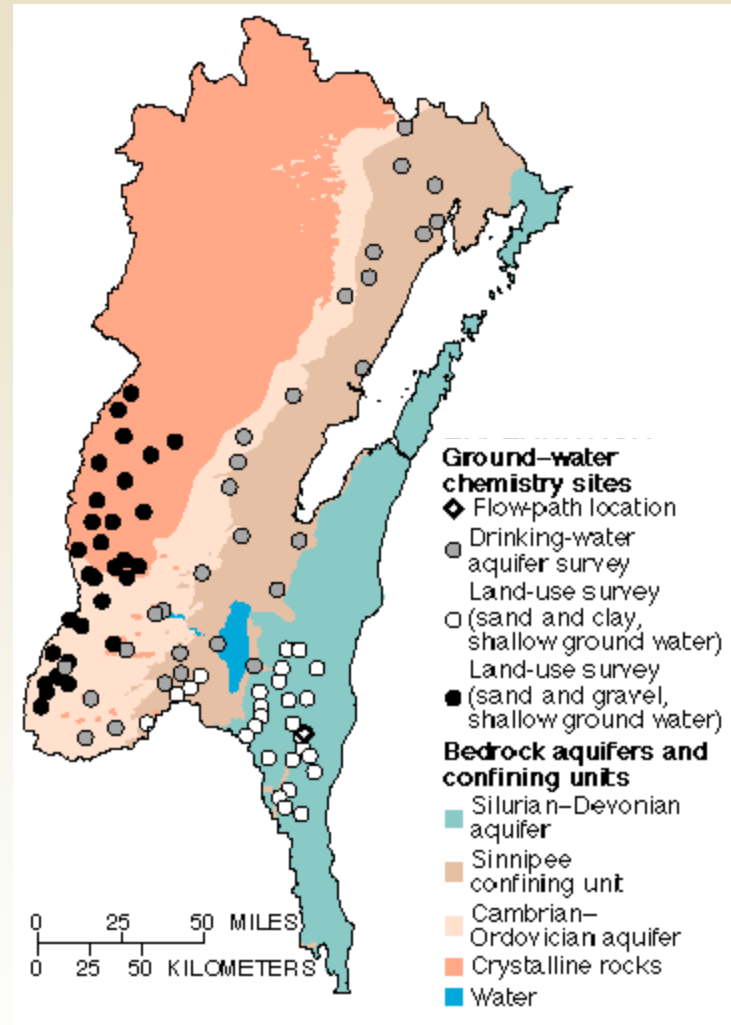

Production of solvents in the United States, 1960-1998
(Zogorski and others, 2006)

Nationwide, multi-scale, nested study design

Rubin's "Creeping Survey"
for a single basin
(Rubin, 1993)

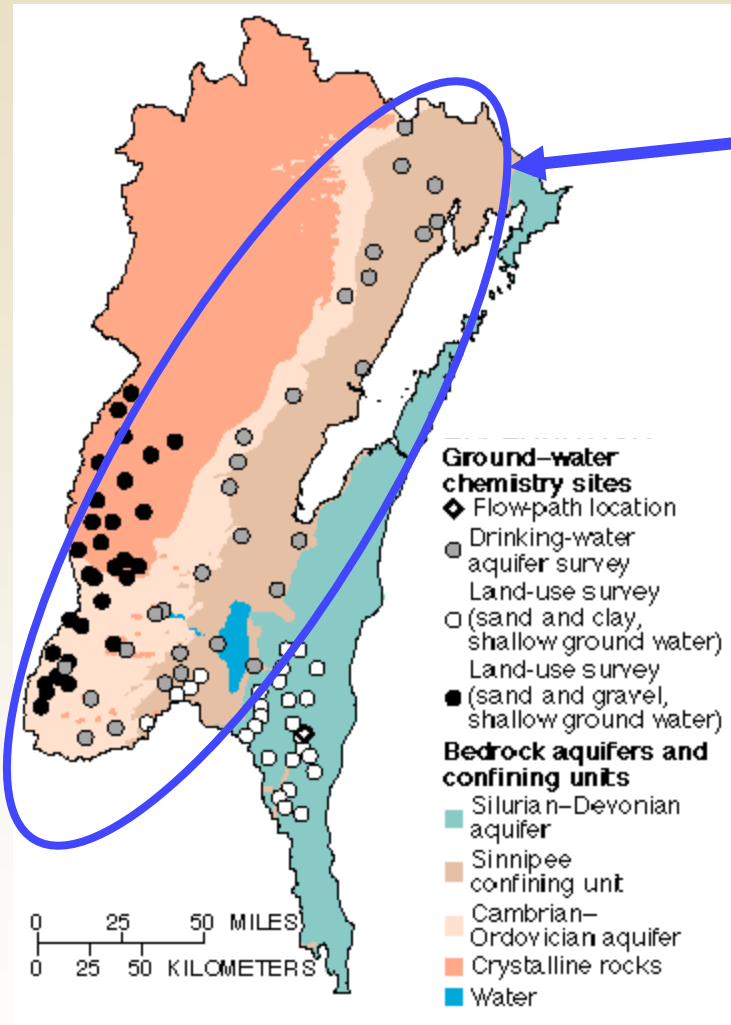

NAWQA study design
for a single basin or "Study Unit"
(Peters and others, 1998)

Nationwide, multi-scale, nested study design

Rubin's "Creeping Survey"
for a single basin
(Rubin, 1993)

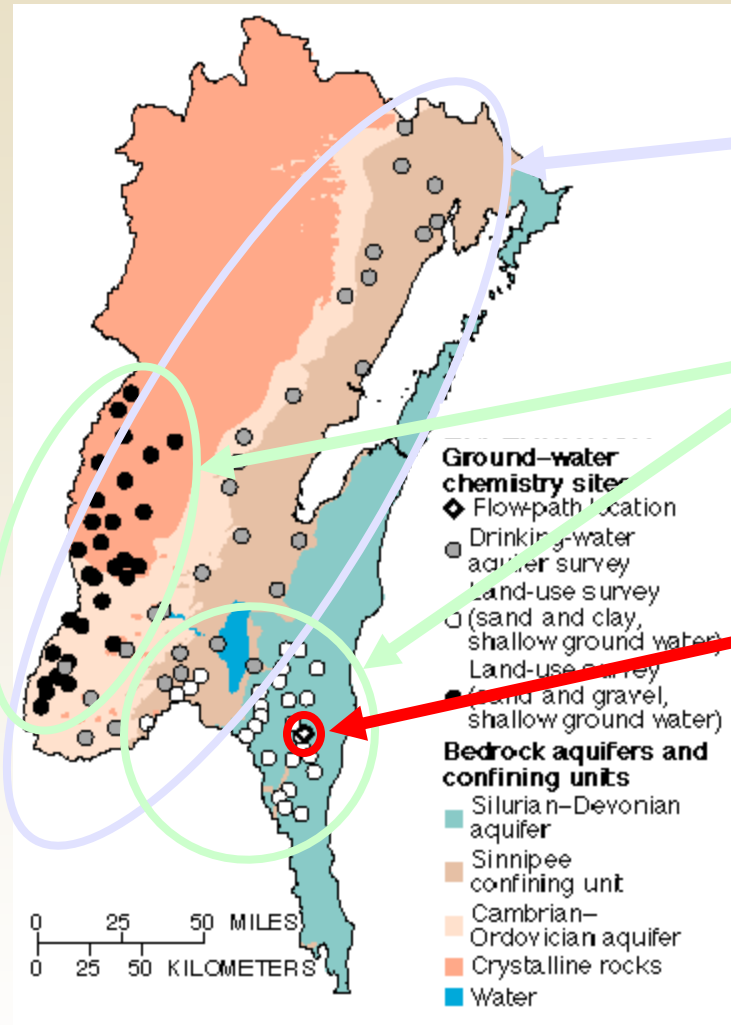

Aquifer survey

NAWQA study design
for a single basin or "Study Unit"
(Peters and others, 1998)

Nationwide, multi-scale, nested study design

Rubin's "Creeping Survey"
for a single basin
(Rubin, 1993)

studies

Flow-
system
study

Flow-System Studies

Nationwide, multi-scale, nested study design

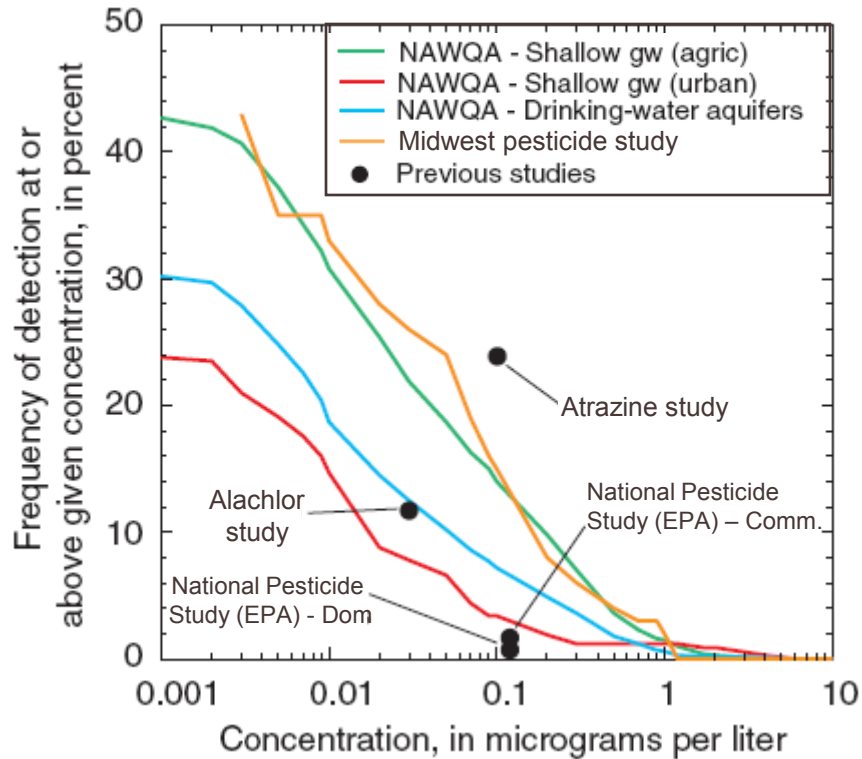

NAWQA Study Units
(Cycle 1)

How representative are the NAWQA results?

