SUPPLEMENTARY PERTINENT DATA OF SURROUNDING PROJECTS

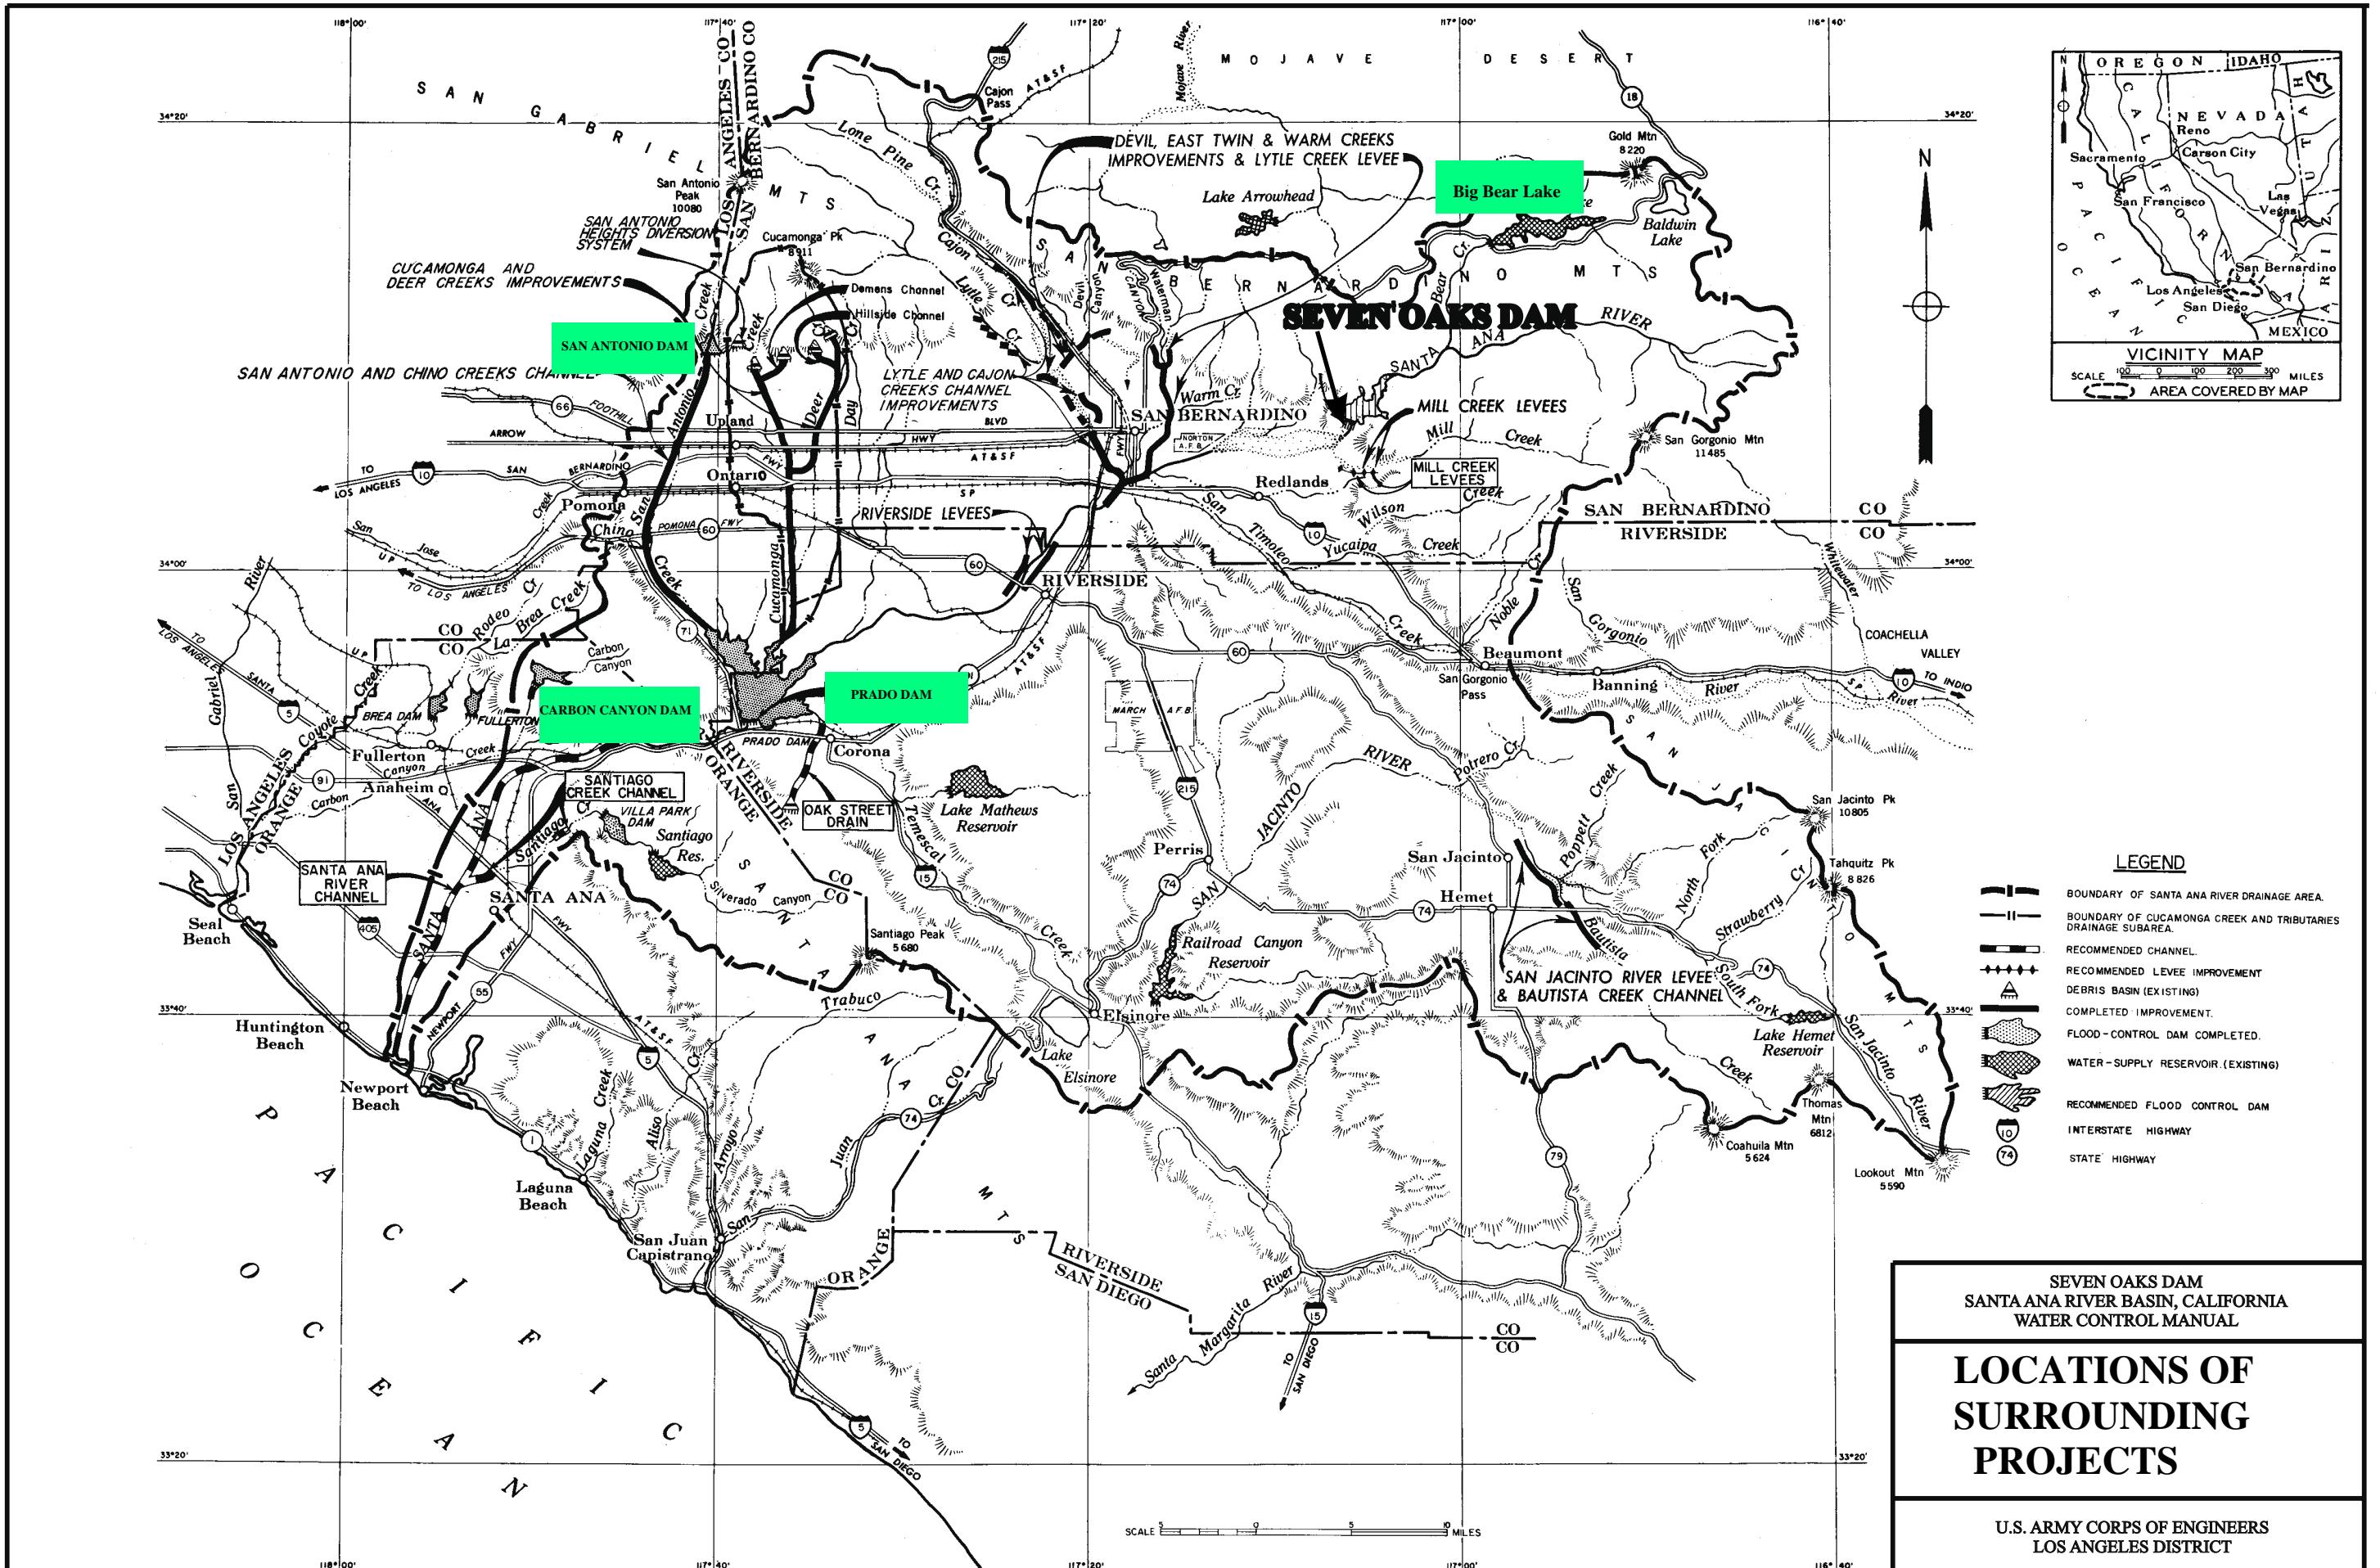

EXHIBIT C PLATE

*Approved 1/22/98***BEAR VALLEY DAM EMERGENCY ACTION PLAN****PREPARATION REPORT****INTRODUCTION**

This report was written in conjunction with the preparation of the Bear Valley Dam Emergency Action Plan (EAP) in order to document the assumptions and conclusions necessary for preparation of that document. The report describes the project, regulatory jurisdiction, dam stability, hazard classification, failure modes, flood hydrology and inundation, early warning and contains photographs of facilities that would be at risk in the event of a dam failure.

