#### Reporting Commodity Injury

Record any new or unusual observations relating to injury of commodity and report them to Quarantine Policy, Analysis and Support (QPAS) in Riverdale. Give pertinent details of the treatment and conditions regarding its application. In appraising the effect of a particular treatment, take care to distinguish between the actual or apparent effects directly attributable to the treatment and those relating to factors or conditions not subject to PPQ control.

Commodities in the T100 series are intended for consumption as food or feed. These commodities may have to be treated with methyl bromide to control a pest.

---

#### FIFRA Section 18 Exemption

Methyl bromide fumigants, except those with “Q” labels, are subject to requirements of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), Section 18 Quarantine Exemption. When commodities intended for food or feed are fumigated with methyl bromide under the FIFRA Section 18 Quarantine Exemption, one additional EPA requirement must be met: PPQ must monitor aeration by sampling the gas concentration to determine when a commodity may be released.

In this manual, fumigation schedules under the FIFRA Section 18 Quarantine Exemption are identified by the following note:

Do not use this treatment schedule if its FIFRA Section 18 Exemption has expired. For the current exemption status, call your local State Plant Health Director (SPHD).

---

## Determine the Correct Label for Fumigation

Always use the label of the fumigant to determine if the commodity can be treated. Fumigation schedules in this publication are intended to clarify and expand commercial labels for methyl bromide. The EPA only authorizes fumigation for commodities that are listed on the label of the gas being used for the fumigation. Also, to comply with State regulations, a fumigant must be registered in the State where it is being used.

Although the EPA only authorizes the use of a pesticide on a crop, animal, or site that is listed on the label of a pesticide, specific pests do not have to be listed on the label to use the pesticide. An amendment to FIFRA in 1978 permits the use of a pesticide to control a pest not on the label if the application is to a crop, animal, or site specified on the label, unless mentioned otherwise.

## How Fruits and Vegetables Are Listed

Fruits and vegetables that are to be fumigated with methyl bromide (T101s) will be listed in alphabetical order. Each schedule will have an assigned letter, e.g., Apples T101-a-1, Zucchini T101-h-3. For fruits and vegetables that require treatment as a condition of entry, refer to the Fruits and Vegetables Manual (Nonpropagative) for the specific treatment. Also, monitor aeration. see [page 2-4-36](#). However, if treatment is required as a condition of entry for a fruit or vegetable, monitoring the aeration is **not** required. On the other hand, if the fruit or vegetable is being treated under a Section 18 Exemption, monitoring aeration is required.

## T102—Water Treatment

Whenever water comes into contact with fresh produce, the water's quality dictates the potential for pathogen contamination. To reduce the risk of food-borne illnesses, the water used for washing, treatments, and cooling must be fortified with sodium hypochlorite (household bleach), and constantly maintained at a chlorine level not to exceed 200 ppm.

### T102-b

#### Cherimoya from Chile

Pest: *Brevipalpus chilensis* (Chilean false spider mite of grapes)

Treatment: **T102-b** Soapy water and wax

1. Immerse fruit for 20 seconds in soapy water bath of one part soap solution (such as Deterfruit) to 3,000 parts water.
2. Follow the soapy bath with a pressure shower rinse to remove all the soapy excess.
3. Immerse fruit for 20 seconds in an undiluted wax coating (such as Johnson's Wax Primafresh 31 Kosher fruit coating). The wax coating should cover the entire surface of the fruit.

At the port of entry, the PPQ Officer should check to make sure the wax coating covers the entire surface of the fruit.

### T102-c

#### Durian and other large fruits such as breadfruit

Pest: External Feeders

Treatment: **T102-c** Warm, soapy water and brushing

1. Add detergent (such as Deterfruit) to warm water (110° to 120°F) at the rate of one part detergent or soap to 3,000 parts water.
2. Immerse the fruit for at least 1 minute in the warm detergent water.
3. Using a brush with stiff bristles, have the importer or the importer's agent scrub each fruit to remove any insects.
4. Using a pressure shower, have the importer or the importer's agent rinse the fruit free from residue (detergent and dead insects).
5. Inspect each brushed and cleaned fruit. Pay particular attention to external feeders such as mealybugs and scales. If any insects remain, have the fruit retreated or have it destroyed.

