TABLE 3 and TABLE 4

**STEELHEAD OVER COLUMBIA AND SNAKE RIVER DAMS 1953-2003  
BY RUN-YEAR (JUNE 1 - MAY 31)**

**Information Below Concerns the Following Two Tables**

Estimating the size of the upriver steelhead run has previously been hampered because of the calendar year approach used in the summary tables. Problems in accountability arise due to overwintering behavior of summer steelhead, especially Snake River stocks, which often have sizeable proportions of the run remaining below mainstem projects during the winter months. Movement of these steelhead commences again the following spring when warming reservoir temperatures trigger upstream movement. For this reason, an additional table has been prepared that summarizes steelhead trout counts at each project on a "fish year" basis: June 1 - May 31. Because all stocks of steelhead cross Bonneville Dam during the calendar year, those summary counts have not been modified.

**Footnotes for the Following Two Tables**

\*Because counting started at each dam early in the year after construction was complete, these figures are for the latter part of the run year only. That part of the run year starting after June 1st the previous year passed the dams without being counted.

\*\*1981 was the last year visual counts were made at Little Goose Project until 1991.

## ADULT FISH FACILITIES OPERATING SCHEDULE

### ***Bradford Island Fish Ladder:***

01 Feb 03 – 26 Feb 03 Out of service (OOS) for winter maintenance.

### ***Cascades Island Fish Ladder:***

16 Dec 02 -- 28 Jan 03 OOS for winter maintenance.

### ***Second Powerhouse Fish Ladder:***

01 Dec 02—18 Jan 03 OOS for winter maintenance.

01 Dec 02 – 10 Mar 03 South Monolith OOS for B2CC construction.

09 Dec 03 – 31 Dec 03 OOS for winter maintenance.

### ***Adult Fish Facility***

25 Nov 02---04 Feb 03 OOS for winter maintenance and modifications.

14 May 03 – 14 May 03 OOS for rail pool modifications.

### ***Fishway Auxiliary Water Supply Turbines:***

#### ***Fish Unit 1:***

01 Nov 02 – 15 Apr 03 OOS for overhaul and stator rewind.

21 Jul 03 – 21 Jul 03 OOS for to mid season fishway dives at PH2.

#### ***Fish Unit 2:***

16 Dec 02 – 18 Jan 03 OOS for winter maintenance.

27 Jan 03 – 27 Jan 03 OOS for WA Shore collection channel inspection dive.

21 Jul 03 - 21 Jul 03 OOS for mid season fishway dives at PH2.

## DOWNSTREAM MIGRANT FACILITIES OPERATING SCHEDULE

### ***First Powerhouse:***

29 Jul 02 – 24 Mar 03 turned south.

09 Apr 03 – 10 Apr 03 OOS for small screen sweep maintenance.

10 Nov 03 – present turned south.

***Second Powerhouse:***

18 Dec 02 – 06 Feb 03      OOS for winter maintenance.  
02 Mar 03 – 10 Mar 03      OOS due to debris jam in the bypass flume.  
27 Mar 03 -- 27 Mar 03      SMF OOS for three way gate repairs.

**FISHWAY ACTIVITIES**

Pacific Northwest National Laboratory and BAE Systems evaluated the variation in fish losses through gaps at the top of the submerged traveling screens at Powerhouse two using an acoustic camera. Data gathered from this study will be used to evaluate fish guidance efficiency in modified and unmodified gate well slots.

The Columbia River Inter-Tribal Fish Commission (CRITFC) again used the second powerhouse Adult Fish Facility (AFF) to collect salmonids. Fish scales were sampled (to determine age) and biological data collected. The work helps satisfy a requirement of the U.S. - Canada Pacific Salmon Treaty to identify "indicator stocks". These stocks are monitored to annually evaluate the success of a program designed to rebuild depressed Columbia River salmon populations. All fish were immediately returned to the fish ladder.

The Oregon Department of Fish and Wildlife (ODFW) worked cooperatively with the CRITFC in the activity described above. They trapped steelhead to determine the hatchery to wild ratio and age composition as called for in the Columbia River Fish Management Plan. All fish trapped were immediately returned to the fish ladder.

The Washington Department of Fish and Wildlife (WDFW) jaw-tagged adult spring chinook at the AFF on the Washington Shore to use in the tooth net or tangle net studies in conjunction with the tangle tooth net fishery in Washington State.

The WDFW collected adult steelhead in the AFF. They trapped steelhead to determine the number and timing of ESA listed steelhead stocks passing Bonneville Dam. The study also assessed stock composition at Bonneville and in the treaty fishery. The study was required by the U.S. v. Oregon Technical Advisory Committee (TAC) which included NMFS and USFWS. All fish trapped were immediately returned to the fish ladder.