The EAP was prepared by reviewing all documentation at the BBMWD offices, telephone conversations with the U.S. Forest Service (USFS), U.S. Army Corps of Engineers (COE) and the State of California, Office of Emergency Services (OES), and included a visit to the office of the California Department of Water Resources, Division of Safety of Dams (DSOD). The EAP adheres to guidelines set by OES, DSOD and the federal government.

PROJECT DESCRIPTION

Bear Valley Dam is a 91-foot(ft) high, concrete, multiple arch structure with a crest length of 360-ft. The dam was constructed in 1911 as a replacement of an old masonry arch dam located about 200-ft upstream. The dam impounds a reservoir with a volume of 73,320 acre-feet(ac-ft), covering an area of 2,973-acres(ac) at a normal maximum water level (NMWL) of El 6743.2. The service spillway consists of five 4.0 x 6.0-ft rectangular openings located in bays 1 and 10, with a sill at El 6736.2 and a maximum discharge of 2,630 cubic feet per second (cfs) at reservoir El 6743.33. The openings are controlled by wooden slide gates which are raised by hand wheels. The outlet works consists of one 36-inch diameter conduit regulated by two gate valves, a 14" and a 24" gates, located at El 6666.0, and has a discharge capacity of 250 cfs. In 1924, the State Department of Transportation (CALTRANS) built a bridge across the crest of the dam. The dam was rehabilitated in 1988 to meet DSOD safety requirements by filling in the multiple arch barrels with mass concrete, thereby converting the dam into a virtual gravity structure. As part of the rehabilitation, the construction of an emergency spillway was begun in three bays near the center of the dam, with a sill at El 6731. This spillway will not be fully operational until the state highway is removed from the dam. It will include the installation of three (3) gates, each approximately 13' x 19', which will provide for the release of approximately 15,000 cfs. It is estimated that Caltrans will construct a new bridge by the year 2002, at which time this spillway can be completed. Management of the dam, bottom of the reservoir and Lake level are by Big Bear Municipal Water District. However, the water rights remain with Bear Valley Mutual Water Company in Redlands.

BEAR VALLEY DAM EMERGENCY ACTION PLAN**REGULATORY AUTHORITY****U.S. Forest Service (USFS)**

Since Bear Valley Dam is located within San Bernardino National Forest, it falls within the jurisdiction of the USFS. The EAP was prepared in response to a letter from the USFS to the General Manager of the BBMWD, dated 28 February 1994. The USFS was consulted as to the scope and content of the EAP.

State of California, Department of Water Resources, Division of Safety of Dams

All privately owned dams in the state of California fall within the jurisdiction of the Division of Safety of Dams (DSOD). The DSOD is responsible for assigning a hazard classification to each dam and Bear Valley Dam has been classified as High Hazard. The state requires that all high hazard dams, have a breach analysis performed, the resulting flood routed downstream and flood inundation maps prepared. This work was done for Bear Valley Dam in 1974 and the work was accepted by the DSOD. Since that time the responsibility for flood inundation mapping has passed to the State Office of Emergency Services (OES).

State of California Office of Emergency Services

The EAP was prepared in accordance with the Standard Emergency Management System (SEMS) Regulations, California Regulations, Title 19, Division 2, OES.

