The National Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The Congressional authorization for these activities (with antecedents to 1867) states that the purpose of the Center is to collect and report "...statistics and information showing the condition and progress of education in the United States and other nations in order to promote and accelerate the improvement of American education."—Section 402(b) of the National Education Statistics Act of 1994 (20 U.S.C. 9001). This law also mandates an annual statistical report on the subject from the Commissioner of Education Statistics. This 1995 edition of *The Condition of Education* responds to the requirements of that law.

This report contains 60 indicators that shed light on the condition of education in the United States. These indicators represent a consensus of professional thinking on the most significant national measures of the condition and progress of education to date, but tempered by the availability of current, valid information. In the text that follows, I will summarize some of the positive developments in American education and point out areas that continue to raise concern. In addition, I will discuss what we know about school quality and describe how the conditions facing the schools have changed.

For some issues of public concern, however, there are no data available that can provide a satisfactory national picture of recent educational developments. One such area where additional work remains is in developing measures of learner outcomes that go beyond the core content areas. These might include measures of integrative reasoning and of attitudes such as tolerance, self-direction, and responsibility. A second area where work remains is in developing better measures of school quality and student learning opportunities.¹

What are high school students studying and how are they performing?

In the 12 years since *A Nation At Risk* advocated tougher course requirements for high school graduation, states and students have responded dramatically. **High school graduates are taking more courses overall, particularly academic**

Percentage of high school graduates earning the recommended credits in *A Nation At Risk*

courses.² The proportion of students completing the recommended core courses in English, math, science, and social studies has increased (*Indicator 25*), and a greater percentage is taking Advanced Placement (AP) courses.

In addition, **more students are taking algebra, geometry, trigonometry, and calculus as well as advanced science courses, including chemistry and physics** (*Indicator 26*). Both college-bound and non-college-bound students are taking more foreign language courses than their counterparts did a decade before. Furthermore, as of 1990, 42 of the 50 states had raised course requirements for high school graduation since the publication of *A Nation At Risk*, and 47 states had mandated student testing standards.³ Of course, these increases can only be considered good news if the content of these courses is at least as rigorous as it was when the National Commission on Excellence in Education made their recommendations. There is some evidence that it is, but we have no national data on the content of courses.⁴

It is also encouraging to see these improvements in high school course taking reflected in **gains in mathematics and science achievement**. Between 1982 and 1992, the mathematics and science proficiency scores of 17-year-olds on the National

Science proficiency scores of students

Assessment of Educational Progress (NAEP) increased (9 points on each assessment). One way to get a sense of how much improvement these gains represent is to compare them to variations in proficiencies between different-aged high school students. Using this comparison, we find that the improvement for 17-year-olds from 1982 to 1992 was roughly equivalent to an additional year or two of learning in high school (*Indicators 15 and 16*). These gains in NAEP proficiency scores are one indication that 17-year-olds in 1992 have made substantial progress in mathematics and science relative to their peers in 1982.

Although proficiency scores in reading and writing have not shown similar increases (*Indicators 13 and 14*), **U.S. students compared favorably to those in other countries in an international assessment of basic reading literacy in 1991-92** (*Indicator 17*).

Low-performing students have also progressed academically since the publication of *A Nation At Risk*. For example, dropout rates have declined (*Indicator 6*); fewer high school students are taking remedial mathematics courses before graduating (*Indicator 26*); and the mathematics and science proficiencies of the lowest performing 17-year-olds have increased (tables 15-3 and 16-3). However, between 1984 and 1992, the reading and writing proficiencies of the lowest performing students remained relatively stable (tables 13-3 and 14-3).

Not only are more students are taking AP examinations, but the science proficiency scores of the highest performing 17-year-olds have increased (table 16-3). In addition, since the early 1980s, the reading and mathematics proficiency

scores of the highest performing 17-year-olds have remained relatively stable (tables 13-3 and 15-3).

It is significant that even though the number of Scholastic Assessment Test (SAT) test-takers as a percentage of high school graduates has increased 8 percentage points since 1983, the average mathematics score has increased and the average verbal score has remained stable (*Indicator 20*). These findings are considered by many to be positive because increasing participation tends to push down scores.

When examining differences in averages across NAEP scores, we should keep in mind that the performance among students of the same age or in the same grade varies considerably. For example, in reading, mathematics, and science, many students score no higher at age 17 than many of their peers did at age 9, despite the fact that they differ by 8 years of schooling.⁵ Schools must cope with this variation while trying to help each student learn as much as possible. It is not surprising, then, that there is also a large degree of variation across schools in the type of curriculum offered to students with different abilities and interests.⁶

Distribution of reading proficiency within age groups: 1992

As a nation, we put great value on mathematics and science. Recently, this is evident in Goal 5 of the National Education Goals: "U.S. students will be first in the world in science and mathematics achievement." Although, as noted above, the mathematics and science scores of U.S. students have increased since the early 1980s, they remain low compared to their counterparts in many other countries (*Indicators 18 and 19*). Moreover, considerable variation exists across states. On the one hand, 8th grade students in some states perform as well as 13-year-old

students from the best performing nations in an international comparison of mathematics achievement. On the other hand, students in other states are performing at levels similar to students in developing countries.⁷

Another area of continuing concern is the academic achievement of minority students in elementary and secondary school. For example, in 1992, the average reading proficiency scores of black 17-year-olds were 36 points below white 17-year-olds and were similar to the average proficiency scores of white 13-year-olds. The white-Hispanic reading gap at age 17 was a little narrower. White-black and white-Hispanic proficiency score differences were of similar magnitudes in science, although they were smaller in mathematics (*Indicators 13, 15, and 16*).

It is also worrisome that despite a narrowing in the white-minority gap in achievement during the 1980s, particularly in mathematics, recent data raise the possibility that the gap is no longer closing. For instance, the most recent (1994) NAEP results in reading suggest that

minority groups lost some of the earlier gains they had made relative to whites.⁸

In addition to a narrowing in the white-minority achievement gap, there are other positive developments with regard to the achievement and attainment of black and Hispanic students. The indicators in this volume contain far more information on different subpopulations than has been reviewed here. For example, an essay reviewing the educational progress of Hispanic students begins on page 6 and an essay reviewing the educational progress of black students is contained in the 1994 edition. A review of the considerable educational advances made by women over the past several decades can be found starting on page 13.

Social scientists attribute much of the white-minority differences in achievement to the higher incidence of poverty in the families of minority children and the lower average educational levels of their parents. It is difficult for schools to compensate for such disadvantages. However, **there is evidence that extraordinary schools and teachers make a difference in how all students perform.** For example, research on early intervention and on one-to-one tutoring demonstrates that at-risk students can achieve at far higher levels than they have in the past.⁹ There is also some evidence, particularly in math and science, that taking more challenging courses is related to higher performance and achievement.¹⁰

Are more young people finishing high school?

Despite curricular changes that may have made school more difficult, students are persisting in their studies. **Overall, the percentage of high school students who leave before graduating has gradually declined and differences between dropout rates for blacks and whites have also narrowed, although most of these changes occurred before the mid-1980s (*Indicator 6*).** This is encouraging because schools provide young people with the opportunity to explore their interests and develop their talents. It is also encouraging because staying in school is an important indication that a young person is learning to be a productive member of U.S. society and is less likely to suffer from poverty and unemployment (*Indicators 28 through 32*).

White-minority difference in reading achievement of 17-year-olds

White-minority difference in math achievement of 17-year-olds

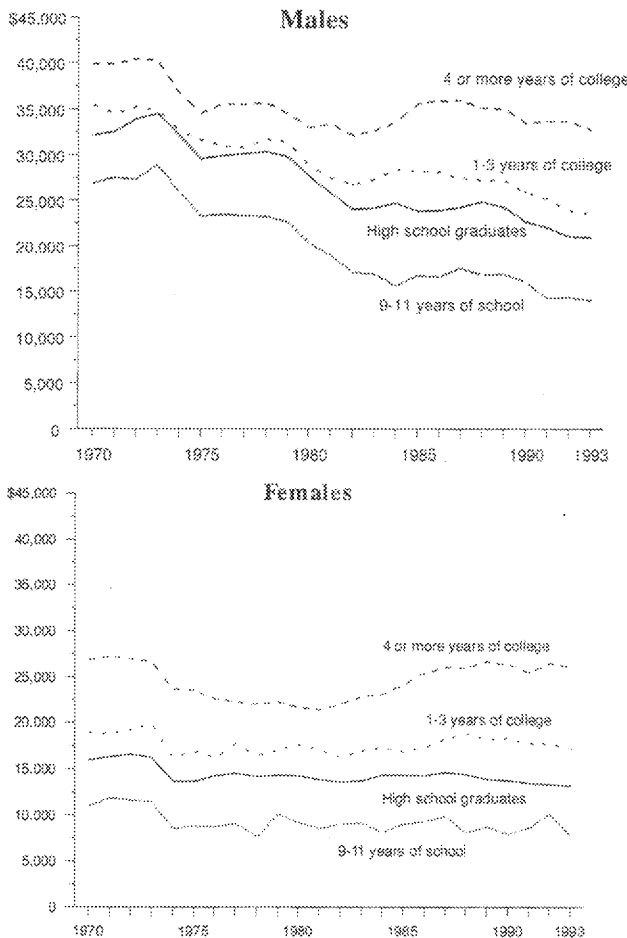

Time of high school completion for 1980 10th-graders

High school completion rates have gradually risen, and for some subgroups are near or over the 90 percent National Education Goal (Indicator 22). The rise is, in part, a result of greater student persistence in high school (discussed above), but may also be a result of more dropouts earning a GED credential. The rise is a positive development, but we must also be cautious because in today's economy a high school diploma or a GED credential may not be sufficient to avoid low earnings, unemployment, and, possibly, poverty. Since the early 1970s, the

Median earnings of wage and salary workers 25 to 34 years old (in 1994 constant dollars)

real wages of young adults with only a high school diploma or GED have declined (table 30-3), and the proportion of this group receiving AFDC or public assistance has increased (Indicator 32). The labor market opportunities for high school graduates are still better than those who complete 9-11 years of education, however.

Are more young people going to college?

In 1992, the rates of attainment in higher education for U.S. men and women were among the highest in the world (Indicator 23).¹¹ This is an indication that higher education is broadly accessible in the United States in comparison to other countries. It is also an indication of the rewards to college attendance. Even though college graduates have faced a difficult labor market over the past few years, their job opportunities and earnings are much better than those of high school graduates. The earnings advantage has grown stronger throughout the 1980s, particularly for males (Indicator 34).

It is not surprising that despite a rapid rise in tuition levels (Indicator 7) more high school graduates are choosing to go immediately to college after high school graduation (Indicator 9). It should be noted, however, that enrollments do not always translate into completions.

High school graduates enrolling in college the October following graduation

Although, more students are going on to college after high school, the data show that it is very common for college students to enroll, leave, possibly return, and not finish within the expected period of time.¹² For example, in 1990, only one-quarter of first-year community college students were enrolled in some form of higher education the next year. And, about one-fifth of

second-year community college students transferred to 4-year colleges or universities (*Indicator 10*).

Noncompletion is not necessarily an indication of failure or a waste of resources. Often students, particularly in the 2-year sector, enter and withdraw from college because of economic opportunities, or they may have begun a program with limited objectives that they were able to achieve. Also, many students attend part time, which can extend the time it takes them to complete a program. Nevertheless, the high rates of noncompletion and interrupted attendance may indicate that students do not have enough information about the actual skills in demand in the labor market before making decisions regarding their education. Moreover, they may have unrealistic views as to how much time, effort, and money will be needed to complete postsecondary education programs and acquire these skills.

High levels of participation in higher education are made possible by generally low tuition levels at public institutions and a financial aid system that is primarily based, particularly the federal component, on need. Average tuition and fees are also much lower at public institutions, where four out of five students are enrolled, than they are at private institutions (*Indicators 8 and 36*).

But to attend postsecondary education on a full-time basis requires that the student not only pay the direct costs of education but also finance living expenses. For example, the *total cost* a student had to finance, including both educational and living expenses, was about \$9,200 for dependent full-time students attending public 4-year institutions in 1992-93. Total aid, including grants, loans, and work-study, reduced the amount that needed to be financed to \$7,300. In addition, most financial aid is sensitive to family income, so this *net cost* was lowest (\$5,070) for students from low income families and highest (\$8,879) for those from high income families.

Although net cost varies a great deal with family income, the question remains whether it varies enough to make higher education equally affordable to all students. One way to answer this question is to estimate *unmet need* as net cost

Costs incurred by dependent full-time undergraduates: 1992-93

	Tuition and fees	Total cost	Net cost
Public 2-year	\$1,072	\$6,410	\$5,717
Public 4-year	2,947	9,187	7,326
Private 4-year	11,004	17,301	11,552

less "expected family contribution;" this is generally considered a reasonable and affordable amount for the family and student to contribute toward the cost of higher education, and it is also used by the student financial aid system. For dependent undergraduates attending 4-year colleges, unmet need is greater, especially when compared to family income, for students from low income families than for those from high income families. It appears that by this test, at least, **higher education is still more difficult for students from low and lower middle income families to afford than for those from upper middle and high income families.**

Net cost incurred by and unmet need of dependent full-time undergraduates, by family income: 1992-93

Family income	Net cost		Unmet need	
	Public 4-year	Private 4-year	Public 4-year	Private 4-year
All	\$7,326	\$11,552	\$1,952	\$4,171
Less than \$27,000	5,070	5,872	3,132	4,425
27,000-44,999	6,426	8,590	2,429	4,980
45,000-59,999	7,598	10,407	1,784	4,204
60,000 or more	8,879	15,752	836	3,633

Clearly, the increasing enrollment rates and rising tuition costs are profoundly affecting the nature of higher education. First, colleges are providing much remedial instruction to students who arrive with weak academic skills.¹³ This may indicate that more students who once would not have considered continuing on to higher education are now enrolling, even though they must take remedial courses. Second, the percentage of full-time college students who report working more than 20 hours a week has increased since the early 1980s (*Indicator 51*). Although working during the school year leaves less time for students to concentrate on their studies or to participate in extracurricular activities, some of the experience that students gain from working may benefit them after graduation. There is

Commissioner's Statement

evidence, however, that working long hours while in college may reduce a student's likelihood of completing college or lengthen the time it takes for those who do complete it. Third, there is some evidence that college students are feeling increasingly stressed by the demands placed on them.¹⁴

What do we know about the quality of schools?

The information presented so far has been about students and what they are or are not achieving. Because of the impact of family income and support on student performance, academic achievement is only a partial indicator of the quality of the schools that U.S. students attend. But what can be said directly about the quality of schools? Are schools providing a safe and supportive environment so that student energies can be devoted to learning? Are schools attracting people with enthusiasm, creativity, and commitment to teaching and supporting them with competitive salaries and sustained professional development? These are also important aspects of school quality.¹⁵ Without question, much work remains to be done to produce reliable statistical measures of school quality.

Expenditures per student are often used as a proxy measure of the quality of education. But, this can only be considered a crude measure, because the results of hundreds of studies that examine the relationship between spending and outcomes such as achievement test scores, dropout rates, and so forth are mixed.¹⁶ Neither a strong nor consistent relationship is found. However, no one can deny the importance of money to build schools, hire teachers, buy textbooks, and otherwise acquire the resources needed to create a safe, supportive learning environment. Among these resources are the intangible qualities of dedicated teachers, principals, and parents who create the learning environment.

At the elementary and secondary levels, **revenues per student have increased substantially** since the early 1980s, a sign that even with the strains of slower economic growth, our nation is willing to continue supporting its schools (*Indicator 52*). Yet, **revenues per student vary widely across states**: state governments, not the federal

Revenues per student from public sources as a percentage of income per capita

government, have responsibility for funding education, and they vary in their capacity and willingness to do so. In addition, there is considerable variation within states because states delegate authority for operating and funding schools to local school districts. For instance, one estimate is that **the wealthiest districts have about 16 percent more cost-of-living adjusted revenue per student than the poorest districts**. However, other factors such as the educational needs of the students require consideration before disparities in the allocation of education resources can be adequately measured. Districts with a large percentage of school age children in poverty, however, do receive a much larger share of their revenue from federal and state sources than from local governments (*Indicator 53*).

An advantage of state and local funding of schools is that parents and citizens have more say in deciding how much education their children get and with what emphasis. A disadvantage is that wealth varies across school districts, leading to imbalances in the resources available to schools even when citizens are equally willing to fund them. This has resulted in complicated state formulas to assist poor school districts and many court challenges to state education financing systems as insufficiently compensatory. The supreme courts of several states have declared the state education financing system unconstitutional because of funding inequities, and more than half the states have cases pending. For example, as a result of a court challenge to its funding arrangements, Kentucky has completely overhauled its educational system from teacher certification requirements to governance

structures. And Michigan recently decided to stop using the property tax to finance its schools, and instead to use a combination of income and sales taxes. Since poor school districts receive most of their revenue from the state, another disadvantage of state and local funding is that economic conditions may cause the state to change its support level at the very moment poor school districts need the funds the most.

Although the level and distribution of education resources is very important, it is equally important that the resources be used effectively. Teacher salaries are a major portion of the elementary and secondary budget, and good teachers are central to a high quality education system. Most of what we consider formal childhood education takes place in classrooms through interactions between teachers and students. Teachers are one conduit through which education and societal values are passed.

The pupil-teacher ratio has declined steadily since the mid 1950s.¹⁷ Average teacher salaries in public schools were also higher in 1994 than in 1960 although most of the gain since 1981 only recouped losses incurred during the 1970s (*Indicator 57*). As most elementary and secondary teachers are women and the labor market opportunities of women have improved over the last two decades, larger increases in salaries may have been necessary for teachers, relative to those in other occupations, to keep teachers in teaching and to induce college students to choose teaching as a career. Nevertheless, using a variety of measures it appears that **teacher earnings are relatively low compared to those of many other professions that college students could pursue.**¹⁸ Policymakers have expressed some concern over whether this discourages the best and the brightest students from choosing teaching as a profession. Evidence of this is mixed. **Some research indicates that those accepting teaching positions were more likely to have lower scores on the SAT and NTE (National Teacher Examination) than non-teaching college graduates** and that those leaving teaching were more likely to have higher SAT and NTE scores than those remaining.¹⁹ Evidence from the 1992 National Adult Literacy Survey (NALS) points in the opposite direction, however. In NALS, **the prose literacy scores of teachers are similar to the scores of many of their colleagues in other**

professions, including private sector executives and managers, engineers, physicians, writers and artists, social workers, sales representatives, education administrators, and registered nurses. With respect to at least prose literacy, there is little evidence that low salaries are attracting only the least able college graduates into teaching (*Indicator 59*).

Average annual salaries of public school teachers (in constant 1994 dollars)

Although many of the characteristics that determine the quality of a teacher are not easily measured, some teacher qualifications can be measured. Many analysts argue that one of the most important characteristics is training and preparation in the subject or field in which the teacher is teaching. Research has shown moderate but consistent support for the reasonable proposition that subject knowledge (knowing what you teach) and teaching skills (knowing how to teach) are important predictors of both teaching quality and student learning.²⁰ Knowledge of subject matter and of pedagogical methods does not, of course, guarantee quality teaching, but it is a necessary prerequisite.

Almost all teachers are certified to teach in their primary assignment field, and a large majority have majored or minored in this field. In fact, most teachers have a graduate degree. About one-quarter of teachers has a secondary assignment field and lower proportions are certified or have majored or minored in this field (*Indicator 58*). **There is considerable variation in teacher qualifications across states, however.** For example, the percentage of high school mathematics teachers who majored in mathematics or mathematics education ranged from 44 percent in California to about 90 percent

Commissioner's Statement

in Alabama and Minnesota.²¹ Although teacher qualifications and credentials may be an indication of minimal competency, these may be poor measures of subject matter and instructional competence.

Certification and educational background of teachers in 1990-91

Considerable policy discussion has addressed the ability of schools to keep qualified teachers, both in general and in specific subject areas such as mathematics and science. **Overall, teacher attrition in public elementary and secondary schools seems to be low.** Only 1 in 20 full-time public school teachers left the teaching profession in a recent year. Furthermore, keeping mathematics and science teachers in the profession does not seem to be as big a problem as was once suggested. The percentage of full-time teachers in public secondary schools in 1990-91 who left teaching in the next year was no higher in mathematics and science than in other teaching fields (*Indicator 60*).

A high level of education and associated professional commitment among teachers benefits both students and the education system. These benefits come at a cost, however, because teachers must be paid enough to justify the investment they have made in their education. Nevertheless, education policymakers must address the more difficult issue of how to make best use of available resources under changing conditions.

How have conditions facing the schools changed?

Changing conditions that schools must confront are putting additional strains on revenues, even though revenues have increased.

First, schools are facing a period of rising enrollments after a long period of decline (*Indicator 35*). It is important to monitor these increases because they will affect school budgets as well as policies of teacher recruitment and retention.

Public school enrollment

Second, many more disabled students, particularly those with learning disabilities, are receiving special services (*Indicator 42*). This has major financial implications for school districts. There is some evidence that the average cost of serving a special education student is as much as 2.3 times the cost of serving regular students (ranging from 1.9 times for students in resource programs to 10.6 times for students in residential programs).²²

Children served in federally supported programs for students with disabilities

Third, many more students speak a language other than English at home and have difficulty speaking English, a likely indication that even more students may have difficulty reading and writing English.²³

By law, school systems nationwide must provide services for children from non-English-language

Children who have difficulty speaking English

backgrounds. Because these students are disproportionately concentrated in a few states (California, Texas, New Mexico, Arizona, and New York), the education systems in these states are under particular strain to respond to the special needs of these children.

Percentage of children who have difficulty speaking English

Fourth, many children live in poverty (22 percent or 14.6 million), and these children typically live in neighborhoods and attend school together. Thus, the schools in these neighborhoods are also facing heavy demands.

Fifth, crime in the schools remains a problem. Violence in and around schools directly affects educators and students by reducing school effectiveness and inhibiting students' learning. In 1993, more than one in five high school seniors were threatened at school. However, between 1976 and 1993, there was little change in victimization rates in schools, except for a slight increase in the percentage of students who reported being threatened, both with and without a weapon. And although generally few differences were seen in school victimization rates among black and white high school seniors, black seniors were more likely than their white

Percentage of children living in poverty in 1992

counterparts to have been threatened with a weapon at school (24 versus 14 percent, *Indicator 47*).

As this discussion indicates, there is not one answer to the complex question of whether the condition of education is improving. Some conditions are improving, while others are not. In a number of areas, research has not been able to disentangle the influences of several factors, so we cannot be certain whether conditions are actually improving or not. However, this volume can help Americans interested in education policy to pose more sophisticated questions. In doing so, we can make progress toward understanding what produces high quality educational institutions, an educated citizenry, and a skilled work force.

²³*The Condition of Education 1994, Indicator 46.*

¹⁵ *Education Counts*, 1991.

The Condition of Education 1995 was authored by a joint NCES/Pinkerton Computer Consultants, Inc./MPR Associates, Inc. team under the general direction of Thomas M. Smith, Director of the Condition of Education Project in the Data Development Division. Overall direction was provided by Nabeel Alsalam, Director of the Special Studies and Reports Program and Jeanne E. Griffith, Associate Commissioner for Data Development.

The authors wish to thank all those who contributed to the production of this report. Huong Huyen, Sharon Xu, and Michelle Brown of Pinkerton Computer Consultants, Inc. made significant contributions, for which we are especially grateful. Huong Huyen produced tabulations from the Schools and Staffing Survey and the National Education Longitudinal Study of 1988. Sharon Xu produced tabulations from several data sets, including the October and March Current Population Surveys. Michelle Brown designed and edited all of the graphics in the report and prepared them for printing. Other Pinkerton staff also made important contributions to the volume, including Bruce Daniel, who produced tabulations from the National Survey of Postsecondary Faculty and the National Education Longitudinal Study of 1988. In addition, Tony Russo designed and formatted the index as well as typeset many of the supplemental tables. Helena Bretherton also made significant contributions to the production of this publication. Finally, James Corina, Hilda Lynch, Ross Merlin, and Mark Glander also produced tabulations in support of this project.

From outside the Department of Education, Eric Grodsky and Richard Phelps of Pelavin Research Institute calculated public expenditure data for countries other than the United States. Within NCES, Thomas D. Snyder provided considerable assistance in data acquisition and use. The draft manuscript was carefully edited by Andrea M. Livingston and Karen Singson of MPR Associates, Inc. and Simone Miranda of OERI.

Producing the *Condition of Education* requires a 12 month cycle. We formally ask for advice twice during this cycle, once when we develop the proposed table of contents and again when the draft *Condition of Education* has been prepared. Reviewers of the plan for the 1995 edition of *The Condition of Education* were: Rolf K. Blank, Council of Chief State School Officers; Lynn M. Cornett, Southern Regional Education Board; Mary Dilworth, American Association of Colleges for

Teacher Education; Jewell Gould, American Federation of Teachers; Sharon Lynn Kagan, Bush Center in Child Development and Social Policy; Gary Natriello, Teacher's College, Columbia University; Patricia Brown, National Governor's Association; Paul E. Barton, Educational Testing Service; Mark Berends, Rand Corporation.

This volume has been reviewed by many people, often within tight time constraints and at the expense of their many other responsibilities. Their high professional standards, discerning eyes, and commitment to quality are crucial to the quality, utility, and relevance of the volume. Mary Frase painstakingly reviewed the entire manuscript through several drafts and made many important suggestions that improved the final result. Susan Ahmed, Sharon Bobbitt, Steve Broughman, Bob Burton, Dennis Carroll, Kathryn Chandler, Mike Cohen, Bill Fowler, Kerry Gruber, Elvie Hausken, Lee Hoffman, Frank Johnson, Andrew Kolstad, Roz Korb, Ralph Lee, Peggy Quinn, Nancy Schantz, Peter Stowe, Marilyn McMillen, Jeff Owings, Jerry West, Deeann Wright, and Linda Zimble of NCES all provided a detailed and helpful reviews. Laurence Peters reviewed the document for the Office of the Assistant Secretary in OERI. Other offices within the Department of Education that provided comments were: Office of the Undersecretary; Office of Vocational and Adult Education; Office of Civil Rights; and Office of Special Education Programs.

Several individuals served as invited external peer reviewers of the draft manuscript and made valuable contributions: Rolf K. Blank, Council of Chief State School Officers; Patricia Brown, National Governor's Association; Joe Creech, Southern Regional Education Board; Lisa Hudson and Harold Himmelfarb, OERI; Reynaldo Macías, University of California, Santa Barbara; Jennifer Manlove and Kristen Moore, Child Trends, Inc.; Michael Podgursky, University of Massachusetts, Amherst.