How representative are the NAWQA results?

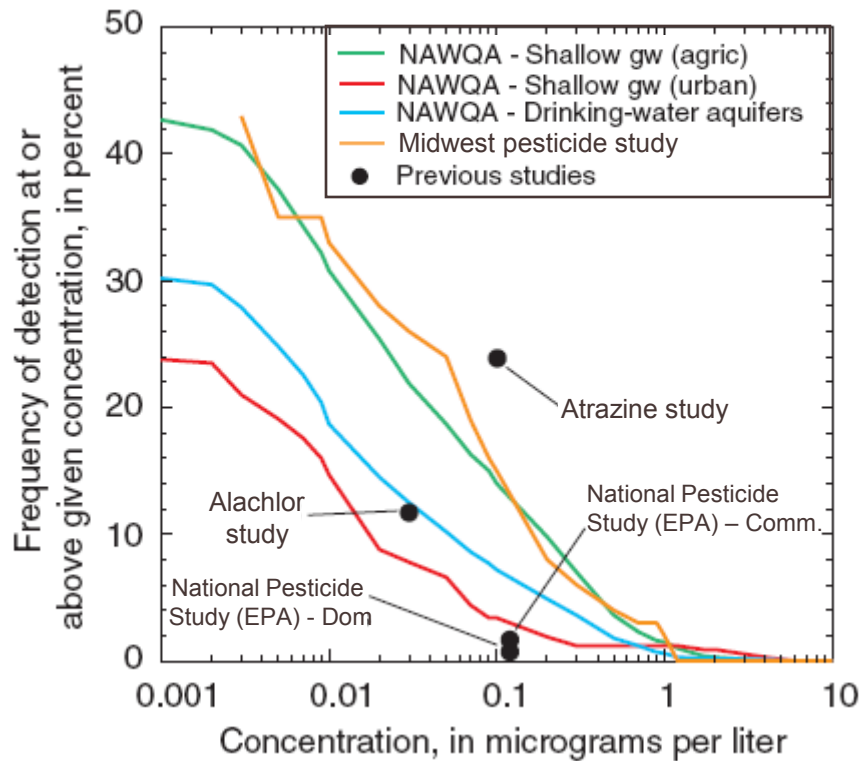

Atrazine

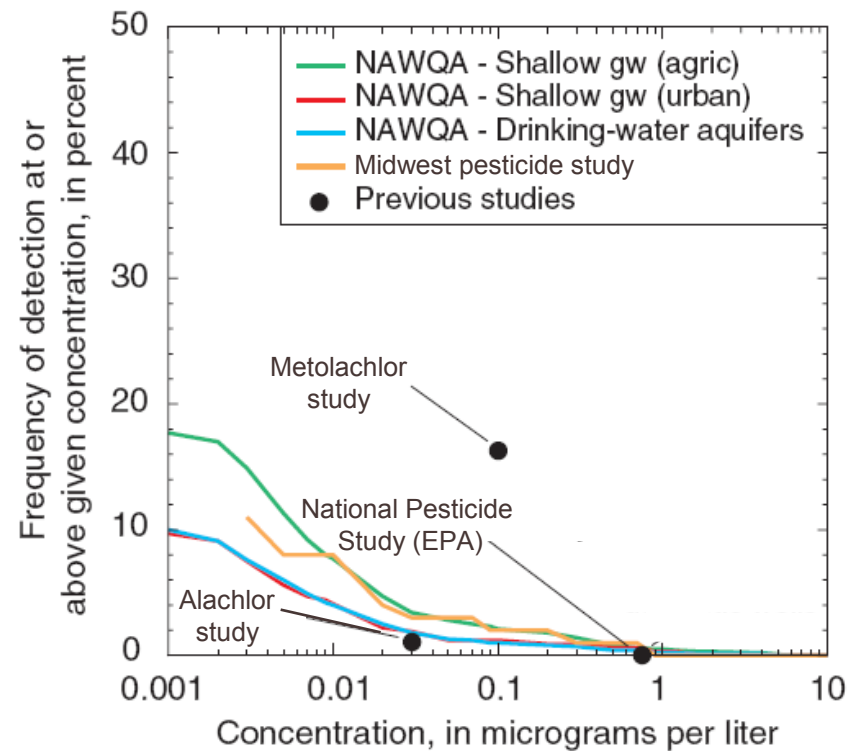

(Barbash and others, 1999)

How representative are the NAWQA results?

Atrazine

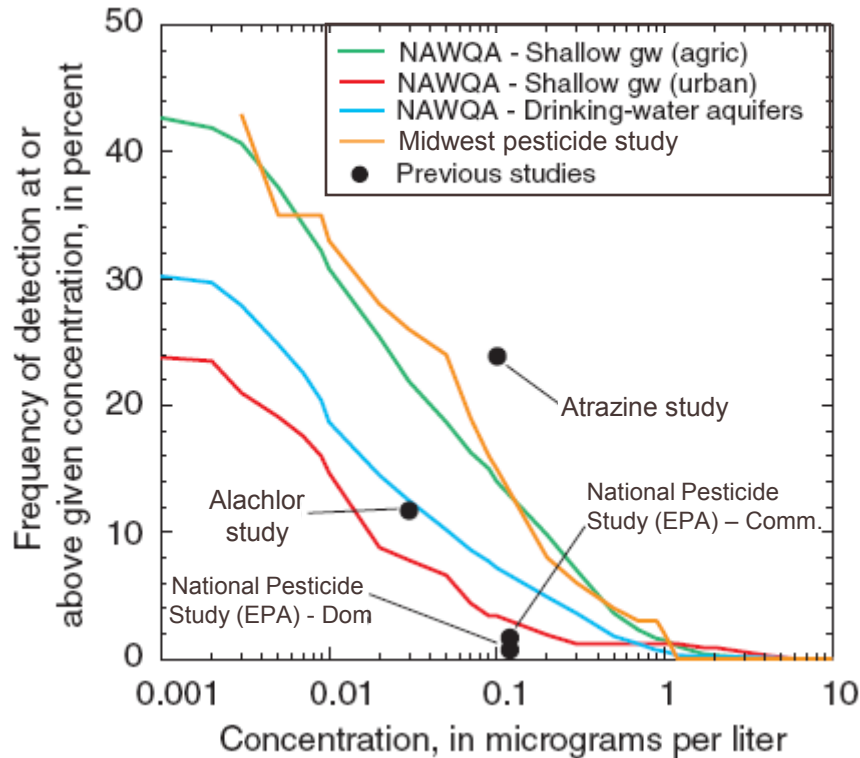

Metolachlor

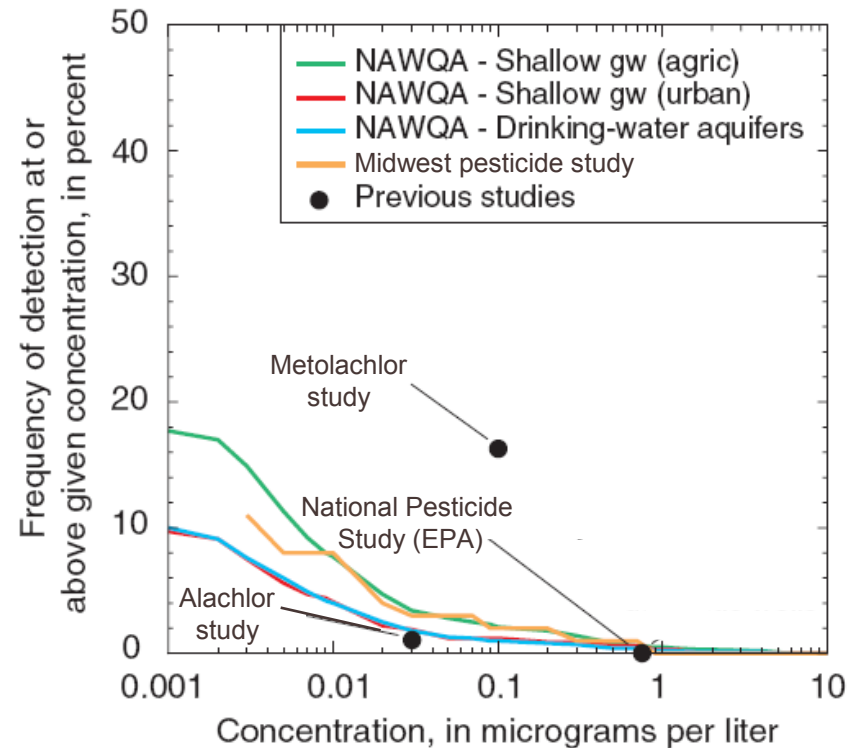

How representative are the NAWQA results?