WDFW collected and tagged chum in the AFF. This study is to determine stock identification and to track the fish to the spawning grounds.

WDFW collected samples from pink salmon in the AFF. This study was to determine stock composition.

University of Idaho continued to radio tag and track chinook and steelhead at Bonneville. Data collected is used to assess fallback rates, passage times and routes and survival of salmonids through hydro-facilities as they continue to the Snake River.

The Fish Passage Center continued to coordinate a fishway inspection program that involved once per month fishway inspections by a National Marine Fisheries Service inspector at Bonneville.

PSMFC continued to maintain adult PIT tag detection in all fishways.

NOAA Fisheries (formerly NMFS) tracked lamprey through the project this year. Lamprey were also marked for evaluation of a lamprey ladder in the AWS channel at Bradford Island. Different configurations were tested to determine the best method for encouraging lamprey to exit that channel.

Pacific States Marine Fisheries Commission (PSMFC) used the juvenile bypass system fish sampling facilities at Bonneville to monitor passage of downstream migrants. Sampling ceased at the PH1 JBS on 31 July because of low fish numbers. PH2 JBS work included pit tag sampling and smolt indexing. All PH2 sampling ended on 31 October.

The NMFS supplied a flat plate PIT tag detector at the sampling tank at the first powerhouse smolt monitoring facility for the fourth year. The device is intended to provide 100% monitoring for PIT tagged fish. PIT tag detection at the second powerhouse monitoring facility was through the use of detector coils instead of a flat plate. These coils are part of the various transport flumes at the monitoring facility. PIT tag detectors were operated by PSMFC. PSMFC maintains a PIT tag information system to monitor juvenile salmonids in the Columbia River Basin.

ICFWRU evaluated physiological changes in migrating and transported Chinook salmon and effects on performance and survival. The study hypothesis was that a prolonged migration, in concert with the energy costs associated with dam passage and poor feeding conditions in the reservoirs, could deplete the energy reserves of the fish and reduce viability.

The following agencies participated at Bonneville Dam in the BPA funded Northern Pikeminnow management and research program. Pikeminnows are predators on juvenile salmonids and are believed to cause significant impact, particularly at locations such as the first powerhouse forebay, because prey and predators collect in large numbers.

- The Oregon Department of Fish & Wildlife (ODFW) sampled pikeminnow populations in many areas in the Columbia River including areas within Bonneville's boat restricted zones. Pikeminnow were collected by electrofishing from boats. ODFW is evaluating effectiveness of population control measures.
- The Washington Department of Fish & Wildlife implemented the sport reward fishery.

The WDFW and ODFW cooperated in conducting special fish counting again this year to estimate passage for tule and bright stock fall chinook. The numbers are used for in-season predictions and to assess final run size. This program was implemented in 1979.

The WDFW counted adult fish under contract with the U.S. Army Corps of Engineers. Fish were counted according to the schedule above for 50 minutes of each hour. The 50 minute totals were multiplied by a factor of 1.2 to estimate passage for each full hour.

Pelfrey Sturgeon Hatchery collected broodstock in Bonneville's tailwaters again this year. Their work is supported by ODFW.

**MONTHLY COUNT OF LAMPREY at  
BONNEVILLE DAM 1939<sup>1</sup> - 1969, 1997 - 2003**

Information concerning the lamprey count table.

The counts in the following table can be considered an approximation of trends, only. Lamprey are difficult animals to count in that they move back and forth in front of the fish count window. They also spend long periods of time resting. Lamprey also are more likely to pass at night than are salmon and for most of the years, fish counting took place only in the daytime. Further, during the 1970s, the count station was changed from a flash board counting system in which the fish passed over a white board to a vertical slot system in which the fish pass through a lighted window. This change could have made a difference in the counts. In addition, it is known that lamprey do not always use the fish ladder and may pass over a dam through several routes including the navigation lock and the auxiliary water supply.

Despite the lack of certainty in these counts, they can demonstrate approximate trends in migration patterns throughout the fish passage season and a rough estimate of population trends from year to year. Nevertheless, to determine present populations will require more study of these animals.

<sup>1</sup>No data are available for 1938.

<sup>2</sup>Because of changes in the Washington shore counting station, lamprey counts from 1938-1949 cannot be compared with counts from 1950 on.

<sup>3</sup>Because of the heavy shad run, fish counters were not asked to count lamprey from June 1 through July 27.