We would also like to thank the following individuals for their valuable suggestions on a draft of the Commissioner's Statement: Norma Cantú, Office of Civil Rights; Thomas Payzant, Office of Elementary and Secondary Education; Terry Peterson, Office of the Secretary; Val Plisko, Planning and Evaluation Service; Dorothy Gilford; Ronald E. Kutscher, Bureau of Labor Statistics; and Andrew Porter, University of Wisconsin-Madison.

Overview

“Why do we seek to know the condition of education? In the answer to this question will be found the reasons for the elaborate statistical record which forms a feature of all official school reports. We take an account of education so that we may know whether it is sufficient in amount and good in quality.”

Henry Barnard
First Commissioner of Education

Introduction

During the 1980s, the country became increasingly aware of a range of critical national issues facing education. These issues included concerns about all children having an equal opportunity to receive a high quality education, general low academic performance, drug use and violence in the schools, unacceptably high dropout rates, the high cost of a college education, and the skills of workers lagging behind technological changes in the workplace. The 1990s have continued the emphasis expressed in the 1980s, with renewed concern over academic standards and school finance reform. These concerns continue to have serious implications, not only for schools and colleges but also for the future of individual citizens, U.S. economic competitiveness, and ultimately the structure and cohesiveness of American society and culture.

The Condition of Education provides a means to report where progress is being made in education and where it is not, to draw attention to emerging issues, and to inform the ongoing policy debate.

The structure of *The Condition of Education*

A quick tour of the volume may help readers make the best use of it. The core of the volume consists of 60 indicators. Each indicator is presented on two pages, with findings summarized in accompanying text, tables, and graphics. Also included in the back of the volume are supplemental tables providing additional details, and sometimes an explanatory note on a technical or data-related issue.

The 60 indicators are organized into six sections:

- Access, Participation, and Progress;
- Achievement, Attainment, and Curriculum;
- Economic and Other Outcomes of Education;
- Size, Growth, and Output of Educational Institutions;
- Climate, Classrooms, and Diversity in Educational Institutions; and
- Human and Financial Resources of Educational Institutions.

Instead of separating the indicators on elementary and secondary education from those on postsecondary education, the volume integrates issues ranging from early childhood education to postsecondary education into each of the six sections.

One can find information on an issue either by turning to the table of contents, which lists the 60 indicators, or by using the index, which references not only the indicators but also the supplemental tables. When an updated indicator is not available in this volume, the index lists the indicator number and edition of *The Condition of Education* that last published an indicator on that topic.

Preceding each section of indicators is a two-page overview that interprets and summarizes some of the findings in that section as they relate to an important issue. In addition, this overview summarizes results drawn from throughout the volume as they relate to particular issues that cut across the six sections.

At the bottom of each indicator page, readers can locate the source of the data for the indicator. The indicators presented in this report have been developed using data from studies carried out by NCES as well as from surveys conducted elsewhere, both within and outside of the federal government. A description of each source is provided starting on page 455. Sometimes more knowledge about the type of survey used to gather the data can help readers interpret the indicator. Because some of the terms used may not be familiar to all readers, a glossary is provided starting on page 485.

In the remainder of this section, we pull together evidence from both the 60 indicators and other sources on four important education issues:

- Access to preschool education;
- Trends in the achievement and attainment of Hispanic students relative to whites;
- Progress in the achievement and attainment of women; and
- The cost of higher education.

These issues were selected, first because of their importance to current policy discussions, and second because a substantial amount of new information on these issues has been included in this volume and other recent NCES publications. In the 1994 edition of the *Condition*, essays were included on high school students 10 years after *A Nation At Risk*; teachers as an educational resource; the educational progress of black students; and sub-baccalaureate postsecondary education.

References to indicators and tables contained in this volume appear in parentheses. The tables cited are in the supplemental tables section, which start on page 169. Occasionally, there are references to indicators found in a previous edition of *The Condition of Education*; these can be recognized by the year following the reference. References to sources other than *The Condition of Education* are footnoted.

Access to preschool education

Today, many parents enroll their children in some form of preschool, which means that kindergarten is no longer the child's first experience with group educational programs. Many early childhood experts believe that children who have been involved in high quality group care or nursery school are better prepared for formal schooling. There is substantial evidence of the short-term effects (e.g., achievement test gains) of attending a high quality early childhood program, and there is some evidence of long-term effects (e.g., an increased likelihood of completing high school).¹ The National Education Goals stress the importance of access to quality early childhood programs. Goal 1 states, "By the year 2000, all children will start school ready to learn." This

goal underscores the role that children's early experience plays in preparing them for successful schooling. Thus, the first objective associated with this goal states that all disadvantaged and disabled children will have access to high quality and developmentally appropriate preschool programs that help prepare them for school. Differences in enrollment rates in early childhood education across family income and race/ethnicity may indicate differential access to this important educational resource. Differences in the knowledge and behaviors of students in these subgroups may be associated with variability in the quantity and quality of early childhood care and instruction.

Do enrollment rates in preschool differ by family income?

Children from lower income families have lower participation rates in preschool. In 1973, the enrollment rates in preschool for 3- to 4-year-olds from low income families was about 20 percentage points lower than those of their counterparts from high income families (15 versus 35 percent). By 1993, enrollment rates for children from both income groups had increased, and the gap between those from low and high income families widened to 28 percentage points (24 versus 52 percent) (*Indicator 2*). The Head Start program has substantially increased the proportion of low income children enrolled in preschool; however, in the early 1990s, it still served fewer than one-half (40 percent) of eligible 4-year-olds, and fewer than 20 percent of eligible 3-year-olds.²

Percentage of 3- to 4-year-olds enrolled in preschool

SOURCE: *Indicator 2*.

Overview

Do enrollment rates in preschool differ by race/ethnicity?

During the mid-1970s, preschool enrollment rates among white and black 3- to 4-year-olds were similar. However, due mostly to increases in preschool enrollment of white 3- to 4-year-olds in the 1980s, average enrollment rates for white preschoolers were nearly 8 percentage points higher than those of blacks and 22 percentage points higher than those of Hispanics by 1993. It should be noted, however, that although white 3- to 4-year-olds were more likely than blacks and Hispanics to be enrolled in preschool, blacks and Hispanics were more likely than whites to be enrolled in kindergarten at that age. As a result, a similar percentage of blacks and whites were enrolled in some type of school program at age 3-4 in 1993. Hispanic school enrollment rates were still substantially lower that year (table 2-1).

Percentage of 3- to 4-year-olds enrolled in preschool

SOURCE: Indicator 2.

How do these enrollment rates change under a broader definition of early childhood education?

Early childhood experts argue that children learn in a variety of settings, and the distinction between "nursery school" (or preschool) and "child care centers" based upon their presumed differential emphasis on educational activities is not meaningful.³ Participation rates of white and black students become indistinguishable when the definition of early childhood education is broadened to include all center-based programs, including day care. For example, in 1993, 73 percent of white first-graders and 76 percent of black first-graders had attended center-based programs before entering kindergarten.⁴ A smaller proportion of Hispanic first-graders (57

Percentage of first-graders who participated in center-based early childhood programs before kindergarten: 1993

SOURCE: Indicator 3.

percent) had participated in these programs, however (Indicator 3).

As with preschool enrollment, students from families with high incomes were more likely to participate in center-based early childhood programs than were students from families of more moderate means. For example, first-graders whose families had incomes greater than \$35,000 were more likely to have attended a center-based early childhood program before kindergarten than first-graders whose families had incomes of \$35,000 or less. Among those who attended such programs, students from families with higher incomes were more likely to attend them for at least 2 years than were students from families with lower incomes (Indicator 3).

How do the enrollment rates in preprimary education in the United States compare to rates in other countries?

The number of years in which children typically participate in school before first grade varies greatly across countries. The average duration of preprimary enrollment, which includes enrollment in both preschool and kindergarten in the United States, ranges from .5 years in the United Kingdom to 3.4 years in France. The

Enrollment rates in public and private preprimary education: 1992

Country	Age			Average duration of preprimary education (in years)
	3	4	5	
	(percent)			
Canada	—	46	69	1.2
United States	29	53	83	1.8
Japan	23	58	66	1.5
France	99	101	100	3.4
United Kingdom	37	13	0	0.5
Former West Germany	31	69	79	2.6

—Not available.

SOURCE: OECD, *Education at a Glance*, 1995, table P02.

average duration of preprimary enrollment in the United States is 1.8 years. The average duration of preprimary enrollment is affected by the supply of and demand for preprimary education in each country as well as the normal starting age of primary education (first grade in the United States). For example, in the United Kingdom, where preprimary enrollment rates are relatively low at ages 4 and 5, the enrollment rates in primary education are relatively high (78 percent at age 4 and 99 percent at age 5). Canada also has a significant proportion of 5-year-olds enrolled in primary education (30 percent).⁵

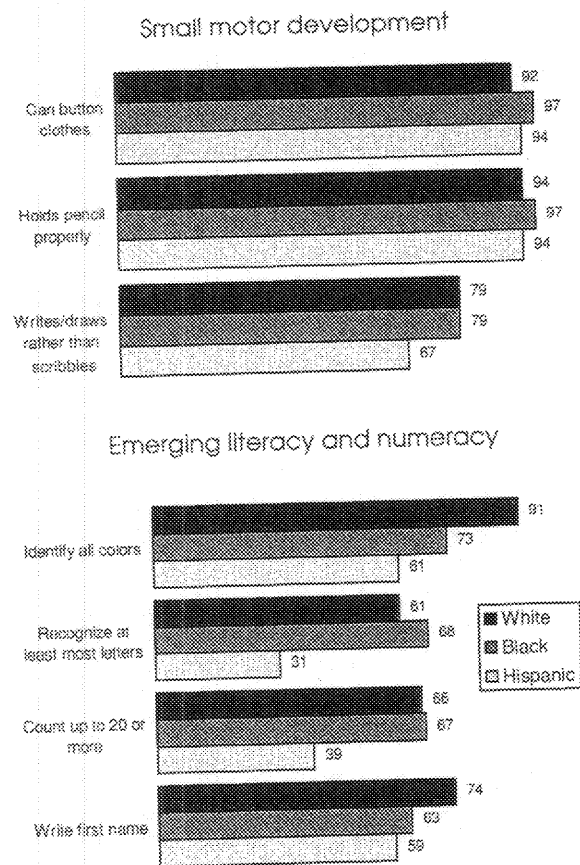

How do the skills and behaviors of children vary before kindergarten?

There are varying opinions about what skills children should possess upon entering kindergarten. Some believe that children should simply be physically and mentally healthy, while others feel it is important for students to have rudimentary skills with such things as numbers, letters, and colors.⁶ Children arrive at kindergarten with a wide variety of skills and experiences, and schools must develop programs that are sensitive to these differences. Understanding the wide range of developmental skills in kindergarten classes is an important first step to providing a quality education to the entire range of students.

A majority of parents indicate that their 4-year-olds were able to identify all colors (84 percent), recognize most letters (57 percent), count to at least 20 (62 percent), write their first name (70 percent), button their clothes (93 percent), hold a pencil properly (94 percent), and write or draw rather than scribble (table 4-1).

At age 4, a greater percentage of whites were able to identify all colors than were blacks or Hispanics. However, blacks were more likely than whites to demonstrate the ability to hold a pencil properly and button their clothes. Both black and white 4-year-olds were more likely than their Hispanic counterparts to recognize most letters of the alphabet, count up to at least 20, and write or draw rather than scribble. The parents of Hispanic 4-year-olds were also more likely than the parents of white and black 4-year-olds to indicate that their child fidgets a lot, has a short attention span, and often has tantrums (table 4-1).

Percentage of 4-year-olds not in kindergarten with selected skills: 1993

SOURCE: Indicator 4.

Furthermore, many of the skills of 4-year-olds are strongly associated with level of family income. For example, students from families with incomes above \$35,000 were more likely to be able to identify all colors and to recognize most letters of the alphabet than were students from families with incomes less than or equal to \$35,000. Differences in social and emotional development and in speech development were also associated with family income (table 4-2).

In summary, preschool attendance rates differ by race/ethnicity and level of family income, although some of these differences attenuate when the definition of early childhood education is expanded to include all center-based care. Moreover, the average duration of preprimary enrollment varies across countries. The average duration of preprimary enrollment in the United States is shorter than among students in France, but longer than among students in the United

Kingdom. The skills that children bring to kindergarten also vary by both race/ethnicity and family income, although opinions about how well-prepared children should be upon entering school vary widely.

Progress in the achievement and attainment of Hispanic students

Education has always been seen as one means of upward mobility, especially for those who are socially and economically disadvantaged. Hispanic children are likely to be at an educational disadvantage relative to whites for several reasons, including lower average levels of parental education and a greater likelihood of living in poverty. A larger percentage of Hispanic students attend disadvantaged schools where the overall academic and supporting environments are less conducive to learning.⁷ In addition, a much higher proportion of Hispanics than non-Hispanics are foreign born. As a result, Hispanic children are less likely to hear or speak English at home and are more likely to have limited English proficiency. Furthermore, Hispanic children are much more likely to experience poverty than white children. In 1992, 39 percent of Hispanic children compared to 16 percent of white children lived in families with an income level below the poverty line (*Indicator 47, Condition 1994*).

Although limited data availability often leads researchers to treat Hispanics as if they were a homogeneous group, the U.S. Hispanic population is diverse. The three largest Hispanic subgroups are Mexican Americans, Puerto Ricans, and Cubans. Recent immigrants from Central and South America constitute a fourth group. These subgroups are concentrated in different parts of the United States, their economic circumstances vary, and the timing of their immigration differs. In this overview, the additional breakouts for the largest Hispanic subpopulations will be made when possible.

Hispanics are the fastest growing ethnic group in the United States, increasing from 6 percent of public school enrollment in 1972 to 12 percent in 1993. In 1993, 2 out of 10 students attending public schools in central cities of metropolitan areas were Hispanic, up from 1 out of 10 students in 1972. In public schools located in other parts

of metropolitan areas, 10 percent of the student body was Hispanic in 1993; in private schools, 7 percent was Hispanic (*Indicator 40*). Furthermore, the ethnic isolation of Hispanic students rose between 1968 and 1992. For example, between 1968 and 1992, the percentage of Hispanic students attending schools that were 90 to 100 percent minority increased from 23 to 34 percent.⁸

Percentage of public school students who are Hispanic

SOURCE: *Indicator 40*.

In many regards, Hispanics trail their white counterparts with respect to educational access, achievement, and attainment, although some of these differences have narrowed over time. Outlined below are some examples of the educational differences between Hispanics and whites with respect to preschool attendance, academic achievement, dropout rates, parental involvement, school climate, course-taking patterns, educational aspirations, college attendance and completion, labor market outcomes, and adult literacy levels.

Do Hispanic children start elementary school with less preschool experience than white children?

Hispanic and white children differ greatly in their extent of participation in education before kindergarten. Several federal programs, such as Head Start, a popular program for disadvantaged preschoolers, were launched to give children from low income families an early start in education. Yet, despite these programs, fewer Hispanic children are enrolled in preschool than white children, and the gap has widened over time. In 1993, 17 percent of Hispanic 3- and 4-year-olds were in preschool programs compared to 35 percent of white children. Since the mid-1970s, white enrollment rates in

preschool have increased more than 10 percentage points, while Hispanic enrollment rates have fluctuated, with the rate in 1993 approximating that in 1973 (table 2-1).

Enrollment rates of 3- to 4-year-olds in preschool

SOURCE: Indicator 2

One possible explanation for the Hispanic-white difference in preschool participation is that the provision of preschool education is not mandatory; it is usually not offered in public schools, whereas kindergarten typically is. Limited financial resources may make it difficult for many Hispanic families to afford private preschool tuition. In 1991, a far lower proportion of Hispanic preschool students (27 percent) were enrolled in private preschools than were white preschool students (68 percent) (table 3-2, *Condition 1994*). Hispanic 3- and 4-year-olds were, however, twice as likely as their white counterparts to be enrolled in kindergarten, 10 and 5 percent, respectively, in 1993 (table 2-1).

Does the academic performance of white and Hispanic students differ in the early grades?

As early as age 9, differences can be seen in the academic performance of Hispanic and white students. Academic proficiency in reading, mathematics, and science, as measured at age 9 by the National Assessment of Educational Progress (NAEP), is lower for Hispanic children than for white children (*Indicators 13, 15, and 16*). Although scores for Hispanic 9-year-olds have increased in mathematics and science over the past 15 to 20 years, there has been little change in the gap between the scores of white and Hispanic 9-year-olds over this time period.

NAEP scores of 9-year-olds in 1992

SOURCE: Indicators 13, 15, and 16.

At age 13, the achievement gap between Hispanic and white students persists for reading, mathematics, and science, even though the gap in mathematics and science has narrowed over the past 15 years or so. In reading, the gap in scores for Hispanic and white 13-year-olds was about 30 scale points in 1975 and 1992 (*Indicator 13*). The achievement gap in mathematics narrowed between the mid-1970s and early 1980s, but has remained stable since then (*Indicator 15*). Finally, the science achievement gap narrowed considerably between 1977 and 1992 as the scores of Hispanic students showed sizable gains (*Indicator 16*).

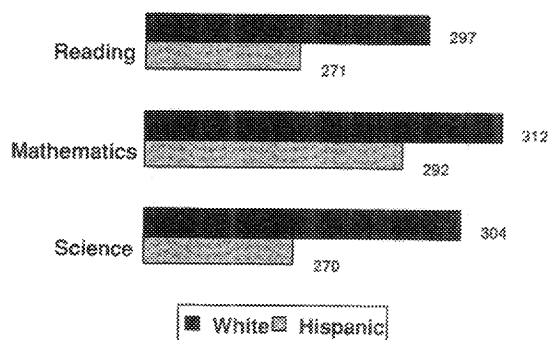

Despite the gains Hispanic 13-year-old students have made, the Hispanic-white mathematics, reading, and science achievement gaps remain large. For example, in 1992, the average mathematics proficiency scores of Hispanic 13-year-olds (259) fell about midway between the average proficiency scores of white 9- and 13-year-olds (235 and 279, respectively). This gap suggests that on average Hispanic children's level of math skills may be as much as 2 years behind that of their white peers by age 13—a deficiency that they will carry with them into high school. The size of the gap was similar in reading and was even worse in science, with Hispanic 13-year-olds scoring at about the same level (238) as white 9-year-olds (239).

Does the gap in achievement that we see between whites and Hispanics at age 13 persist in high school?

When students were tested again near the end of high school, their NAEP scores indicate a large gap in reading, writing, science, and mathematics achievement between whites and Hispanics. The Hispanic-white gap in reading

and mathematics, however, has narrowed over time. For example, in 1975, average reading proficiency among Hispanics at age 17 was well below (40 scale points) that of 17-year-old whites and also below (10 scale points) that of 13-year-old whites; in 1992, the proficiency gap was less (26 scale points) between Hispanic and white 17-year-olds, and the reading level of 17-year-old Hispanics was about the same as that of 13-year-old whites (*Indicator 13*). Most of these gains in reading were made by 1984, however.

NAEP scores of 17-year-olds in 1992

SOURCE: *Indicators 13, 15, and 16.*

The gap between the mathematics proficiency of Hispanic and white high school students has also narrowed over time, although the difference remains large. In 1973, average mathematics proficiency among 17-year-old Hispanics was 33 scale points behind that of their white counterparts, and about the same as that of 13-year-old whites; in 1992, it was 20 scale points behind that of 17-year-old whites, and 13 scale points above that of 13-year-old whites (*Indicator 15*).

There is strong evidence that the Hispanic-white achievement gap seen at age 17 in reading, mathematics, and science begins as early as age 9. For example, the Hispanic-white differences in reading at ages 9 in 1984, 13 in 1988, and 17 in 1992 are 30, 21, and 26 scale points, respectively. In other words, the large achievement gap observed for this cohort was present at age 9, and it remained with age.

Are fewer Hispanic students dropping out of high school now than previously?

Fewer Hispanic teenagers are dropping out of high school before graduating. Although the dropout rate is still considered high by many

educators, the 10th- to 12th-grade dropout rate among Hispanics (12 percent) was substantially lower in 1992 than it was a decade earlier (19 percent).⁹ The reasons that both Hispanics and whites gave for leaving school were more often school-related than job- or family-related concerns. Three out of 10 Hispanic female dropouts reported leaving school because they were pregnant, about the same proportion as white females.¹⁰

Tenth- to 12th-grade dropout rates

SOURCE: NCES, High School and Beyond study and the National Education Longitudinal Study of 1988.

With a lower proportion of Hispanic high school students dropping out, one might expect the percentage of 16- to 24-year-old Hispanics who have *not* completed high school or earned a GED (the status dropout rate) to have declined. However, there was no measurable decline in the status dropout rate for Hispanics between 1972 and 1992.¹¹ This may be due, in part, to high dropout rates for Hispanics before 10th grade,¹² and high immigration rates for less educated Hispanic young adults who may never enter U.S. schools.

Are Hispanic dropout rates related to migration?

The length of time a Hispanic family has lived in the United States is strongly related to dropout rates for students in that family. In 1989, 43 percent of Hispanic 16- to 24-year-olds born outside the 50 states and the District of Columbia had not completed high school or a GED. The status dropout rates for first and at least second generation Hispanic Americans were considerably lower (17 and 24 percent, respectively). It should be noted, however, that Hispanic dropout rates are still double

those of non-Hispanics when the length of residency in the United States is taken into account. In other words, high status dropout rates among Hispanics are not just a problem associated with recent immigration.¹³

Status dropout rates among 16- to 24-year-olds: November 1989

Recency of migration	Total	Non-Hispanic	
		Hispanic (percent)	Hispanic
Total	13	31	10
Born outside 50 states and D.C.	29	43	8
First generation	10	17	6
Second generation or more	11	24	11

SOURCE: Current Population Survey, 1989.

How do dropout rates vary among Hispanic subpopulations?

Compared to the status dropout rate for all 16- to 24-year-old Hispanics in 1989 (31 percent), the dropout rates for Mexican Americans (36 percent) and Puerto Ricans (32 percent) were similar. However, the dropout rates for "other Hispanics" (19 percent) and Cubans (9 percent) were much lower.¹⁴

Mexican Americans made up about 64 percent of the Hispanic population in 1989, and about 74 percent of all Hispanic dropouts in this age group. Among Mexican Americans born elsewhere, the dropout rate was 55 percent; this subgroup accounted for about 48 percent of all Hispanic dropouts.

How does the learning environment of Hispanic and white students differ?

Research indicates that a safe and orderly school environment is key to effective learning. A student's achievement can be affected by the degree to which the school maintains such an environment. In 1992, Hispanic seniors were more likely than white seniors to report that disruptions by other students interfered with their learning, that fights often occurred between different racial/ethnic groups, and that they did not feel safe at their school.¹⁵ Furthermore, Hispanics were almost three times as likely as whites to report that there were many gangs in their school. Hispanics were no less likely than whites, however, to report that in their school "discipline is fair,"

the "teaching is good," and that "teachers are interested in students."

Twelfth-graders' attitudes about school climate: 1992

Statements about school climate	Percent who strongly agree or agree		
	Total	Hispanic	White
Discipline is fair	68	75	68
Teaching is good	85	89	85
Teachers are interested in students	82	84	82
I don't feel safe at this school	10	15	9
Disruptions by other students interfere with my learning	33	40	31
Fights often occur between different racial/ethnic groups	23	32	21
There are many gangs in school	16	36	13

SOURCE: NCES, National Education Longitudinal Study of 1988.

Are the parents of Hispanic students more or less likely than those of white students to be involved in their children's education?

The degree to which parents are involved in their children's education is also crucial to effective schooling. Although the vast majority of eighth-grade students reported in 1988 that they talk to their parents about school, Hispanic eighth-graders were slightly less likely than their white peers to talk with their parents about school activities, class studies, or selecting courses. Similar percentages of Hispanic and white students had parents who checked their homework and limited their going out with friends. Hispanic eighth-graders, however, were more likely than their white counterparts to report that their parents had limited their television viewing and that their parents had visited their classes (*Indicator 43, Condition 1994*).

Parents of both Hispanic and white 12th-grade students reported in 1992 that they were more likely to be contacted by school personnel regarding the academic performance of their child than about their child's behavior. In general, parents of both Hispanic and white 12th-graders were contacted by school personnel for similar reasons; however, parents of Hispanic children were less likely to be asked to volunteer at school (table 44-1).

Are the course-taking patterns of white high school graduates different from those of Hispanic graduates?

The racial/ethnic background of students does not appear to affect the total number of courses

that they take and the type of curriculum that they follow. In 1992, Hispanic and white high school graduates had, on average, earned a similar number of total course units (24 each) and academic units (17 and 18, respectively) (*Indicator 23, Condition 1994*). Hispanic graduates were, however, less likely than their white counterparts to have taken the core curriculum (4 units of English and 3 units each of science, social science, and mathematics) recommended in *A Nation At Risk* (*Indicator 25*).¹⁶

Percentage of high school graduates earning the recommended credits in core courses in *A Nation At Risk*

SOURCE: *Indicator 26*.

In addition, Hispanic graduates were less likely than their white counterparts to take higher level mathematics, science, and foreign language courses. In 1992, Hispanic graduates were more likely than white graduates to have taken remedial mathematics and were less likely to have taken algebra II, geometry, or trigonometry than were white graduates (table 25-2). Although similar percentages of Hispanic and white graduates took biology, Hispanics were less likely

Percentage of high school graduates taking selected mathematics and science courses

Mathematics and science courses	1982		1992	
	White	Hispanic	White	Hispanic
Mathematics				
Remedial mathematics	27.0	48.5	14.6	24.2
Geometry	53.9	29.0	72.6	62.9
Algebra II	40.5	22.5	59.2	46.9
Trigonometry	13.8	6.8	22.5	15.2
Calculus	5.0	1.6	10.7	4.7
Science				
Biology	80.1	73.2	93.5	91.2
Chemistry	34.7	16.7	58.0	42.6
Physics	15.3	5.5	25.9	15.7
Biology, chemistry, and physics	11.2	3.7	22.6	12.8

SOURCE: Table 26-2.

to have taken chemistry, physics, or a combination of biology, chemistry, and physics (table 25-2). However, Hispanic college-bound graduates were just as likely as their white peers to have taken at least 2 years of a foreign language in high school (*Indicator 26, Condition 1994*).

Do the educational aspirations of white and Hispanic students differ?