U.S. Corps of Engineers (COE)

The COE is currently constructing Seven Oaks Dam approximately 15 miles downstream from Bear Valley Dam on the Santa Ana River. When completed the dam will be 550-ft high with a crest length of 2,630-ft and a width of 40-ft at El 2610. The dam is a zoned rockfill embankment with an upstream slope of 2.2:1 and a downstream slope of 1.8:1. The outlet works is 18" in diameter and has a discharge capacity 7,000 cfs. The ogee type ungated spillway is located in the right abutment with a crest length of 560-ft at El 2580. The dam is designed to safely pass the probable maximum flood (PMF) with a peak discharge of 180,000 cfs and a maximum reservoir level at El 2605. The reservoir is sized for 32,000 ac-ft of sediment storage, 145,600 ac-ft of active storage to spillway elevation, and a flood surcharge of 145,600 ac-ft.

DAM STABILITY

The stability of the rehabilitated Bear Valley Dam was verified in the Report on Structural Analysis of Rehabilitation by R.W. Beck and Associates in December 1987. It determined that the factor of safety during the two extreme loading conditions is as follows:

	<u>Factor of Safety</u>	<u>Required</u>
Seismic Loading	>2.1	1.0
PMF Loading	>2.0	1.0

BEAR VALLEY DAM EMERGENCY ACTION PLAN

This means that the likelihood of Bear Valley Dam failing in either an extraordinary seismic event or flood is extremely remote.

HAZARD CLASSIFICATION

Bear Valley Dam is classified as High Hazard by DSOD and the USFS which is defined as "failure, no matter how improbable, would result in the loss of life or excessive economic loss". Although the hazard posed by a dam break at Bear Valley will be reduced once Seven Oaks Dam is completed in 1999, more than likely the dam will maintain its High Hazard classification because of the continued threat posed to campers and recreational users in Bear Creek Canyon between the dam and Seven Oaks Dam.

MODE OF FAILURE

Concrete dams can fail due to sliding along the foundation, shearing through the dam, excessive cracking, overturning or failure of an abutment. In any of these modes failure must be considered to be instantaneous. There would be few, if any, precursors of dam failure. Extreme loads that could induce failure through one of the modes described above could be imparted by a large earthquake or during overtopping of the dam during a large flood.

DOWNSTREAM IMPACTS

An inspection of the canyon formed by Bear Creek and the Santa Ana River downstream of Bear Valley Dam as far as the site of Seven Oaks Dam revealed it to be devoid of permanent human habitation. However the following facilities exist in this stretch of the canyon which would certainly be affected by the failure of Bear Valley Dam:

Campgrounds

The USFS maintains several campgrounds for public use along Bear Creek downstream of Bear Valley Dam:

Siberia Creek Campground

The campground consists of one metal firepit and is located on a small terrace on the left bank of Bear Creek about 20-ft above stream bed, at approximately El 4760. The campground is very remote and can only be reached on foot, however there are signs that the campsite is being frequented.

Slide Lake Campground

The campground consists of several rock ringed fire pits and, is located on the right bank of Bear Creek just above boulder strewn stream bed at approximately El 3860. The site is accessible by vehicle. The campground was unoccupied at the time of the inspection, however it showed signs of frequent visitation and vandalism. The campground would be inundated by a flood of moderate size with or without the failure of Bear Valley Dam,

BEAR VALLEY DAM EMERGENCY ACTION PLAN

as it is located upstream of a large rock slide emanating from Slide Peak which has formed a natural dam across the creek. A high water mark can be observed along the banks of the creek upstream indicating the level the water in the lake reaches during large flood events of around El 4000.

Bear Creek Campground

Bear Creek Campground is a poorly defined collection of rock ringed fire pits in the flood plain of Bear Creek at about El 3520, just upstream of the confluence with the Santa Ana River. It is accessible by vehicle and shows signs of frequent visitation and vandalism. The campground would be flooded by moderate floods irrespective of failure of the dam.

Santa Ana River Hydroelectric System

The Santa Ana River Hydroelectric System consists of a sequence of interconnected intakes, aqueducts and powerhouses. The project was built in the late 1800's and early 1900's. The system is owned and operated by Southern California Edison (SCE).