### ADULT FISHWAY OPERATING 2002 SCHEDULE

The following information includes fishway operation for calendar year 2003. Total length of time for annual fishway outages can be determined by referring to previous years' annual reports. "Out of service" indicates fish ladder dewatered and auxiliary water system off for routine annual maintenance. Dive inspections were conducted 8/4/03 and 8/7/03 at The Dalles, per Fish Passage Plan requirement, requiring a short period of fishway outage, with the auxiliary water system off.

### ADULT FISH FACILITY OPERATING SCHEDULE

#### *East Fishway*

Jan. 1 – Feb. 26	out of service.
Feb. 26 - Dec. 31	in service.

#### *North Fishway*

Jan. 1 - Jan. 13	in service.
Jan. 13 – Jan. 21	out of service.
Jan. 21 - Dec. 1	in service.
Dec. 1 – Dec. 31	out of service.

#### *Ice / Trash Sluiceway (Juvenile)*

Jan. 1 - Apr. 1	orifice flow.
Apr. 1 - Nov. 13	in service.
Nov. 13 - Dec. 1	day operation only.
Dec. 1 - Dec. 31	no flow.

#### *Spillway (Juvenile)*

Jan. 1 - Apr. 15	closed.
Apr. 15 - Aug. 31	24 hour spill for fish.
Aug. 31 - Dec. 31	closed.

## 2002 FISH RELATED DEWATERINGS

### *Fishway Dewatering Procedures*

Bulkheads are installed and drain valves open to dewater various areas of fishways. Fisheries personnel enter these areas to salvage fish that become entrapped. Minimal handling of fish is applied. Fish that are reluctant to vacate an area are captured and transported to the forebay or tailwater, depending on circumstances such as fish species, age class and stress levels. A follow up inspection is made to account for possible missed fish. Efforts are made to provide continual water supply during the entire operation to reduce fish stranding. Fishway areas not included on this list are inspected by divers to inspect equipment condition.

### *Fishway Dewaterings*

South entrance (1/15) - Annual inspection and maintenance. Thirteen lamprey, 5 sucker and 23 juvenile salmonids removed and released to tailwater.

North fishway auxiliary water system PUD intake (12/4) – Annual inspection and maintenance. Four juvenile steelhead removed and released to tailwater.

North fish ladder (12/1) – Annual inspection and maintenance. Two juvenile steelhead and 15 lamprey removed and released to forebay.

North fishway entrance (12/3) – For grating installation. No fish

### *Fishway Dives*

North and east fishway (1/16) – Annual inspection. Grating found in good condition.

North and east fishway (8/4) – Annual mid season inspection. Damaged grating found in collection channel at unit bay 13.

Collection channel repair (8/7) – Grating damage found on 8/4 repaired by replacement with new grating.

### *Turbine Dewatering Procedures*

Turbine dewatering for routine maintenance usually involves low numbers of fish, due to operational guidelines. If a turbine unit fails, operational guidelines cannot always be followed, which usually results in higher numbers of fish entrapment. Removal of fish from these areas has a greater fish stress risk due to handling. Procedures are continually analyzed to determine the best method for preventing fish stress or loss. Fish are removed from scroll case and draft tubes by fish bags. If numbers of fish are higher than two bags, transport tanks are placed in the draft tube gallery for transport by crane. Fish are released to tailwater either with bag and rope or tank and crane.

### ***Turbine Dewaterings***

Main turbine unit 17 (2/28) – Routine maintenance. One adult steelhead removed from scroll case. No fish found in draft tube.

Main turbine unit 7 (6/3) – Routine maintenance. One juvenile steelhead found in scroll case. Three catfish found in draft tube.

Fish turbine unit F2 (1/28) – Routine maintenance. No fish found in scroll case or draft tube.

### ***Navigation Lock Dewatering Procedures***

Navigation lock dewaterings for annual maintenance requires labor intensive fish removal efforts. It is impossible to remove fish from all areas of the navigation lock areas due to access limitations. Fish are removed from the supply conduits and the floor diffuser laterals. Fish are then removed by seine and dipnet and transported to a release site by tank.

### ***Navigation Lock Dewaterings***

Navlock dewater for annual inspection/maintenance (Mar.10-19) - Upstream gate area, no fish found.

## 2003, 2002, 2001- FISHWAY INSPECTION COMPARISON

Three adult fishway inspections are conducted per day during the adult fish passage season (March 1 to November 31). One adult fishway inspection is conducted per day during the non- passage season. Items shown in *italics* are inspected once per day. All other items are inspected during every fishway inspection. Guidelines are provided by the COE Fish Passage Plan. Weekly fishway status reports are provided throughout the year. Inspections of the John Day Smolt Monitor Facility are made once per two hours, 24 hours per day during the juvenile sampling season (April 1 to Mid Sept.) SMF status reports are included in the weekly fishway status report. Increased or continual problem areas indicated in red. Values are rounded to the nearest whole percent.