On average, Hispanic students have lower educational aspirations than white students. In 1990, 14 percent of Hispanic sophomores aspired to a high school diploma or less, compared to 9 percent of white sophomores. Forty-seven percent of Hispanic sophomores aspired to a bachelor's degree or higher, compared to 61 percent of whites.¹⁷

In 1990, Hispanic sophomores, however, were just as likely as whites to have teachers recommend college attendance, and to receive advice on college attendance from guidance counselors. Hispanic sophomores were also about as likely to have their parents advise them to attend college as their white counterparts (*Indicator 7, Condition 1994*).

Percentage of 1990 high school sophomores for whom college was recommended

SOURCE: NCES, National Education Longitudinal Study of 1988.

How different are college enrollment rates for Hispanic and white high school graduates?

Although Hispanic high school sophomores had lower educational aspirations than their white counterparts, college transition rates among Hispanic and white high school graduates did not differ measurably. The percentage of Hispanics enrolling in college in October following high school graduation was 58 percent in 1992, a difference that is

statistically indistinguishable from the college transition rate for white high school graduates (*Indicator 9*). Hispanics, however, were more likely to attend 2-year public colleges in 1992, where they represented 10 percent of total enrollment, than 4-year colleges and universities, where they represented 5 percent of total enrollment (*Indicator 49*).

Do Hispanic and white students study different subjects in college?

Hispanic and white degree recipients concentrated in different fields of study at both the associate's and bachelor's degree levels. In 1991, at the associate's degree level, Hispanic men were slightly less likely than white men to major in other technical/professional fields, but were more likely to major in arts and sciences. On the other hand, Hispanic women were more likely than white women to earn associate's degrees in the arts and sciences and business, but were less likely to earn degrees in health-related fields. Differences in the fields studied by Hispanics and whites at the associate's degree level narrowed for men and widened for women (*Indicator 29, Condition 1994*).

At the bachelor's degree level, in 1991, Hispanics were more likely than whites to major in social

Percentage distribution of bachelor's degrees conferred

Field of study	1977		1991	
	Hispanic	White	Hispanic	White
Total degrees	100.0	100.0	100.0	100.0
Humanities and social/behavioral sciences	41.6	33.7	36.7	33.3
Humanities	19.0	16.2	17.4	16.3
Social/behavioral sciences	22.6	17.5	19.3	17.0
Natural sciences	8.2	10.0	6.2	6.2
Life sciences	5.3	5.9	4.1	3.4
Physical sciences	1.8	2.5	1.1	1.5

Computer sciences	0.5	0.7	2.5	2.0
Engineering	4.8	5.1	7.2	6.6
Technical/professional	44.9	50.5	47.4	51.8
Education	16.3	15.5	9.6	11.1
Business and management	13.9	16.5	21.4	22.9
Health sciences	4.6	6.4	4.7	5.5
Other technical/professional	10.1	12.1	11.7	12.3

SOURCE: Table 30-2, *Condition 1994*.

and behavioral sciences and were less likely to major in technical/professional fields. Overall, Hispanic-white differences in the fields studied narrowed between 1977 and 1991, although almost all of the decrease occurred between 1977 and 1981 (*Indicator 30, Condition 1994*).

Do Hispanics and whites have different postsecondary persistence rates?

The persistence rates of Hispanic and white postsecondary students vary greatly by degree objective. Among beginning students whose goal in 1989-90 was a vocational certificate, a lower percentage of Hispanic students had completed one by early 1992 than had white students (32 versus 53 percent). Among beginning students who sought an associate's degree, however, Hispanic students were far more likely to have been continuously enrolled or to have reenrolled after an interruption in 1992 than their white counterparts (72 versus 53 percent). The persistence rates of Hispanic and white students pursuing bachelor's degrees were similar over this period, although whites were more likely than Hispanics to have been continuously enrolled (*Indicator 10, Condition 1994*).

Among a recent cohort of full-time students pursuing associate's and bachelor's degrees, Hispanics and whites displayed similar persistence rates. Nevertheless, young adult Hispanics in general have much lower college attainment rates than do young adult whites. In 1994, 52 percent of Hispanic high school graduates 25 to 29 years old had completed at least some college, compared to 63 percent of their white counterparts. In addition, 13 percent of Hispanic high school graduates in this age group had earned a bachelor's degree or more, compared to 30 percent of whites. These gaps in educational attainment rates between Hispanics and whites have not closed between 1971 and 1994 (*Indicator 22*).

Hispanics who do complete college take longer, on average, than whites. Of 1990 college graduates, 60 percent of Hispanic students completed in 5 or fewer years, compared to 72 percent of white students. Taking longer to graduate may result from changing schools or majors, stopping out, or

taking a reduced course load for financial, academic, or personal reasons. The additional time in college can be costly to the individual, as it delays entrance into the full-time labor market (*Indicator 6, Condition 1993*).

Are there gender differences in degree attainment for Hispanics?

Hispanic women earn substantially more bachelor's degrees than Hispanic men, although both groups have made substantial gains in degree attainment since the early 1980s. The number of degrees earned by Hispanic men increased by 50 percent between 1981 and 1991, while the number earned by Hispanic women increased by 86 percent (*Indicator 31, Condition 1994*).

Does the relationship between education and labor market outcomes differ for Hispanics and whites?

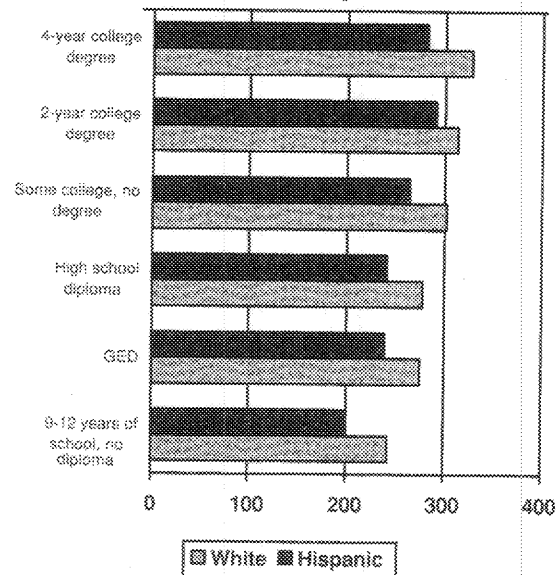

Among both Hispanics and whites, those with more education have better employment and earnings outcomes. In 1992, 54 percent of Hispanic recent high school graduates not enrolled in college were employed, compared to 29 percent of Hispanic recent dropouts. Yet white graduates not enrolled in college were still far more likely than Hispanic graduates to be employed (*Indicator 28*).

Earnings among 25- to 34-year-old Hispanics, particularly Hispanic females, show that the incentive to pursue additional education is sizable. For example, in 1993, Hispanic males with 9-11 years of schooling earned 27 percent less than male Hispanic high school graduates; those with a bachelor's degree earned 60 percent more. Hispanic females with 9-11 years of schooling earned 30 percent less than their counterparts with a high school diploma; those with a bachelor's degree earned 82 percent more. Between 1981 and 1993, the earnings advantage of completing college increased for Hispanic males and females, as well as for white males and females (tables 30-1-3). However, Hispanic-white differentials in earnings exist at each level of educational attainment. For example, white male college graduates 25 to 34 years old earned 23 percent more in 1993 than did Hispanic male college graduates of the same age (table 30-1).

How do the literacy levels of Hispanics and whites differ?

Large gaps between the literacy skills of Hispanics and whites exist both within and across levels of education. On the National Adult Literacy Survey, Hispanics scored at levels that were similar to whites with less education. For example, Hispanics with a 4-year college degree have literacy levels resembling those of whites with a high school diploma. The difference in prose literacy between Hispanic and white college graduates is 46 points, similar to the difference between the scores of white high school and college graduates (52 points). However, the gap in literacy between Hispanics and whites is less for 16- to 24-year-olds than for 25- to 64-year-olds (*Indicator 20, Condition 1994*). The differences in the labor market opportunities of Hispanics and whites noted above may be related to the differences in the literacy levels of both groups at similar levels of educational attainment.

Average prose literary scores: 1992

SOURCE: NCES, National Adult Literacy Study.

In summary, Hispanic children are less likely to be enrolled in preprimary education. Gaps in reading, mathematics, and science achievement appear at age 9, and do not narrow with age. Hispanic students are no less likely than white students to have their parents involved in their schooling, although Hispanic students are in some cases more likely to face a disorderly school

environment than their white peers. Hispanic graduates are less likely to have taken advanced science and mathematics courses than their white counterparts in high school, but are just as likely to have taken foreign languages. Even though they have lower educational aspirations than whites, Hispanic students are about as likely as whites to make the immediate transition from high school to college. However, educational attainment levels are lower among Hispanic than white young adults. For Hispanics, educational attainment is positively associated with employment and earnings, although earnings and employment rates are lower for Hispanics than for whites with the same amount of education. Hispanics have lower literacy levels than whites, both in general and at similar levels of educational attainment.

Educational progress of women

Over the past two decades, women have made important advances in their educational attainment. The large gaps between the education levels of women and men that were evident in the early 1970s have essentially disappeared for the younger generation. Despite their gains in educational attainment, however, young women still earn less than young men with similar levels of education. In 1993, the average earnings of female high school graduates aged 25 to 34 years old were 37 percent lower than those of male graduates of the same age. Female college graduates earn, on average, 20 percent less than their male counterparts (tables 30-1, -2, -3). Furthermore, these large gender differences in earnings persist after taking educational attainment and prose, document, and quantitative literacy skills into account (*Indicator 31*).

Differences in progression rates, types of courses taken, level of effort, academic achievement, and field of study may all affect the labor market opportunities of women relative to men. Below, we summarize these educational differences, focusing on those that research has shown to be related to labor market outcomes.

Do females and males progress at similar rates through school?

Generally, females start school at an earlier age than males and are less likely to fall behind.¹⁸ For example, 22 percent of 8-year-old females were below the modal (most common) grade for their age in October 1989, compared to 28 percent of their male peers. At age 13 the disparity was larger: 26 percent of females compared to 36 percent of males were below modal grade for their age (*Indicator 3, Condition 1992*).

Females are less likely to have repeated a grade than males. Nine percent of 16- to 24-year-old females had been retained in one or more grades, compared to 14 percent of their male counterparts in 1992 (table 4-1, *Condition 1994*).

Are females more or less likely than males to be placed in special education programs?

Females are far less likely than males to be enrolled in special education programs. In 1990, only one-third of special education students were female (table 42-4).

Do the achievement levels of females and males differ in the early grades?

At both ages 9 and 13, the achievement levels of females are higher in reading, similar in mathematics, and lower in science than those of males (*Indicators 13, 15, and 16*).

Do the differences that we see in the achievement of females and males at age 13 persist into high school?

When retested near the end of high school, male and female 17-year-olds varied at least as much in their achievement as they did at younger ages. For example, in 1992, average reading proficiency for females was 12 scale points higher than for males. To understand the magnitude of this difference, it is helpful to look at the difference in proficiency scores across ages in 1992. A 12-scale point difference on the NAEP reading assessment corresponds to about 40 percent of the difference between the average scores of 13- and 17-year-olds in 1992. In other words, the gap in reading proficiency between males and females is roughly equivalent to about one and a half years of schooling (*Indicator 13*). This

NAEP scores in 1992

SOURCE: Indicators 13, 15, and 16.

performance difference favoring 17-year-old females in 1992 was as large as that in 1971 and as the proficiency gaps that existed at ages 9 and 13.

In mathematics and science, 17-year-old females score lower on average than males. In 1992, females scored 4 scale points lower than males on the NAEP mathematics assessment (roughly equivalent to about half a year of schooling), and 10 scale points lower on the science assessment (about a year's worth of science). Although both females and males have made gains in mathematics and science achievement since 1982, the gender gap for these subjects has not narrowed measurably.

NAEP scores of 17-year-olds in 1992

SOURCE: Indicators 13, 15, and 16.

Are females more or less likely than males to come to class unprepared?

Sophomore females were less likely than males to report coming to school without basic supplies in 1992. In particular, males were more likely than females to report that they usually or often come to school without books, paper and pencil, and completed homework (*Indicator 44, Condition 1994*).

Are the parents of females more or less likely than males to be involved in their child's education?

In 1988, eighth-grade females were more likely than males to report talking to their parents about selecting courses, about their school activities, and about their class studies. However, males and females were equally likely to have their parents review their homework, limit their television watching, and limit their going out with friends. However, females were less likely than males to have had their parents speak with their teacher or guidance counselor (*Indicator 43, Condition 1994*).

Do females and males take different courses in high school?

Among 1992 public high school graduates, females took more credits in academic subjects than males (18 versus 17 credits), whereas in the class of 1969, males and females took about the same number of credits (15 each) (*Indicator 23, Condition 1994*). Between 1982 and 1992, the percentage of both female and male graduates who took advanced mathematics and science courses in high school increased, although for many subjects gender parity had been attained by 1982. In the class of 1992, females were less likely than males to take remedial mathematics in high school, more likely to take algebra II, and just as likely to take calculus. With respect to science, females were more likely than males to take biology and just as likely to take chemistry. Females were less likely, however, to take physics (table 26-1).

In 1992, college-bound female high school graduates were more likely than male graduates to study a foreign language for at least 2 years in high school (78 versus 67 percent). In addition, females were more than twice as likely as males to take 4 years of a foreign language (19 versus 9 percent, *Indicator 26, Condition 1994*).

Percentage of high school graduates taking selected mathematics and science courses

Mathematics and science courses	1982		1992

Biology, chemistry, and physics	7	13	19	24

SOURCE: Table 26-1.

Do men and women differ with respect to attending college right after graduation?

Between 1976 and 1987, women and men were equally likely to enroll in college in the fall following high school graduation; but since the late 1980s, women have been slightly more likely than men to do so (Indicator 9). Furthermore, women are more likely than men to enroll in a 4-year college after graduation from high school. In 1993, the enrollment rate for women at 4-year institutions was 42 percent, compared to 36 percent for men. Women were just as likely as men, however, to enroll in 2-year institutions after high school graduation (table 9-1).

Percentage of high school graduates enrolling in college the October following graduation

SOURCE: Indicator 9.

In 1992, the majority of students enrolled in undergraduate and graduate programs were women, although more men were enrolled in first-professional programs, such as medicine, law, or dentistry.¹⁹

Have increasing college enrollment rates raised the aggregate educational attainment levels of women?

Over the past 20 years, college attainment rates among young women have increased dramatically, while rates for men remain basically unchanged. In the early 1970s, among high school graduates, about 40 percent of women aged 25–29 had completed 1 or more years of college, compared to 50 percent of similarly aged men. By 1994, a higher percentage of women than men in this age group had attended at least some college (62 versus 59 percent, table 22-2). A similar trend has occurred for female college graduates. In the early 1970s, among high school graduates, about 20 percent of women compared to 27 percent of men aged 25–29 had completed 4 or more years of college. By 1994, a similar percentage of men and women in this age group had earned a bachelor’s degree or more (table 22-3).

How have women progressed with respect to the number of degrees earned?

Data on the number of degrees conferred demonstrate even more clearly the educational progress of women relative to men. In 1992, more associate’s, bachelor’s, and master’s degrees were awarded to women than to men, whereas in 1977 the reverse was true. Though fewer doctoral and first-professional degrees were awarded to women than to white men in 1992, the gap has narrowed considerably.²⁰

How do the college course-taking patterns of women and men differ at the undergraduate level?

Similarities in the mathematics and science course taking (except for physics) of women and men in high school disappear when examining college transcripts. Among 1985–86 bachelor’s degree recipients, women were much less likely than men to have taken courses in the physical sciences, mathematics, computer science, and engineering, but were more likely to have taken courses in the life sciences (Indicator 28, Condition 1994).

In the social and behavioral sciences, women were more likely than men to have taken psychology and sociology, and were less likely to have taken political science and economics. Many of these differences, however, are linked to differences in choice of college major.

Women and men tend to study different fields in college, despite a narrowing of differences for undergraduates and in some fields for graduates. At the bachelor's level, women were about three times as likely as men to graduate with degrees in education in 1991-92, but this represented a decline from 1971. Women are also far more likely than men to major in English, foreign languages, communications, psychology, and the health professions and related fields. Although the differences between men and women with respect to field of study are decreasing in the biological/life sciences and business, women are still less likely than men to major in these fields. Moreover, women continue to be much less likely than men to major in mathematics, engineering, the physical sciences, and computer sciences.²¹

Ratio of the proportion of bachelor's degrees earned by women in a specific field relative to the proportion earned by men

Field of study	1972	1982	1992
Biological/life sciences	0.54	0.82	0.90
Business	0.14	0.64	0.76
Communications	0.71	1.28	1.32
Computer science	0.20	0.53	0.34
Education	3.71	3.10	3.18
Engineering	0.01	0.13	0.14
English	2.36	1.90	1.66
Modern foreign languages	3.99	3.16	2.24
Health sciences	3.99	5.23	4.28
Mathematics	0.82	0.74	0.74
Physical sciences	0.23	0.34	0.41
Psychology	1.11	1.99	2.31
Social sciences	0.73	0.80	0.71

SOURCE: NCES, IPEDS/HEGIS surveys of degrees conferred.

At the graduate level, the tendency of women and men to choose different fields of study has declined in many major fields. For example, differences in the proportions of women and men earning master's degrees in the life sciences, physical sciences, computer science, and engineering have narrowed over time. Differences in the proportions of men and women earning master's degrees in business management decreased between the early 1970s and the mid-1980s when the trend leveled off. Moreover, differences in the proportions of men and women earning master's degrees in the social sciences have disappeared. However, in some fields of study, large gaps do remain. For instance, at the master's degree level, women

were almost three times as likely as men to earn graduate degrees in education and health professions, but only one-seventh as likely to earn degrees in engineering (Indicator 27).

How do the educational attainment levels of women in the United States compare to those of women in other countries?

Women in the United States generally have higher educational attainment than their counterparts in other countries. For example, in 1992 among U.S. women 25-64 years old, 84 percent had completed high school—far more than their counterparts in Japan, Germany, the United Kingdom, France, Canada, and Italy. Also, 21 percent had received a bachelor's degree or more, again far more than their counterparts in other countries (table 23-1).

In several countries, the educational attainment of younger generations of women has improved rapidly. This is evident in the fact that the attainment of women 25-34 years old was substantially higher than that for all women. As a result, the gap is closing between the educational attainment of women in these countries and the United States. For example, in Japan 92 percent of women 25-34 years old had

Educational attainment of 25- to 34-year-old females in 1992

SOURCE: Indicator 23.

finished secondary education, and in Germany 86 percent had done so, compared to 87 percent in the United States. Nevertheless, women 25-34 years old in the United States were still much more likely to complete higher education than their counterparts in Japan and Germany (*Indicator 23*).

In addition, in 1987, the percentage of women awarded university degrees in science and engineering fields was much higher in the United States than in other highly industrialized countries, including Japan or West Germany (*Indicator 2:8, Condition 1991*).

How have the labor market outcomes of women changed over time?

The employment rates of young women rose steadily throughout the 1970s and 1980s for those with a high school education or better (*Indicator 30, Condition 1992*). Furthermore, the gap between the employment rates for women and men narrow with increasing levels of educational attainment. For example, in 1994, the difference between the employment rates of 25- to 29-year-old males and females was 20 percentage points for high school graduates and 7 percentage points for college graduates (*Indicator 29*).

Female college graduates shared in the growth in earnings of all college graduates in the 1980s. Although, as noted above, female college graduates earn less on average than male college graduates, the earnings advantage that female college graduates enjoy over female high school graduates is greater than that enjoyed by males (*Indicator 30*).

In summary, women have made important advances in education over the last few decades, closing the gender gap in educational attainment among younger women that existed 20 years ago. In high school, females read and write better than males, although they perform worse in mathematics and science. The mathematics and sciences courses that females and males take in high school are similar, with the exception that females are less likely than males to study physics. Moreover, females are more likely than males to go to college immediately after high school and are just as likely to earn degrees. Although females tend to major in different subjects than males in college, many of these differences have narrowed over time. But despite

large gains in educational attainment and labor force participation, significant differences in earnings persist between females and males, even at similar levels of education.

The cost of higher education

The answers to many important questions about higher education are determined in part by its cost. Is higher education a good investment for students? Is higher education affordable to students from middle income families? Is higher education accessible to students from low income families? Is higher education a good value? How are the costs of higher education shared between students, their families, and government?

Distribution of enrollment in higher education, by type and control of institution: 1993

SOURCE: Integrated Postsecondary Education Data System, Fall Enrollment, 1993.

These questions are interrelated with some highly publicized issues. For instance, reports of tuition charges of \$20,000 or more have raised fears that college has become unaffordable. Some believe that federal financial aid policy should help more people finance their education. Others argue that too much federal financial aid is provided in the form of loans as opposed to grants. Further, public postsecondary institutions have had to cope with smaller appropriations as governments face increased pressure on their budgets and are relying more on tuition as a source of revenue. Finally, average faculty salaries have recently been rising faster than inflation, but only after much of their purchasing power was eroded during the high inflation years of the 1970s.

private institutions. Also, only one in four of the students attending private institutions were attending universities where tuition charges are higher than those at other private 4-year institutions.²²

Average annual rate of increase in tuition and fees (above the rate of inflation)

	1980-90	1990-94	1980-94
Public		(percent)	
Universities	4.0	4.8	4.2
Other 4-year	4.0	6.3	4.7
2-year	2.7	6.3	3.7
Private			
Universities	5.2	3.8	4.8
Other 4-year	4.6	3.2	4.2
2-year	4.4	1.5	3.6

SOURCE: Table 7-2.

Between 1980 and 1990, tuition charges increased at all types of higher education institutions, and since 1990 the rate of increase at public institutions has been greater than that at other institutions or than previously. For example, at public universities, tuition and fees grew at a rate of 4.0 percent per year (above the rate of inflation) between 1980 and 1990, but at a rate of 4.8 percent per year between 1990 and 1994. On the other hand, median family income did not keep pace with inflation. It fell in constant dollars from \$42,500 in 1980 to \$40,500 in 1993 (*Indicator 7*).

What have been the effects of rising costs on students?

Despite rising tuition charges, college-going rates have continued to rise, and there is no evidence

Distribution of enrollment in higher education, by type and control of institution: 1993

SOURCE: Integrated Postsecondary Education Data System, Fall Enrollment, 1993.

that students are switching to lower cost 2-year colleges. In 1980, 30 percent of that year's high school graduates were enrolled in 4-year colleges in October compared to 38-40 percent in the early 1990s. Between 1980 and 1993, the percentage who enrolled in 2-year colleges did not change appreciably: it rose only from 19 percent in 1980 to 20 percent in 1990 and to 22 percent in 1993. Even among low income families who may be more affected by rising college tuition, college-going rates increased significantly from 33 percent in 1980 (at both 4-year and 2-year colleges) to 47 percent in 1990 and 50 percent in 1993 (*Indicator 9*).

Perhaps a reason for the continuing increase in college enrollment rates in the face of rising tuition is the relative advantage that college graduates have over high school graduates in the labor market. For example, in 1994 among 25- to 29-year-old males, college graduates were much less likely to be unemployed than high school graduates (3 versus 9 percent); and their female counterparts followed a similar pattern (table 29-1). Among 25- to 34-year-old workers, males who had graduated from college earned 57 percent more and females 99 percent more than their counterparts who had graduated from high school (*Indicator 30*).

Furthermore, while tuition charges were rising between 1980 and 1993, the earnings premium for graduating college was also rising, and may have outweighed any negative effect of rising tuition on enrollment rates. For male workers, the premium increased from 19 to 57 percent; for female workers, it increased from 52 to 99 percent. However, these increases were largely due to a decrease in the average earnings of high school graduates, rather than an increase in the average earnings of college graduates. For example, for males the average earnings of college graduates were about \$33,000 in both 1980 and 1993; however, the average earnings of male high school graduates fell from about \$28,000 to \$21,000 over the same period (tables 30-1 and 30-3). Thus, young people today may need to acquire postsecondary education as protection from a deteriorating labor market for workers who have only a high school education.

Student financial aid, particularly from federal sources, is designed to defray some of the cost to students of attending college, particularly for

those from low income families. During the 1992-93 academic year, the average amount of grant aid allocated to dependent full-time students attending public 4-year colleges was 29 percent of the average tuition charged them (*Indicator 8*). In effect, students received, on average, a 29 percent discount on tuition charges. Because the amount of grant aid is larger for students from low income families, this percentage was higher for students from such families (80 percent) than for students from high income families (10 percent). For those attending private 4-year colleges and universities, the patterns were similar; however, for students from low income families attending private 4-year institutions, the average amount of grant aid received was a smaller percentage of their average tuition charges than for their counterparts attending public 4-year institutions (64 versus 80 percent).

Average grant aid as a percentage of average tuition charged for dependent full-time undergraduates: 1992-93

SOURCE: National Postsecondary Student Aid Study: 1992-93.

Private higher education institutions have substantially increased the amounts they are spending on scholarships and fellowships. This may allow these institutions to help those students who are most likely to need a reduction in tuition if they are to attend. At private universities, expenditures per full-time-equivalent (FTE) student for scholarships and fellowships increased from \$1,800 in 1980 to \$3,000 in 1990 and to \$3,600 in 1992 (in constant 1994 dollars). At other private 4-year colleges, the amounts were smaller, but the gains equally important—from \$1,100 in 1980 to \$2,000 and

\$2,400 in 1990 and 1992, respectively. The increases at public institutions were not as great. At public universities, scholarship and fellowship support rose from \$500 to \$900 between 1980 and 1992, and at other public 4-year colleges from \$400 to \$500 (table 55-1).

Have costs to higher education institutions risen as quickly as costs to students, i.e., tuition?

In general, expenditures per FTE student increased only moderately over the same period. At public universities, they increased about 16 percent in constant dollars from about \$15,000 to about \$17,000 between 1980 and 1992; at public 2-year colleges, they rose and fell during the 1980s, but were at a similar level in 1992 to that in 1980—\$5,700 (*Indicator 55*). They rose the most (about 43 percent) at private universities where total (education and general) expenditures per FTE student rose from about \$23,000 to \$32,000.

Expenditures in higher education, by type and control of institution: 1992

Type and control of institution	Total (1994 dollars)	Percent change since 1980	Share for instruction (percent)	Change in share since 1980 per instructor
Public universities	\$17,246	16	36	-3
Private universities	32,242	43	38	0
Other public 4-year	11,654	6	43	-2
Other private 4-year	15,029	34	33	-4
Public 2-year	5,686	-1	50	0

SOURCE: Tables 55-1 and 55-2.