Atrazine

Metolachlor

Detection frequencies (for pesticides) found to be generally consistent with those from previous studies

(Barbash and others, 1999)

National Assessments of Contaminant Occurrence

Pesticides (Major aquifers)

Atrazine

Metolachlor

Major aquifers

EXPLANATION

Estimated 1997 agricultural use intensity,
in pounds per square mile per year

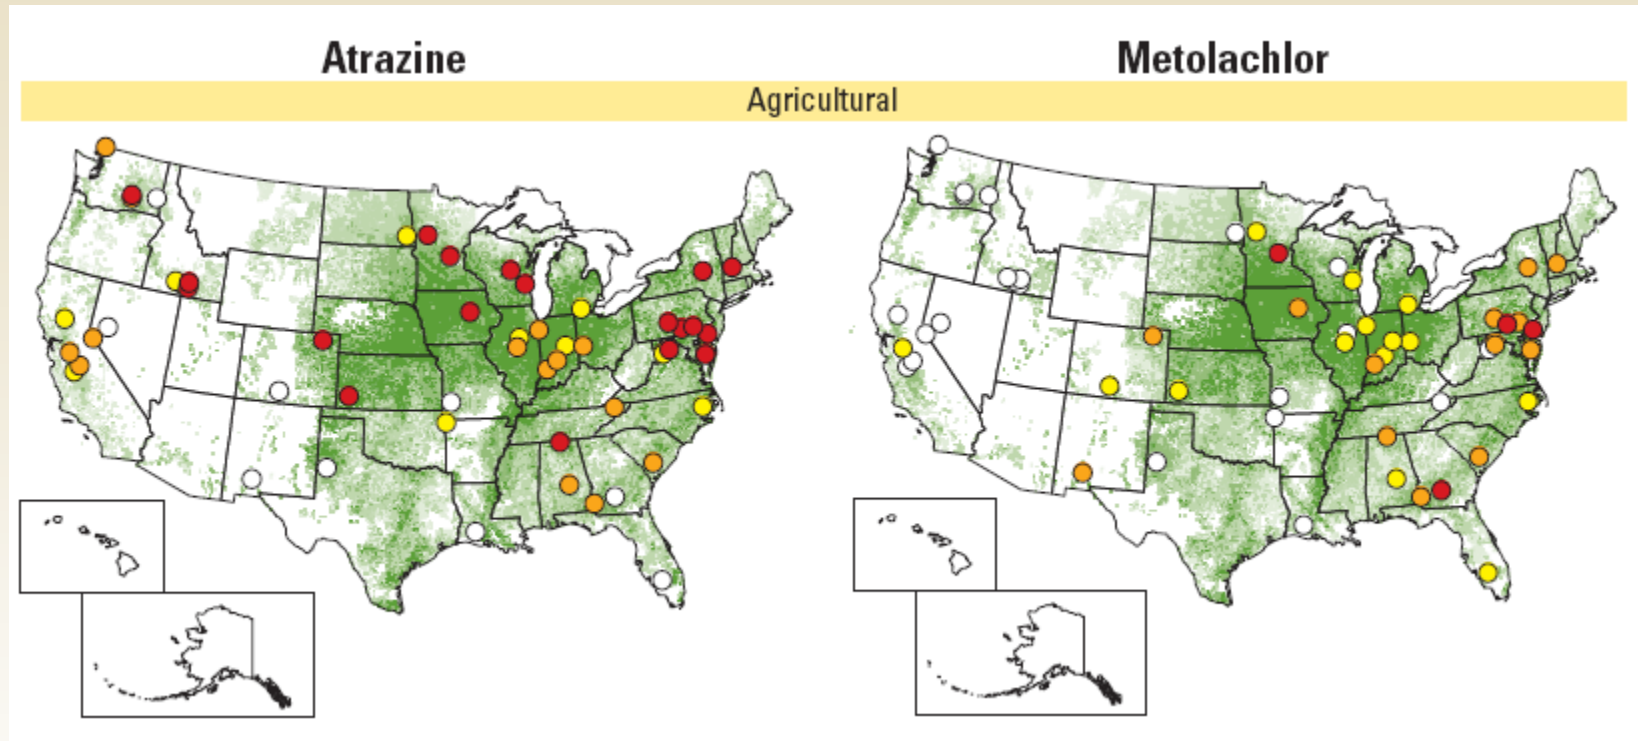

Major
aquifers

Frequency of detection at 0.01 µg/L or
greater, as percentage of wells in study

National Assessments of Contaminant Occurrence

Pesticides (Agricultural areas)

