Idaho National Laboratory 2006 Illness and Injury Surveillance Report

At A Glance

The 6,756 employees at INL in 2006 represented an 11 percent decrease from 2005. The INL work force has declined 20 percent since 2002, when there were 8,453 workers. Since 2002, women have accounted for approximately 24 percent of the work force, less than the 29 percent among the Illness and Injury Surveillance Program (IISP) sites as a group from 1995 to 2004.

The average age of the work force has increased steadily since 2002 for both men and women. In 2006, the average age was 47 years for men and 46 years for women. This increase is similar to that seen from 1995 to 2004 among DOE sites included in the IISP.

The total number of absences at INL decreased from 2003 to 2006. There were 195 absences in 2006, a 79 percent decrease from the 911 absences reported in 2003. The decreased number of absences resulted from a decision by the site's Medical Director to capture only those absences with diagnoses for which an *International Classification of Diseases, 9th Revision, Clinical Modification* (ICD-9-CM) diagnosis code was reported. The average length of the absences at INL increased during this same period, possibly because the exclusion of absences without ICD-9-CM codes removed many less serious health events of shorter absence duration. The average length of the absences among all workers was 58 days in 2006, compared with an average between 31 and 39 days from 2003 to 2005.

The absence rate among all workers in 2006 was 2.89 per 100 workers. Absence rates decreased from 2003 to 2006, with 2003 having the highest rate, 15.09 absences per 100 workers.

In 2006, 39 absences among 35 women produced an absence rate of 2.41 per 100 workers (39/1,616). A total of 156 absences were reported by 140 men; the absence rate was 3.04 per 100 workers (156/5,140). The lower absence rate among women than among men is contrary to what was observed for INL from 2003 to 2005 and for all IISP sites from 1995 to 2004. From 1995 to 2004, absence rates for women were at least 51 percent higher than the rates for men among the sites in the IISP.

Injuries and disorders of the respiratory and musculoskeletal systems were among the top 3 diagnoses reported by men and women at INL from 2003 to 2006. These 3 diagnostic categories had the highest rates among all DOE IISP sites from 1995 to 2004.

In 2006, there were 18 OSHA events reported by women and 50 OSHA events reported by men at INL. A total of 113 diagnoses were reported for these events, mostly the result of injuries. The rate of OSHA events has been stable since 2003. OSHA rates declined among all DOE IISP sites as a group from 1995 to 2004.

Sentinel Health Events for Occupations (SHEOs)

An occupational sentinel health event (SHEO) is a disease, disability, or death that is likely to be occupationally related. Although sentinel health events may indicate an occupational exposure, many may result from nonoccupational exposures. Sentinel health events are therefore assessed in two categories:

Definite Sentinel Health Events: Diseases that are unlikely to occur in the absence of an occupational exposure (e.g., asbestosis).

Possible Sentinel Health Events: Diseases that may be occupational but can also occur in the absence of an occupational exposure (e.g., lung cancer or carpal tunnel syndrome).