Intake, Aqueduct and Powerhouse No. 1

The intake is located on the left bank of Bear Creek and the aqueduct, consisting of a steel pipe, immediately bridges the creek before entering a series of flumes and tunnels on the right bank of the creek. It is likely that this pipe crossing would be destroyed by any large flood irrespective of the failure of Bear Valley Dam.

It was not possible to visit powerhouse No.1 during the site visit, however judging from its location near the river, heavy damage could be expected during a large flood. The powerhouse is unmanned but occasionally visited by SCE operation and maintenance personnel.

Intake, Aqueduct and Powerhouse No.2

Powerhouse No. 2 and a portion of the aqueduct are located below El 2605, the maximum water level of Seven Oaks Reservoir during passage of the PMF. Therefore this facility is scheduled to be abandoned and would no longer be impacted by a flood caused by the failure of Bear Valley Dam.

FLOOD HYDROLOGY AND INUNDATION

Various reports on flood hydrology were reviewed including "Dam Inundation Study" prepared by CM Engineering Associates in 1974, and the following observations were made:

- The maximum flow (Q_{max}) used in the 1974 inundation study agrees well with current OES criteria.
- Current OES criteria calls for superimposing the failure hydrograph on a concurrent 10-year discharge in the downstream channel. The 1974 inundation study assumed no downstream

BEAR VALLEY DAM EMERGENCY ACTION PLAN

inflow. Inflow to Bear Creek and the Santa Ana River downstream of the dam can be assumed to be less than 1% of the peak flow and therefore would have an insignificant impact on flooding.

- Information on the dam breach hydrograph modeled in 1974 was not available, although the report states that it was computed using OES criteria. Since the current and 1974 Qmax values agree well, it can be assumed that the hydrograph criteria from OES were properly applied and would be consistent with current criteria.
- Results of hydrograph routings were not included in the 1974 report. Routing was performed using the Convex Method and the Storage-Indication Method according to the text. A current analysis would use HEC-1 and apply the Modified Puls (normal depth) or Muskingum-Crage Methods. All are based on the same theory and should give similar results if properly applied. The narrow valley between Bear Valley Dam and Seven Oaks Reservoir will not produce large flood routing attenuation, so this part of the analysis is not expected to be critical.
- Volume of Big Bear Lake is 73,320 ac-ft at the spillway crest. Volume of Seven Oaks Reservoir is 112,000 ac-ft at the spillway elevation and 138,000 ac-ft at the crest elevation. Therefore, it can be concluded that Seven Oaks Dam would not overtop if Bear Valley Dam were to fail. Therefore, BBMWD should not be responsible for analyzing flood inundation downstream of Seven Oaks Reservoir. Such flood inundation responsibility rests with the COE.
- The inundation map in the 1974 study only indicates flood boundaries. Current OES criteria requires maps to contain the following information:
 - flood boundaries
 - flood elevations at cross sections
 - peak discharge at cross sections
 - flood peak travel time at cross sections
 - flooding time and deflooding time at cross sections (when flow leaves the channel on the rising hydrograph limb and returns to the channel on the falling limb)

It is impossible to generate this information from the data included in the report, although other backup data (e.g., computer runs) may be available somewhere to provide some of the required information.

- Campgrounds, gauging stations and hydropower facilities are the only impacted facilities shown in the flooded area on the USGS map. Therefore, there does not appear to be sufficient reason to re-do the dam break inundation analysis.
- The James M. Montgomery report on spillway routing gives a PMF outflow of 36,400 cfs. This is about 10 percent of the dam failure peak. Increasing the dam break peak by this 10% in the case of a dam break caused by the PMF would have little impact on the flood boundaries and inundation elevations in the canyon downstream of the dam. Therefore, it does not appear necessary to simulate a concurrent PMF and dam failure event for purposes of the EAP.