## T102-e

### Limes

Pest: Mealybugs (Pseudococcidae) and other surface pests

Treatment: **T102-e** Hot water immersion

1. Fruit must be treated in a certified hot water immersion treatment tank, and the treatment must be monitored by an inspector.
  - A. Fruit must be submerged at least 4 inches below the water's surface.
  - B. Water must circulate continually and be kept at 120.2°F (or above) for 20 minutes. Treatment time begins when the water temperature reaches at least 120.2°F in all locations of the tank.
2. Cooling and waxing the fruit are both optional, and are the sole responsibility of the processor.

Phytotoxic damage (increased yellowing) may occur if the temperature reaches 125.6°F or if the treatment duration significantly exceeds 20 minutes.

## T102-b-1

### Limes from Chile

Pest: *Brevipalpus chilensis* (Chilean false spider mite of grapes)

Treatment: **T102-b-1** Soapy water and wax

1. Immerse fruit for 20 seconds in soapy water bath of one part soap solution (such as Deterfruit) to 3,000 parts water.
2. Follow the soapy bath with a pressure shower rinse to remove all the soapy excess.
3. Immerse fruit for 20 seconds in an undiluted wax coating (such as Johnson's Wax Primafresh 31 Kosher fruit coating). The wax coating should cover the entire surface of the fruit.

At the port of entry, the PPQ Officer should check to make sure the wax coating covers the entire surface of the fruit.

### T102-d-1

### Longan fruit from Hawaii

Pest: *Ceratitidis capitata* (Mediterranean fruit fly) and  
*Bactrocera dorsalis* (Oriental fruit fly)

Treatment: **T102-d-1** Hot water immersion

Fruit must be at ambient temperature before the treatment begins

1. Submerge the fruit at least 4 inches below the water's surface in a hot water immersion treatment tank certified by APHIS.
2. Keep the fruit submerged for 20 minutes after the water temperature reaches at least 120.2°F in all locations of the tank. The water must circulate continually and be kept at 120.2°F (or above) for the duration of the treatment.

Phytotoxic damage (increased yellowing) may occur if the temperature exceeds 121.1°F.

3. Cool the fruit to ambient temperature. Hydrocooling for 20 minutes at 75.2°F is recommended, though not required, to prevent injury to the fruit from the hot water immersion treatment.

### T102-d

### Lychee (litchi) fruit from Hawaii

Pest: *Ceratitidis capitata* (Mediterranean fruit fly) and *Bactrocera dorsalis* (Oriental fruit fly)

Treatment: T102-d Hot water immersion

1. Lychees must be thoroughly examined at the packinghouse by an inspector and found free of ***Cryptophlebia spp.*** (Lychee fruit moth) and other plant pests<sup>4</sup>
2. Fruit must be grown and treated in Hawaii, under monitoring of an inspector, in a certified hot water immersion treatment tank.<sup>5</sup>
  - A. Fruit must be submerged at least 4 inches below the water's surface.

4 Because ***Eriophyes litchii*** (lychee mite) cannot be effectively detected by inspection, and would not be effectively eliminated by hot water immersion, the lychees may not be shipped into Florida. Each carton must be stamped "Not for importation into or distribution in Florida."

5 Use of Treatment T102D is at the risk of the shipper. Limited research on fruit quality after treatment application indicated that fruit quality varies among cultivars. 'Kaimana' and 'Kwai Mi' ('Tai So') tolerate the treatment better than 'Brewster' and 'Groff'; no other cultivars were tested.

- B.** Water must circulate constantly, and be kept at 120.2°F (or above) for 20 minutes. Treatment time begins when the water temperature reaches at least 120.2°F in all locations throughout the tank.<sup>6</sup>

Temperatures exceeding 121.1°F can cause phytotoxic damage.