EXPLANATION

Estimated 1997 agricultural use intensity, in pounds per square mile per year

Shallow ground-water studies, by land use

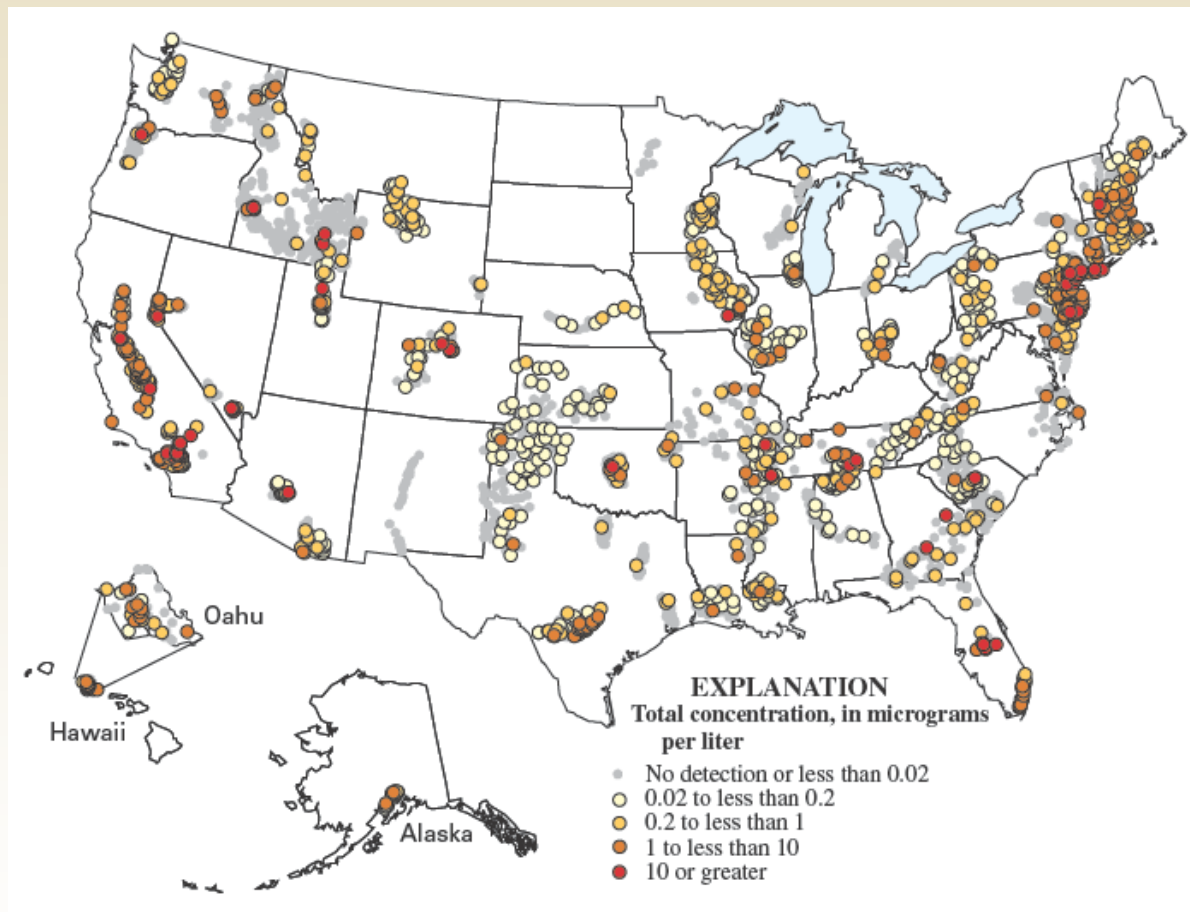

Frequency of detection at 0.01 µg/L or greater, as percentage of wells in study

National Assessments of Contaminant Occurrence

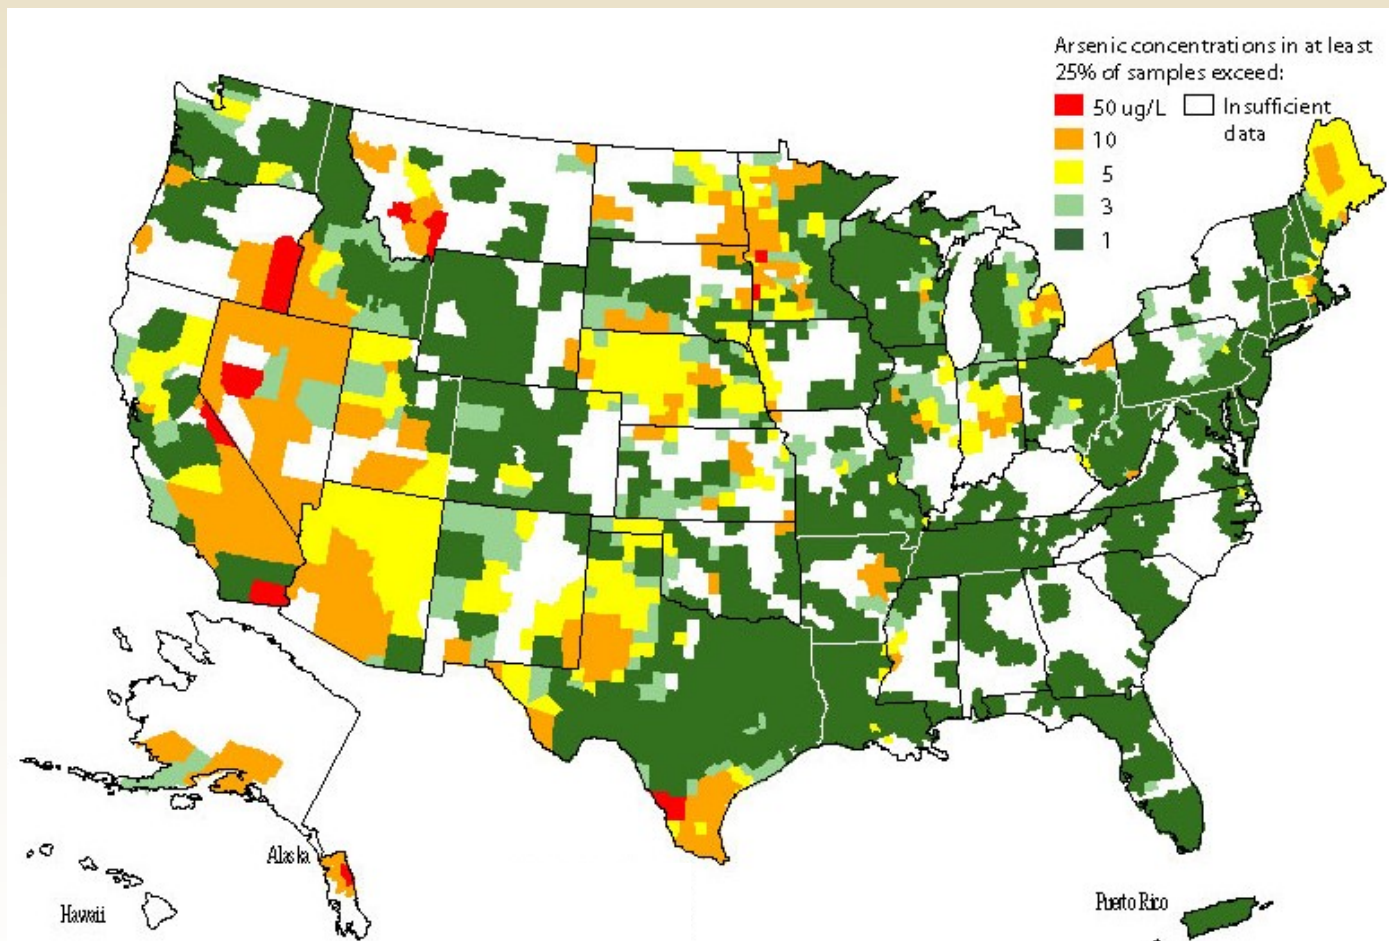

VOCs

(Zogorski and others, 2006)

National Assessments of Contaminant Occurrence

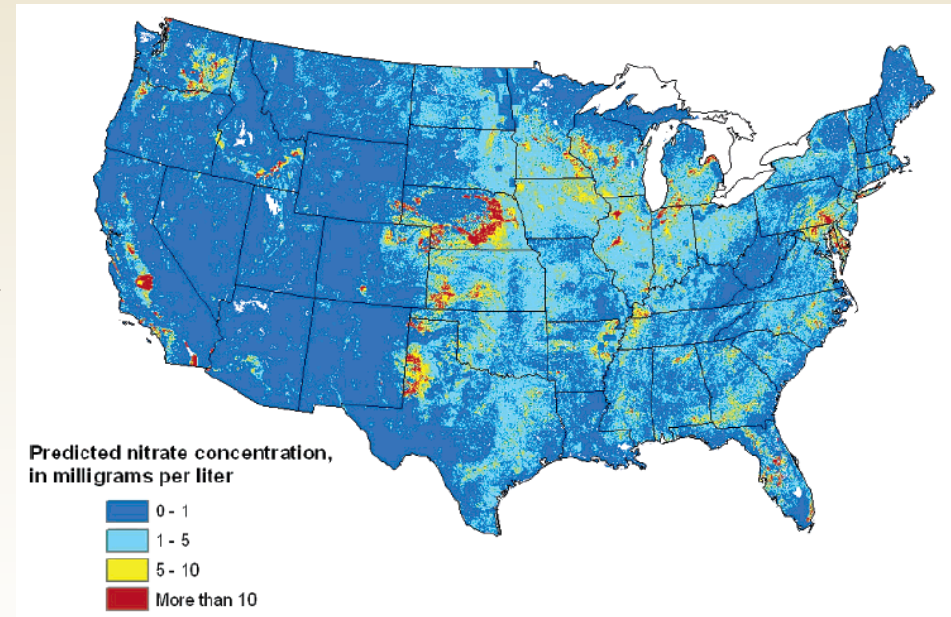

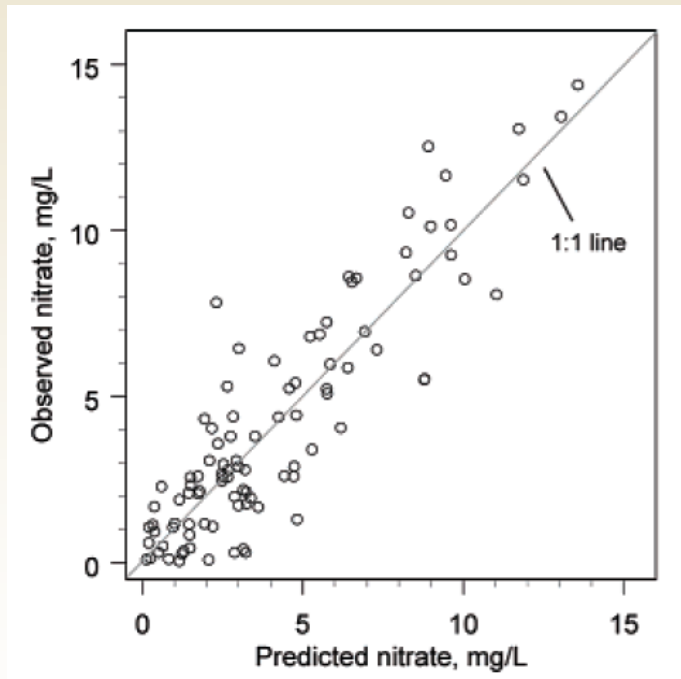

Arsenic

Nationwide Predictions of Contaminant Occurrence

(Statistical approaches)

Nitrate Concentrations Predicted in Shallow Ground Water Using a Nonlinear Regression Model

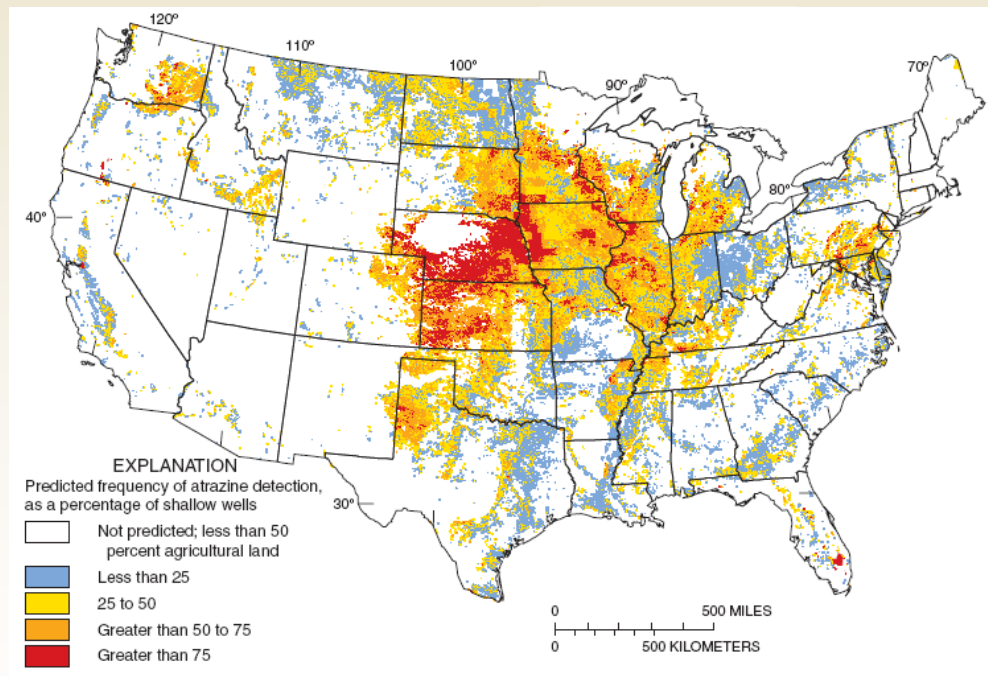

(Nolan and Hitt, 2006)

Nationwide Predictions of Contaminant Occurrence

(Statistical approaches)

Frequencies of Atrazine Detection in Shallow Ground Water Predicted Using a Nonlinear Regression Model