Instruction is the largest category of expenditure for higher education institutions, but only at 2-year colleges does it reach half of all expenditures. At 4-year institutions, the share of expenditure for instruction varied from 33 percent at private colleges to 43 percent at public colleges in 1992. Other large categories include administration, research, and operation/maintenance of plant (table 55-1). Expenditures for instruction per FTE student rose more slowly than total (education and general) expenditures at most types of institutions. For example, instruction's share of the total fell by 2 percentage points at public colleges and by 4 percentage points at private colleges. The exception was private universities where

instruction was a similar share of total expenditures in both 1980 and 1992 (table 55-2).

What factors are behind the rising expenditures per student in many sectors of higher education?

One possibility would be that enrollment fell as the large baby boom cohorts finished college, while employment of faculty and other staff remained stable. This pattern is not apparent in most sectors of higher education. The size of high school graduating classes did fall from 3.2 million in 1977 to 2.5 million in the early 1990s. However, while the graduating classes were getting smaller, enrollments at higher education institutions only leveled off during the first half of the 1980s and then continued increasing (table 36-1). Universities were the exception where enrollment grew very little between 1980 and 1992.²³ Finally, the number of staff employed in higher education increased over this period. The result of the two trends was that the number of FTE staff per 100 FTE students increased from 18.1 to 20.3 between 1983 and 1987 and was stable before (1977 to 1983) and after (1987 to 1989).²⁴

Before considering another possibility, consider the distribution of types of staff employed in higher education and the effect they may have on the quality of education. In 1991, there were approximately six FTE faculty, both instructional and research, six other professional staff, and eight other non-professional staff for every 100 FTE students in higher education.²⁵ In public elementary and secondary schools, there were six classroom teachers and another five staff for every 100 students.²⁶ Despite the similar number of faculty per 100 FTE students in higher education and elementary/secondary schools, many of the classes at colleges and universities are quite large. For example, 33 percent of the classes at research universities have 50 or more students. At liberal arts institutions, however, only 5 percent of such classes are this large (table 50-1). Between 1988 and 1993, there was little change in the percentage of classes with more than 50 students.

Another possible factor that may be contributing to rising expenditures in some sectors of higher education could be rising prices of resources utilized by institutions of higher education. If resource prices rose faster than inflation and institutions did not change the quantity of

resources employed per FTE staff, then expenditures per FTE student would rise. For example, if average faculty salaries rose faster than inflation but institutions maintained a stable number of faculty per 100 students, then expenditures per FTE student would rise—barring a reduction in the price or utilization of some other resource such as equipment, buildings, or staff benefits. It is worthwhile to focus some attention on faculty salaries, because it is likely that most expenditures at higher education institutions are for staff, as opposed to building and equipment, and one in three staff are faculty.²⁷

Although average faculty salaries fell in constant dollar terms during the high inflation period of the 1970s, the trend reversed and average faculty salaries rose significantly during the 1980s. For example, the average salary of full professors at public institutions fell from \$64,000 in 1972 to \$49,000 in 1981 (in constant 1993 dollars). It then rose during the 1980s and was \$58,000 in 1992.²⁸ At private institutions the patterns were similar. However, as was noted above, expenditures for instruction, which include expenditures for all faculty time except the part paid for by research grants and contracts, rose more slowly than total expenditures. This suggests that increased utilization or prices of other resources, including non-faculty staff, had a larger effect on expenditures than increased faculty salaries.

Finally, a possible reason for the rise in the cost of higher education over the long term is a lack of increase in productivity in higher education. Whereas, many sectors of the U.S. economy, particularly manufacturing and agriculture, have used technology and innovation to either increase the quantity or quality of goods provided with no corresponding increases in resources used, higher education is still provided in largely the same way it was when the nation was born. When productivity growth in a particular sector of the economy lags that in the rest of the economy, the cost of providing that good or service will increase.²⁹

Has tuition as a source of revenue increased in importance?

In general, the trends in revenue per FTE student followed patterns similar to those for expenditures in each sector of higher education.

With the exception of public 2-year colleges, revenue per FTE student (in constant dollars) increased at all types of higher education institutions between 1980 and 1992. At private institutions, the increase was particularly dramatic. At private universities, revenue per FTE student increased from \$22,900 to \$30,500, and at private 4-year colleges, it increased from \$11,000 to \$14,200 over this period. However, while revenue per FTE student increased, government appropriations fell (in constant dollars and as a percentage of total revenue) at all types of institutions. For public institutions, which rely heavily on government appropriations, the fall was particularly large between 1990 and 1992; even with significant increases in tuition revenue per FTE student, total revenue fell or remained steady over this period (*Indicator 56*).

The result of increasing tuition charges and declining government appropriations is that between 1980 and 1992 the share of revenue from tuition and fees increased at all types of institutions. Although public institutions rely less on tuition than do private institutions, the share of their revenue from tuition and fees increased 6 to 7 percentage points for all types of public institutions. On the other hand, these institutions rely much more heavily on government appropriations, and the share of their revenue from these sources fell 8 to 12 percentage points in all sectors. At private institutions, which rely heavily on tuition revenue, the share of revenue from this source increased 5 to 8 percentage points (table 56-2).

Is higher education still a good value?

Despite the large increase in average tuition charges, these charges remain well below total education and general expenditures per FTE student. At public institutions, average tuition charges are lower than expenditures for instruction per FTE student, i.e., excluding expenditures for administration, operation/maintenance of plant, libraries, and student services. At private universities, average tuition charges are similar to instructional expenditures per FTE student (\$13,800 versus \$12,300); however, at other private 4-year institutions, average tuition charges are higher than instructional expenditures per FTE student (\$10,200 versus \$5,000), but less than total

expenditures per FTE student (\$11,700). In most sectors of higher education, students are charged less on average than institutions spend for instruction, and some research suggests that students prefer to attend high spending institutions, particularly those where the difference between expenditures and tuition is the greatest.³⁰

The cost of college to students includes more than the expenditures for tuition; it also includes foregone earnings. It is difficult for a person with a good job or the prospect of getting one to give up that income source to enroll in higher education. The earnings and experience given up to continue education are significant, possibly greater than the tuition that must be paid.³¹ Even if the earnings of high school graduates between the ages of 18 and 23 are relatively low, they are nevertheless high when compared to average tuition charges, particularly those at public institutions. Thus, falling labor market opportunities for high school graduates may have reduced the cost of enrolling in higher education as much as rising tuition has increased it.

On the benefit side, large economic benefits appear to accrue to those who participate in higher education. Unemployment rates are lower, earnings are higher, working conditions are better, and fringe benefits are more generous for college graduates than for high school graduates. In addition, at least one of these benefits, the earnings benefit, not only has been increasing in recent years but also appears to grow larger with age.

In short, higher education still appears to be a good investment for students.

Conclusion

The Condition of Education presents data and analyses on a wide variety of issues in education. The preceding discussion has highlighted only a few of the issues presented in the 60 indicators in this volume. The reader is encouraged to read the overviews to each section for discussion of other issues, to peruse the indicators of interest, and to use the tables for additional details.

- ²⁹ This phenomenon is widely known in the economics profession as "Baumol's disease." See Baumol, William J. "Macroeconomics of Unbalanced Growth: The Anatomy of Urban Crisis," *American Economic Review*, 57 (June 1967) and Baumol, W. J. and W. G. Bowen, *Performing Arts: The Economic Dilemma*, 1967. The "disease" is the inevitable rise as the economy grows and incomes rise in the cost of some goods or services which meet three criteria: 1) slower productivity growth than in the rest of the economy, 2) increasing (relative) demand as incomes grow, and 3) lack of good alternatives to the good or service. (Higher education may be in this category, but there are plausible arguments for why it may not be, also.) If these three criteria hold for higher education, then over time its cost is likely to increase without a commensurate increase in quality or quantity.

- ³¹ Most analysis of the rate of return to education by economists builds on this fact. See, for example, Jacob Mincer. *Schooling, Experience, and Earnings*. National Bureau for Economic Research, 1974.

Access, Participation, and Progress

Participation

School enrollment rates among children 6 to 14 years old are essentially 100 percent, while enrollment rates among children 3 to 5 years old and young people 16 to 23 years old have increased substantially since 1970. In 1993, the percentage of 3- and 4-year-olds enrolled in school was 27 and 54 percent, respectively, up from 13 and 29 percent in 1970. The percentage of 5-year-olds enrolled was 92 percent, up from 81 percent in 1970 (*Indicator 1*). Virtually all children now attend kindergarten before starting first grade.

When one includes all center-based programs such as Head Start, nursery school, and day care, participation rates in early childhood programs are higher. Seventy-two percent of children who were in first grade in 1993 had attended some form of center-based program before kindergarten. While blacks and whites had similar participation rates (73 and 76 percent, respectively), Hispanics had much lower rates of participation (57 percent). Of those attending center-based programs, students from families with incomes over \$50,000 were more likely than students whose family income was \$50,000 or under to attend these programs for 2 years or more (*Indicator 3*).

Enrollment rates (in schools and colleges) among 16- to 24-year-olds have also increased over the past two decades. For example, the enrollment rate of 22-year-olds was 31 percent in 1993, up from 20 percent in 1970 (*Indicator 1*). These increases may indicate that a higher proportion of high school graduates are going on to college before the age of 25, or that students are remaining in college for a longer period of time. While the *number* of 25- to 34-year-old students in colleges and universities increased between 1970 and 1993,* enrollment *rates* in general did not increase among this age group (table 1-1). The rise in the number of older students enrolled (those, aged 25 to 34) is due to an increasing number of older people in the population (the aging of those born during the post-World War II baby boom), not to an increasing *percentage* of the older population enrolling in college.

Participation in education among older adults is extensive. Among 25- to 34-year-olds in October 1993, the enrollment rate in 2- and 4-year colleges

and universities varied from 15 percent for 25-year-olds to 5 percent for 34-year-olds (*Indicator 1*). Furthermore, one out of three full-time workers and one out of six part-time workers participated in training to improve their current job skills in 1991 (*Indicator 12*).

The enrollment trends outlined above varied across racial/ethnic groups. While preschool enrollment rates among 3- and 4-year-olds increased between 1971 and 1993 for all racial/ethnic groups, the increase was larger for whites than for blacks and Hispanics. Throughout the 1980s, the percentage of white 3- and 4-year-olds enrolled in preschool increased, while the rates for blacks and Hispanics were generally stable (table 2-1). On the other hand, more black and Hispanic 3- and 4-year-olds were enrolled in kindergarten than whites of the same age. And, among 5-year-olds, there is no difference in the percentage of whites and blacks enrolled in kindergarten (table 2-2).

Access

Access to preschool may be affected by family income because nursery schools are primarily private—accounting for 62 percent of preschool enrollment in 1992 (*Indicator 37, Condition of Education 1994*)—and charge tuition. In 1993, 52 percent of 3- and 4-year-olds from high income families were enrolled in preschool compared to 24 percent of those from low income families (*Indicator 2*). This difference was larger than it was in the early 1970s. However, in 1993, over 60 percent of first graders whose family income was under \$20,000 had attended some form of center-based program before kindergarten (*Indicator 3*).

Increased access to early childhood programs should contribute to children being better prepared when entering kindergarten. Of the population of 4-year-olds not yet enrolled in kindergarten in 1993, parents reported that a majority were able to identify all colors, recognize most letters, count to at least 20, write their first name, and hold a pencil properly. Moreover, less than one-third of the parents reported that their 4-year-old had temper tantrums often, a short attention span, or fidgeted a lot. Four-year-olds from high income families, who were more likely to attend an early childhood program, displayed more skills than students from low income families. According to reports from parents in 1993, 4-year-old children from high income families (\$50,000 or

more) were more likely than those from low income families (less than \$20,000) to be able to recognize all letters and to count to 50. In addition, children from low income families were more likely to fidget and to have short attention spans than children from high income families (*Indicator 4*).

As society enters the information age, computer literacy has become more and more important. In 1993, almost 70 percent of students in grades 1 through 12 used a computer either at home or in school. The percentage of students who use computers has doubled since 1984, at which time it was 35 percent. Although as a whole a greater proportion of students use computers today, some groups of students do so less than others. In 1993, about one-half of students from high income families used a computer at home, compared to about 5 percent of students from low income families (*Indicator 5*). In addition, white students were more likely than black or Hispanic students to use a computer both at home and at school.

Access to postsecondary education is influenced by the cost of college to students and their families. Since 1980, the cost of college attendance has increased much faster than family income. Tuition and room and board at public and private institutions increased 42 and 68 percent, respectively, between 1980 and 1992. During this same period, median family income decreased by 5 percent (*Indicator 7*). Student financial aid helps reduce the cost of attending college. Among dependent, full-time undergraduates attending public 4-year institutions, the average grant aid received was 29 percent of the average tuition and fees charged during the 1992-93 academic year. This ratio varied from 80 percent for students from low income families to 10 percent for those from high income families (*Indicator 8*).

Despite the increasing cost of college attendance, the percentage of high school graduates who enrolled in college following graduation increased from 49 percent in 1980 to 62 percent in 1993 (*Indicator 9*). However, high school graduates from low income families were less likely than graduates from high income families to enroll in college (50 versus 79 percent in 1993).

Persistence

Overall, the persistence rate in high school was 96 percent in 1993; that is, 96 percent of students in grades 10 to 12 in the fall of 1992 were enrolled

again in the fall of 1993 (or had graduated during the year). The other 4 percent dropped out of school during the year or failed to return in the fall. Persistence in high school is strongly associated with family income. For students from high income families, the persistence rate was 99 percent, while the rate for students from low income families was 88 percent. A hopeful sign is that the persistence rate has gradually increased over the past two decades for students from low income families—from below 83 percent in 1973 to 91 percent in 1990, although there has been a slight drop since then, down to 88 percent in 1993. Persistence rates have improved across all racial/ethnic groups between 1972 and 1993. The persistence rates for white, black, and Hispanic students increased by 1.4, 3.7, and 4.5 percentage points, respectively (*Indicator 6*).

Although, as noted previously, more students are going on to college after high school, the data show that it is very common for college students to enroll, leave, possibly return, and not finish within the expected period of time. (*Indicator 10, Condition of Education 1994*). For example, in 1990 only one-quarter of first-year community college students were enrolled in some form of higher education the next year. And, about one-fifth of second-year community college students transferred to 4-year colleges or universities (*Indicator 10*).

For the students who reach graduate school, earning a doctorate is taking longer. The number of years in graduate school that it took students to complete their doctoral degrees increased by 1.7 years, on average, between 1970 and 1993. Among new doctorate recipients in 1993, registered time-to-degree was about 8 years for students majoring in education, the humanities, the social and behavioral sciences, and other technical/professional areas. Students who earned a Ph.D. in the natural or computer sciences or in engineering took about 6 years to finish their doctorate (table 11-1).

NOTE:

*U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, table 171.

School enrollment rates, by age

- ◆ Since 1970, practically all children between the ages of 6 and 15 have been enrolled in school.
- ◆ Enrollment rates for 3- to 5-year-olds were substantially higher in 1993 than in 1970. However, most of the increase had occurred by 1980.
- ◆ Enrollment rates among 16- to 25-year-olds were higher in 1993 than in 1970. For 17- to 20-year-olds, rates decreased between 1970 and 1974 before beginning to increase. For 21- and 22-year-olds, most of the increase occurred after 1982, and for 23- and 24-year-olds most of the increase occurred after 1984. Enrollment rates among those over age 25 generally did not increase over the period (see supplemental table 1-1).

Learning occurs throughout a person's life, even though participation in formal education is generally only mandatory for those between 6 and 16. Enrollment rates of younger and older persons are an indication of the importance of formal education in the United States.

Percentage of the population enrolled in school, by age: Selected Octobers 1970-93

October	Age															
	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

Enrollment rates in preprimary education

- ◆ In 1993, 34 percent of all 3- to 4-year-olds were enrolled in preschool.
- ◆ In 1973, the enrollment rate in preschool for 3- to 4-year-olds from low income families was about 20 percentage points lower than the rate for those from high income families. By 1993, enrollment rates for 3- to 4-year-olds from both income groups had increased, and the gap had widened to 28 points.
- ◆ During the 1970s, white and black preschool enrollment rates were similar. However, due to increases in white enrollment between 1978 and the late 1980s, white enrollment rates were 8 percentage points higher than those of blacks and 21 percentage points higher than those of Hispanics in 1993 (see supplemental table 2-1).
- ◆ At ages 3–4, whites were more likely than blacks to be enrolled in preschool, while blacks were more likely than whites to be enrolled in kindergarten. As a result, in 1993, a similar percentage of blacks and whites (40 and 43 percent, respectively) were enrolled in some type of school program at ages 3–4 (see supplemental table 2-1).

Within most population groups, an increasing percentage of children receive preschool instruction. This instruction contributes to the preparation of children to participate in elementary school. Many policymakers and educators believe that it is important to help children from disadvantaged backgrounds start elementary school on an equal footing with other children by involving them and their parents in preschool programs.

Percentage of 3- to 4-year-olds enrolled in preschool and kindergarten, by family income: October 1970-93

Participation in center-based early childhood programs before kindergarten

- ◆ While 72 percent of all first-graders had previously attended center-based early childhood programs, a smaller proportion of Hispanic first-graders (57 percent) had participated in these programs than their white (73 percent) or black (76 percent) counterparts.
- ◆ Of those first-graders who had ever attended a center-based program, blacks were more likely than Hispanics to have attended when they were less than 3 years old. In addition, blacks were more likely (85 percent) than Hispanics (73 percent) to have attended center-based programs for at least 1 year.
- ◆ Students from higher income brackets were more likely to participate in center-based early childhood programs than students of more moderate income brackets. Of those first-graders who had ever attended a center-based program, students from families with incomes over \$50,000 were more likely than students whose family income was \$50,000 or less to have attended these programs for 2 years or more.
- ◆ First-graders in single-parent homes who had attended center-based programs were more likely to enter a center-based program at age 2 or younger than were first-graders living with two biological or adoptive parents; however, there were basically no differences in overall participation rates in center-based care across family structure (see supplemental table 3-3).

For many young children, enrollment in kindergarten is no longer their first experience with group educational programs. Moreover, many early education experts believe that children are better prepared for first grade if they have participated in some high quality group care or nursery school. Center-based programs, which include Head Start, nursery school, preschool, prekindergarten, and day care, act as a bridge between the home environment and the classroom.

Percentage of first-graders who participated in center-based early childhood programs before kindergarten, the length of time they attended kindergarten, and selected characteristics of those who attended center-based programs, by race/ethnicity and family income: 1993

Selected characteristics	Total	Race/ethnicity			Family income				
		White	Black	Hispanic	\$10,000 or less	\$10,001-20,000	\$20,001-35,000	\$35,001-50,000	\$50,001 or more

Length of time first-graders enrolled in a center-based program (for those who ever attended)									
Less than 1 year	21.6	22.4	15.2	27.2	19.0	33.3	24.1	19.9	14.9
One year, less than 2 years	28.4	25.9	35.1	32.6	38.2	32.9	30.9	28.3	16.9
Two years or more	50.0	51.7	49.7	40.2	42.8	33.8	45.0	51.8	68.2
Length of time first-graders attended kindergarten*									
One year	93.8	93.9	91.8	95.8	90.7	93.2	95.4	94.2	95.2
Two years or more	6.2	6.1	8.2	4.2	9.3	6.8	4.6	5.8	4.8

* Only includes those students who attended kindergarten. Less than 1 percent of the surveyed population did not attend kindergarten. Estimates based on parent reports.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1993.

Percentage of first-graders who participated in center-based programs before kindergarten and length of time enrolled, by race/ethnicity, family income, and family structure: 1993

* Adoptive parents are included in the category "biological parents."

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1993.

Skills and behaviors of 4-year-olds prior to entering kindergarten

- ◆ A majority of parents indicated that their 4-year-olds were able to identify the primary colors (84 percent), recognize most letters (57 percent), count to at least 20 (62 percent), write their first name (70 percent), and hold a pencil properly (94 percent) (see supplemental table 4-1).
- ◆ In 1993, a greater percentage of 4-year-old whites were able to identify primary colors and write their first name than were black and Hispanic counterparts. However, blacks were more likely than whites to have mastered the small motor development skills of being able to hold a pencil properly and button their clothes (see supplemental table 4-1). Blacks and whites were more likely than Hispanics to recognize all letters of the alphabet, to count up to 50 or more, and to identify primary colors.
- ◆ About a quarter of 4-year-olds often have tantrums, fidget a lot, and have short attention spans. Hispanic 4-year-olds were more likely than white and black 4-year-olds to fidget a lot and to have short attention spans. In addition, children who lived with two biological or adoptive parents were less likely to have tantrums, fidget a lot, and have short attention spans than those who lived with single parents.
- ◆ Students from families with incomes above \$35,000 were more likely to be able to identify primary colors and to recognize all letters of the alphabet than were students from lower income families (see supplemental table 4-2).

Prior to entering the school system, children receive training at home and possibly at preschool or day care centers. Children therefore arrive at kindergarten with a wide variety of skills and experiences, which must be integrated into the teaching environment. Examining the extent to which students possess certain behavioral and school-related skills provides educators with a picture of the skill levels of the students who will be entering their classes.

Skills and behaviors of 4-year-olds not enrolled in kindergarten, by race/ethnicity and family structure: 1993

Skills and behaviors	Total	Race/ethnicity			Family structure			
		White	Black	Hispanic	Two biological ¹ parents	One biological ¹ parent	One biological ¹ and one step parent	Other relatives
Emerging literacy and numeracy

Student use of computers

- ◆ In 1993, more than two-thirds of all students in grades 1–12 used a computer either at home or at school, with a majority, 59 percent, using a computer at school.
- ◆ The percentage of students using a computer at school more than doubled between 1984 and 1993, increasing from 29 to 59 percent. Twenty-eight percent of students used a computer at home in 1993, up from 12 percent in 1984.
- ◆ Whites were more likely than blacks or Hispanics to use a computer either at home or at school, both in grades 1–6 and in grades 1–12. In 1993, approximately 40 percent of blacks and Hispanics in grades 1–6 did not use computers at all compared to 20 percent of their white counterparts.
- ◆ Between 1984 and 1993, the proportions of students in grades 7–12 who used a computer either at home or at school increased at similar levels across family income. On one hand, the gain for low income students can be explained primarily by their increased use of computers at school, which rose 32 percentage points; on the other, the gain for high income students can be explained by their increased use of computers at school, which rose 30 percentage points, and at home, which rose 29 percentage points.

In our increasingly technological society, computers are an essential tool. Exposure to computers in school may help young people gain the computer literacy they will need to function effectively in society. Many students have access to computers at home, but the amount of access is directly related to socioeconomic factors. Examining the extent to which students have access to computers either at home or in school may help predict how prepared students will be to enter an automated work force.

Percentage of students who used a computer at school or at home, by selected characteristics: October 1984, 1989, and 1993

Current education level, race/ethnicity, and family income level*	1984			1989			1993

Persistence in high school

- ◆ **Ninety-six percent of 15- to 24-year-olds who were enrolled in grades 10–12 in 1992 were enrolled again in 1993 or had graduated. Four percent were not enrolled in school in 1993, even though they had not completed high school. Some of these dropouts may re-enroll during a subsequent school year.**
- ◆ **The high school persistence rate for students from high income families was 11 percentage points higher than the rate for students from low income families. The difference in persistence rates between students from high and middle income families was only 3 percentage points.**
- ◆ **In 1993, for the average of the first 3 years of college (grades 13–15), blacks were less likely than whites to continue their enrollment, but those blacks who did remain in college were equally as likely as whites to advance to the next level (see supplemental table 6-2).**

Persistent attendance, measured by the proportion of students who maintain their enrollment from one school year to the next, is strongly associated with completing high school. Students who do not complete high school face a decreased opportunity for assuming a successful and fully functional place in the American work place and society at large.

Percentage of high school students in grades 10–12, aged 15–24, enrolled the previous October who were enrolled again the following October¹, by sex, race/ethnicity, and family income: October 1972–93

October	Total	Sex		Race/ethnicity ²			Family income ³		
		Male	Female	White	Black	Hispanic	Low	Middle	High

College costs and family income

- ◆ Between 1980 and 1993, college costs have risen rapidly in both public and private institutions, with tuition, room, and board increasing more at private colleges than at public colleges (68 versus 42 percent in 1994 constant dollars).
- ◆ Between 1980 and 1993, tuition, room, and board at public institutions increased from 10 percent to 14 percent of median family income (for families with children 6 to 17 years old). This increase was larger for low income families than for high income families—it increased from 16 to 23 percent for families at the 25th percentile of family income compared to an increase from 7 to 10 percent for those at the 75th percentile.
- ◆ After periods of decline in the 1960s and 1970s, the tuition, room, and board at public institutions rose to a high of 15 percent of median family income (for all families) in 1993. At private institutions, tuition, room, and board as a percentage of median family income rose every year between 1979 and 1993, rising from 23 to 41 percent (see supplemental table 7-1).

A family's ability to afford college for its children depends on many factors, including tuition levels, availability of financial aid, family income and assets, and family size. Tuition, room, and board are a measure of the gross price of college. The average cost for tuition, room, and board as a percentage of family income is an indicator of the affordability of a college education.

Average tuition, room, and board (in 1994 constant dollars) and as a percent of income of families with children 6 to 17* years old at selected percentiles: 1975–93

Year	Public institutions						Private institutions

* These families may have children age 18 and older; however, they have at least one child between 6 and 17 years old, and none under 6. All families, not just married-couple families, are included. Supplemental table 7-1 provides data for a longer series of years but is based on the incomes of all families.

NOTE: Tuition, room, and board includes those for 2-year colleges, 4-year colleges, and universities. In-state tuition and fees are used for public institutions.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, table 304. U.S. Department of Commerce, Bureau of the Census, *Current Population Reports*, series P-60 (based on the March supplement to the Current Population Survey).

Undergraduate tuition, room, and board as a percentage of family income

For public institutions, as a percentage of income of families with children
6 to 17 years old at selected income percentiles: 1975-93

As a percentage of median income of all families,
by control of institution: 1964-93

NOTE: In-state tuition and fees are used for public institutions.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, table 304. U.S. Department of Commerce, Bureau of the Census, *Current Population Reports*, Series P-60 (based on the March supplement to the Current Population Survey).