- 3.** Hydrocooling for 20 minutes at 75.2°F is recommended, though not required, to prevent injury to the fruit from the hot water treatment.

## T102-a

### Mango

Pest: *Ceratitis capitata* (Mediterranean fruit fly), *Anastrepha* spp., *Anastrepha ludens* (Mexican fruit fly)

Treatment: **T102-a** Hot water immersion

Fruit must be treated in country of origin at a certified facility and under the monitoring of APHIS personnel.

- 1.** Mangoes must be pre-sorted by weight class. Treatment of mixed loads is not allowed.
- 2.** Pulp temperature must be 70°F or above before start of treatment.
- 3.** Fruit must be submerged at least 4 inches below the water's surface.
- 4.** Water must circulate constantly and be kept at least 115°F throughout the treatment with the following tolerances:
  - ◆ **During the first 5 minutes of a treatment**—Adjusted Tank Temperatures from [Figure 6-1-1](#) on [page 6-5-3](#) that are below 113.7°F are allowed during the first 5 minutes of a treatment only if the temperature is at least 115°F at the end of the 5 minute period.
  - ◆ **For treatments lasting 65 to 75 minutes**—Adjusted Tank Temperatures from [Figure 6-1-1](#) on [page 6-5-3](#) may fall as low as 113.7°F for no more than 10 minutes under emergency conditions.
  - ◆ **For treatments lasting 90 to 110 minutes**—Adjusted Tank Temperatures from [Figure 6-1-1](#) on [page 6-5-3](#) may fall as low as 113.7°F for no more than 15 minutes under emergency conditions.

---

<sup>6</sup> Treatment does not begin until after the fruit is immersed and the water temperature recovers to 120.2°F (or above). Therefore, before the start of the treatment, fruit pulp temperatures of 70°F (or above) are recommended to minimize water temperature recovery time and the overall time fruit are immersed in heated water. Fruit quality of treated lychees with initial pulp temperatures below 68°F has not been studied.

5. Determine the dip time from Tables [Table 5-2-1](#) on page 5-2-52, [Table 5-2-2](#) on page 5-2-52, or [Table 5-2-3](#) on page 5-2-53.

Dip times for T102-a are valid if the fruit is not hydrocooled within 30 minutes of removal from the hot water immersion tank.

However, if hydrocooling starts immediately after the hot water immersion treatment, then the original dip time must be extended for an additional 10 minutes.

(Hydrocooling is optional and may be done only at temperatures of 70°F or above, for any length of time, or not at all.)

## **T104—Pest Specific/Host Variable**

For the treatments that follow, never exceed the labeled or Section 18 dosage and time for the specific commodity at the given temperature. Moreover, the specific commodity being treated determines if the schedule is a labeled treatment or one authorized under a Section 18 exemption. For example, oranges cannot be treated for hitchhikers using T104-a-1 at 40-49°F because this schedule requires 4 lbs. of methyl bromide/1,000 ft<sup>3</sup>. Whereas, the methyl bromide “Q” label allows a maximum of only 3 lbs. at this temperature range. Therefore, the oranges would have to be heated to at least 50°F before fumigation because at 50°F a dosage of only 3 lbs./1,000 ft<sup>3</sup> is required.

Although the following treatments are pest specific, the treatment schedule for the associated host will determine if and when a pest specific treatment can be used. Always check the schedule for the host before selecting the proper treatment schedule. Also, consult the methyl bromide labeling brochure, and do not exceed the restrictions on dosage and exposure time.

## T105—Irradiation

Irradiation (IR) is an approved treatment for all imported fruits and vegetables and for fruits and vegetables moved interstate from Hawaii, Puerto Rico, and the U.S. Virgin Islands. In addition, irradiation can be used against particular pests (Refer to [Table 5-2-4](#) on page 5-2-61) of cut flowers and foliage, however, some damage may occur.