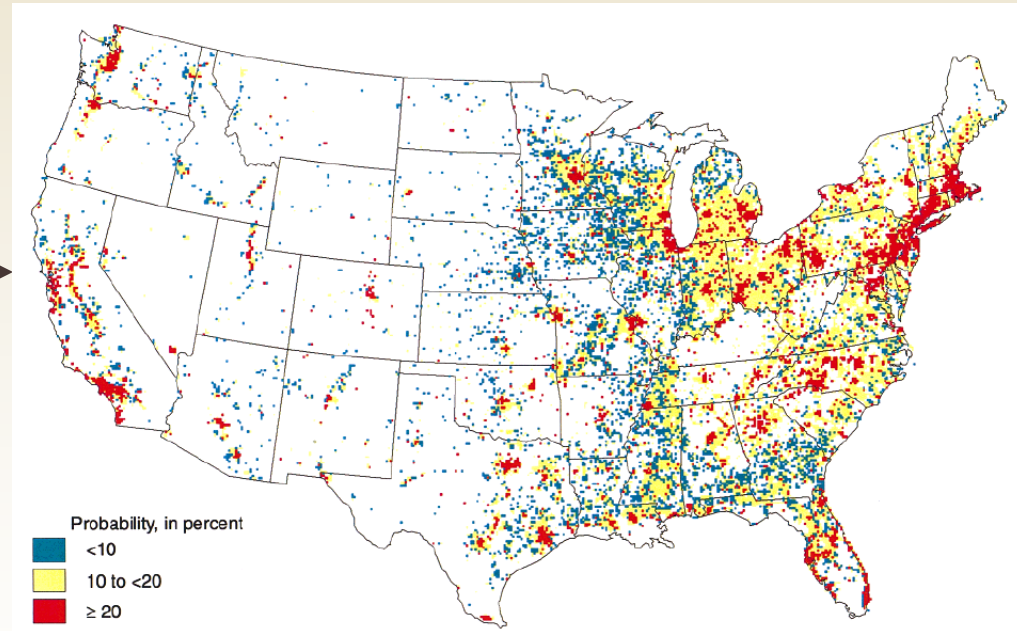

(Stackelberg and others, 2005)

Nationwide Predictions of Contaminant Occurrence

(Statistical approaches)

Probability of Detecting a VOC in Untreated Ground Water (where 5 or more people per sq. km. use ground water)

(Squillace and others, 1999)

Unprecedented Analytical and Spatial Scope Allows Analysis of Broad Issues

- Co-occurrence among contaminant groups
- Investigation of previously un(der)examined compounds
 - Study of newly introduced compounds
 - Comparisons of detection patterns between degradates and parent compounds
- Examination of factors affecting occurrence and persistence

Co-occurrence Among Contaminant Groups

Nitrate, pesticides and VOCs in 1255 domestic wells and 242 public water supplies across the Nation

Pesticides predominate over VOCs and nitrate in the most common mixtures

Co-occurrence Among Contaminant Groups

Nitrate, pesticides and VOCs in 1255 domestic wells and 242 public water supplies across the Nation

Pesticides predominate over VOCs and nitrate in the most common mixtures

Detections are more frequent with increasing population density for pesticides and VOCs, but much less so for nitrate

Large-Scale Assessments of Previously Un(der)examined Contaminants

- Methyl *tert*-butyl ether (MTBE)
- Acetochlor
- Glyphosate (*Round-Up*)
- Prometon
- Several pesticide degradates (e.g., from acetochlor, alachlor, metolachlor, cyanazine, fipronil)
- Wastewater compounds (*on the horizon*)

Large-Scale Assessments of New Contaminants

The world's first continent-wide solute transport experiment!

Broad scope of degradates included most of the principal reactions involved in pesticide transformation

<u>Reaction Type</u>	<u>Example</u>	<u>Biotic or Abiotic?</u>	<u>NAWQA example (Reference)</u>
Nucleophilic substitution - By water (hydrolysis)	<p>atrazine → hydroxyatrazine (HYA) + HCl</p>	Abiotic (mostly)	Upper Midwest (Kalkhoff and others, 2003)
- By glutathione enzyme (GSH)	<p>metolachlor → metolachlor ethanesulfonic acid (MESA) + metolachlor oxanilic acid (MOA)</p>	Biotic	Hudson River Basin (Phillips and others, 1999)
Addition (hydration)	<p>Cyanazine → Cyanazine amide</p>	Abiotic	Upper Midwest (Kalkhoff and others, 2003)
Elimination (dehydrohalogenation)	<p>1,2-dibromo-3-chloropropane (DBCP) → 1,2-dibromopropene (DBP)</p>	Abiotic	San Joaquin-Tulare Basin (Burow and others, 1999)
Photolysis	<p>fipronil → desulfinyl fipronil</p>	Abiotic	Acadian-Pontchartrain Basin (Demcheck and others, 2004)
Dealkylation	<p>atrazine + 2O₂ → deethyl atrazine (DEA) + 2CO₂ + 4H⁺</p>	Biotic	White River Basin (Carter and others, 1995)
Oxidation	<p>aldicarb + O₂ → aldicarb sulfone</p>	Abiotic (mostly)	Lower Tennessee River Basin (Woodside and others, 2004)
Reductive dehalogenation	<p>1,2-dichloropropane → 1-chloropropane + 2-chloropropane</p>	Biotic	Puget Sound Basin (Tesonero and others, 2001)

Broad scope of degradates included most of the principal reactions involved in pesticide transformation

<u>Reaction Type</u>	<u>Example</u>	<u>Biotic or Abiotic?</u>	<u>NAWQA example (Reference)</u>
Nucleophilic substitution - By water (hydrolysis)	<p>atrazine → hydroxyatrazine (HYA) + HCl</p>	Abiotic (mostly)	Upper Midwest (Kalkhoff and others, 2003)
- By glutathione enzyme (GSH)	<p>metolachlor → metolachlor ethanesulfonic acid (MESA) + metolachlor oxanilic acid (MOA)</p>	Biotic	Hudson River Basin (Phillips and others, 1999)
Addition (hydration)	<p>Cyanazine → Cyanazine amide</p>	Abiotic	Upper Midwest (Kalkhoff and others, 2003)
Elimination (dehydrohalogenation)	<p>1,2-dibromo-3-chloropropane (DBCP) → 1,2-dibromopropene (DBP)</p>	Abiotic	San Joaquin-Tulare Basin (Burow and others, 1999)
Photolysis	<p>fipronil → desulfinyl fipronil</p>	Abiotic	Acadian-Pontchartrain Basin (Demcheck and others, 2004)
Dealkylation	<p>atrazine + 2O₂ → deethyl atrazine (DEA) + 2CO₂ + 4H⁺</p>	Biotic	White River Basin (Carter and others, 1995)
Oxidation	<p>aldicarb + O₂ → aldicarb sulfone</p>	Abiotic (mostly)	Lower Tennessee River Basin (Woodside and others, 2004)
Reductive dehalogenation	<p>1,2-dichloropropane → 1-chloropropane + 2-chloropropane</p>	Biotic	Puget Sound Basin (Tesonero and others, 2001)

metolachlor → MESA + MOxA

atrazine → DEA

Many degradates detected more often than their parent compounds

(Groschen and others, 2004)

Factors Associated with Contaminant Detections

Previous studies suggested that chemical properties are poor predictors of pesticide detections

Expected pattern

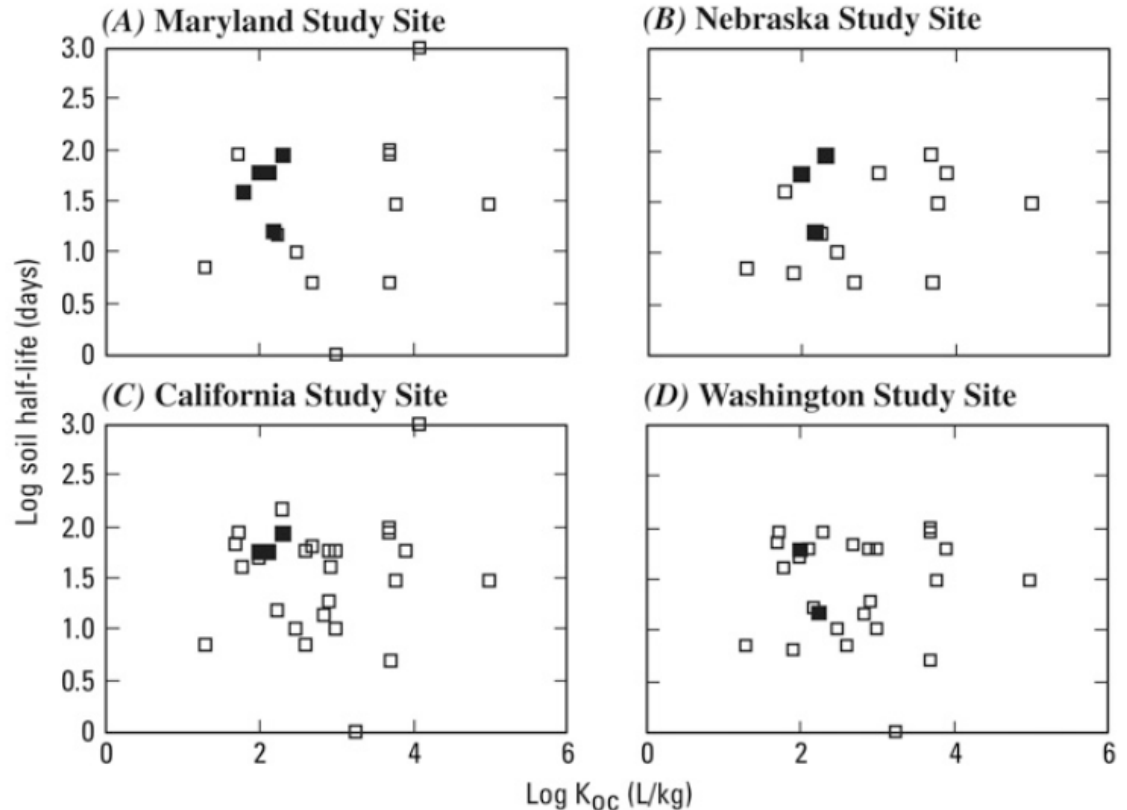

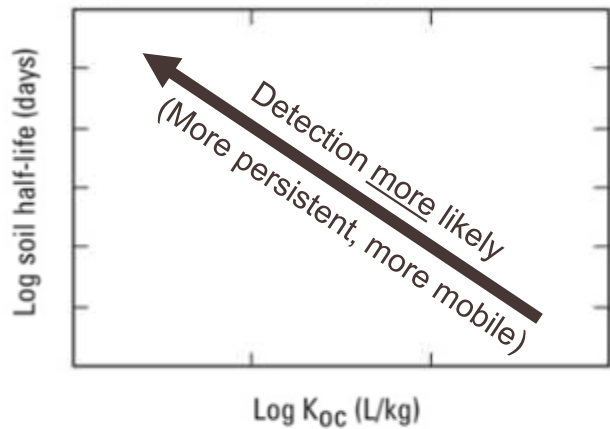

Observations from seven earlier multi-state studies

Solid symbols – Compound detected
Open symbols – Compound not detected

(Barbash and Resek, 1996)