**Discussion**

Weirs 154-157 decrease in criteria performance due to automation problems. Maintenance was notified for fine tuning as much as possible. Margin of out of criteria was minimal, usually within 0.2' of criteria. Junction pool weirs were manual adjusted throughout the passage season. JP2 and JP4 were pulled from the water due to low tailwater elevations on several occasions. In combination, this resulted in a substantial decrease in criteria performance. Automation upgrades are planned prior to '04 passage season in attempts to resolve the problem. Investigation continues to determine hydraulic affects of JP weirs to the system. HELCRABS hydraulic modeling may provide some answers as to whether these weirs are needed. Adult radio-telemetry from past several years has not revealed passage problems in this area.

The east entrance E2 weir had a substantial decrease in criteria due to cable failure mid October. E2 was left closed and E3 was opened to compensate. Prior to the cable failure, out of criteria averaged 1%. The cable system is to be repaired prior to '04 passage season. Additionally, hoist system improvements will be added to all east and west entrance weirs to prevent similar failures.

The south entrance weirs S1 and S2 showed substantial improvement due to a hoist system improvement installed prior to the '03 passage season.

Collection channel velocity continues to have frequent slow areas at eth east end of the powerhouse. Attempts were made to improve these velocities many years ago with limited results. There are about 6 diffusers in that area which are broke in a partial open position. If they can be repaired and closed, an improvement may be made in this area. HELCRABS hydraulic modeling may also reveal some solutions if implementation is successful.

### ADULT FISHWAY OPERATING 2003 SCHEDULE

The following information includes fishway operation for calendar year 2003. Total length of time for annual fishway outages can be determined by referring to previous years annual reports. “Out of service” indicates fish ladder dewatered and auxiliary water system off for routine annual maintenance. Dive inspection was conducted on 8/5/03, per Fish Passage Plan requirement, requiring a short period of fishway outage, with the auxiliary water system off.

### ADULT FISH FACILITY OPERATING SCHEDULE

#### *South Adult Fishway*

Jan. 1 – Mar. 3	out of service.
Mar. 3 – Dec. 3	in service.
Dec. 3 – Dec. 31	out of service.

#### *North Adult Fishway*

Jan. 1 – Feb. 18	in service.
Feb. 18 – Mar. 6	out of service.
Mar. 6 – Dec. 31	in service.

#### *Smolt Monitoring Facility*

Jan. 1 – Mar. 31	out of service.
Mar. 31 – Sep. 16	in service.
Sep. 16 - Dec. 31	out of service.

#### *Juvenile Bypass System*

Jan. 1 – Jan. 23	in service.
Jan. 23 – Dec. 20	out of service.
Dec. 20 - Dec. 31	1/3 service.

#### *Spillway (Juvenile)*

Jan. 1 - Apr. 15	closed.
Apr. 15 - Aug. 31	intermittent spill for fish.
Aug. 31 - Dec. 31	closed.

## 2003 FISH RELATED DEWATERINGS

### *Fishway Dewatering Procedures*

Bulkheads are installed and drain valves open to dewater various areas of fishways. Fisheries personnel enter these areas to salvage fish that become entrapped. Minimal handling of fish is applied. Fish that are reluctant to vacate an area are captured and transported to the forebay or tailwater, depending on circumstances such as fish species, age class and stress levels. A follow up inspection is made to account for possible missed fish. Efforts are made to provide continual water supply during the entire operation to reduce fish stranding. Fishway areas not included on this list are inspected by divers to inspect equipment condition.

### *Fishway Dewaterings*

South fish ladder (12/3)- Annual inspection and maintenance. Two lamprey removed and released to tailwater.

Juvenile Bypass System (1/23) – Annual inspection and maintenance. One adult steelhead pushed to tailwater.

Collection channel bays 1-16 (2/6) – Annual inspection and maintenance. No fish found.

North fish ladder (2/18) – Annual inspection and maintenance. Approximately 600 adult steelhead and 12 juvenile steelhead pushed to tailwater. Removed 4 steelhead, 5 juvenile steelhead and 4 lamprey and released to forebay and tailwater. Umatilla tribes removed 238 lamprey for restocking efforts in Umatilla river. Approximately 1,000 lamprey removed from upper diffuser chamber and released to tailwater. Approximately 100 decomposed lamprey also found in diffuser chamber near count station.

Smolt Monitor Facility (6/26) – To evacuate adult fish from dewatering structure. Six sturgeon, 75 adult Chinook, 25 lamprey, 600 shad were pushed through the PDS fish drain to tailwater.