Treatment must be conducted at approved facilities in a foreign country, Hawaii, Puerto Rico, US Virgin Islands or any area in the US mainland that does not support fruit flies (any state except AL, AZ, CA, FL, GA<sup>8</sup>, KY, LA, MS<sup>8</sup>, NV, NM, NC<sup>8</sup>, SC, TN, TX, or VA).

Refer to chapter [Certifying Irradiation Treatment Facilities](#) on page 6-8-1 of this manual for facility certification requirements.

When designing the facility's dosimetry system and procedures for its operation, the facility operator must address guidance and principles from American Society for Testing Materials (ASTM) standards or an equivalent standard recognized by the Administrator of APHIS.

(The American Society for Testing and Materials (ASTM) publication, ISO/ASTM 51261-2002 (E), "**Standard Guide for Selection and Calibration of Dosimetry Systems for Radiation Processing**" is available from: ASTM, 100 Barr Harbor Drive, West Conshohocken, Pennsylvania, USA 19428-2959).

---

<sup>8</sup> IR facilities may be located at the airport of Atlanta, GA, maritime ports of Gulfport, MS, and Wilmington, NC, provided the conditions listed in CFR 305.31(b) are met.

The following table lists pest-specific minimum absorbed doses for use on any fruit, vegetable, cut flower or foliage:

## T107—Cold Treatment

### Pulp of the Fruit

The pulp of the fruit must be at or below the indicated temperature at time of beginning treatment for all cold treatments.

### Fruits for Which Cold Treatment Is Authorized

The following cold treatment schedules are authorized by Plant Protection and Quarantine (PPQ) for the control of specific pests associated with shipments of fruit. The cold treatment schedule that must be used for a specific commodity from a specific country is listed in the Fruits and Vegetables Section of the PPQ Nonpropagative Manual. These cold treatment schedules indicate the specific pests for which they are designed to control.

Treatment upon arrival may be accomplished at authorized ports as named in the permits.

Treatment in transit may be authorized for specifically equipped and approved vessels or containers and from approved countries, for entry at ports named in the permits. Intransit cold treatment authorization must be preceded by a visit to the country of origin by a PPQ Official to explain loading, inspection, and certification procedures to designated certifying officials of country of origin. Refrigerated compartments on carrying vessels and cold storage warehouse must have prior certification by PPQ. Authorization of cold treatments from countries with direct sailing time less than the number of days prescribed for intransit refrigeration treatment must be contingent on importer understanding that prescribed intransit refrigeration period must be met before arrival of vessel at the approved U.S. port.

Gaps in the cold treatment data print-out for pulp sensors and air sensors shall be allowed or disallowed on a case-by-case basis, taking into account the number of gaps, the length of each gap, and the temperatures before and after. Air temperatures may occasionally exceed treatment temperatures during defrost cycles; however, fruit temperatures should not rise appreciably during this time. During non-defrost times, the temperatures of the air sensors should never exceed the maximum allowable treatment temperature.

**Important**

The fruit must be precooled at or below the target treatment temperature prior to loading. A certified USDA representative must sample the fruit pulp temperatures during loading in all sections of the lot until precooling has been accomplished.

## T108—Fumigation Plus Refrigeration of Fruits

### Fruits for Which Fumigation Followed by Cold Treatment Is Authorized

The following treatment schedules (fumigation followed by cold treatment) are authorized by Plant Protection and Quarantine (PPQ) for the control of specific pests associated with shipments of fruit. The treatment schedule that must be used for a specific commodity from a specific country is listed in the Fruits and Vegetables Section of the PPQ Nonpropagative Manual. These treatment schedules indicate the specific pests for which they are designed to control.

**Important**

For Hawaiian-grown avocados, research has shown that, during the process of cold treatment (T108-a), a single transient heat spike of no greater than 39.6°F (4.2°C) and no longer than 2 hours, during or after 6 days of cold treatment, does not affect the efficacy of the treatment. However, in the absence of supporting research, such a tolerance for heat spikes shall not be extended to other fruits.