Time to complete a doctorate degree, by field of study

- ◆ Among all dependent, full-time undergraduate students attending public 4-year institutions, average grant aid received was 29 percent of the average tuition and fees charged during the 1992–93 academic year. This ratio varied from 80 percent for students from low income families to 10 percent for those from high income families. This ratio also varied from 16 percent for dependent full-time students at private for-profit institutions (calculated from supplemental table 8-1) to 37 percent for those at public 2-year institutions.
- ◆ The average net cost (total cost minus total aid) was 80 percent of the average total cost (\$7,326 versus \$9,187) for dependent, full-time undergraduates attending public 4-year colleges. This ratio varied from 57 percent for students from low income families to 91 percent for those from high income families. This ratio also varied from 89 percent for students attending public 2-year colleges to 67 percent for students attending private, not-for-profit, 4-year institutions.
- ◆ Among independent, full-time students at private, for-profit institutions, the average grant aid received (\$1,346) was 28 percent of the average tuition and fees charged (\$4,748). This ratio varied from 37 to 18 percent for students with low to high household income (calculated from supplemental table 8-1).

Cost may affect a student's access to a college education. The net cost of college attendance is total cost minus total aid—that is, tuition, fees, and living expenses minus grants, loans, and work study. Net cost as a percentage of total cost is a measure of the fraction of cost that remains to be financed by students and their families after student financial aid is used. However, living expenses arguably must be incurred whether or not a student attends college, loans must be repaid, and work study is payment for work. A second measure, grant aid as a percentage of tuition and fees paid, provides an indication of the discount received on educational expenses.

Cost of college attendance and student financial aid for dependent, full-time undergraduate students, by family income and type and control of institution: Academic year 1992–93

Type and control of institution and family income of dependent students	Tuition and fees	Total cost	Grants	Total aid	Net cost	Ratios	
						Grants to tuition and fees	Net cost to total cost
Public 4-year institutions							
Dependent, full-time students	\$2,947	\$9,187	\$855	\$1,864	\$7,326	29	80
Low income	2,559	8,820	2,041	3,746	5,070	80	57
Lower middle	2,728	8,878	961	2,422	6,426	35	72
Upper middle	2,846	8,924	509	1,331	7,598	18	85
High income	3,382	9,758	354	890	8,879	10	91
Private, not-for-profit, 4-year							
Dependent, full-time students	11,004	17,301	3,455	5,697	11,552	31	67
Low income	8,444	14,232	5,417	8,350	5,872	64	41
Lower middle	10,560	16,905	4,890	8,270	8,590	46	51
Upper middle	11,195	17,422	4,240	6,934	10,407	38	60
High income	12,399	18,958	1,736	3,150	15,752	14	83
Public 2-year							
Dependent, full-time students	1,072	6,410	395	600	5,717	37	89
Low income	948	6,199	1,027	1,322	4,848	108	78
Lower middle	1,052	5,995	312	588	5,348	30	89
Upper middle	1,134	7,060	122	247	6,686	11	95
High income	1,311	6,745	83	167	6,367	6	94

NOTE: Total cost includes budget allowances for student living expenses; total aid includes grants, loans, and work study; net cost is total cost minus total aid. See supplemental note to this indicator for more detailed definitions of concepts.

College cost and student financial aid for dependent, full-time undergraduates, by type and control of institution and family income: Academic year 1992-93

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Postsecondary Student Aid Study: 1993.

Immediate transition from high school to college

- ◆ Sixty-two percent of 1993 high school graduates were enrolled in college the October following graduation—22 percent in 2-year colleges and 39 percent in 4-year colleges.
- ◆ Between 1973 and 1993, the proportion of high school graduates going directly to college increased from 47 to 62 percent. Historically, more students enroll in 4-year colleges, but the proportion of students choosing 2-year colleges was higher in 1993 than in 1973.
- ◆ High school graduates from low income families were twice as likely to go directly to college in 1993 than in 1973. Yet, only 50 percent of high school graduates from low income families went directly to college as compared to 79 percent of those from high income families.

Most college students enroll in college immediately after finishing high school. The percentage of high school graduates enrolled in college the October following graduation is a leading indicator of the total proportion of that year's graduates who will ever enroll in college. The percentage enrolling is a reflection not only of the accessibility of higher education to high school graduates but also of their assessment of the value of attending college compared to working, entering the military, traveling, and other possible pursuits.

Percentage of high school graduates who were enrolled in college the October following graduation, by type of college, family income, and race/ethnicity: 1972-93

October	Type of college			Family income ¹			Race/ethnicity

— Not available.

¹ Revised from previously published figures.

² Due to the small sample size for the Hispanic category, 3-year averages were calculated. The 3-year average for 1992 is the average percentage of graduates enrolled in college in 1991, 1992, and 1993.

NOTE: Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between.

SOURCE: U.S. Department of Commerce, Bureau of the Census, October Current Population Surveys.

Percentage of high school graduates enrolled in college the October following graduation: October 1972-93

By family income

By race/ethnicity

* Due to the small sample size for the Hispanic category, 3-year overlapping averages were calculated. The 3-year average for 1992 is the average percentage of graduates enrolled in college in 1991, 1992, and 1993.

NOTE: Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between.

SOURCE: U.S. Department of Commerce, Bureau of the Census, October Current Population Surveys.

Activities of 1990 2-year college students 1 year later

- ◆ Of all 2-year college students in October 1990, 23 percent were enrolled in some type of postsecondary institution 1 year later. This rate was about the same for black, Hispanic, and white students. However, the rate did vary by age and sex; older students and females were less likely to be enrolled a year later than younger students and males, respectively.
- ◆ Among 2-year college students in October 1990 who indicated they had completed 1 year of college by October 1991, 17 percent were still enrolled in a 2-year college at that time. Among those who indicated they had completed 2 years of college by October 1991, 22 percent had enrolled in a 4-year college and were pursuing a bachelor's degree.
- ◆ Among 2-year college students in October 1990, 77 percent were not students a year later; 63 percent were not students but were working. The unemployment rate was 10 percent among these nonstudents.

Two-year colleges have many roles in American higher education. They are usually located near students' homes, are inexpensive, and offer students an opportunity to begin a 4-year program and later transfer to a 4-year school. Moreover, 2-year colleges offer occupationally specific programs that help students acquire skills that make it easier for them to find work. At 2-year colleges, students who work full time can attend part time and take a few specific courses, or they can pursue a 2-year program over a longer period of time. Following the next-year activities of 2-year college students provides an indication of how students are using 2-year colleges to further their educational goals.

Activities of 2-year college students in October 1990 1 year later, by selected characteristics: October 1991

Student characteristics	Percentage in each activity category							Unemployment rate of nonstudents
	Students			Nonstudents				
	Total*	2-year school	4-year school pursuing a bachelor's degree	Total	Working	Unemployed	Not in the labor force	
All	22.9	9.1	11.0	77.1	62.8	7.1	7.2	10.2
Age in 1991

Net cost of attending postsecondary education

- ◆ Between 1970 and 1993, total time-to-degree among doctoral students increased for all fields of study, with the largest increase in years occurring in the education and other technical/professional fields.
- ◆ Time-to-degree varied by field of study throughout the 1970–93 time period. Students who majored in the natural sciences or in computer sciences and engineering took less time on average to complete their doctorates, whereas students who majored in education or other technical/professional fields generally took longer.
- ◆ Registered time-to-degree increased slightly between 1970 and 1993, and showed less variability across fields of study and between males and females than total time-to-degree (see supplemental tables 11-2 and 11-3).
- ◆ While overall females tend to take longer to complete their doctorates, within the same fields of study, male and female total time-to-degree is similar except in the education and other technical/professional fields (see supplemental tables 11-2 and 11-3).
- ◆ Total time-to-degree differs for students with various types of primary sources of financial support in graduate school. Students whose primary source of support was personal resources had the longest time between completing their bachelor's and doctor's degrees, whereas students with federal research assistantships had the shortest. Types of primary financial support were less related to registered time-to-degree (see supplemental table 11-4).

Trends in the number of years doctoral students take to complete their degrees suggest changes in the time needed to produce doctorate-level personnel. These trends also may provide clues to other important changes, such as in students' financial resources and amount of part-time study. Total time-to-degree (TTD) measures the number of years between completion of the baccalaureate and doctorate degrees, including nonenrolled as well as enrolled time. Registered time-to-degree (RTD), however, only measures the number of years enrolled, full time or part time, in graduate school.

Median total time-to-degree for doctorate degrees among U.S. citizens and permanent U.S. residents, by sex and field of study: Selected years of doctorate 1970–93

Year of doctorate	Sex			Field of study					
	Total	Male	Female	Humanities	Social and behavioral sciences	Natural sciences	Computer sciences and engineering	Education	Other technical/professional*
Total time-to-degree (TTD, in median years)									
1970	7.9	7.6	9.7	9.2	7.6	6.1	6.9	12.7	8.5
1972	8.2	8.0	9.8	9.2	7.7	6.5	7.6	12.6	8.6

Skill improvement training among currently employed workers

- ◆ In 1991, one out of three full-time workers and one out of six part-time workers received training to improve their current job skills in the last 12 months.
- ◆ In both 1983 and 1991, women were as likely as men to have received training while on their current job.
- ◆ The proportion of workers who had ever received skill improvement training on their current job increased between 1983 and 1991.
- ◆ The likelihood of workers receiving skill improvement training is related to their education, occupation, and age. In 1991, college graduates, workers in executive, professional and technical occupations, and those aged 35–44 were more likely to have received training on their current job than other workers.

In the face of changing technologies, work methods, and markets, firms and workers may benefit from education or training that upgrades or reorients worker skills. The proportion of workers receiving skill improvement training on their current job is an indication of the extent to which firms invest in the re-education of the employed workforce. Differences in the proportions among types of workers who receive training are an indication of those for whom employers find it valuable to invest in training.

Percentage of workers aged 16 and over who received skill improvement training while on their current job, by worker characteristics: 1983 and 1991

Workers who received skill improvement training while on their current job, by worker characteristics

SOURCE: U.S. Department of Labor, Bureau of Labor Statistics, *How Workers Get Their Training: A 1991 Update*, Bulletin 2407, August 1992. U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1991.

Achievement, Attainment, and Curriculum

Indicators of what students have learned in school are perhaps the most important measures of the outcomes of education. Performance on examinations is one measure of what has been learned. However, examinations do not measure the wide array of skills and experiences that formal education provides. Educational attainment (e.g., finishing high school or college) is an indirect measure of how much subject matter students may have learned, as well as how much students potentially have gained in learning civic responsibilities, social skills, work ethics, and life skills. Furthermore, information about courses taken in high school and fields of study in college is an additional indirect indicator of the content of students' knowledge.

Achievement

The National Assessment of Educational Progress (NAEP) has assessed students' knowledge in reading, writing, science, mathematics, and other subjects for more than 20 years. Average reading proficiency among 9-year-olds was about the same in 1992 as in 1971; among 13- and 17-year-olds, it was slightly higher in 1992. Average science proficiency among 9-year-olds was higher in 1992 than in 1970; among 13-year-olds, it was the same in 1992 as in 1970; and among 17-year-olds, it was lower. Average writing proficiency of 11th-graders was about the same in 1992 as in 1984; however, 4th- and 8th-graders showed marked progress between 1990 and 1992 (*Indicators 13, 14, and 16*).

Mathematics achievement is assessed through NAEP for 9-, 13-, and 17-year-olds, through the SAT for college-bound high school seniors, and through the GRE for college graduates intending to continue their education. NAEP shows that average mathematics proficiency among 9- and 13-year-olds was slightly higher in 1992 than in 1973 and that among 17-year-olds, it was about the same (*Indicator 15*). Average scores on the mathematics section of the SAT showed similar patterns of change. For example, SAT scores fell somewhat during the 1970s, but rose during the early 1980 and early 1990s. Unlike NAEP, not all of the decline in SAT mathematics scores during the 1970s has been recouped. However, participation in the SAT exam has increased significantly; in 1993, 41 percent of high school seniors took the SAT, up from 32 percent in 1976

(table 20-1). The percentage of minority test-takers has doubled during this same time period—rising from 15 to 30 percent. GRE test-takers as a percentage of college graduates have also increased from 29 percent in 1980 to 35 percent in 1993. GRE quantitative scores have increased 45 points since 1973, mainly due to a sharp rise in scores during the 1980s (*Indicator 21*).

Although overall scores have not changed much over the last two decades, NAEP shows that the large gap in achievement between whites and minorities has narrowed somewhat. Blacks have improved relative to whites in reading, mathematics, and science. For example, in 1971, average reading proficiency among 17-year-old blacks was well below that of both 17-year-old and 13-year-old whites (52 and 22 scale points, respectively); although the gap was still large in 1992, the reading proficiency of 17-year-old blacks was closer (36 points) to that of 17-year-old whites, and about the same as that of 13-year-old whites (*Indicator 13*). In general, improvement in average reading proficiency among Hispanics relative to whites was not as widespread as it was among blacks. The same trend is evident in SAT scores between 1976 and 1994. As the verbal scores of whites decreased 8 points, those of blacks increased by 20 points, and those of Hispanics remained relatively stable.

International comparisons. Recent international comparisons of student achievement are available in basic reading literacy, mathematics, and science. Generally, U.S. students compare favorably to their counterparts in other large industrialized countries in reading, but unfavorably in mathematics and science (*Indicators 17, 18, and 19*). However, differences among countries do not seem so large when they are compared to the variation within countries. Although the United States is a culturally diverse country with respect to language, it is less diverse than some of the other large industrialized countries. A smaller percentage of 9-year-old students in the United States speak a language at home that is different from the one spoken at school than their counterparts in the former West Germany, France, Italy, or Canada (*Indicator 17*).

Adult Literacy. In 1992, the literacy of adults aged 16 and older was assessed in three areas: prose,

document, and quantitative. Approximately 20 percent of the adults in the United States performed at the lowest proficiency level. Scores of whites averaged 67 to 75 points higher than those of Hispanics and 49 to 63 points higher than those of blacks in each of the three areas. In addition, older Americans had lower literacy scores than younger ones, and adults with more education had higher literacy scores than adults with less education (*Indicator 20* and tables 20-1 and 20-3, *Condition of Education 1994*).

Attainment

High school completion. In 1994, 86 percent of all 25- to 29-year-olds had a high school diploma or an equivalency certificate, up from 78 percent in 1971. However, the completion rate varied among racial/ethnic groups. In 1994, 91 percent of whites had a high school diploma or the equivalent, compared to 84 percent of blacks and 60 percent of Hispanics. Blacks showed the most improvement, as the percentage of blacks earning a high school diploma or equivalency certificate rose 25 percentage points between 1971 and 1994, compared to 9 and 12 percentage points for whites and Hispanics, respectively (*Indicator 22*). In terms of high school attainment, the United States compares favorably to other large industrialized countries. A similar or higher percentage of 25- to 64-year-olds in the United States have completed high school than 25- to 64-year-olds in many other countries. With respect to young adults, however, several other nations approach or surpass U.S. secondary education completion rates (*Indicator 23*).

College attainment. After high school, many people stop (or delay) further formal education. In 1994, of 25- to 29-year-olds who had completed high school, 61 percent had completed at least some college, and 27 percent had earned a bachelor's degree or more (*Indicator 22*). In the United States, a larger portion of young adults have earned college degrees compared to their counterparts in most other industrialized countries (*Indicator 23*).

Curriculum

The courses students take in high school and college are an indirect indication of the content of students' knowledge. In order to graduate, students in public high schools in 1990-91 were required, on average, to take almost 4 years of

English, 2.5 years of math, and 2 years of science. As district spending increased, students were more likely to be required to complete 13 or more years of coursework in English, math, science, and social studies (except in the highest spending districts). Students in districts with very low median household incomes were more likely to be required to meet or exceed the core requirements in English, mathematics and science recommended in 1983 by the commission that issued *A Nation At Risk* than students in districts with moderate or high median household incomes (*Indicator 24*). A greater percentage of 1992 than 1982 high school graduates earned the number of units in the core courses—4 units in English and 3 each in science, social studies, and mathematics—recommended in *A Nation at Risk* (*Indicator 25*). In 1992, 47 percent of high school graduates had earned at least this number of credits compared to 13 percent in 1982. A higher percentage of 1992 high school graduates took mathematics and science courses (both overall and in specific subject areas) than 1982 graduates, particularly in geometry, algebra I, biology, and chemistry (*Indicator 26*). Members of the high school class of 1992 also took more foreign language courses than their counterparts who graduated in 1982 (*Indicator 26, Condition of Education 1994*).

Business is the most popular major in college—24 percent of all bachelor's degree recipients in 1990 majored in business (*Indicator 27, Condition of Education 1994*). However, the percentage of students receiving an associate's degree in business decreased between 1987 and 1990, while the percentage earning an associate's degree in arts and sciences increased (*Indicator 29, Condition of Education 1994*). At the graduate level, males were still twice as likely as females to earn degrees in business, although the gap has declined significantly since the early 1970s (*Indicator 27*). Regardless of the degree earned, at least 60 percent of undergraduate students take courses in the arts, English literature, psychology, sociology/anthropology, history, physical science, and mathematics, reflecting a wide diversity of studies in college (*Indicator 28, Condition of Education 1994*).

Trends in the reading proficiency of 9-, 13-, and 17-year-olds

- ◆ Overall, reading proficiency for 9-year-olds improved between 1971 and 1980, then declined between 1980 and 1992, essentially returning to the 1971 level. At age 13, little change occurred from year to year, but average performance was higher in 1992 than in 1971. Scores for 17-year-olds increased between 1971 and 1984, then remained stable through 1992.
- ◆ Females continue to outscore males in all age groups.
- ◆ Although black students have made no progress since 1988, the average reading proficiency of black students was higher in 1992 than in 1971. Scores for Hispanic students increased between 1975 and 1992 for 17-year-olds. The gap between white students and their black and Hispanic counterparts decreased for blacks at all three age levels and for Hispanic 17-year-olds.
- ◆ There is evidence that reading proficiency increases more between ages 9 and 13 than between ages 13 and 17. For example, in 1992, there was an average proficiency difference of 50 scale points between 9- and 13-year-olds, and 30 scale points between 13- and 17-year-olds. This pattern holds for both genders and all racial/ethnic groups.

A student's ability to read is essential to the educational process. If students fall behind in reading proficiency, they may find it difficult to benefit from other aspects of the curriculum. In the future, poor readers may also find it difficult to participate effectively in an economy requiring increasingly sophisticated job skills.

Average reading proficiency (scale score), by sex and age: Selected years 1971-92

Year	Total			Male			Female		
	Age 9	Age 13	Age 17	Age 9	Age 13	Age 17	Age 9	Age 13	Age 17

Average reading proficiency, by race/ethnicity and age

Percentile distribution of reading proficiency for 13-year-olds, by race/ethnicity

Percentile distribution of reading proficiency, by race/ethnicity and age for 1992

NOTE: The reading proficiency scale has a range from 0 to 500.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, Trends In Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.

Trends in writing proficiency in grades 4, 8, and 11

- ◆ Average writing proficiency remained relatively stable for fourth-grade students between 1984 and 1990, then rose between 1990 and 1992. Eighth-grade writing scale scores increased 17 scale points in 1992 after a decline between 1984 and 1990. Eleventh-grade scores have remained relatively unchanged since 1984.
- ◆ Females have outscored males at all levels since 1984.
- ◆ Scores for white eighth-grade students decreased between 1984 and 1990, and then rose dramatically in 1992. Hispanic and black eighth-grade students also showed strong improvements between 1990 and 1992.
- ◆ In 1992, 87 percent of 11th-graders could write focused, clear responses (Level 250); 36 percent were generally able to write more complete responses (Level 300); and only 2 percent provided effective, coherent responses (Level 350) (see supplemental table 14-2).
- ◆ Scores at the 5th percentile rose between 1990 and 1992 for all age groups, while scores at the 95th percentile decreased for 11th-graders and remained the same for 4th-graders. This shift caused a decrease in the variability of scores for 4th- and 11th-graders. Eighth-grade scores increased at the upper percentile levels, causing the entire distribution to shift upward (see supplemental table 14-3).

Effective writing skills are important in all stages of life from early education to future employment. In the business world, as well as in school, students often must convey complex ideas and information in a clear, succinct manner. Inadequate writing skills, therefore, could inhibit achievement across the curriculum and in future careers.

Average writing proficiency, by race/ethnicity and grade

Percentile distribution of writing proficiency in grade 8, by race/ethnicity

Percentile distribution of writing proficiency, by race/ethnicity and grade for 1992

NOTE: The writing proficiency scale has a range from 0 to 500.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, Trends In Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.

Trends in the mathematics proficiency of 9-, 13-, and 17-year-olds

- ◆ Average mathematics proficiency improved between 1978 and 1992 for all age groups, with the largest improvements occurring among 9- and 13-year-olds.
- ◆ White, black, and Hispanic 9-year-olds showed large improvements in average mathematics proficiency between 1982 and 1992, after a rather flat trend occurred between 1973 and 1982.
- ◆ Although a large gap in mathematics proficiency exists for all age groups between whites and their black and Hispanic peers, at ages 13 and 17, white scores increased at a slower rate than black and Hispanic scores causing this gap to decrease over the last 20 years.
- ◆ Increases in performance between 1978 and 1992 varied across proficiency levels. The percentage of 17-year-olds scoring at or above Level 250 increased from 92 to 97 percent; those scoring at or above Level 300 increased from 52 to 59 percent; but those scoring at or above Level 350 stayed at 7 percent (see supplemental table 15-2).
- ◆ There is much variation in the mathematics proficiency scores of students. For example, in 1992, scores for 9-year-old whites varied by more than 100 scale points between the 5th percentile and the 95th percentile. In addition, whites had higher scores at the 95th percentile at age 9 than at the 50th percentile at age 13 (see supplemental table 15-3).

Proficiency in mathematics is an important outcome of education. In an increasingly technological world, the mathematics skills of the nation's workers may be a crucial component of economic competitiveness. In addition, knowledge of mathematics is critical for success in science, computing, and a number of other related fields of study.

Average mathematics proficiency (scale score), by sex and age: Selected years 1973-92

Year	Total			Male			Female		
	Age 9	Age 13	Age 17	Age 9	Age 13	Age 17	Age 9	Age 13	Age 17

¹ Statistically significant difference from 1992.

² Statistically significant difference from 1973.

NOTE: The mathematics proficiency scale has a range of 0 to 500. (See supplemental table 15-1 for detailed explanations of levels.)

Level 150: Simple arithmetic facts

Level 200: Beginning skills and understandings

Level 300: Moderately complex procedures and reasoning

Level 350: Multi-step problem solving and algebra

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, *Trends in Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.*

Average mathematics proficiency (scale score): 1978-92

Average mathematics proficiency, by race/ethnicity and age

Percentile distribution of mathematics proficiency for 13-year-olds, by race/ethnicity

Percentile distribution of mathematics proficiency, by race/ethnicity and age for 1992

NOTE: The mathematics proficiency scale has a range from 0 to 500.

SOURCE: U.S. Department of Education, National Center For Education Statistics, National Assessment of Educational Progress, Trends In Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992, Mathematics; 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.

Trends in the science proficiency of 9-, 13-, and 17-year-olds

- ◆ In 1992, average science achievement was higher at all three age levels than in 1982, the year before *A Nation at Risk* was published. In addition, the gap between male and female scores at ages 13 and 17 has decreased.
- ◆ In 1992, the average science proficiency of blacks and Hispanics remained well below that of whites. However, between 1977 and 1992, the proficiency gap decreased between whites and blacks at age 9 and between whites and Hispanics at age 13.
- ◆ A higher percentage of 9-, 13-, and 17-year-olds demonstrated general science skills by reaching Levels 200 and 250 in 1992 than in 1982. In addition, more 17-year-olds reached Levels 300 and 350 in 1992, exhibiting detailed knowledge and analytical understanding of scientific principles and the ability to integrate specialized scientific information (see supplemental table 16-2).
- ◆ There is a great deal of variation in science proficiency scores within an age group. For example, the proficiency of white 9-year-olds varies by 120 scale points from the 5th percentile to the 95th percentile. By comparison, the difference in the proficiency of median white 9- and 17-year-olds is 66 scale points (see supplemental table 16-3).

Competence in science is an important outcome of education. The ability to apply scientific information, interpret data, and make inferences about scientific findings is required in a world that relies heavily on technological and scientific advances.

International comparisons of reading literacy

- ◆ In an international assessment of basic reading literacy, 9-year-olds from the United States performed better on average on the narrative domain than students from other large countries.
- ◆ At age 14, students in the United States scored higher on the expository domain on average than students of similar ages in West Germany and Spain.
- ◆ There is far greater variation in the basic reading literacy of students within each country than there are differences in averages among countries. For example, among 9-year-olds, the difference between the 10th and the 90th percentile on the narrative domain was 235 scale points in the United States, compared to a difference of 62 scale points between the United States and West Germany (see supplemental table 17-2).
- ◆ Children whose home language is different from the one spoken at school showed lower literacy levels in most countries, including the United States, at both ages 9 and 14.

The ability to read is a minimum requirement to participate productively in a global economy and to fulfill basic civic responsibilities. Comprehending and effectively using written language are crucial for both future learning and the development of basic job skills.

Average reading literacy scale scores, by age and country: School year 1991-92

Larger countries	Average overall score			Average domain scale score			Non-school language spoken at home		School language spoken at home	
	Total	Male	Female	Narrative	Expository	Documents	Percentage of students	Average score	Percentage of students	Average score
Age 9										
United States	547	543	552	553	538	550	4	520	96	549
France	531	530	533	532	533	527	9	491	91	536
Italy	529	525	537	533	538	517	27	513	73	537
Spain	504	500	508	497	505	509	13	499	87	505

United States	535	530	543	539	539	528	4	478	96	539
West Germany	522	522	526	514	521	532	8	455	92	530
Italy	515	511	520	520	524	501	26	488	74	525
Spain	490	488	492	500	495	475	11	481	89	491

NOTE: In the Study of Reading Literacy, 32 countries assessed the reading achievement of students in the grades where most 9- and 14-year-olds were enrolled. The countries above are the larger countries. The above scores were scaled using the Rasch procedure. The domain scores for each age group were scaled to a mean of 500 and a standard deviation of 100. The average overall score is the mean of the domain scale scores. Some student groups were excluded by the participating countries, such as those in private schools, schools serving disabled children, or schools where the language of instruction is different from the primary national language. See supplemental tables 17-1 through 17-4 for details on excluded populations and performance information on other countries.

International comparisons of mathematics performance

- ◆ In the second International Assessment of Educational Progress (IAEP), 9-year-old students from the United States scored lower on average in mathematics performance than 9-year-olds from all other large countries.
- ◆ Thirteen-year-olds from the United States scored lower on average than students of the same age in other large countries, except Spain.
- ◆ Average mathematics proficiency among 13-year-old students in the United States was 48 scale points below their South Korean counterparts. This is more than half of the difference between 9- and 13-year-olds in the United States, suggesting that United States students at age 13 may be performing at levels similar to Korean 9-year-olds rather than to their Korean age mates.
- ◆ There is far greater variation in the mathematics proficiency of students within each country than there are differences in averages among countries. For example, among 13-year-olds the difference between the 10th and 90th percentile was 124 scale points in the United States, compared to a difference in average proficiency between the United States and Taiwan of 51 scale points.