Smolt Monitor Facility (9/16) – Closed for winter. Approximately six sturgeon (~3'), 50 shad, 6 catfish, 500 lamprey, 100 adult steelhead and 150 adult chinook were pushed through the PDS fish drain to tailwater. One hundred forty one lamprey removed from flume and released to forebay the following day.

### *Fishway Dives*

North fishway (1/15) – Annual inspection. Grating found in good condition.

South and north fishway (8/5) – Annual mid season inspection. Grating found in good condition.

### ***Turbine Dewatering Procedures***

Turbine dewatering for routine maintenance usually involves low numbers of fish, due to operational guidelines. If a turbine unit fails, operational guidelines cannot always be followed, which usually results in higher numbers of fish entrapment. Removal of fish from these areas has a greater fish stress risk due to handling. Procedures are continually analyzed to determine the best method for preventing fish stress or loss. Fish are removed from scroll case and draft tubes by fish bags. If numbers of fish are higher than two bags, transport tanks are placed in the draft tube gallery for transport by crane. Fish are released to tailwater either with bag and rope or tank and crane.

### ***Turbine Dewaterings***

Main turbine unit 4 (1/8) – Routine maintenance. No fish found in scroll case. Approximately 95 catfish, 6 sturgeon removed from draft tube and released to tailwater.

Main turbine unit 13 (3/31) – Routine maintenance. One steelhead found in scroll case. No fish found in draft tube.

Main turbine unit 5 (5/19) – No fish found in scroll case. Draft tube not dewatered.

### ***Navigation Lock Dewatering Procedures***

Navigation lock dewaterings for annual maintenance requires labor intensive fish removal efforts. It is impossible to remove fish from all areas of the navigation lock areas due to access limitations. Fish are removed from the supply conduits and the floor diffuser laterals. Fish are then removed by seine and dipnet and transported to a release site by tank.

### ***Navigation Lock Dewaterings***

Navlock (3/10-3/19) – No fish found in supply conduits. Five adult steelhead removed from laterals and released to tailwater.

## 2003, 2002, 2001 FISHWAY INSPECTION COMPARISON

Three adult fishway inspections are conducted per day during the adult fish passage season (March 1 to November 31). One adult fishway inspection is conducted per day during the non- passage season. Items shown in *italics* are inspected once per day. All other items are inspected during every fishway inspection. Guidelines are provided by the COE Fish Passage Plan. Weekly fishway status reports are provided throughout the year. Inspections of the John Day Smolt Monitor Facility are made once per two hours, 24 hours per day during the juvenile sampling season (April 1 to Mid Sept.) SMF status reports are included in the weekly fishway status report. Increased or continual problem areas indicated in red. Values are rounded to the nearest whole percent.

### **Discussion**

The north entrance showed an increase in criteria performance, similar to 2001. Collection channel velocity is frequently low at the location of the velocity meter. However, subjective observation of flow in the channel does not show obvious slow velocities. Possible causes for this value are: faulty velocity meter, higher surface velocities than at depth, diffuser turbulence influence... Investigation will continue.

### FISHWAY ACTIVITIES

Adult chinook and steelhead were radio-tracked past the dam in 2003 as part of a broader, ongoing study to evaluate fish passage from below Bonneville Dam to above Lower Granite Dam.

Water temperatures were recorded hourly in eight locations within the adult fishways during the fish passage season. The purpose of this effort, ongoing since 1999, is to determine if thermal barriers exist and take corrective action if needed.

The control and electrical systems for the tilting weirs in the Washington shore fish ladder were upgraded during the winter outage. To ensure that the weirs operated properly after the new systems were installed, the forebay was briefly fluctuated through its full operating range (335 to 340 feet msl) in March. Similar work is scheduled for the Oregon shore ladder in 2004.

The juvenile fish facility was operated for juvenile fish transport/bypass and adult fallbacks from 18 March to 18 December.

**McNary Historic Fish Count Schedule 1954-2002 (information based on previous Annual Fish Passage Reports)**

16 hour counts occurred between the hours of 0400-2000 PST unless otherwise stated.

8 hour counts occurred between the hours of 0800-1600 PST unless otherwise stated.

## FISHWAY ACTIVITIES

Adult chinook and steelhead were radio-tracked past the dam in 2003 as part of a broader, ongoing study to evaluate fish passage from below Bonneville Dam to above Lower Granite Dam.

Water temperatures were recorded hourly in ten locations within the adult fishways during the fish passage season. The purpose of this effort, ongoing since 1999, is to determine if thermal barriers exist and take corrective action if needed.