**Important**

Cold treatment in break-bulk vessels must be initiated by an APHIS Officer when shipments are from Italy, and Taiwan. However, cold treatment in containers may be initiated by treatment technicians from these countries only because they have been trained to initiate cold treatments for containers and not break-bulk vessels

Some varieties of fruit may be injured by exposure to MB. Importers should be encouraged to treat small samples of fruit to determine tolerance levels before shipping commercial quantities. The USDA is not liable for damages caused by quarantine.

## T110—Quick Freeze

There are two alternative Quick Freeze treatments, depending on whether the commodity is to be treated and released or destroyed. The commodities listed in [Figure 5-2-1](#) below are not eligible for this treatment:

**Avocados with seeds** are prohibited from South America, Central America, or Mexico; **Citrus with peel** is prohibited from Afghanistan, Andaman Islands, Argentina, Bangladesh, Brazil, Cambodia, China (People's Republic of), Comoros, Côte d'Ivoire, Federated States of Micronesia, Fiji Islands, Home Island in Cocos (Keeling) Islands, Hong Kong, India, Indonesia, Japan and adjacent islands, Korea, Laos, Madagascar, Malaysia, Maldives, Mauritius, Mozambique, Myanmar, Nepal, Oman, Pakistan, Papua New Guinea, Paraguay, Philippines, Reunion Islands, Rodrigues Islands, Ryukyu Islands, Saudi Arabia, Seychelles, Sri Lanka, Taiwan, Thailand, Thursday Island, United Arab Emirates, Uruguay, Vietnam, Yemen, and Zaire. **Mangoes with seeds** are prohibited from Barbados, Dominica, French Guiana, Guadeloupe, Martinique, St. Lucia, and all countries outside of North, Central, and South America and their adjacent islands (which include the Caribbean Islands and Bermuda). **Black currants** are enterable only to areas specified in the import permit. **Corn-on-the-cob** is prohibited from Albania, Algeria, Bosnia and Hercegovina, Croatia, Cyprus, Egypt, France, Greece, Israel, Italy, Lebanon, Libya, Malta, Macadonia, Morocco, Sardinia, Slovenia, Spain, Syria, Tunisia, and Turkey.

**Never** use this treatment for the control of bruchid beetles in dried beans. Research has shown that a treatment of -18°C (-0.4°F) for 14 days would be needed to be efficacious.

**FIGURE 5-2-1 Commodities Ineligible for Quick Freeze Treatment**

### T110-a

Treatment: T110-a — Quick Freeze

1. Initially, lower the commodity's temperature to 0°F (-17.77°C) or below.
2. Hold the commodity's temperature at 20°F (-6.66°C) or below for at least 48 hours.

The commodity may be transported during the 48-hour treatment period, but at no time may the commodity's temperature rise above 20°F (-6.66°C) prior to release.

All fruits and vegetables (except for the commodities listed in [Figure 5-2-1](#)) are enterable from all foreign countries after receiving this treatment in accordance with 7CFR 319.56-2c. Also, interstate movement of all fruits and vegetables from offshore areas of the United States (except mango from Hawaii) is authorized in the frozen state after being quick frozen.

Freezing will ruin the market quality of most fresh fruits and vegetables, except for thick-skinned items such as durian and coconut. Generally, this treatment is used on fruits and vegetables that will be processed into another form (e.g., for puree, juice, or mashed vegetables).

### T110-b

Treatment: **T110-b** — Quick Freeze for Destruction

T110-b may ONLY be used with permission from CPHST Treatment Quality Assurance Unit.

Contact 919-855-7457 for official approval.

1. Initially, lower the commodity's temperature to 0°F (-17.77°C) or below.
2. Hold the commodity's temperature at 20°F (-6.66°C) or below for at least 48 hours.

The commodity may be transported during the 48-hour treatment period, but at no time may the commodity's temperature rise above 20°F (-6.66°C) prior to release.

3. After treatment, transport the commodity to a landfill for deep burial.

This treatment is considered an acceptable method of destroying most commodities in lieu of returning them to the country of origin, with the exceptions listed in the [Figure 5-2-1 on page-5-2-79](#) at the beginning of this treatment schedule.