The technical skills of a nation's workers are a crucial component of its economic competitiveness. The youth of today will be tomorrow's workers and will be competing in the global marketplace. They will depend on the mathematics learned in this decade to succeed in the complex business and technological environments of the future.

Proficiency scores on mathematics assessment, by age and country: 1991

Larger countries ¹	Average proficiency score			Percentile scores						
	Total	Male	Female	1st	5th	10th	Median	90th	95th	99th
Age 9										
South Korea	473	480	465	334	383	407	475	534	550	586

International comparisons of science performance

- ◆ In the second International Assessment of Educational Progress (IAEP), 9-year-old students from South Korea scored higher on average in science performance than 9-year-olds from the United States. Students of the same age from Spain scored lower on average.
- ◆ Thirteen-year-olds from South Korea, Taiwan, the former Soviet Union, and Canada scored higher on average than U.S. students of the same age.
- ◆ The difference in science proficiency between 9- and 13-year-olds in the United States (75 scale points) was less than the proficiency difference in other large countries (ranging from 95 to 110 scale points).
- ◆ Among 9-year-olds, boys performed better than girls in South Korea, Taiwan, and Spain. At age 13, this gender difference held across all large participating countries except Taiwan.

The scientific and technological skills of a nation's workers are a crucial component of its economic competitiveness. The youth of today will be tomorrow's workers and will be competing in the global marketplace. They will depend on the science learned in this decade to succeed in the complex business and technological environments of the future.

Scholastic Aptitude Test (SAT) scores

- ◆ Average total SAT scores remained relatively unchanged between 1993 and 1994. However, the performance of male test-takers dropped by 3 points in verbal and 1 point in mathematics, while the scores of female test-takers rose by 1 point in verbal and 3 points in mathematics, slightly narrowing the gap between the sexes.
- ◆ The number of SAT test-takers as a percentage of high school graduates remained at about 42 percent during the 1992–94 period, up from 35 percent in 1984. The proportion of minority SAT test-takers more than doubled between 1976 and 1994, rising from 15 to 31 percent (see supplemental table 20-1).
- ◆ Since 1976, the mean scores of black test-takers have risen 20 points on the verbal section and 34 points on the mathematics section, while the mean scores of whites have fallen 8 points on the verbal section and have risen 2 points on the mathematics section (see supplemental table 20-2).
- ◆ In 1994, students from families with the lowest parental education and income levels received the lowest scores overall, and scores increased with higher levels of parental education and income (see supplemental table 20-4).

The Scholastic Aptitude Test (SAT) is the test taken most frequently by college-bound students. It is designed to predict success in the freshman year of college, and to track the performance of groups of students who intend to enter college across time. When interpreting these scores the reader should be aware that the proportion of high school graduates who take the exam changes over time.

Mean SAT scores of college-bound seniors, by sex: 1972–94

Year	Verbal			Mathematics			Combined

NOTE: The term "college-bound seniors" refers to those students from each high school graduating class who participate in the College Board Admission Testing Program. This population does not include all high school seniors, nor all first-year college students, as approximately one-third of high school graduates participate in the American College Testing Program. See the supplemental note to *Indicator 20* for information on interpreting SAT scores and for a discussion of the new version of the SAT.

Graduate Record Examination (GRE) scores

- ◆ The average total score on the GRE fell 70 points between 1965 and 1979, then increased 55 points between 1979 and 1990. Between 1990 and 1993, the scores decreased 10 points, reaching the lowest level since 1987.
- ◆ The average GRE verbal score has not yet recovered from the decline experienced throughout the 1960s, 70s, and early 80s; in 1993, it was 49 points below the average score in 1965. However, the quantitative score rose 45 points between 1973 and 1993 and was 24 points higher in 1993 than in 1965.
- ◆ The percentage of test-takers who are not U.S. citizens increased between 1979 and 1988. Non-U.S. citizens performed better on the quantitative component but worse on the verbal component than U.S. citizens (see supplemental table 21-3).

The Graduate Record Examination (GRE), which is taken by less than one-third of college graduates, is a measure of the general learned abilities of prospective graduate students. Because there currently is no method to assess learning at the college level, the GRE, by default, is the best measure of general learned abilities of college graduates. However, the reader should be aware of the limitations of average GRE scores, including (1) the proportion of college graduates taking the exam changes over time; (2) an increasing proportion of foreign students are taking the exam; and (3) the average scores include some students who take the exam more than once.

Graduate Record Examination (GRE) scores and the number of test-takers, by percentage of bachelor's degrees awarded and citizenship: Selected academic years ending 1965-93

Academic year ending	GRE test-takers			GRE scores

Educational attainment

- ◆ Educational attainment rates of 25- to 29-year-olds increased between 1971 and 1994. The percentage of students completing high school rose 8 percentage points; the percentage of high school graduates completing at least some college rose 17 percentage points; and the percentage of high school graduates completing 4 or more years of college rose 5 percentage points.
- ◆ Between 1971 and 1994, the percentage of 25- to 29-year-old high school graduates completing 4 or more years of college rose 9 percentage points for females and 1 percentage point for males, eliminating the differences between males and females (see supplemental table 22-3).
- ◆ While fewer black 25- to 29-year-olds had completed high school than their white counterparts in 1994, the gap between the percentages of blacks and whites completing high school closed between 1971 and 1994 (decreasing from 23 to 7 percentage points). Also, 50 percent of black graduates had completed at least some college compared to 63 percent of white high school graduates, and a smaller percentage of black than white (16 compared to 30 percent, respectively) graduates had completed a bachelor's or higher degree.
- ◆ In 1994, fewer Hispanic 25- to 29-year-olds had completed high school than their white counterparts. Fifty-two percent of Hispanic graduates completed at least some college, and 13 percent completed a bachelor's or higher degree, compared to 63 and 30 percent, respectively, of their white counterparts. These gaps in educational attainment rates between Hispanics and whites have not closed between 1971 and 1994.

Completing 4 years of college is an important educational accomplishment that will yield many benefits to those who achieve it. It represents the end result of both starting college and persistent enrollment. Some students stop out, and others drop out, but the vast majority of those who will ever complete 4 years of college do so by their late 20s.

Percentage of 25- to 29-year-olds who have completed high school and percentage of high school graduates who have completed 1 or more and 4 or more years of college, by race/ethnicity: Selected years March 1971-94

March	High school graduates*				High school graduates* completing:

International comparisons of educational attainment, by age

- ◆ The educational attainment of the U.S. population is high compared to other large industrialized countries. A similar or higher percentage of 25- to 64-year-olds in the United States have completed secondary school and college than their counterparts in Japan, Germany, the United Kingdom, France, Italy, or Canada.
- ◆ In Japan, Germany, the United Kingdom, and Canada, 25- to 34-year-olds have completed secondary education at rates similar to their counterparts in the United States.
- ◆ Young men aged 25–34 in Japan were much more likely to have completed higher education than men of the same age group in the other large highly industrialized countries. Young men in the United States ranked second.
- ◆ Young women aged 25–34 in the United States were much more likely to have completed higher education than women or men of the same age in other large industrialized countries (with the exception of men in Japan).

The percentage of the population completing secondary and higher education in the United States and other highly industrialized countries provides an indication of the skill level of the U.S. work force as compared to its economic competitors. Furthermore, contrasting the educational attainment of the general population to the attainment of younger age cohorts provides a means of comparing past and recent progress in the rate at which individuals complete high school or college.

Percentage of the population in large industrialized countries who have completed secondary and higher education, by age, sex, and country: 1992

Country	25–64 years old		25–34 years old					
	Both sexes		Both sexes		Male		Female	
	Secondary education	Higher education	Secondary education	Higher education	Secondary education	Higher education	Secondary education	Higher education
United States	84.0	23.6	86.5	23.2	85.9	23.3	87.0	23.1
Japan*	69.7	13.3	90.6	22.9	89.3	34.2	91.8	11.5
Germany	81.9	11.6	88.6	11.8	90.9	13.0	86.3	10.5

High school graduation requirements

- ◆ As district spending increased, students were more likely to be required to complete 13 or more years of coursework in English, mathematics, science, and social studies except for school districts spending the most per pupil.
- ◆ Students in districts with low median household income were more likely to be required to meet or exceed the NCEE recommendations in English, math, and science than students in districts with middle or high median household income.
- ◆ The median district requirements in the four core subjects ranged from 10 to 12 years of coursework in all but four states (see supplemental table 24-7).

One of the national education goals states that students leaving grade 12 will have demonstrated competency in English, mathematics, science, history, and geography. The extent to which district high school graduation requirements include substantial coursework in these core subjects provides one indicator of the support educators are giving this goal. The 1983 recommendations by the National Commission on Excellence in Education (NCEE)—4 years of English, and 3 years each of mathematics, science, and social studies—provide a useful standard for comparison among districts.

Average years of study required in core subjects for public high school graduation and percentage of students in districts with graduation requirements at or above the NCEE's recommendations, by subject and selected district characteristics: 1990-91

District characteristic	English		Mathematics		Science		Four core subjects*	
	Percent with Years	4 or more	Percent with Years	3 or more	Percent with Years	3 or more	Percent with Years	13 or more
Total	3.8	81.5	2.5	41.6	2.1	21.1	11.3	19.8
Spending per pupil in school district								
Less than \$3,500	3.8	86.2	2.5	44.0	2.1	17.7	11.1	14.9

High school course taking in the core subject areas

◆ **Between 1982 and 1992, the percentage of high school graduates earning the recommended units in core courses* increased sharply, from 13 to 47 percent. This increase was broadly based, occurring for both sexes and all racial/ethnic groups.**

In 1983, A Nation At Risk claimed that our society had "lost sight of the basic purposes of schooling, and of the high expectations and disciplined effort needed to attain them." As a remedial step, the report recommended that all students seeking a diploma be required to enroll in the "New Basics," a core curriculum composed of 4 units of English; 3 units each of science, social studies, and mathematics; and 0.5 units of computer science.

◆ **For private school graduates, the percentage earning the recommended units increased from 17 to 66 percent (49 percentage points), compared to an increase from 12 to 45 percent (33 percentage points) for public school graduates.**

◆ **Over the same period, the percentage of graduates completing the recommended credits in core courses increased more for students whose parents had only completed high school (about 36 percentage points) than for students whose parents had completed college (29 percentage points), effectively closing the gap between the two groups.**

Percentage of high school graduates who earned the recommended units in core courses,* by selected student characteristics: 1982, 1987, 1990, and 1992

Characteristic	1982	1987	1990	1992	Percentage point change

High school mathematics and science course-taking patterns

- ◆ High school graduates in 1992 were more likely to take mathematics courses at the level of algebra I or higher and science courses at the level of biology or higher than their counterparts in 1982.
- ◆ The proportion of high school graduates who took algebra II and geometry and the proportion who took biology and chemistry each increased 6 percentage points between 1990 and 1992 (to 50 and 54 percent, respectively).
- ◆ The percentage of high school graduates who had taken remedial mathematics declined from 33 percent in 1982 to 17 percent in 1992.
- ◆ A larger percentage of 1992 graduates, both male and female, earned credit in biology, chemistry, and physics than their 1982 counterparts. Similar percentages of males and females earned credit in chemistry in both years. Females were more likely to earn credit in biology, while males were consistently more likely to earn credit in physics (see supplemental table 25-1).

Courses in mathematics and science can teach students to use higher level thinking skills to solve complex problems. These skills are considered valuable both in educational and marketplace settings. Analysis of course-taking patterns of high school graduates can indicate levels of exposure in these fields for individuals who are about to advance to higher education or enter the work force.

Percentage of high school graduates taking selected mathematics and science courses in high school: 1982, 1987, 1990, and 1992

Mathematics and science courses ¹	1982	1987	1990	1992	Percentage point change

— Not available.

¹The minimum number of units used for inclusion in this indicator was 1.00 for individual courses except for algebra II, trigonometry, and analysis/precalculus where 0.5 was set as the minimum number of credits.

²Algebra I was revised from previously published figures to include those students who had taken algebra I, or its equivalent, before entering high school.

NOTE: Percentages reflect only those courses taken in high school except for algebra I. Because some students take these other courses in the eighth grade, these percentages could underestimate the number of individuals who have ever taken these subjects in school. See supplemental note to Indicator 25 for further explanation.

Graduate field of study, by sex

- ◆ Overall, in 1992, relatively more women than men earned graduate degrees in the humanities, social/behavioral sciences, education, and health professions. A higher proportion of men than women earned graduate degrees in natural sciences, computer sciences and engineering, and business management.
- ◆ Between the early 1970s and early 1980s, the concentration ratio for humanities at the master's degree level decreased dramatically; since the mid-1980s, the ratio has remained fairly steady, with a slightly higher proportion of women than men earning master's degrees in humanities.
- ◆ Differences in the proportions of men and women earning master's degrees in business management narrowed between 1971 and the mid-1980s when the trend leveled off. The differences in the proportion earning a doctor's degree in this field narrowed between 1971 and 1989, then dropped slightly. Nevertheless, in 1992, men were almost twice as likely as women to earn graduate degrees in business management.
- ◆ From 1971 until 1983, a higher percentage of men than women earned master's degrees in the social and behavioral sciences. From 1984 to the present, a higher percentage of women than men earned master's degrees in this field. At the doctorate level, women have been consistently more likely to earn a degree in the social and behavioral sciences since 1971.

The female field concentration ratio shows how much the fields studied by women differ from those studied by men. Ratios above 1.0 indicate that women are more likely than men to major in a field, and ratios below 1.0 indicate the opposite pattern. Changes in the ratio show whether differences in the field preferences of men and women are narrowing or widening. Thus they point to possible future changes in the occupations and earnings potential of women compared to men.

Female field concentration ratio: Selected academic years ending 1971-92¹

Economic and Other Outcomes of Education

Education is an investment in human skills. Like all investments, it involves both a cost and a return. The cost to the student of finishing high school is quite low, because it consists mainly of the relatively low wages earned by a 16- to 19-year-old dropout. The cost to the student of attending college is higher, and principally includes tuition, books, fees, and the earnings given up by not working or by working part time in college. In contrast, the returns come in many forms. Some are monetary, while others are personal, social, cultural, and more broadly economic. Some are directly related to the labor market, others are not. Some accrue to the individual, others to society and the nation in general. Among the returns related to the labor market are better employment opportunities, jobs that are less sensitive to general economic conditions, better opportunities to participate in employer-provided training, and higher earnings. Other returns that are not related to the labor market and are often attributed to education include greater interest and participation in civic affairs such as rates of volunteerism (*Indicator 33*) or voting (*Indicator 35, Condition 1994*), and lower rates of welfare dependency (*Indicator 32*) or greater knowledge of healthy behavior (*Indicator 36, Condition 1994*).

The costs and returns of investing in postsecondary education have changed over time,* which affects the incentive for individuals to participate. Measures presented in this section illuminate changes in the rewards of finishing high school (or conversely, the penalties of not finishing) and changes in the rewards of investing in postsecondary education.

Penalties of Not Graduating From High School

These indicators suggest some general conclusions regarding the labor market penalties of not finishing high school. The immediate difficulty of making the transition from full-time school attendance to full-time work appears much greater for those who leave school before finishing high school. Without prior job experience or specialized training, school leavers may find it difficult to find jobs that they are willing to take. In October 1993, of young people 16 to 24 years old who had left school *during the previous year* without finishing high school, only 47 percent were employed (up from 36 percent

the previous year). In contrast, of those who had graduated from high school in 1993 and did not enroll in college, 64 percent were employed (about the same as the previous year) (*Indicator 28*).

As young people enter their 20s, some of the problems of making the transition from school to the work force are solved. For example, among males in October 1993, the employment rate was 62 percent among recent high school dropouts (table 28-1) compared to 66 and 71 percent among male dropouts aged 20–24 and 25–29, respectively, in March 1994 (*Indicator 29*). Nevertheless, high school dropouts have lower employment rates than graduates at all ages.

Rewards of College Attendance and Graduation

The ratio of the median annual earnings of those who attend and graduate from college to the median annual earnings of high school graduates provides an indication of the financial returns of attending and graduating from college. In 1993, for males 25–34 years old, the earnings premium for attending college and earning a bachelor's degree was 57 percent, and the earnings premium for attending college without attaining a bachelor's degree was 12 percent. For females of the same age group, the 1993 premium for attending and earning a bachelor's degree was even larger—99 percent, while the premium for attending without attaining a bachelor's degree was 31 percent (*Indicator 30*).

Welfare Reciprocity

The benefits of education to the individual include a higher income and a greater likelihood of employment. To the nation, these benefits correspond to a larger, more productive work force. Among those 25 to 34 years old who went beyond eighth grade, higher education levels also correspond to lower rates of welfare reciprocity. For instance, in 1992, 17 percent of that age group with 9 to 11 years of schooling received income from AFDC or public assistance, while 6 percent of those with 12 years of schooling received welfare income. Among black 25- to 34-year-olds, the contrast is even more striking—36 percent of those with 9 to 11 years of schooling received welfare income in 1992, compared to 13 percent of those with 12 years of schooling (*Indicator 32*).

Completing high school appears to lead to better employment prospects and, thus, less reliance on welfare. Higher education levels correspond to better employment prospects (*Indicators 28, 29, and 30*). Those with a high school education or more have lower rates of welfare reciprocity (*Indicator 32*).

Volunteerism

Education plays a vital role in preparing individuals for active participation in the political, economic, and social lives of their communities. Volunteerism rates for those with postsecondary education are one indication of the relationship between educational attainment and civic responsibility.

There is a strong positive relationship between volunteerism and participation in postsecondary education. Those with some postsecondary education were more likely to volunteer and make charitable contributions. For example, 68 percent of individuals over the age of 25 with some postsecondary education volunteered at least some time in 1992, while 37 percent of the individuals over 25 years old with no postsecondary education volunteered in 1992. Among the same age groups, 87 percent of those with some postsecondary education and 63 percent of those without postsecondary education made charitable contributions in 1992 (*Indicator 33*).

Many factors may influence this relationship. Those with more education may feel a greater responsibility to perform volunteer community service than those with less education. The higher incomes of those with postsecondary education may influence volunteering and charitable giving behavior. In 1992, those with higher incomes were more likely to volunteer and give, regardless of postsecondary education participation. However, within the same income group, individuals with postsecondary education were more likely to volunteer or give than those without postsecondary education (*Indicator 33*).

Literacy

One of the most basic functions of education is to improve literacy. The economic outcomes of literacy are similar to the outcomes of education—higher levels of literacy are associated with better labor market outcomes for the individual. For instance, in 1991, the least

literate male and female workers had annual earnings that were about half of the average earnings for all male and all female workers, respectively. This occurs in part because those with lower literacy levels have less education. However, among those who ended their formal education with a high school diploma, the least literate had earnings that were still lower than the average for all those with that level of educational attainment—about one-fourth less than the average for both men and women (*Indicator 31*).

Doctoral Programs

Doctoral programs constitute the highest level of the education system. The first job taken by new doctoral recipients is indicative of the focus of doctoral programs. The proportion of new doctoral recipients with definite job plans in the United States who have taken jobs in higher education has fallen from 68 percent in 1970 to 52 percent in 1993. However, plans of doctoral recipients vary greatly depending on their field of study. For example, 86 percent of new humanities doctoral recipients with definite job plans in the United States took jobs in higher education, whereas less than one-fourth of new physical sciences or engineering doctoral recipients took higher education jobs. The varied job outcomes of graduates of doctoral programs reflect the different job opportunities for graduates of these programs across disciplines.

NOTES:

*See Murphy, Kevin and Finis Welch. "Wage Premiums for College Graduates: Recent Growth and Possible Explanations," *Educational Researcher*, May 1989 for a more detailed presentation of changes between 1964 and 1986 in the relative earnings of workers with different levels of education and experience by sex and race.

Transition from high school to work

◆ In 1993, 64 percent of recent high school graduates not enrolled in college were employed compared to 47 percent of recent dropouts. During the period of economic recession between 1989 and 1992, the percentage employed in both groups fell about 10 percentage points. However, in 1993, the employment rate for dropouts increased markedly, rising more than 10 percentage points.

The transition from high school to work can be difficult. Without prior job experience or specialized training, school leavers may find it difficult to find jobs they are willing to take. The employment rate among school leavers, both those who have not finished high school and those who have finished but have not gone on to college, is an indication of the ease of making the transition.

◆ Nearly every year between 1973 and 1993, white dropouts were more likely to be employed than black high school graduates not enrolled in college.

◆ Among recent high school graduates in the labor force, males were equally as likely to be unemployed as females. However, males continue to be more likely than females to be in the labor force and to be employed. While the percentage of females in the labor force dropped by more than 5 percentage points between 1991 and 1992, it rebounded by more than 13 percentage points in 1993 (see supplemental table 28-1).

Employment rates for recent high school graduates not enrolled in college and for dropouts, by graduation status and race/ethnicity: October 1973-93

Employment of young adults

- ◆ Among males 25- to 29-years-old, employment rates were somewhat lower for high school graduates than for college graduates. For those who had not completed high school, the employment rates were substantially lower than for those with higher levels of attainment.
- ◆ Among females 25- to 29-years-old, employment rates increased markedly with each higher level of educational attainment. The difference between those who had not finished high school and those who had done so was particularly large (35 percent versus 65 percent).
- ◆ Among females aged 30 to 64, those who had not finished high school were also much less likely to be employed than those with higher levels of attainment.
- ◆ Among males aged 30 to 59, employment rates for those with a bachelor's degree were somewhat higher than for those with only some college.

The percentage of a population group employed is influenced by a variety of factors. Some factors influence the willingness of employers to offer jobs to individuals with different levels of education at the going wage rate, and others influence the willingness of these individuals to take jobs at that rate. The higher the proportion employed, the better are their labor market opportunities relative to other things they could do, and vice versa. To a certain extent, employment rates for older groups are an indication of what younger groups may experience when they become older. However, labor market opportunities were different when these older groups were beginning their work lives than they are for today's young adults.

Percentage of the population* who were employed, by sex, educational attainment, and age: March 1994

Age	Males					Females

* Noninstitutionalized civilians. Some individuals in the population are not in the labor force, that is, they are not looking for a job. They may want to attend school or work in the home, for example. Many young persons aged 20-24 years old were enrolled in school or college and are not in the labor force. Women, especially older women, are also less likely to be in the labor force than their male counterparts. An alternative measure of labor market opportunities, the unemployment rate, is presented in supplemental table 29-1. Also, see the supplemental note to *Indicator 28* for a comparison of labor force statistics.

NOTE: Included in the total but not shown separately are those who have attained eight or fewer years of schooling. The category "grades 9 to 11" includes those who have attended 12th grade but have not received a diploma; "high school diploma" includes those who have received an equivalency certificate; "some college" includes those who have received an associate's degree; "bachelor's degree" includes those who have received advanced degrees.

Annual earnings of young adults

- ◆ In 1993, the median annual earnings of males aged 25–34 who had not completed high school (9–11 years of school completed) were about 67 percent of the earnings of their counterparts who had completed high school. The ratio of earnings of female dropouts to graduates was about 59 percent.
- ◆ Since 1970, the earnings advantage for 25- to 34-year-olds with some college (13–15 years of school) and college degrees (16 or more years of school) was generally greater for females than for males; that is, the percentage difference between the earnings of females with some college or a college degree and the earnings of female high school graduates was greater than the corresponding percentage difference for males.
- ◆ The earnings advantage of completing college increased between 1970 and 1993 for both males and females.
- ◆ In 1993, the median annual earnings of workers with a bachelor's degree were much higher than the earnings of those who attended only some college. For example, among female workers 25 to 34 years old, the median annual earnings of college graduates were approximately \$26,000, while those of females with some college were approximately \$17,000 (see supplemental table 30-2).

Wages and salaries are influenced by many factors, including the employer's perception of the productivity and availability of workers with different levels of education. They are also affected by economic conditions in the industries that typically employ workers with different levels of education. Annual earnings are influenced by the number of weeks worked in a year and the usual hours worked each week. The ratio of annual earnings of high school dropouts or college graduates to those of high school graduates is affected by all these factors; it is a measure of the earnings disadvantage of not finishing high school and the earnings advantage of completing college.

Ratio of median annual earnings of wage and salary workers 25 to 34 years old with 9–11, 13–15, and 16 or more years of school to those with 12 years of school, by sex: Selected years 1970–93

Year	9–11 years of school		13–15 years of school		16 or more years of school	
	Male	Female	Male	Female	Male	Female
1970	0.84	0.69	1.10	1.19	1.24	1.68

1984	0.63	0.56	1.15	1.21	1.36	1.61
1986	0.69	0.65	1.18	1.21	1.50	1.78
1988	0.68	0.56	1.10	1.31	1.42	1.81
1990	0.71	0.58	1.14	1.34	1.48	1.92
1991*	0.64	0.64	1.14	1.32	1.53	1.90
1992*	0.68	0.76	1.13	1.34	1.60	2.00
1993*	0.67	0.59	1.12	1.31	1.57	1.99

* Beginning with the March 1992 survey, which collected earnings for calendar year 1991, new questions were used to obtain the educational attainment of respondents. See the supplemental note to *Indicator 22* for further discussion.

NOTE: This ratio is most usefully compared to 1.0. For example, the ratio of 1.57 in 1993 for males with 16 or more years of school means that they earned 57 percent more than males with 12 years of school. The ratio of .67 in 1993 for males with 9–11 years of school means that they earned 33 percent less than males with 12 years of school.

SOURCE: U.S. Department of Commerce, Bureau of the Census, March Current Population Surveys.

Ratio of median annual earnings of wage and salary workers 25 to 34 years old with 9-11, 13-15, and 16 or more years of school to those with 12 years of school, by sex:
1970-93

NOTE: One (1.0) on the scale represents earnings equal to those with 12 years of school; 2.0 represents double their earnings; 0.5 represents half their earnings. The scale on the graph makes the distance between 1.0 and 2.0, or doubling, the same as that between 1.0 and 0.5, or halving.

Labor market outcomes of literacy and education

- ◆ Educational attainment and literacy level are both positively associated with higher annual earnings and lower unemployment rates. Furthermore, literacy is positively associated with earning higher wages and a reduced likelihood of being unemployed within different levels of educational attainment.
- ◆ In 1992, of males whose highest education level was a high school diploma, those at prose proficiency level 4 (scores between 326 and 375) had 29 percent higher annual earnings than those at proficiency level 2 (scores between 226 and 275). The difference in earnings between those females at proficiency level 4 and those females at proficiency level 2 was not statistically significant, however.
- ◆ Of females whose highest education level was a high school diploma, those at prose proficiency level 4 were far less likely to be unemployed than those at proficiency level 2 (unemployment rates of 5 versus 12 percent). The unemployment rates for those females with a bachelor's degree were similar at proficiency levels 2, 3, and 4, however.