Factors Associated with Contaminant Detections

During the NAWQA program, physical and chemical properties were again found to be only moderately reliable predictors of occurrence

EXPLANATION

- Parent pesticide detected in ground-water sample
- Parent pesticide not detected in ground-water sample

Four ag areas examined for the ACT studies
(Steele and others, 2008)

Factors Associated with Contaminant Detections

Pesticide detection frequencies found to be related to use and persistence

Atrazine
(Soil half-life \approx 146 days)

Simazine
(Soil half-life \approx 91 days)

Metolachlor
(Soil half-life \approx 26 days)

Alachlor
(Soil half-life \approx 21 days)

Cyanazine
(Soil half-life \approx 17 days)

Herbicide detection frequencies
versus agricultural use
(Barbash and others, 1999)

Factors Controlling Persistence

<u>Reaction Type</u>	<u>Example</u>	<u>Biotic or Abiotic?</u>	<u>NAWQA example (Reference)</u>
Nucleophilic substitution			
- By water (hydrolysis)	<p>atrazine → hydroxyatrazine (HYA)</p>	Abiotic (mostly)	Upper Midwest (Kalkhoff and others, 2003)
- By glutathione enzyme (GSH)	<p>metolachlor → metolachlor ethanesulfonic acid (MESA) + metolachlor oxanic acid (MOA)</p>	Biotic	Hudson River Basin (Phillips and others, 1999)
Addition (hydration)	<p>Cyanazine → Cyanazine amide</p>	Abiotic	Upper Midwest (Kalkhoff and others, 2003)
Elimination (dehydrohalogenation)	<p>1,2-dibromo-3-chloropropane (DBCP) → 1,2-dibromopropene (DBP)</p>	Abiotic	San Joaquin-Tulare Basin (Burov and others, 1999)
Photolysis	<p>fipronil → desulfinyl fipronil</p>	Abiotic	Acadian-Pontchartrain Basin (Demcocheck and others, 2004)
Dealkylation	<p>atrazine → deethyl atrazine (DEA)</p>	Biotic	White River Basin (Carter and others, 1995)
Oxidation	<p>aldicarb → aldicarb sulfone</p>	Abiotic (mostly)	Lower Tennessee River Basin (Woodside and others, 2004)
Reductive dehalogenation	<p>1,2-dichloropropane → 1-chloropropane + 2-chloropropane</p>	Biotic	Puget Sound Basin (Tesoriero and others, 2001)

Factors Controlling Persistence

<u>Reaction Type</u>	<u>Example</u>	<u>Biotic or Abiotic?</u>	<u>NAWQA example (Reference)</u>
Nucleophilic substitution			
- By water (hydrolysis)	<p>atrazine → hydroxyatrazine (HYA) + HCl</p>	Abiotic (mostly)	Upper Midwest (Kalkhoff and others, 2003)
- By glutathione enzyme (GSH)	<p>metolachlor → metolachlor ethanesulfonic acid (MESA) + metolachlor oxanic acid (MOA)</p>	Biotic	Hudson River Basin (Phillips and others, 1999)
Addition (hydration)	<p>Cyanazine → Cyanazine amide</p>	Abiotic	Upper Midwest (Kalkhoff and others, 2003)
Elimination (dehydrohalogenation)	<p>1,2-dibromo-3-chloropropane (DBCP) → 1,2-dibromopropene (DBP)</p>	Abiotic	San Joaquin-Tulare Basin (Burow and others, 1999)
Photolysis	<p>fipronil → desulfinyl fipronil</p>	Abiotic	Acadian-Pontchartrain Basin (Demcocheck and others, 2004)
Dealkylation	<p>atrazine → deethyl atrazine (DEA) + 2CO₂ + 4H⁺</p>	Biotic	White River Basin (Carter and others, 1995)
Oxidation	<p>aldicarb → aldicarb sulfone</p>	Abiotic (mostly)	Lower Tennessee River Basin (Woodside and others, 2004)
Reductive dehalogenation	<p>1,2-dichloropropane → 1-chloropropane + 2-chloropropane</p>	Biotic	Puget Sound Basin (Tesoriero and others, 2001)

atrazine → DEA

Factors Controlling Persistence

Ratio of DEA to atrazine concentrations (extent of reaction) increases with increasing soil contact time

National overview of deethylatrazine/atrazine ratio in streams and ground water

Deethylatrazine/atrazine ratio in the White River, Indiana

⇒ Transformation of atrazine to DEA appears to occur primarily in soils

(Gilliom and others, 2006)

Use of Subsurface Residence Times to Understand Changes in Ground-Water Quality

Use of Ground-Water Residence Times to Study Geochemical Processes

Formation of DEA favored in areas with thicker unsaturated zones

**Thick
Unsaturated
Zone (>10 m)**

**Thin
Unsaturated
Zone (<2m)**

Ground water age (years)

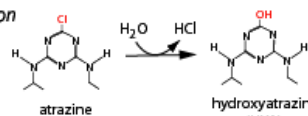

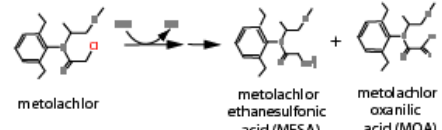

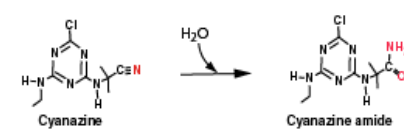

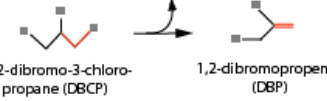

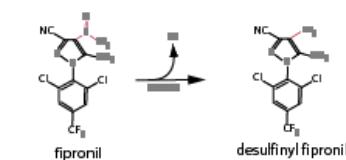

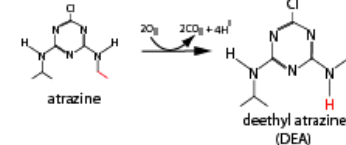

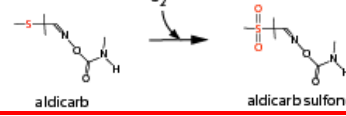

Ground water age (years)

(Tesoriero and others, 2007)

Evolution of Redox Conditions in Ground Water

Effects of Redox Conditions on Persistence

<u>Reaction Type</u>	<u>Example</u>	<u>Biotic or Abiotic?</u>	<u>NAWQA example (Reference)</u>
Nucleophilic substitution			
	<p>- By water (hydrolysis)</p>  <p>atrazine → hydroxyatrazine (HYA)</p>	Abiotic (mostly)	Upper Midwest (Kalkhoff and others, 2003)
	<p>- By glutathione enzyme (GSH)</p>  <p>metolachlor → metolachlor ethanesulfonic acid (MESA) + metolachlor oxanilic acid (MOA)</p>	Biotic	Hudson River Basin (Phillips and others, 1999)
Addition (hydration)	 <p>Cyanazine → Cyanazine amide</p>	Abiotic	Upper Midwest (Kalkhoff and others, 2003)
Elimination (dehydrohalogenation)	 <p>1,2-dibromo-3-chloropropane (DBCP) → 1,2-dibromopropene (DBP)</p>	Abiotic	San Joaquin-Tulare Basin (Burow and others, 1999)
Photolysis	 <p>fipronil → desulfinyl fipronil</p>	Abiotic	Acadian-Pontchartrain Basin (Demcheck and others, 2004)
Dealkylation	 <p>atrazine → deethyl atrazine (DEA)</p>	Biotic	White River Basin (Carter and others, 1995)
Oxidation	 <p>aldicarb → aldicarb sulfone</p>	Abiotic (mostly)	Lower Tennessee River Basin (Woodside and others, 2004)
Reductive dehalogenation	 <p>1,2-dichloropropane → 1-chloropropane + 2-chloropropane</p>	Biotic	Puget Sound Basin (Tesoniero and others, 2001)