Adult PIT tag detectors were installed around submerged orifices and vertical slots in both ladders during the winter outage.

The Walla Walla District continued a hydraulic evaluation of the adult fishways in 2003. The purpose was to analyze existing operating conditions and investigate alternatives to improve fish passage.

Three new AWS pumps and new diffusers were installed in the north shore ladder during the winter outage. The new pumps are 50% larger than the three old ones and only two pumps are needed to operate the fishway (one pump is a backup). The eight AWS pumps for the south shore ladder had their butterfly valves rehabbed and hydraulic systems upgraded.

The juvenile fish facility was operated for juvenile fish bypass and adult fallbacks from 17 March to 17 December.

Note: March counts were from video tape. The counts are 10-hour counts and occurred between the hours of 0600-1600 PST.

\*March 3 Missed counts from 0600 to 1000 hours at the North and South Shores due to an incorrectly programmed VCR.

\*March 25, 27-31 The turbidity level was very high; therefore, it was extremely difficult to observe fish passing the window.

\*March 26, missed counts from 0600 to 800 hours at the South Shore station due to a power failure that subsequently turned off the lights for the count window.

### FISHWAY ACTIVITIES

Adult chinook and steelhead were radio-tracked past the dam in 2003 as part of a broader, ongoing study to evaluate fish passage from below Bonneville Dam to above Lower Granite Dam.

Water temperatures were recorded hourly in nine locations within the adult fishways during the fish passage season. The purpose of this effort, ongoing since 1999, is to determine if thermal barriers exist and take corrective action if needed.

The Walla Walla District continued a hydraulic evaluation of the adult fishways in 2003. The purpose was to analyze existing operating conditions and investigate alternatives to improve fish passage.

AWS pump 2 was rehabbed (turbine, gearbox, and the pump itself) during the winter outage. Pump 3 was rehabbed in 2002 and pump 1 will be done in 2004.

The juvenile fish facility was operated for juvenile fish transport/bypass and adult fallbacks from 24 March to 16 December.

### Lower Monumental Historical Fish Count Schedule 1969-2002 (information based on previous Annual Fish Passage Reports)

16 hour counts occurred between the hours of 0400-2000 PST unless otherwise stated.

8 hour counts occurred between the hours of 0800-1600 PST unless otherwise stated.

### FISHWAY ACTIVITIES

Adult chinook and steelhead were radio-tracked past the dam in 2003 as part of a broader, ongoing study to evaluate fish passage from below Bonneville Dam to above Lower Granite Dam.

Water temperatures were recorded hourly in six locations within the adult fishway during the fish passage season. The purpose of this effort, ongoing since 1999, is to determine if thermal barriers exist and take corrective action if needed.

The Walla Walla District continued a hydraulic evaluation of the adult fishway in 2003. The purpose was to analyze existing operating conditions and investigate alternatives to improve fish passage.

A turbine for one of the three AWS pumps was replaced during the winter outage. The windows in the fish ladder viewing room and fish counting slot were also replaced.

The juvenile fish facility was operated for juvenile fish transport/bypass and adult fallbacks from 18 March to 18 December.

### Little Goose Fish Count Schedule 1970-2003 (information based on previous Annual Fish Passage Reports)

16 hour counts occurred between the hours of 0400-2000 PST unless otherwise stated.

8 hour counts occurred between the hours of 0800-1600 PST unless otherwise stated.

### FISHWAY ACTIVITIES

Adult chinook and steelhead were radio-tracked past the dam in 2003 as part of a broader, ongoing study to evaluate fish passage from below Bonneville Dam to above Lower Granite Dam.

Water temperatures were recorded hourly in seven locations within the adult fishway during the fish passage season. The purpose of this effort, ongoing since 1999, is to determine if thermal barriers exist and take corrective action if needed.

Adult PIT tag detectors were installed around submerged orifices and vertical slots in the ladder during the winter outage.

The Walla Walla District continued a hydraulic evaluation of the adult fishway in 2003 to analyze existing operating conditions and investigate alternatives to improve fish passage.

NOAA Fisheries operated the adult fish trap from March 3 to August 1 and September 9 to November 20. The trap was shut down during the warmer part of the summer due to high water temperatures. The trap was used for coded wire tag detection, sort-by-code, reconstructing the fall chinook run, radio tagging coho and steelhead, evaluation of fish transportation, sampling for headburns, and recapturing radiotagged chinook and steelhead.

The gearbox for AWS pump 1 was replaced and various modifications were made to pumps 2 and 3 during the winter outage. The windows in the fish ladder viewing room and fish counting slot were also replaced.

The juvenile fish facility was operated for juvenile fish transport/bypass and adult fallbacks from 19 March to 18 December.