As our society becomes more technologically advanced, many have argued that there is a greater need for all individuals to become more literate and for a larger proportion to develop advanced skills. Some argue that a growing number of workers are being expected to comprehend information presented in lengthy and sometimes complex formats, to compare and contrast information, to generate ideas based on what they read, and to apply arithmetic operations sequentially to solve a problem. Furthermore, strong literacy skills are a prerequisite for fully taking advantage of formal education and job-related training. The degree of variability in labor market outcomes by literacy within educational attainment levels is an indicator of the direct and indirect (i.e., through education) effects of literacy on success in the workplace.

Labor market outcomes of 25- to 64-year-olds, by sex, prose proficiency level, and highest education level attained: 1992

Welfare reciprocity, by educational attainment

- ◆ In 1992, high school dropouts were three times more likely to receive income from AFDC or public assistance than high school graduates who did not go on to college (17 percent versus 6 percent).
- ◆ Between 1972 and 1992, both high school dropouts and graduates who did not go on to college became more likely to receive AFDC or public assistance income. During this period, the increase in the likelihood of receiving welfare income was greater for high school dropouts than for graduates who did not go on to college. Therefore, the difference between the two groups in the percentage receiving such income rose (from 7 percent to 12 percent).

Public investment in education has many potential benefits for the nation. One possible benefit of the availability of free or low cost education is reduced reliance on welfare and public assistance programs among those who attain higher levels of education. The extent to which people with more education rely less on welfare and public assistance is an indication of this benefit. However, not all people who attain higher levels of education do so because of the availability of low cost education. Therefore, the indicator may overstate this benefit from public investment in education.

Percentage of persons aged 25-34 who received income from AFDC or public assistance, by years of schooling completed: 1972-92

Year	Years of schooling completed											
	All persons						White		Black		Hispanic

Community service and volunteerism

- ◆ **Having some postsecondary education was clearly associated with increased levels of volunteering and giving. Adults aged 25 years and older with some postsecondary education were twice as likely as those with less education to report both volunteering their time and making charitable contributions in the last 12 months (63 and 32 percent, respectively).**
- ◆ **Among respondents with some postsecondary education, about one-fourth (22 percent) were identified as being generous volunteers (volunteered at least 4 hours per week in the last 12 months), compared with 12 percent with no postsecondary education.**
- ◆ **Within income levels, adults with some postsecondary education were much more likely to report volunteering than were those with no postsecondary education. This was especially apparent for low income groups (less than \$20,000) where adults with some postsecondary education were nearly twice as likely to report volunteering (54 percent) than were those with no postsecondary education (27 percent).**

Giving of one's time or money is a measure of the degree to which citizens share responsibility for the welfare of their community. Higher education may increase a person's sense of responsibility to give back to their community in the form of community service and charitable contributions.

Population 25 years and older who reported volunteering and giving charitable contributions in the last 12 months, by education level and selected characteristics: 1992

New doctoral recipients taking jobs in higher education, by field of study

- ◆ The proportion of new doctoral recipients with definite employment commitments* who took jobs in higher education declined substantially between the early 1970s and the early 1980s. Since then, the proportion has remained relatively stable.
- ◆ While all fields of study showed an overall decline in the proportion of new doctorates taking jobs in higher education between 1970 and 1993, the largest decline occurred in the fields of social and behavioral sciences (27 percentage points), life sciences (26 percentage points), and education (26 percentage points).
- ◆ Between 1970 and 1993, a larger proportion of those with new doctorates in the humanities had job commitments in higher education than those with doctorates in other fields; new mathematics doctoral recipients ranked second. During the same period, new doctoral recipients with the lowest proportion of job commitments in higher education included those in engineering and physical sciences.
- ◆ Between 1979 and 1986, approximately 50 percent of new doctorates in the field of computer sciences had job commitments in higher education. However, between 1987 and 1993, that percentage fluctuated from a high of 69 percent in 1987 to a low of 42 percent in 1992 (see supplemental table 34-1).

New doctoral recipients have several career options, including positions in higher education; nonprofit agencies; and federal, state, and local governments, as well as positions in the private sector. Changes in the proportion of new doctoral recipients who take jobs in colleges and universities reflect both the availability of academic jobs in any given year as well as the availability of attractive positions outside of academe.

Percentage of new doctoral recipients with definite employment plans in the United States who had job commitments in higher education, by field of study: Selected years of doctorate 1970-93

— Data not collected as a separate field of study.

* This indicator pertains only to definite employment commitments in the United States. A "definite commitment" is defined as a signed contract, acceptance of a formal offer, etc. Employment in higher education includes positions in 4-year colleges or universities, medical schools, and junior or community colleges, with the exception of postdoctoral fellowships.

NOTE: Respondents who reported definite employment plans in higher education could be referring to teaching, research and development, administration, or other professional services.

*Size, Growth, and Output of
Educational Institutions*

The education system must adapt to demographic changes in the population, as well as respond to changing conditions in society and the economy. In turn, these changes in the education system influence major support industries, future entries to the labor force, and future economic activity. The indicators in this section provide some evidence of changes in the size, growth, and output of educational institutions.

Enrollment

In 1993, over 63 million people in the United States, almost 1 in 4, were enrolled in elementary and secondary schools, colleges, and universities. This included about 37 million students in kindergarten through grade 8, 13 million in grades 9 through 12, 6 million in 2-year colleges, and 9 million in 4-year colleges and universities (table 35-1 and table 36-1).

Most students are enrolled in public educational institutions, but a considerable number are enrolled in private institutions. The percentage of students enrolled in private schools is high for preprimary children (62 percent), but falls for older children (12 percent in grades K–8, and 9 percent in grades 9–12, *Indicator 35* and *Indicator 37, Condition of Education 1994*). For postsecondary education, the split between public and private institutions depends strongly on the type of institution; 4 percent of enrollment at 2-year colleges but 33 percent of enrollment at 4-year colleges and universities is in private institutions (*Indicator 36*). Institutions with less-than-2-year programs are predominately private and for-profit.¹

The amount of time spent in school changed substantially between 1970 and 1992 for those in kindergarten and higher education. The percentage of kindergartners who attend full day has more than tripled since 1970. Forty-four percent of students attended kindergarten full day in 1992 compared to 13 percent in 1970 (*Indicator 37, Condition of Education 1994*). Part-time undergraduates in colleges and universities were more prevalent in recent years (an average of 26 percent between 1987 and 1990) than they were two decades earlier (an average of 17 percent between 1967 and 1970) (*Condition of Education 1992, table 46-5*). However, almost all of the increase in the percentage of

undergraduates attending part time occurred between 1970 and 1977 and has remained fairly stable since then.

Growth of Enrollment

After the end of World War II, the number of births per year reached a peak of 4.3 million in 1957. The baby boom period between 1946 and 1964 was followed by a period of declining births, which reached a low of 3.1 million in 1973. Since then, the number of births has gradually risen, reaching 4.2 million in 1990.² These trends are reflected, with lags, in the growth and decline of enrollments. Between 1970 and 1984, total public school enrollment fell about 15 percent; from 1984 to 1994, it rose about 13 percent (*Indicator 35*). Private school enrollment remained relatively stable during this time.

Changes in enrollment trends appear first in elementary schools, and later in secondary schools. Enrollment in public schools in kindergarten through grade 8 declined throughout the 1970s, reaching a low point in 1984, and has been rising since then (*Indicator 35*).

Enrollment in public schools in grades 9–12 declined from 1976 through 1990, with some minor fluctuations in the mid-1980s. It then increased between 1990 and 1994 and is projected to continue increasing past the end of the century.

In higher education, the level of enrollment is less tied to the number of births than it is in elementary and secondary schools where enrollment is nearly universal. Total enrollment in higher education rose throughout the 1970s, as would be expected, given the rising number of high school graduates. In the first half of the 1980s, it remained stable with a small drop in 1984. Enrollment rose each year between 1985 and 1992, despite the falling number of high school graduates after 1988, and then dropped slightly between 1992 and 1993 (*Indicator 36*). Two factors account for the continued growth in enrollment: increasing enrollment rates among new high school graduates (*Indicator 9*), and the increasing number of older students as the large baby boom cohorts age.

The distribution of total enrollment between public and private institutions has changed little over the last two decades. Public institutions continue to enroll nearly 8 out of every 10

students. Within the public sector, enrollment in 2-year institutions grew faster than in 4-year institutions in the late 1980s and early 1990s. As a result, 2-year institutions increased their share of public enrollment from 35 to 39 percent between 1985 and 1993.

Diplomas and Degrees

Whereas enrollment indicates the size of the educational system, completions are one measure of the quantity of education the system is delivering. Each diploma or degree awarded is one indication that the education system has made more knowledge and skill available in society. Public and private high schools awarded 2.5 million diplomas, and GED programs awarded almost a half a million equivalency credentials in 1992.³

At the undergraduate level, the two most common credentials are the associate's and bachelor's degrees. The number of associate's degrees, many of which are in occupationally specific fields, increased moderately during the 1980s after a period of rapid growth during the 1970s. In 1992, over 500,000 associate's degrees were awarded—26 percent more than in 1980 and 11 percent more than in 1985. The number of bachelor's degrees awarded also grew throughout the 1980s. In 1992, colleges and universities awarded 1.1 million bachelor's degrees—22 percent more than in 1980 (table 37-1).

At the graduate level, master's degrees were the most numerous type of degree awarded. In 1992, there were almost 353,000 awarded, in contrast to 74,000 first-professional degrees and 41,000 doctor's degrees. The distribution of type of degrees changed somewhat during the last half of the 1980s. Following years of negative or little growth, the number of doctor's degrees awarded rose 23 percent between 1985 and 1992.

Conversely, after a long period of growth, the number of first-professional degrees awarded fell between 1985 and 1988, was stable through 1990, and then rose 4 percent between 1990 and 1992 (table 37-1). The number of master's degrees awarded was 18 percent larger in 1992 than in 1980; the number declined 5 percent between 1980 and 1984, and then increased each year after 1984.

The fields in which degrees were awarded have shifted several times over the past two decades. Since the mid-1980s, there has been a reversal of some of the earlier trends. In particular, the number of degrees conferred in the humanities, social/behavioral sciences, computer science, and business management have increased while the number conferred in physical sciences, life sciences, and engineering have decreased (*Indicator 39*). The number of bachelor's degrees earned in science and engineering peaked in the mid-1980s, but then fell in the late 1980s and early 1990s. The number of master's degrees earned in science and engineering increased throughout the 1980s and has remained fairly stable in the early 1990s, while the number of doctor's degrees conferred has been increasing steadily since 1983 (*Indicator 38*).

Elementary and secondary school enrollment

- ◆ From 1984 to 1994, total public school enrollment rose 13 percent, after falling 15 percent between 1970 and 1984; public schools continue to enroll almost 9 out of 10 children.
- ◆ Total private school enrollment rose 6 percent between 1970 and 1984; between 1984 and 1994, private school enrollment decreased 2 percent.
- ◆ Total public school enrollment is projected to rise from 45 million in 1995 to 49.7 million by 2005, an increase of 10 percent. During the same period, total private school enrollment is expected to increase 9 percent, rising from 5.7 million to 6.2 million.
- ◆ Between 1970 and 1993, the share of total public school enrollment increased in the South and West, while it declined in the Northeast and the Midwest.

School enrollment is one measure of the size of the education system and of the demand for teachers, buildings, and other resources. Past trends and projected future changes in the composition of enrollment across levels of education and regions of the country, as well as between public and private schools, provide an indication of the types of teachers and other resources required. Elementary and secondary school enrollment is determined primarily by demographics, such as birth rates and immigration.

Elementary and secondary school enrollment in thousands, by control and level of school, with projections: Selected years, fall 1970 to fall 2005

College and university enrollment, by type and control of institution

- ◆ Total enrollment in public 4-year institutions increased 13 percent between 1981 and 1993. Over the same period, total enrollment in private 4-year institutions increased 16 percent.
- ◆ Enrollment in public 2-year institutions fell between 1982 and 1985. However, between 1985 and 1992, it increased annually, with the largest growth occurring between 1990 and 1991. Enrollment fell slightly again between 1992 and 1993.
- ◆ The distribution of total enrollment between public and private institutions has changed little over the last two decades. Public institutions continue to enroll nearly 8 out of every 10 students.
- ◆ Within the public sector, enrollment in 2-year institutions grew faster than it did in 4-year institutions during the late 1980s and early 1990s. As a result, 2-year public institutions increased their share of enrollment from 35 to 37 percent between 1985 and 1993.

Colleges and universities offering 2- and 4-year programs under public and private control address somewhat different student needs. Fluctuations in enrollments may indicate, among other things, changes in student interest in the various kinds of services offered, changes in the cost of attendance, and changes in the availability of student financial aid.

Index of total enrollment in higher education, by type and control of institution: Fall 1972-93

Fall of year	Index of enrollment (1981=100)				Percentage of enrollment

Degrees conferred, by level

- ◆ In 1992, the number of associate's, bachelor's, master's, and doctor's degrees awarded all reached their highest levels to date despite a decline in the number of high school diplomas and GED credentials awarded during most of the period since 1979.
- ◆ Following years of decline or little growth, the number of doctor's degrees conferred rose 23 percent between 1985 and 1992.
- ◆ The number of master's degrees conferred fell between 1977 and 1984 but increased each year after that, rising 24 percent between 1984 and 1992.
- ◆ After some period of decline in the mid-1980s, the number of both associate's and first-professional degrees grew between 1988 and 1992, 16 and 5 percent, respectively.

Trends in the number of degrees conferred, by degree levels, provide clues to changes in the productivity of the nation's higher education system, the allocation of resources within the system, and the level of trained individuals within society. Viewed in relation to the eligible population—for example, the number of high school graduates—the data show whether degrees conferred have lagged behind or exceeded growth in that population.

Index of the number of degrees conferred, by degree level and the number of high school completions (1981=100): Academic years ending 1971-92

Academic year ending	Associate's degrees	Bachelor's degrees	Master's degrees	Doctor's degrees	First-professional degrees ¹	High school diplomas and GED recipients ²

Associate's and bachelor's degrees and high school completions

Advanced degrees

NOTE: High school completers are the graduates of regular public and private day school programs and the recipients of GED credentials. Data for GED recipients are not available before 1974.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, tables 99, 101, and 234 (based on IPEDS/HEGIS surveys of degrees conferred and Common Core of Data; American Council on Education, annual GED surveys).

Science and engineering degrees conferred

- ◆ The number of bachelor's degrees earned in the science and engineering fields peaked in the mid-1980s, representing 22 percent of the total number of bachelor's degrees conferred in 1986. Since then, the number of science and engineering degrees conferred has fallen, reaching 16 percent of total bachelor's degrees conferred in 1992 (see supplemental table 38-2).
- ◆ The number of science and engineering master's and doctor's degrees conferred grew faster than the total number of master's and doctor's degrees between 1981 and 1992. However, in 1992, science and engineering master's and doctor's degrees made up approximately the same percentage of total degrees as they did in 1971 (see supplemental table 38-2).
- ◆ The percentage of master's degrees conferred in the natural sciences and engineering to foreign students rose sharply from 16 percent in 1977 to 30 percent in 1992. The percentage of doctor's degrees conferred in the same fields rose from 19 percent in 1977 to 43 percent in 1992 (see supplemental table 38-4).

Concerns about the nation's economic competitiveness have focused attention on the study of science and engineering in our educational institutions. Trends in science and engineering degrees are one indicator of the changing opportunities in the job market as well as the increasingly technical marketplace.

Bachelor's degrees conferred, by field of study

- ◆ After declining for several years, the number of degrees conferred in the humanities and the social and behavioral sciences has grown since the mid-1980s. Combined with business degrees, these three types of degrees have constituted half or more of all degrees conferred since 1971.
- ◆ The number of degrees earned in engineering declined 20 percent between 1986 and 1992, while the number of degrees earned in computer sciences also declined during this period by 41 percent.
- ◆ The percentage of natural science degrees dropped from about 10 percent in 1971 to less than 7 percent in 1992. A major factor in this decrease was the sharp decline in mathematics degrees between 1971 and 1981, when the number of degrees earned in mathematics decreased by more than 50 percent (see supplemental table 39-3).
- ◆ Business degrees grew as a percentage of all bachelor's degrees between 1971 and 1988, when they reached a peak of 24 percent. Since then, their share of total degrees has slowly fallen (see supplemental table 39-3).

Changing opportunities within the job market affect the fields in which students choose to major. In turn, student choices of major affect the demand for courses and faculty, as well as the supply of new graduates in different fields. Trends in the number and proportion of bachelor's degrees conferred in different fields help to identify these changing conditions.

Index of the number of bachelors' degrees conferred and the percentage of total bachelor's degrees conferred, by field of study: Selected academic years ending 1971-92

*Climate, Classrooms, and Diversity in
Educational Institutions*

The quality of a student's education is reflected not only in the subject areas taught in school, but also in the learning environment schools provide and in the importance attached to education outside of school. A school's learning environment may be enhanced by features such as high achievement standards, opportunities to learn, programs for special populations, a safe environment, and involved parents. However, these features are too numerous to be adequately covered by a few indicators, and national data on many aspects of interest are lacking. Therefore, the indicators in this section must be viewed as only a small sampling of the indicators necessary to fully describe the learning environment of students.

Diversity of Students

Racial and ethnic diversity can bring both cultural variation and special needs to the schools. In 1993, Hispanic children ranged from 5 percent of children in public schools in nonmetropolitan areas to 22 percent of children in public schools in central cities. Black children ranged from 10 percent of students in private schools to 33 percent of children in public schools in central cities. Even though little change has occurred since 1970 in the of students in central city public schools who are black, the proportion of students who are Hispanic has been increasing in all schools (*Indicator 40*). Together, black and Hispanic students make up the majority of public school students in central cities.

Higher education institutions are less diverse than public elementary and secondary schools for two reasons: minorities make up a smaller percentage of the total population at the higher ages; and minorities, with the exception of Asians, are less likely than whites to enroll in higher education. However, the diversity of students on college campuses has been growing. For instance, the percentage of college students who are minority increased from 15 percent in 1976 to 22 percent in 1992 (*Indicator 49*). Blacks accounted for nearly 10 percent of the enrollment at colleges and universities in 1992, Hispanics 7 percent, Asians 5 percent, and American Indians 1 percent. Minorities make up a smaller percentage of the total enrollment in 4-year than in 2-year higher education institutions.

Classrooms

Programs and services offered by schools are a function not only of the needs of the students but

also of the resources available to that school. A higher percentage of fourth-grade students in public compared to private schools were in schools that offered specialized programs targeted toward children with unique needs. For example, 52 percent of fourth-grade public school students were in schools that offered English as a second language compared to 14 percent of private school students. Similarly, 92 percent of public school fourth-graders were in schools that offered handicapped programs compared to 25 percent of private school students. Higher percentages of students in public versus private schools were in schools that offered gifted programs, medical care, and remedial classes, regardless of age (*Indicator 41*).

One aspect of the quality of a student's higher education is the experience and expertise of the faculty with whom a student has contact. Courses in colleges and universities are taught by faculty ranging from instructors to full professors who are likely to have a wide range of experience and expertise. For these reasons, it is useful to consider what percentage of a student's classroom exposure is to senior faculty (full and associate professors). At research institutions, about two-thirds of a student's classroom exposure to faculty is with senior faculty, and it is closer to one-half at doctoral, comprehensive, and liberal arts institutions (*Indicator 50*). However, it is also important to consider the size of the classes in which this exposure takes place. Only 5 percent of lower division classes at liberal arts institutions have more than 50 students compared to 33 percent at research institutions (table 50-1).

Climate

The learning climate both reflects and influences the behavior of students and is affected by events within and outside of the school. Students must be physically present at school in order to learn, so tardiness, absenteeism, and mobility can detract from learning. Violence and crime in schools, as well as exposure to drugs and alcohol, can also negatively affect the learning environment. Additionally, the extent to which parents are involved in their children's education can influence the likelihood that their children will be successful in school. Extracurricular activities and outside employment can also affect a student's education, both positively and negatively.

The amount of time students spend in school is important for learning. Not all students, however,

make it to school every day. For example, students in public high schools were more likely than students in public elementary or middle schools to be absent from school. (Average daily school absentee rates were 8 percent for high schools, 5 percent for elementary schools, and 7 percent for middle schools.) Public high schools with a large percentage of students eligible for free lunch had higher absenteeism rates, and, in general, absenteeism was a greater problem in public central city schools (*Indicator 45*).

High mobility can also be detrimental to learning. Students who change schools are often at a higher risk of being retained in grade. Thirty-one percent of the eighth-graders in 1988 were affected by two or more school changes for reasons other than grade promotion between first grade and the middle of eighth grade (*Indicator 46*). Students from low income and non-two parent families were more likely than students from other families to change schools frequently. Violence in and around schools directly affects educators and students and can reduce school effectiveness and inhibit students' learning. The most common form of victimization at school, theft, was reported by 41 percent of 1993 seniors. The rate of violence does not seem to be increasing, as little change occurred in the student victimization rates for seniors between 1976 and 1993. Rates did not vary for blacks and whites, except that a higher percentage of black than white seniors reported being threatened or injured with a weapon at school (*Indicator 47*).

Drugs and alcohol affect the climate of the school by interfering with the learning process. In-school drug and alcohol use has fallen dramatically over the past decade. For example, in 1980, 21 percent of seniors reported having used marijuana at school during the previous year, compared to 6 percent in 1993 (table 48-3). Alcohol was reported to have been used during the previous year by 76 percent of seniors in 1993, down from 85 percent in 1976. Students were more likely to encounter someone trying to sell them drugs at school in public schools and in public urban and suburban schools than in private schools or public rural schools (*Indicator 48*).

Teachers, education researchers, and policymakers advocate strong parent involvement in the education of their children. One method that schools use to build family-school partnerships is to contact the parents. Parents of 12th-grade students reported that they were more likely to be contacted by school personnel regarding the academic performance of

their child than about their child's behavior (*Indicator 44*). Parents who had bachelor's degrees or higher, whose child attended private school, or whose child's achievement test scores were in the highest quartile were more likely than other parents to be contacted by school personnel about volunteering in school. Parents of students attending low poverty schools were generally more likely than other parents to be contacted concerning their child's academic performance and academic program.

In addition to developing the academic skills of students, schools promote students' social and emotional development through various means including extracurricular activities. Seventy-eight percent of high school seniors in 1992 participated in at least one type of extracurricular activity (*Indicator 43*). A large percentage of students were active in varsity sports (41 percent); fewer were in school plays, musicals, service clubs, or government (14 to 15 percent). Seniors from families in the highest socioeconomic quartile were more likely than those from lower quartiles to participate in all types of extracurricular activities, with the exception of school vocational clubs. Whites were more likely than blacks to be involved in a school play or musical, the yearbook or newspaper, or in academic clubs. In addition, white seniors were more likely than Hispanic seniors to participate in at least one extracurricular activity (84 versus 78 percent).

Students spend more time outside of school than in school, so their use of time outside of school has important consequences for their learning. In addition to participating in extracurricular activities, many students hold jobs. In 1992, about 30 percent of high school students were employed, and 11 percent reported working 20 or more hours per week (*Indicator 49*, Condition of Education 1994). An even greater percentage of students held a job while in college. In 1993, almost half of all full-time college students and 85 percent of part-time students were employed (*Indicator 51* and table 51-3). Employment among full-time college students has increased from 34 percent in 1970 to 46 percent in 1993. Full-time college students from high income families are less likely to be employed or to work as many hours as their lower income classmates. While a job or related activity could take time away from a student's studies, it may also provide the student with an education that cannot be obtained inside a classroom.

Racial and ethnic distribution of elementary and secondary students

- ◆ Since 1970, approximately one out of every three students in central city public schools has been black. In 1993, 10 percent of the students in metropolitan-area public schools outside of central cities were black, up from 6 percent in 1970.
- ◆ In 1993, 2 out of every 10 students in central city public schools were Hispanic, up from 1 in 10 in 1972.
- ◆ Since 1981, black and Hispanic students have made up the majority of public school students in central cities (see supplemental table 40-1).
- ◆ In 1993, 10 percent of students in private schools were black and 7 percent were Hispanic, up from 5 percent in 1972 in each case.

Changes in the racial/ethnic composition of students may contribute to a greater degree of heterogeneity of language and culture in our nation's schools. While a variety of backgrounds and interests of students can enhance the learning environment, it can also create new or increased challenges for the schools. Many minority students come from poor or non-English language backgrounds and may be at greater risk of not succeeding in school than other children.

Percentage of students in grades 1-12 who are black and Hispanic, by control of school and metropolitan status: 1970-93

Year	Black					Hispanic

Programs and services offered by schools

- ◆ During school year 1993–94, public school students were more likely than private school students to have available to them certain programs for students with special needs—bilingual education, English as a second language, programs for the handicapped or the gifted and talented, and diagnostic and prescriptive services.

As schools undertake to serve increasingly diverse student bodies, both the content of the curriculum and the scope of noncurricular activities have changed. The programs and services that a particular school offers today are a function of not only the needs of the students, but also the resources available to that school. Differences in offerings across schools provide information as to how educational resources are being employed.

- ◆ Fourth-graders in public schools with a low poverty level (5 percent or less receiving free or reduced-price lunch) were more likely to have programs for the gifted and talented, diagnostic and prescriptive services, and extended day programs in their schools than fourth-graders in public schools with a high level of student poverty (more than 40 percent receiving free or reduced-price lunch).
- ◆ Public school fourth-graders in rural areas were more likely to have remedial math and reading programs in their schools, but were less likely to have an extended day program available than their counterparts in central cities or the urban fringe/large town (see supplemental table 41-1).
- ◆ The percentage of public school students who have various programs and services available to them varies widely by state. For example, less than 25 percent of students in Michigan and Tennessee attend schools offering medical health care services, compared to more than 80 percent of students in Delaware, New Hampshire, and New Jersey (see supplemental table 41-4).