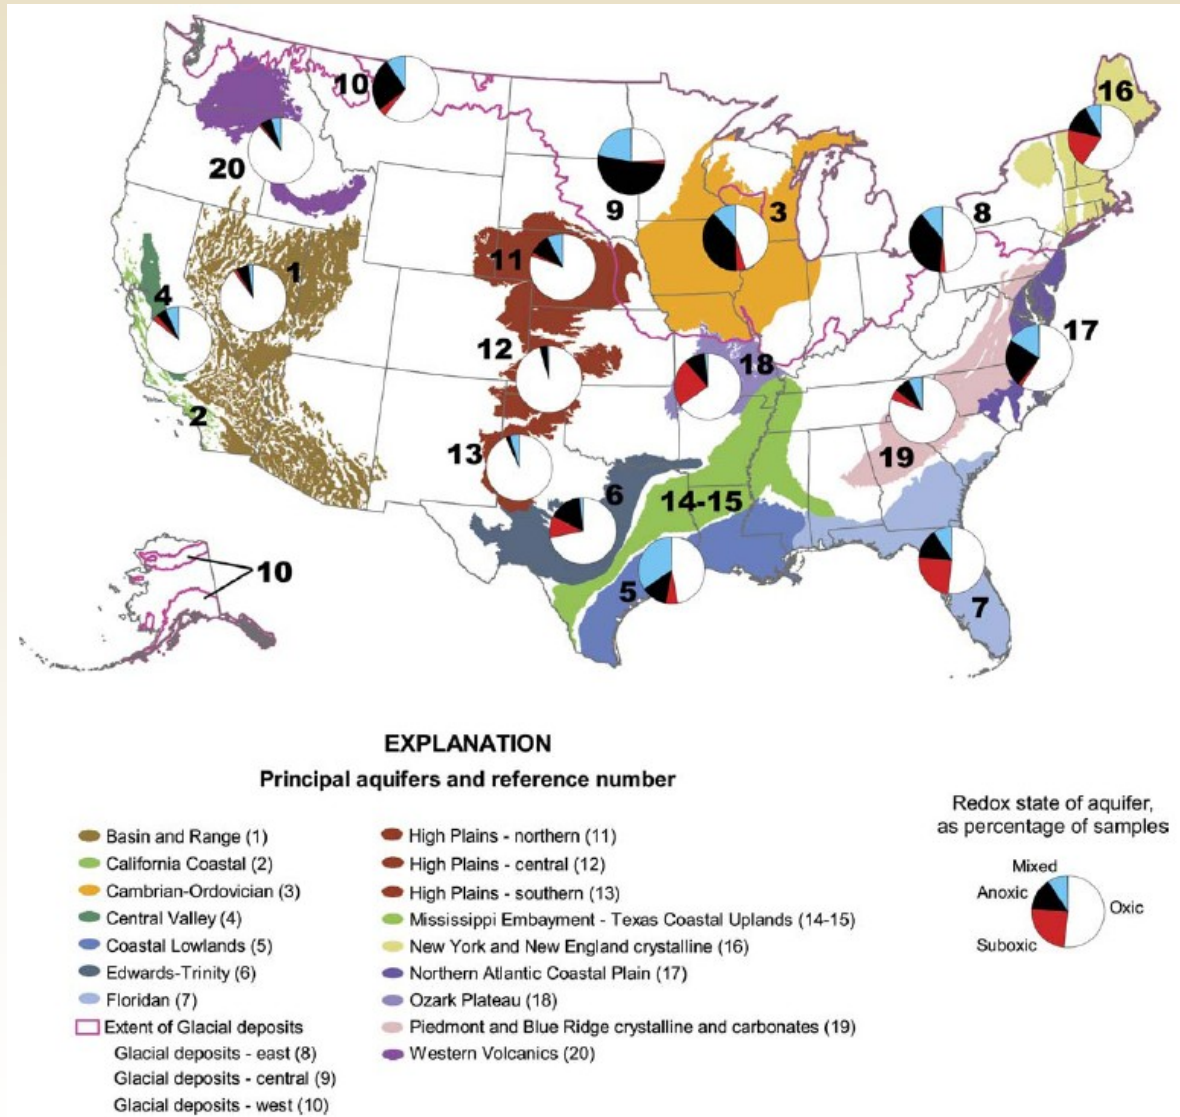

Scaling up from the Laboratory to the Field

Dechlorination of DCP to CP Requires Iron-Reducing Conditions
(Flow-system study in northwestern Washington)

(Tesoriero and others, 2001)

First National Map of Redox Conditions

(McMahon and Chapelle, 2007)

Consistent with previous studies, nitrate concentrations were lower under more reducing conditions

(McMahon and Chapelle, 2007)

Consistent with laboratory studies, the more heavily chlorinated (oxidized) VOCs were detected more frequently in oxic than in anoxic ground waters

Scaling up from the Laboratory to the Field

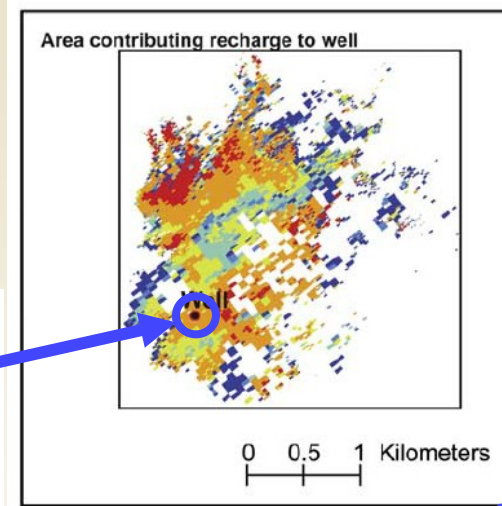

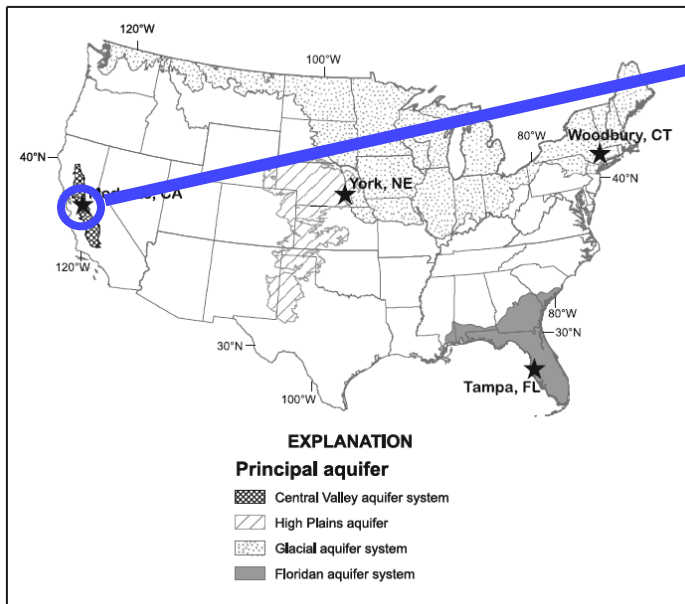

Dechlorination of Chloroform With Onset of Anoxic Conditions

(Zogorski and others, 2006)

Prediction of Contaminant Occurrence in Ground Water

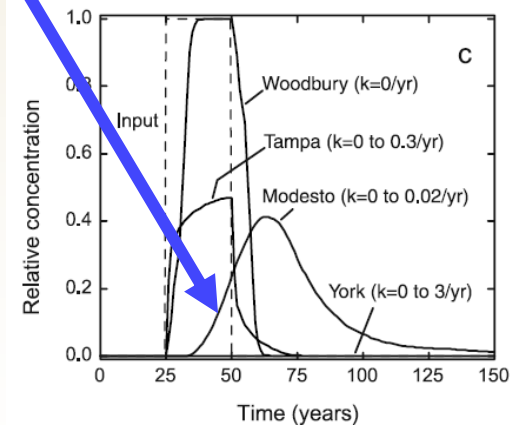

Solute Transport-and-Fate Simulations
(Burow and others, 2008; McMahon and others, 2008)

Explanation

- Public supply well
- Particle travel times (years)
- 8 to 20
 - 20 to 40
 - 40 to 60
 - 60 to 80
 - 80 to 100
 - >100