## **FISH LADDER OPERATING AND MAINTENANCE SCHEDULE – WANAPUM DAM**

### ***Left Bank Ladder***

01 Jan – 14 Jan	Out of criteria for annual inspection, maintenance and control system repairs.
15 Jan – 04 Dec	In service.
05 Dec – 31 Dec	Out of criteria for annual inspection, maintenance and repairs.

### ***Right Bank Ladder***

01 Jan – 15 Jan	Out of criteria for annual inspection, maintenance and repairs.
16 Jan – 31 Dec	In service.

Note: Out of criteria dates provided above reflect those periods of time when the adult fishway was out of operational flow and/or head differential criteria. Upstream passage is possible for one to several days before and after the indicated dates.

## **FISHWAY ACTIVITIES**

The Public Utility District No. 2 of Grant County conducted 24-hour fish counts at Priest Rapids Dam, using three 8-hour shifts from 15 April through 15 November 2003. Counts were made at both ladders using visual observations at the count boards each day of the week. No adult counts are taken at Wanapum Dam although the PUD is testing a video counting system at the hydro project.

The adult fishway automation project at Priest Rapids Dam has been completed and the Wanapum Dam project will require several more years to complete.

The Mid-Columbia Coordination Committee approved to permanently close all collection channel orifice gates at Wanapum and Priest Rapids Dams in 2001. Main slotted entrances at the end of the channel remain open.

With agency support, the PUD installed an adult PIT tag detector system and in ladder equipment for adult video counts at Priest Rapids Dam. The PIT tag detector system became operational on April 1 at both fishways. No adult video fish counts were taken.

Washington Department of Fish And Wildlife trapped and examined steelhead at the Priest Rapids Dam coded wire tag trapping facility from 22 July through 13 November. The trap was operated 8 hours a day usually every Tuesday and Thursday. During this operation, the Yakama Indian Nation trapped and radio tagged coho at the trapping facility.

The Priest Rapids Hatchery did not trap broodstock at Priest Rapids Dam. At fish agency request, removal of the left bank hatchery trapping facility was completed in 2003.

**Priest Rapids Historic Fish Count Schedule 1988-2002 (information based on previous Annual Fish Passage Reports)**

16 hour counts occurred between the hours of 0400-2000 PST unless otherwise stated.

8 hour counts occurred between the hours of 0800-1600 PST unless otherwise stated.

### FISHWAY ACTIVITIES

The Rock Island Bypass Trap was operated from April 1 through August 31. Juvenile fish were sampled daily during this time period.

Noise monitoring was completed in 2003 for the installation of the PIT tag detectors in the adult fishway. Final installation will be completed in March 2004.

Chelan County PUD was involved in a radio telemetry study to determine the migratory patterns of adult bull trout. The fish were monitored as they passed Rocky Reach and Rock Island dams and migrated up and down the Entiat and Wenatchee rivers. The PUD also assisted the Yakama Nation with monitoring the passage of radio-tagged adult coho at both projects.

### FISH COUNTING SCHEDULE

Jan 1 - Apr 13	No counting.
Apr 14 - Nov 14	Video recording 24 hours per day/7 days a week. Video counting daily 0700 - 1530 hours Pacific Standard Time.
Nov 15 - Dec 31	No counting; video recording 24 hours per day/7days a week to monitor bull trout passage at Rocky Reach Dam only.

---

### FISH LADDER OPERATING SCHEDULE

Jan 2 to Feb 28 - Fishway out of service for annual maintenance
Mar 1 to Jan 1 - Fishway in service

---

### FISHWAY ACTIVITIES

The juvenile fish bypass system was operated for fish passage from April 1 to August 31, 2003. Juvenile fish sampling was conducted throughout the entire operation. The annual bypass evaluation included radio tag releases and collection of data on species composition and fish condition. Chelan County PUD completed construction of the new juvenile fish bypass (production) system in late March 2003.

Chelan County PUD was involved in a radio telemetry study to determine the migratory patterns of adult bull trout. The fish were monitored as they passed Rocky Reach and Rock Island dams and migrated up and down the Entiat and Wenatchee rivers. The PUD also assisted the Yakama Nation with monitoring the passage of radio-tagged adult coho at both projects.

## WELLS DAM

---

### FISH COUNTING SCHEDULE

Adult counting schedules at Wells are from May 1 through November 15. Fish passage is assessed by reviewing a videotape record made the previous day. Passage by species and ladder is made for each hour of the day. Counts between 1967 and 1997 were reported for 16 hours (0500 – 2100 PST). Starting in 1998, as per the request of the Wells Coordinating Committee, counts were reported in a 24 hour (0000 – 2400) format. Either format is available upon request from Douglas PUD. Chinook are separated into three populations based upon date of passage through the ladders. Spring Chinook pass from May 1 through June 28, Summer Chinook between June 29 and August 28, and Fall Chinook from August 29 through November 15.