BEAR VALLEY DAM EMERGENCY ACTION PLAN**Emergency Preparedness and Early Warning**

If the dam were to fail in a seismic event, failure would be instantaneous and there would be no time to warn anyone at the campgrounds or along the river downstream even if it was possible to determine that the dam had breached. Furthermore there are no communications facilities in the canyon. Early warning sirens at the dam would be ineffective more than a few miles downstream and recreational users would probably not know what the sirens meant if they heard them.

In the event of failure during an extreme flood event such as the PMF, the storm would be a tropical cyclone off the Pacific Ocean with a duration of several days. The intense rainfall accompanying such a storm would wash out trails and roads leading to the campgrounds and it is highly unlikely that there would be people in the canyon during such an event.

CONCLUSIONS:

- Bear Valley Dam is safe even under extreme loading conditions resulting from a large earthquake or overtopping by the PMF.
- The dam is correctly classified as "High Hazard" because in the event of failure it is remotely possible that there could be loss of human life or excessive economic loss (e.g., SCE Powerhouse No. 1).
- It is extremely unlikely that there would be anyone in the canyon during a dam failure caused by the PMF. Therefore, the only situation where people might be at risk would be a sunny day failure caused by a large earthquake.
- If the dam were to fail, failure would be instantaneous and there would be no time to warn people downstream.
- It would be impractical to install an early warning system.
- The Seven Oaks reservoir management plan identifies the maximum storage at any given time to be no more than 25% of its 145,600 acre feet capacity (36,400 acre feet). The Seven Oaks reservoir would therefore contain the flood volume released by the failure of the Bear Valley Dam, even at Big Bear Lake's maximum capacity of 73,370 acre feet, and there would be no further risk downstream.

PHOTOGRAPHS

BEAR VALLEY DAM**EMERGENCY ACTION PLAN (EAP)**

ADOPTED JANUARY 1998
Revised December 1998

NAME: Bear Valley Dam Number 803**OWNER:** Big Bear Municipal Water
District (BBMWD)**FOREST:** San Bernardino**RANGER DISTRICT:** Big Bear**LOCATION OF DAM:** SW S22, T2N, R1W, San Bernardino Base and Meridian**ROUTE TO DAM:** Approximately 4 miles west of the town of Big Bear Lake via State Highway 18 or approximately 24 miles east of the intersection of State Highways 18 and 330.**HEIGHT:** 91 feet **ADMINISTRATIVE CLASS:** A **HAZARD RATING:** High**STORAGE VOLUME (NWL):** 73,320 acre-feet **SURFACE AREA:** 2,973 acres**NORMAL MAXIMUM WATER LEVEL (NMWL):** El 6743.2**TYPE OF STRUCTURE:** Concrete Multiple Arch. Ten arches (bays) ranging in height from 15 to 91-feet founded on a foundation of sound crystalline rock. Total crest length is 360-feet. Bays have been filled with mass concrete to form a virtual gravity dam with an upstream slope of 0.75:1 and a vertical downstream face from the crest to El 6691.0 below which the face slopes 0.25:1. The downstream side of the dam is further stabilized by 11, 1.5-foot to 5.0-foot wide buttresses located between each bay.**OUTLET WORKS:** One 36-inch diameter conduit controlled by two gate valves (14" and 24") location in bay no. 7 at El 6666.0. Discharge capacity is 250 cfs.

BEAR VALLEY DAM EMERGENCY ACTION PLAN (EAP)

SERVICE SPILLWAY: Five 4.0 x 6.0 rectangular openings located at the end bays (nos. 1 and 10) on either abutment with a sill at El 6736.2. Wood slide gates are operated by hand wheels. Discharge capacity is 2,630 cubic feet per second with the reservoir at El 6742.33.

EMERGENCY SPILLWAY: Total of 108-feet wide, ungated, ogee type located in bay nos. 5, 6 and 8. Discharge capacity will be approximately 15,000 cfs at reservoir El 6742.33 when emergency spillway construction is completed. Overtopping rates at a free overflow situation of current structure are:

OVERTOPPING DEPTH <u>(feet-inches)</u>	DISCHARGE <u>(cubic feet per second)</u>
0-1	28
0-6	416
1-0	1,188
2-0	3,362
3-0	6,178
4-0	9,504
5-0	13,282
6-0	17,464
7-0	22,002
8-0	26,884
9-0	32,076
9-6.8	36,400

BRIDGE: State Highway 18 crosses the dam on a bridge located on the crest of the dam.