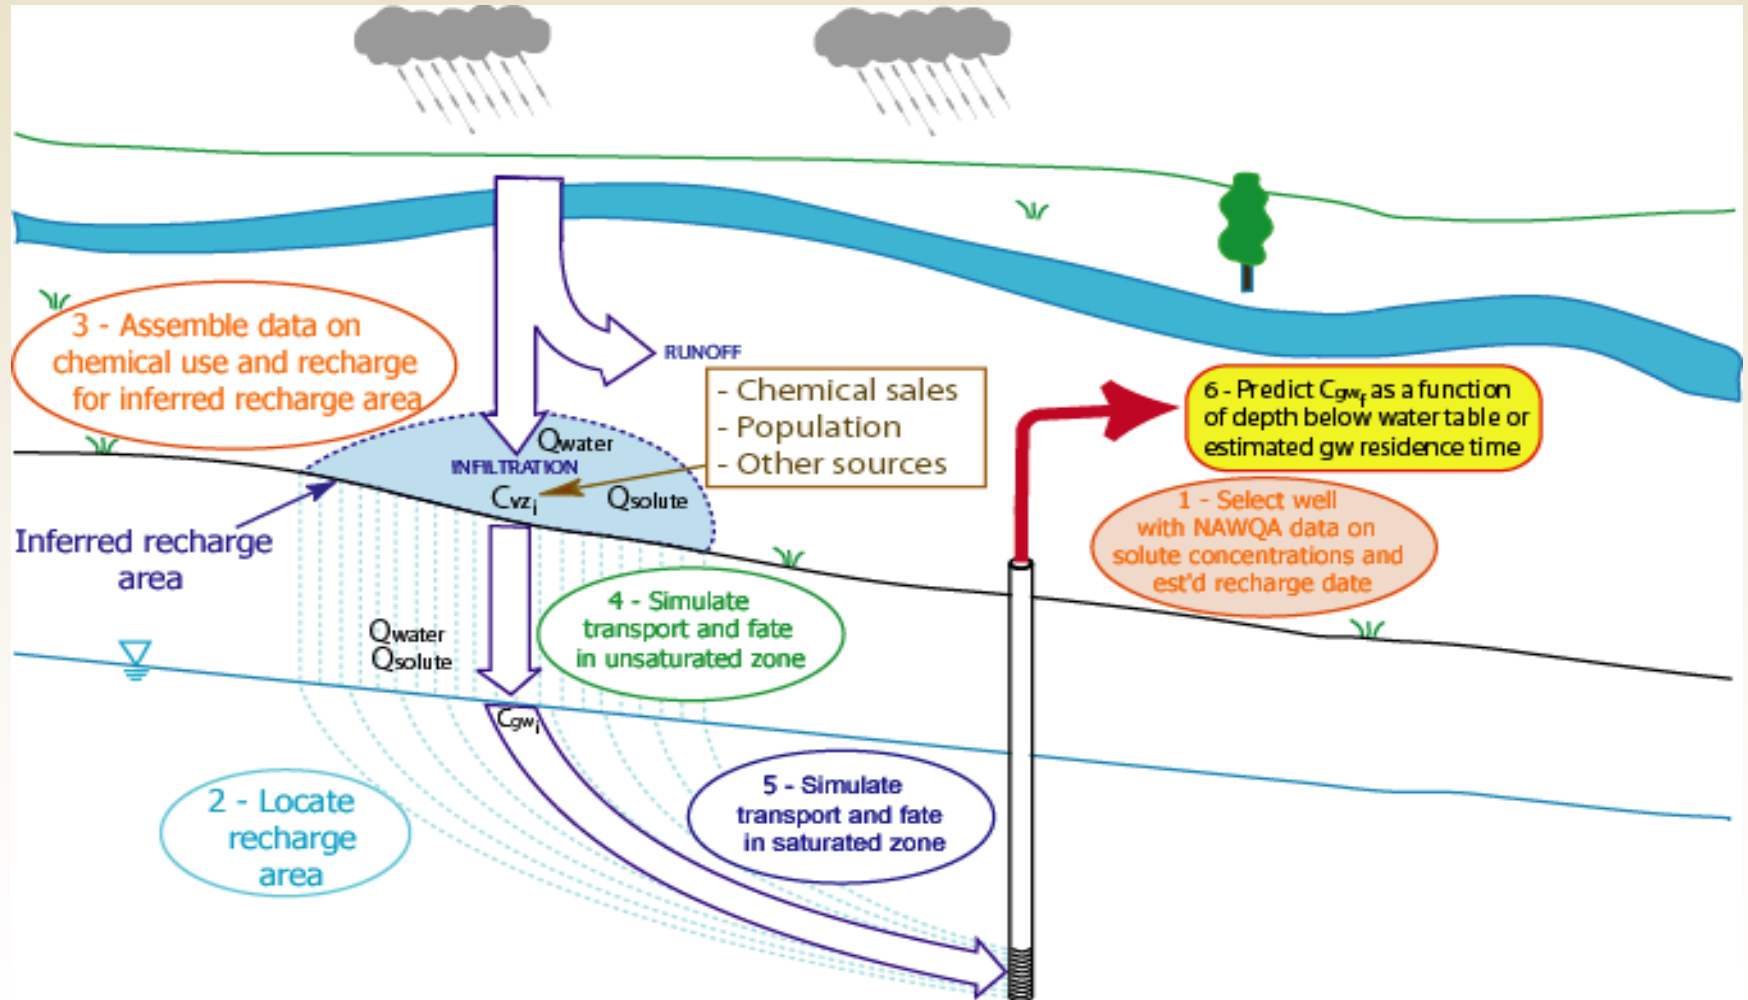

Modeled Age Distribution

Predicted nitrate concentrations over time

Putting It All Together

Proposed System for Predicting Ground-Water Vulnerability to Surface-Derived Contamination Across the United States

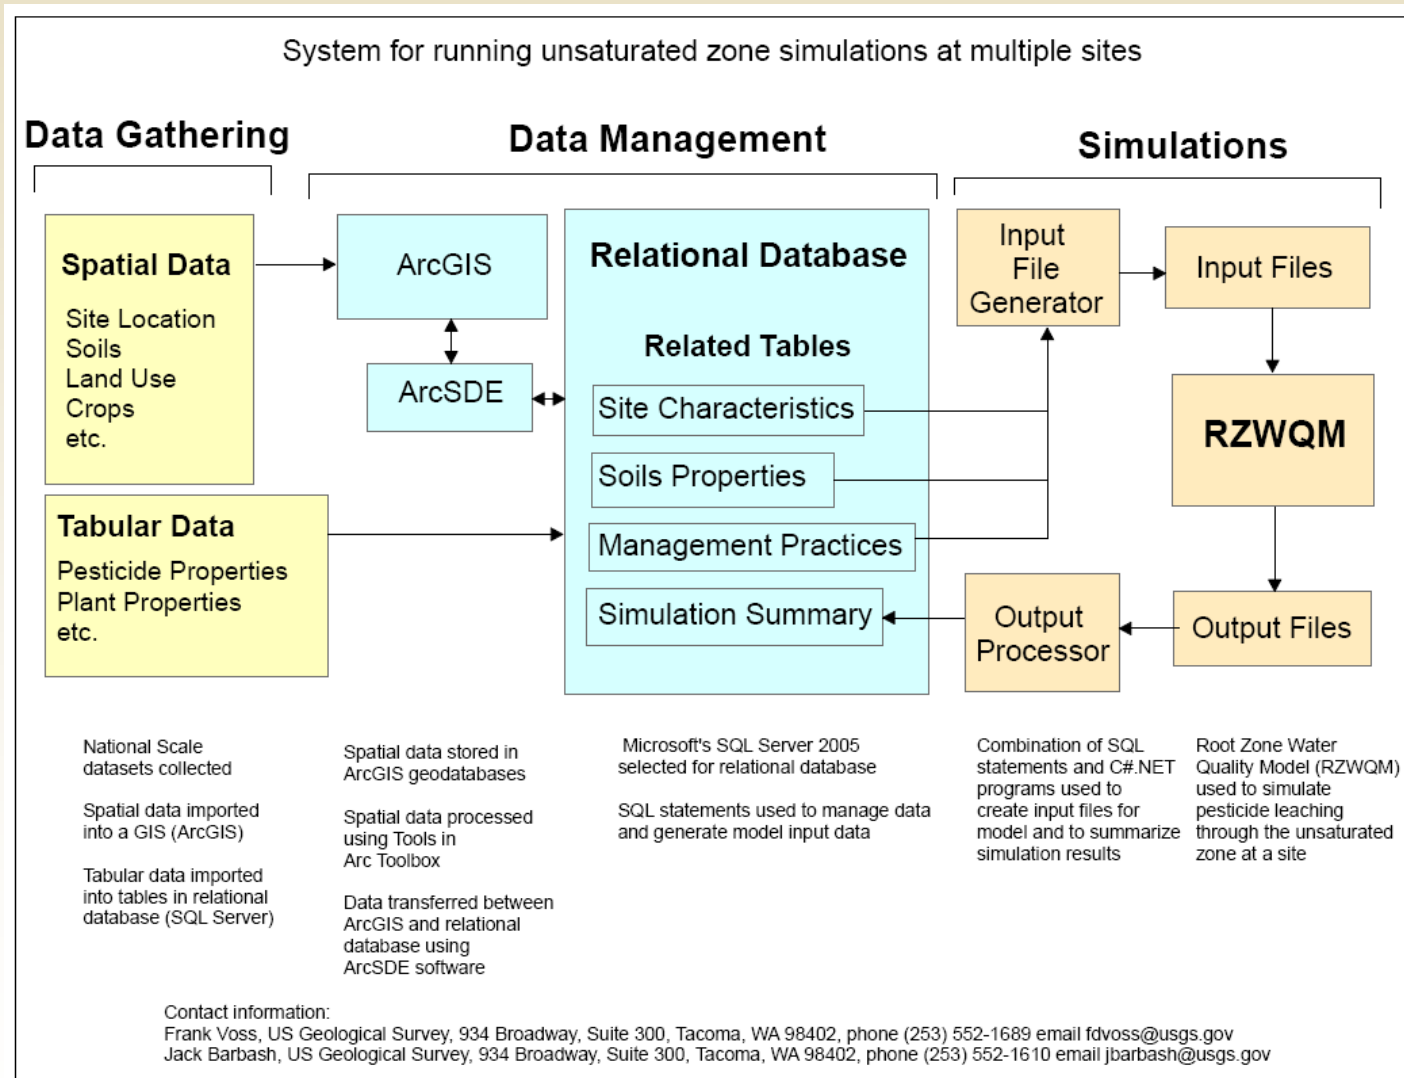

Comparisons of Vadose-Zone Model Predictions Against Field Observations

(White River Basin, Indiana – Uncalibrated simulations)

(Nolan and others, 2005)

Use of GIS-Linked Modeling to Predict Ground-Water Vulnerability to Surface-Derived Contamination Across the United States

New Contributions to Ground-Water Science from the NAWQA Program

- **Nationwide summaries of existing information**
- **Nationwide study design** → **Occurrence** → **Prediction**
- **Investigation of previously un(der)examined contaminants**
- **Nationwide investigation of trends**
- **Nationwide study of factors and processes controlling sources, transport and fate of contaminants (e.g., redox conditions)**
- **Use of solute transport-and-fate models to predict ground-water quality in multiple settings around the Nation**

Vat's Next?

- **Continued investigation of trends in ground-water quality**
- **Increased emphasis on the use of solute transport-and-fate models to:**
 - **Predict ground-water trends**
 - **Predict ground-water vulnerability to contamination**
- **Examination of other previously un(der)examined sources, such as:**
 - **Confined animal feeding operations (CAFOs)**
 - **Road salt**
 - **Septic systems**
- **Examination of other previously un(der)examined contaminants, such as:**
 - **Pharmaceuticals**
 - **Personal care products**
 - **Additional pesticides and degradates**
 - **Pesticide adjuvants (“inert” ingredients)**