---

### DESCRIPTION OF THE ADULT PASSAGE FACILITIES

The two fish ladders at Wells Dam are conventional staircase type fish ladders with 73 pools. The ladders are located at the east and west endwall of the dam. The lower 56 pools discharge a constant 48 cfs dropping one foot at each pool into the attraction chamber in the lower ladder. Discharge from one pool to another is over a seven foot wide overflow section in the wall between pools with additional flow through two 18 inch by 15 inch submerged orifices. Pools 67 and 68 have adult PIT tag detection weirs that interrogate passage of all adults just prior to the ladder exit. Information on PIT tag detection of adults using both east and west ladders is found on the PTAGIS web page ( <http://www.pittag.org/web/Adult/index.html> ). Pool No. 64 of both fishways contain facilities for counting fish. The main features of this facility are a counting room with an observation window adjacent to the fish ladder, a telescoping gate and light panel are used to guide the fish closer to the observation window. At Pool No. 40 of the ladders are provisions for sorting and trapping various species of fish. The fisheries agencies and tribes develop broodstock collection protocols at the beginning of each season for collection of spring and summer chinook, sockeye and coho salmon and summer steelhead. These plans are submitted annually to the Wells Coordinating Committee.

At the bottom of the fish ladder, projecting downstream from the line of the hydrocombine is the portion of the endwall structure, which incorporates the functions of fish attraction and collection. Two-turbine pumps deliver attraction flow to the water supply chamber located adjacent to the ladder. The total flow from the turbine pump(s) plus the 48 cfs coming down the ladder from the reservoir is discharged to the tailwater through a single fish attraction opening per ladder. These openings are eight-foot wide vertical slot openings with vertical miter gates. Originally an additional set of side gates were provided. Ladder entrances were designed to have the side gate be open at 2 – 4' and the end gate would automatically adjust its width to maintain a one foot differential in the collection chamber. Since July 1970, the side gate has been set at a four foot

opening with the end gate fixed at six feet. A 1.5 foot differential is maintained as the two turbine pumps adjust output. On June 29, 2000, the joint fisheries parties agreed to have the side entrances permanently closed. This decision was based upon several years of radio telemetry studies with various species of anadromous fish that showed improved passage times with the side gates closed.

## **FISH LADDER OPERATING SCHEDULE**

Annual maintenance is performed on the ladders at Wells to clean the ladder of debris and service the attraction flow pumps. During this time the ladders are taken out of service and de-watered. The dates of this work in 2003 were as follows:

### **West Ladder**

January 1 through January 22, 2003 Inspection & Maintenance

December 2 through December 31, 2003 (Outage will extend into 2004)

### **East Ladder**

January 27 through February 20, 2003 Inspection and Maintenance

## **JUVENILE PASSAGE FACILITIES**

The juvenile Bypass at Wells Dam uses the hydrocombine design of the dam by modifying five of the eleven spill bays. The even number spill bays are partially constricted with barriers that improve the attraction flow from the forebay into the spill bay area. Up to 11,000 cfs of water is made available for bypass flow during the juvenile migration.

The operation of the bypass in 2003 was coordinated with the Wells Habitat Conservation Plan Coordinating Committee and with the Wells Coordinating Committee. In the past hydroacoustics and fyke netting have provided information on real time data of the fish migration. The fixed dates agreed to by both committees were established from 21 years of hydroacoustic and 14 years of species composition information collected on juvenile run patterns at Wells Dam. The spring period ran from April 12 through June 13 for a total of 63 days and a total discharge of 1.0 MAF, or 6.5% of total project discharge. The summer bypass started on June 14 and ran through August 26 for a total of 74 days and a project discharge of 1.1 MAF or 6.6% of the total discharge.

## **MISCELLANEOUS**

In 2003, radio telemetry receivers were monitored at Wells Dam for a Chelan PUD study with Bull Trout and a Yakama Indian Nation study with coho. Antenna and receiving

units were installed at Wells Dam as well as in neighboring tributaries. Information from these two studies is still being analyzed.

2003 was the sixth highest total passage of salmonids from the 36 years of passage records since the completion of the dam in 1967, based upon the historical 16-hour count format. It was the second largest year for summer chinook with over nine times the average value. It was also a very high count for lamprey. Average lamprey passage for the past five years (1998 – 2003) is 235. In 2003, there were 1,408 lampreys that ascended Wells Dam.