COMMUNICATION CONDITIONS: The BBMWD headquarters in the town of Big Bear Lake is equipped with 6 telephone ground lines. In addition, headquarters operates a VHF radio base station that is in communication with BBMWD vehicles (total of 16 units). The General Manager and key personnel are equipped with cellular telephones and pagers.

PURPOSE OF EAP: Establish responsibility, communication, and emergency action guidelines for four potential dam emergency conditions (scenarios).

AUTHORITY: The EAP has been prepared in accordance with the requirements of the State of California, Offices of Emergency Services (OES); Department of Water Resources, Division of Safety of Dams (DSOD); and federal emergency action plan guidelines.

BEAR VALLEY DAM EMERGENCY ACTION PLAN (EAP)

TESTING AND UPDATING OF EAP: The EAP should be updated any time there is a change affecting the plan, such as a change in responsible persons at BBMWD or one of the other key organizations in the EAP. The EAP will be reviewed and updated yearly as a minimum. Likewise the EAP should be tested on a yearly basis by simulating one of the emergency conditions described.

DISSEMINATION OF EAP: The BBMWD will send a copy of the EAP along with flood inundation mapping to each of the organizations listed therein. It will be the responsibility of each organization to disseminate the EAP plan to those persons within their organization with a need to know and especially those who would be responsible for implementing the plan. A copy of the EAP should be posted on a bulletin board or other prominent location at each of these organizations.

PERTINENT DATA
JULY 1990

Stream System.....	San Antonio Creek
Drainage Area.....	sq. mi... 26.7
Reservoir:	
Elevation	
Streambed at upstream toe of dam.....ft, NGVD...	2,125
Debris Pool.....ft, NGVD...	2,164
Flood control pool (spillway crest).....ft, NGVD...	2,238
Spillway design surcharge level.....ft, NGVD...	2,254.4
Top of dam.....ft, NGVD...	2,260
Area	
Debris pool.....acres..	59
Spillway crest.....acres..	145
Spillway design surcharge level.....acres..	163
Top of dam.....acres..	168
Capacity, gross	
Debris pool.....acre-ft..	953 (0.67*)
Spillway crest.....acre-ft..	8,535 (6.02*)
Spillway design surcharge level.....acre-ft..	11,063 (7.83*)
Top of Dam.....acre-ft..	11,992 (8.46*)
Allowance for sediment	
50-year.....acre-ft..	2,000
Reservoir design flood.....acre-ft..	1,350
Dam: - Type.....	
Height above original streambed.....ft..	160
Top length.....ft..	3,850
Top width.....ft..	30
Freeboard.....ft..	5.1
Spillway: - Type..... Ungated overflow concrete ogee	
Crest length.....ft..	200
Design surcharge.....ft..	16.4
Design discharge.....c.f.s..	51,160
Outlets:	
Gates - type.....	Vertical lift
Number and size.....	3 - 5'-8"W x 10'H
Gate sill elevation.....ft., NGVD..	2,125
Conduits	
Number and size - diameter.....ft..	1 - 14.5
Length.....ft..	508
Maximum capacity at spillway crest.....c.f.s..	11,800
Regulated capacity at spillway crest.....c.f.s..	8,000
Reservoir design flood:	
Duration (inflow).....Days..	2
Total volume.....acre-ft..	22,500 (15.81*)
Inflow peak.....c.f.s..	19,000
Spillway design flood:	
Duratioon (inflow).....Days..	1
Total volume.....acre-ft..	18,200 (11.90*)
Inflow peak.....c.f.s..	60,000
Historic maximums:	
Maximum release.....c.f.s..	8,420
Date.....	1-25-69
Maximum water surface elevation.....ft., NGVD..	2225.6
Date.....	2-19-80