Percentage of fourth-grade students in schools offering various programs and services, by selected school characteristics: School year 1993–94

School characteristics	Bilingual education	English as a second language	Remedial reading	Remedial math	Programs for the handicapped	Programs for the gifted and talented	Diagnostic and prescriptive services	Extended day	Medical health care services
Public schools									
All fourth-grade students	23.2	51.9	86.4	61.0	91.5	77.9	82.7	40.8	56.9

Education of students with disabilities

- ◆ The number of students participating in federal programs for children with disabilities increased each year between 1977 and 1993, despite a decrease in elementary and secondary enrollment during the late 1970s and mid-1980s (see supplemental table 42-1).
- ◆ In 1993, students with disabilities receiving services in federal programs equaled nearly 12 percent of all students enrolled in grades K-12.
- ◆ The percentage of disabled students identified as having learning disabilities rose 24 percentage points (from 22 to 46 percent) between 1977 and 1993, while the proportion identified as mentally retarded or with speech or language impairments each fell 16 percentage points (from 26 to 10 percent and from 35 to 19 percent of the total, respectively).
- ◆ During the 1991-92 school year, 95 percent of students with disabilities were taught in regular school buildings. Of these students, 95 percent of those with speech or language impairments were taught in regular classrooms and/or resource rooms compared to 12 percent of deaf-blind students. Fifty-nine percent of mentally retarded students were taught in separate classrooms in regular school buildings compared to 4 percent of students with speech or language impairments (see supplemental table 42-6).

The Individuals with Disabilities Education Act (IDEA) mandates that all children have available to them a free and appropriate education designed to meet their unique needs. Changes in the number and distribution of students with disabilities affect the level of effort required of educators and policymakers to comply with the current law and help them to forecast the need for future resources.

Children from birth to age 21 served in federally supported programs for students with disabilities, by type of disability: Selected school years ending 1977-93

Type of disability	1977	1979	1981	1983	1985	1987	1989	1991	1993

Extracurricular activities

- ◆ Almost 83 percent of high school seniors in 1992 participated in at least one extracurricular activity. The most popular activity was varsity sports, with 36 percent of students participating.
- ◆ Females were more likely than males to participate in all extracurricular activities with the exception of sports.
- ◆ Participation in any extracurricular activity was relatively similar across racial/ethnic groups. However, blacks were more likely to be involved in school vocational clubs than whites, Hispanics, and Asians, while Asians were more likely than both blacks and Hispanics to be involved in academic clubs.
- ◆ Seniors in the highest socioeconomic quartile were more likely than students from the lower quartiles to participate in most extracurricular activities with the exception of school vocational clubs—students from the lowest quartile were more likely to belong to these organizations.
- ◆ Seniors' participation in extracurricular activities is about the same regardless of the poverty level or minority enrollment of the schools they attend (see supplemental table 43-1).

Students spend a majority of their time outside of the classroom. How this time is spent may be an indication of the students' growth and opportunities available to them. Participation in extracurricular activities, for example, may affect academic performance, attachment to school, and social development. Almost every high school in the U.S. offers some type of extracurricular activity, such as music, academic clubs, and sports. These activities provide opportunities for students to learn the values of teamwork, a channel for reinforcing skills, and the opportunity to apply academic skills in other arenas as a part of a well-rounded education.

Percentage of high school seniors participating in extracurricular activities, by activity and selected characteristics: 1992

Characteristic	Extracurricular activity

SES quartile ²										
Lowest	76.3	29.2	24.8	17.6	11.4	14.3	18.7	11.0	8.4	24.8
Middle	81.9	34.2	28.8	19.6	14.8	16.9	24.1	14.7	12.5	19.6
Highest	89.3	43.9	32.5	22.0	19.4	25.1	31.1	19.8	19.6	9.9

¹ Any activity is a measure of the percentage of students who reported that they had participated in at least one of the above listed activities during the school year.

² SES quartiles provide a relative measure of the socioeconomic status of families. The middle two quartiles were collapsed, creating a three-level SES scale with the values "lowest" (lowest quartile), "middle" (the two middle quartiles), and "highest" (highest quartile). See Glossary for further explanation.

Types of contact between parents and school personnel

- ◆ Parents of 12th-grade students reported that they were more likely to be contacted by school personnel regarding the academic performance of their child than about their child's behavior.
- ◆ Parents of seniors in private schools were more likely than their counterparts in public schools to be called to request volunteer services or to discuss their child's post-high school plans, while parents of public high school seniors were more likely to be contacted about their child's attendance.
- ◆ Parents of white seniors were more likely than those of black, Hispanic, or Asian seniors to be asked to volunteer at school. Black parents were more likely than white or Hispanic parents to be contacted by school personnel to inform them about helping their child with school work (see supplemental table 44-1).
- ◆ Parents of seniors in schools with 41 percent or more of students receiving free or reduced-price lunch were more likely than parents of seniors in schools with less than 5 percent of students receiving free or reduced-price lunch to be contacted regarding their child's academic performance or academic program. Parents in rural schools were the least likely to be contacted about their child's attendance, and parents in urban schools were the least likely to be contacted by school personnel requesting parent volunteers (see supplemental table 44-3).
- ◆ Parents who had a bachelor's degree or higher or whose child's achievement test scores were in the highest quartile were more likely to be called by school personnel regarding their child's post-high school plans and to be asked to volunteer at school than were other parents (see supplemental tables 44-2 and 44-4).

When school personnel and parents communicate, they establish a stronger learning environment for the student both at home and at school. Schools contact parents for many reasons, including when their child is experiencing academic or behavioral difficulties, when the teacher wishes to discuss future plans for the child, or when the school is looking for parent volunteers. It is important to determine whether parents are being contacted only when there is a problem at school, or if school personnel are striving to develop a strong line of communication with the parents.

Percentage of 12th-grade students whose parents reported that school personnel contacted them at least once during the current school year, by percent of students receiving free or reduced-price lunch in public schools, control of school, and reason for contact: 1992

Reason school personnel contacted parents	Total	Percent of students receiving free or reduced-price lunch in public schools				Control of school		
		0-5%	6-20%	21-41%	41+%	Public	Catholic	Other private

Student absenteeism and tardiness

◆ In 1991, the student absentee rate increased with school level and was generally greater in public central city schools.

◆ An average of 8 percent of the students in public high schools were absent on a typical day (12 percent in central cities). Forty-four percent of central city public high school teachers reported that student absenteeism was a serious problem in their schools.

An important aspect of students' access to education is the amount of time actually spent in the classroom. When students are absent from school, arrive late, or cut class, they forgo opportunities to learn. Furthermore, when students disrupt classes by being late or frequently absent, they interfere with other students' opportunities to learn. And, maybe most importantly, the habits of consistent and on-time attendance are habits that will serve young people well in their future work lives.

◆ Public high schools with more than 40 percent of their students eligible for free or reduced lunches had a higher absentee rate (10 percent) than those with lower percentages of eligible students, which had absentee rates of 7 to 8 percent.

◆ In central city public high schools with more than 40 percent of the students eligible for free or reduced lunches, 55 percent of the teachers thought that absenteeism was a serious problem in their school, and 49 percent thought that tardiness was a serious problem. Thirty-six percent considered cutting class a serious problem (see supplemental table 45-2).

Student mobility*

- ◆ Thirty-one percent of the eighth-grade class of 1988 changed schools two or more times after entering first grade and before the middle of eighth grade, and 10 percent changed schools two or more times between the middle of eighth grade and spring 1992.
- ◆ White students were less likely to move two or more times after entering first grade and before the middle of eighth grade than were Asians. Between the middle of eighth grade and spring 1992, white students changed schools less frequently than did either Hispanics or blacks.
- ◆ Students who lived with their mother and father during the eighth grade were less likely to have changed schools two or more times either between first grade and the middle of eighth grade or between the middle of eighth grade and spring 1992 than were students living in other types of families.
- ◆ Students in low income families (under \$10,000) were more likely to change schools two or more times after entering first grade and before the middle of eighth grade than were students whose annual family income equaled or exceeded \$20,000.

Students change schools for academic, personal, and family-related reasons. Those who make frequent school changes can experience inappropriate placement in a new school, lack of continuity of lesson content, disruptions in social ties, and feelings of alienation. Teachers may also find it difficult to identify and meet the academic and social needs of the highly mobile student.

Percentage of the eighth-grade class of 1988 who changed schools between entering first grade and the middle of eighth grade and between the middle of eighth grade and spring 1992, by selected background characteristics

Background characteristics in 1988	Number of school changes after entering first grade and before the middle of eighth grade		Number of school changes between the middle of eighth grade and Spring 1992	
	Less than 2	2 or more	Less than 2	2 or more

Crime in the schools

- ◆ Victimization rates of high school seniors changed little between 1976 and 1993, with the exception of a slight increase in the percentage of students who reported being threatened both with and without a weapon. The most common type of victimization reported by high school seniors in 1993 was having something stolen (41 percent) (see supplemental table 47-1).

Violence in and around schools directly affects educators and students by reducing school effectiveness and inhibiting students' learning. Additionally, unsafe school environments may place students who are already at risk of school failure for other reasons in further jeopardy. In recent years, educators and policymakers have voiced growing concern about possible increases in the incidences of school-related criminal behavior. Studying trends in victimization rates provides a picture of the safety of today's schools.

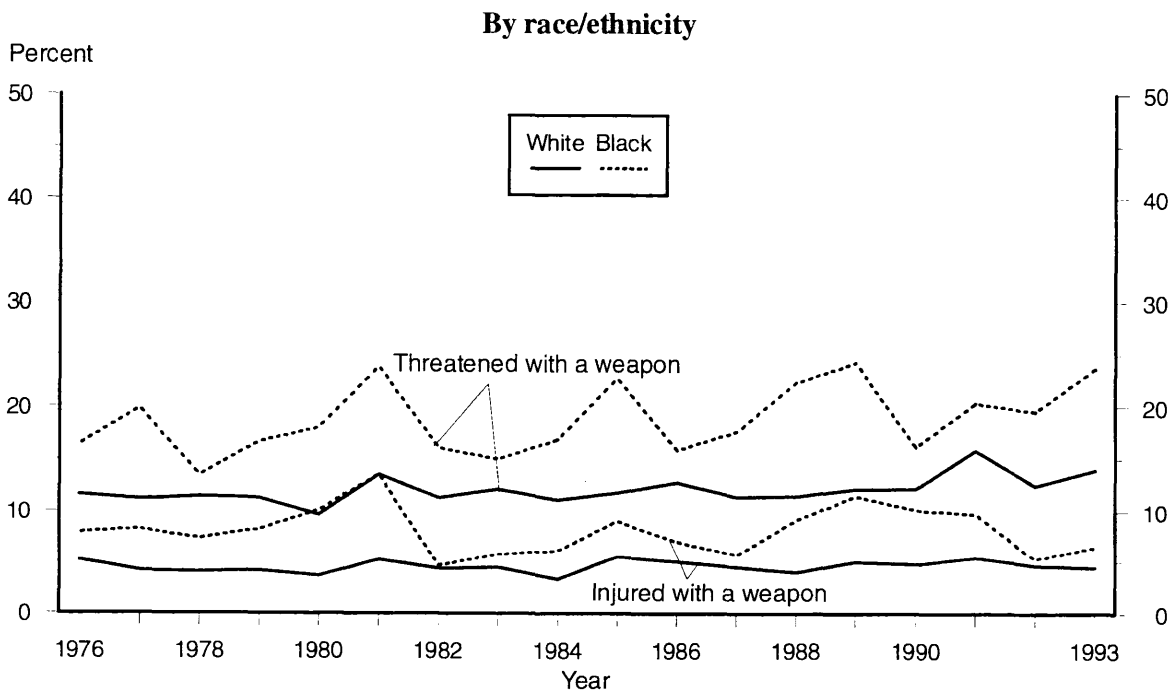

- ◆ Black and white high school seniors were about equally likely to report being victimized at school, except that blacks were more likely than whites to have been threatened or injured with a weapon. Twenty-four percent of black high school seniors reported being threatened with a weapon in 1993 compared to 14 percent of white seniors.
- ◆ Twelfth-grade males were more likely than 12th-grade females to report that they were threatened at school and that they got into a physical fight either at school or when going to or from school (see supplemental table 47-3).
- ◆ Only about 5 percent of students attended schools equipped with metal detectors. Students attending a public school, a high school, a school located in an urban area, or a school with an enrollment above 1,000 were more likely to have metal detectors or security guards in their schools than were students attending other types of schools (see supplemental table 47-4).

Percentage of high school seniors who reported being victimized at school, by type of victimization and race/ethnicity: 1976-93

Student drug and alcohol use

◆ Drug use by high school seniors fell dramatically throughout the 1980s and early 1990s. For example, in 1994, 4 percent of seniors who report using cocaine during the previous year, down from 12 percent in 1981. Marijuana use dropped from 46 percent in 1981 to 26 percent in 1993; however, it climbed back to 31 percent in 1994.

Drugs and alcohol interfere with thinking and can reduce academic achievement. Crimes of violence may accompany or result from substance abuse. Educators and administrators need to be able to determine the scope of the drug and alcohol problem for students. The percentage of students reporting that they have been approached at school to buy drugs is an indicator of the extent to which the school environment is directly affected by the drug problem.

- ◆ While the percentage of high school seniors reporting alcohol use at any time during the previous year has decreased since 1979, it remains high. In 1993, 76 percent of high school seniors reported using alcohol in the previous year (see supplemental table 48-1).
- ◆ In 1993, 8 percent of 12th-graders and 6 percent of 8th-graders reported that they were under the influence of alcohol while at school at least 1 day in the previous month. Similar percentages (9 and 5 percent, respectively) responded that they were under the influence of marijuana or some other illicit drug while at school at least once in the past month (see supplemental table 48-2).
- ◆ Students in 8th grade in 1988 and 10th grade in 1990 who attended public schools were more likely to have had someone offer to sell them drugs at school than students in all three types of private schools. Such differences between schools became less pronounced in 1992.

Percentage of high school seniors who reported using drugs or alcohol at any time during the previous year, by type of drug: Selected school years ending 1975-94

Type of drug	1975	1978	1981	1984	1987	1990	1993	1994
Alcohol	84.8	87.7	87.0	86.0	85.7	80.6	76.0	—

Student drug and alcohol use

Percentage of high school seniors who reported using drugs or alcohol at anytime during the previous year, by type of drug: 1975-94

Percentage of students who had someone offer to sell them drugs at school during the first half of the school year, by grade and year and control of school: Spring 1988, 1990, and 1992

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Education Longitudinal Study of 1988, Base Year (1988), First Follow-up (1990), and Second Follow-up (1992) Student Surveys.

Racial and ethnic distribution of college students

- ◆ The student body at the nation's colleges and universities has become increasingly heterogeneous since the mid-1970s. Minority students increased from 15 percent of all students in 1976 to nearly 22 percent in 1992.
- ◆ Hispanics and Asians increased as a percentage of all college students throughout the period from 1976 to 1992.
- ◆ Following a period of decline, the black share of enrollment has risen since 1988 to a slightly higher level than in the mid-1970s.
- ◆ Black students accounted for nearly 10 percent of the total enrollment at colleges and universities in 1992. Hispanics made up 7 percent, Asians 5 percent, and American Indians 1 percent of enrolled students.
- ◆ At 2-year public colleges, about equal proportions of the black and Hispanic students were enrolled. At 4-year colleges, however, there were about twice as many blacks as Hispanics.

Colleges and universities seek diversity in their student bodies: variety in the backgrounds and interests of students enhances the learning environment. The racial/ethnic mix of college students is one aspect of student diversity. Variations in the racial/ethnic composition of college enrollment suggest differences in the needs, interests, and backgrounds of the student body.

Percentage of total enrollment in higher education institutions, by race/ethnicity and control and type of institution: Fall, selected years 1976-92

Fall of year and control and type of institution	White	Total minority	Minority				Nonresident alien
			Black	Hispanic	Asian/ Pacific Islander	American Indian/ Alaskan Native	
All institutions, by fall of year

Student exposure to faculty at institutions of higher education

◆ At research, doctoral, and comprehensive institutions in both 1987 and 1992, the majority of classroom exposure to faculty for students in undergraduate upper division courses and graduate courses was with senior faculty—full professors and associate professors.

An institution's most experienced faculty are its senior faculty. They have more teaching, research, and administrative experience. More contact with these faculty may enhance the quality of the learning environment for students at colleges and universities. One measure of a student's contact with senior faculty is the percentage of a student's classroom time spent with full or associate professors.

◆ At comprehensive institutions in 1992, undergraduate students in lower division courses had less classroom exposure to senior faculty than did students in upper division courses.

◆ Students in undergraduate courses at research institutions had about the same classroom exposure to senior-level faculty as did students in undergraduate courses at comprehensive and liberal arts institutions. However, for undergraduate students in classes taught by senior-level faculty, those at research institutions were more likely to be in classes of more than 50 students than those at comprehensive and liberal arts institutions (see supplemental table 50-1).

NOTE: Total student classroom hours are calculated as the number of classroom hours per week times the number of students in each course summed over all classes, as reported by faculty members. The percentages are calculated as the sum of the classroom hours spent with faculty of a particular rank divided by total student classroom hours. See supplemental note for definitions of faculty, institutions, and course divisions used in this indicator.

Percentage of classroom hours 4-year college and university students are exposed to senior faculty, by type of institution and course division: Fall 1987 and fall 1992

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Survey of Postsecondary Faculty, 1988 and 1993.

Working while in college

- ◆ Almost half (46 percent) of all 16-to-24-year-old full-time college students were employed in October 1993, and about one-fourth worked at least 20 hours per week. In addition, approximately 85 percent of 16-to-24-year-old part-time college students were employed, with 75 percent working at least 20 hours per week (see supplemental table 51-3).
- ◆ The percentage of 16-to-24-year-old full-time college students who were employed rose from 34 percent in 1970 to 47 percent in 1988, and since has remained fairly stable.
- ◆ White 16-to-24-year-old full-time college students are more likely to be employed than their black counterparts.
- ◆ Full-time college students, aged 16 to 24, from high income families were less likely to be employed than full-time college students from low or middle income families, and were also less likely to work at least 20 hours per week (see supplemental table 51-2).

Working while enrolled in college can be both beneficial and detrimental to a student's academic and labor market success. Although working during the school year leaves less time for students to concentrate on their studies or to participate in extracurricular activities, students may learn things from work experience that are not taught in the classroom. While some studies show that working long hours while in college may reduce a student's likelihood of completing college or lengthen the time it takes for those who do complete it, some employment may increase expected postgraduation wages.

*Human and Financial Resources of
Educational Institutions*

The 1980s and early 1990s have presented many fiscal challenges to schools, colleges, and universities. More than half of the states face challenges to the constitutionality of their systems of financing public elementary and secondary education. The percentage of limited-English-proficient and handicapped students is on the rise. And in postsecondary education, institutions have confronted both a declining number of new high school graduates and reduced support from state appropriations. Furthermore, calls to raise the quality of education have grown as Americans increasingly feel the competitive pressure of the global marketplace and the decline in their economic prosperity.

Financial Resources

The United States invests a substantial amount in education. One measure of this investment is revenues from public sources for a particular level of education (whether or not the institution that eventually receives the revenue is publicly controlled), divided by the number of students enrolled at that level (whether or not the institution in which they are enrolled is publicly controlled).

Per student. In 1993, revenues from public sources to support elementary and secondary education were \$5,379 per student. Public revenues for higher education in 1992 were about \$4,556 per student (*Indicator 52*).

Over time. During the post-World War II era, revenues from public sources for students in elementary and secondary schools have increased substantially every decade. These revenues increased almost fivefold between 1950 and 1993, rising from \$1,200 to \$5,400 per student (adjusted for inflation) (*Indicator 52*). This trend is likely to have been driven by many factors. For example, the education system has assumed greater responsibility in many areas, such as education of disabled students. In addition, public policy has increased spending on children from poor families and has sought to increase the quality of education of minorities to a level comparable to that of the majority. Furthermore, women are participating in more traditionally male occupations, driving up the cost of education by forcing teacher salaries to be more competitive

with other professions as women find alternative careers.

The ability of taxpayers to finance a larger education budget also increased over the decades, although it did not rise up at the same rate as public revenue per student. Between 1950 and 1993, personal income per capita increased about 250 percent, whereas public revenues per student rose almost 450 percent. It could be said that U.S. taxpayers are making more of an effort to finance elementary and secondary public education. This is reflected in the increase in the national effort index (per student revenues for elementary and secondary education from public sources as a percentage of personal income per capita) over the last four decades. Revenues per student were 14 percent of personal income per capita in 1950, and 25 percent in 1993 (*Indicator 52*). This is near the top for the G-7 industrialized democracies (*Indicator 54*).

Between districts. Some school districts receive more revenue per student than others. For instance, the wealthiest districts in terms of median household income have 15 percent more cost-of-living adjusted revenue per student than the poorest districts (*Indicator 53*).

Human Resources

The most important resource used in education is personnel. In 1991, in elementary and secondary education, there were 11 full-time-equivalent (FTE) staff per 100 students. Of these, six were classroom teachers and three were support staff, such as secretaries and bus drivers. The remaining two were principals, assistant principals, school district administrators, librarians, guidance counselors, and teacher aides (*Indicator 57, Condition of Education 1993*).

The cost of staff resources is determined not only by the number of staff employed but also by their salaries. In 1994, the average annual salary of public elementary school teachers was about \$35,800; for secondary school teachers, it was \$37,300. Teacher salaries in public schools rose between 1960 and 1972; then they fell until 1980, rose until 1992, and have been fluctuating ever since. Average beginning teacher salaries did not rise as rapidly as average teacher salaries during the 1980s, and they were \$24,700 in 1994, about the same level as two decades earlier (*Indicator 57*).

Teacher salaries are relatively low when compared to those of alternative professions that college students could pursue. There is some concern among policymakers whether this discourages the best and brightest from choosing teaching as a profession. In 1991, elementary and secondary school teachers had prose literacy skills similar to physicians, engineers, postsecondary teachers, social workers, writers and artists, financial managers, registered nurses, and sales representatives in the business and financial fields. However, their earnings were often substantially less than professionals in these other occupations (*Indicator 59*). There may be some nonpecuniary benefits of teaching that compensate teachers for the low pay.

Although it is very difficult to assess the quality of a teacher based on easily measured characteristics, many analysts argue that the education and certification of teachers are very important. How well do teachers' education's match what they are assigned to teach? Less than 5 percent of full-time teachers in public secondary schools were not certified to teach in their main assignment field in 1990-91, and one out of four did not major or minor in a subject area similar to the one they spend most of their time teaching. However, of those teachers who had an additional assignment field in 1990-91 (22 percent), about one-third were not certified to teach in that field and 55 percent had neither majored nor minored in that subject area. It would appear then that there is a mismatch between the background and teaching assignments for a significant number of teachers, especially for those who have an additional assignment field (*Indicator 58* and table 58-1).

In the last two decades, as fewer college graduates entered the teaching profession and enrollments increased in elementary and secondary schools, policymakers have become concerned about the supply of teachers. Replacing teachers who leave is the largest single factor determining the demand for additional teachers. Between the school years of 1990-91 and 1991-92, about 1 in 10 teachers left teaching. About one-third of public school teachers left for retirement, while about one-eighth of the private school teachers left for this reason. Relatively few teachers reported dissatisfaction with teaching as a career as their main reason for leaving teaching, although about twice as many secondary teachers

reported this reason as did elementary teachers, for both public and private schools (*Indicator 60*).

Higher Education Budgets

Between 1980 to 1992, average revenue per student rose at public 4-year colleges and universities. While revenue from tuition and fees rose, revenue from government sources fell. Expenditures per student at these institutions rose somewhat more than revenue per student over the same period. Expenditures for administration and student services rose more than expenditures for instruction. Although a small part of the total, expenditures for scholarships and fellowships also rose a great deal over the period at these institutions (*Indicators 55* and *56*).

At private 4-year colleges and universities, both revenue per student and expenditures per student rose more than at public institutions between 1980 and 1992. Not surprisingly, over this period, revenue from tuition and fees increased dramatically at private institutions.

At public 2-year colleges, neither revenue per student nor expenditure per student was higher in 1992 than in 1980. However, revenues from tuition and fees rose while revenue from government sources fell.

National index of public effort to fund education

- ◆ In 1993, the national index of public effort for elementary and secondary education was 25.3, a slight decrease after a 4-point increase between 1982 and 1992. The public education revenue for elementary and secondary students (in 1994 constant dollars) has risen from \$639 per student in 1930 to \$5,379 per student in 1993.
- ◆ The national effort index of public effort for higher education was 21.8 in 1992, the lowest level since 1930. However, higher education public revenues per student (in 1994 constant dollars) have been relatively stable since 1970, with the exception of a drop in the early 1980s.
- ◆ After remaining relatively stable during the 1980s, elementary and secondary public education revenue as a percentage of Gross Domestic Product (GDP) rose between 1988 and 1993, but has not rebounded to the level of the early to mid-1970s. Higher education revenue as a percentage of GDP has remained about 1 percent since the mid-1960s.

The national index of public effort is revenue raised for the education of students relative to the income of taxpayers adjusted for the number of students and number of people in the population. The numerator is revenues per student, a measure of average financial resources available for the education of each student. The denominator is personal income per capita, a measure of the taxpayer's average ability to pay. The index can be interpreted as the number of dollars of revenue raised for each student from each 100 dollars of income received by each member of the population.

National index of public effort (public education revenues per student in relation to per capita personal income), by level: Selected school years ending 1930-93

School year ending	National index		Public education revenue				Per capita personal income ¹

Public school district funding differences

- ◆ **The wealthiest districts in terms of household income have more revenue per student than the poorest districts. However, the difference is reduced from about 36 percent to about 16 percent when adjustment is made for cost-of-living.**
- ◆ **School districts with less than 5 percent of children living in poverty have more revenue per student than those with more than 25 percent. However, the difference is reduced from 27 percent to 20 percent when adjustment is made for cost-of-living. The low poverty districts receive much less of their revenue from state and federal sources than do high poverty districts (35 versus 73 percent).**
- ◆ **Districts with less than 3 percent of students receiving special education services received 7 percent less revenue per student before adjusting for cost of living but 4 percent more after adjusting, than districts with 10 percent or more special education students.**

Differences in the revenue public school districts receive have led to legal challenges of the equity of school finance in many states. Achieving equity in the allocation of resources for education requires consideration of factors such as the cost-of-living and the educational needs of children in addition to the wealth of the school district. Districts in high cost-of-living regions may have to raise more revenue to provide their employees with compensation comparable to those in low cost regions. Districts with high percentages of disabled, limited-English-proficient, and poor children may have to raise more revenue to provide education comparable to those in districts with lower percentages of these children. This indicator addresses only the effect of the first factor on measures of resource inequality.

Total revenue per student in actual dollars and dollars adjusted for cost-of-living, and revenue shares from local, state, and federal sources, by district characteristics: 1989-90

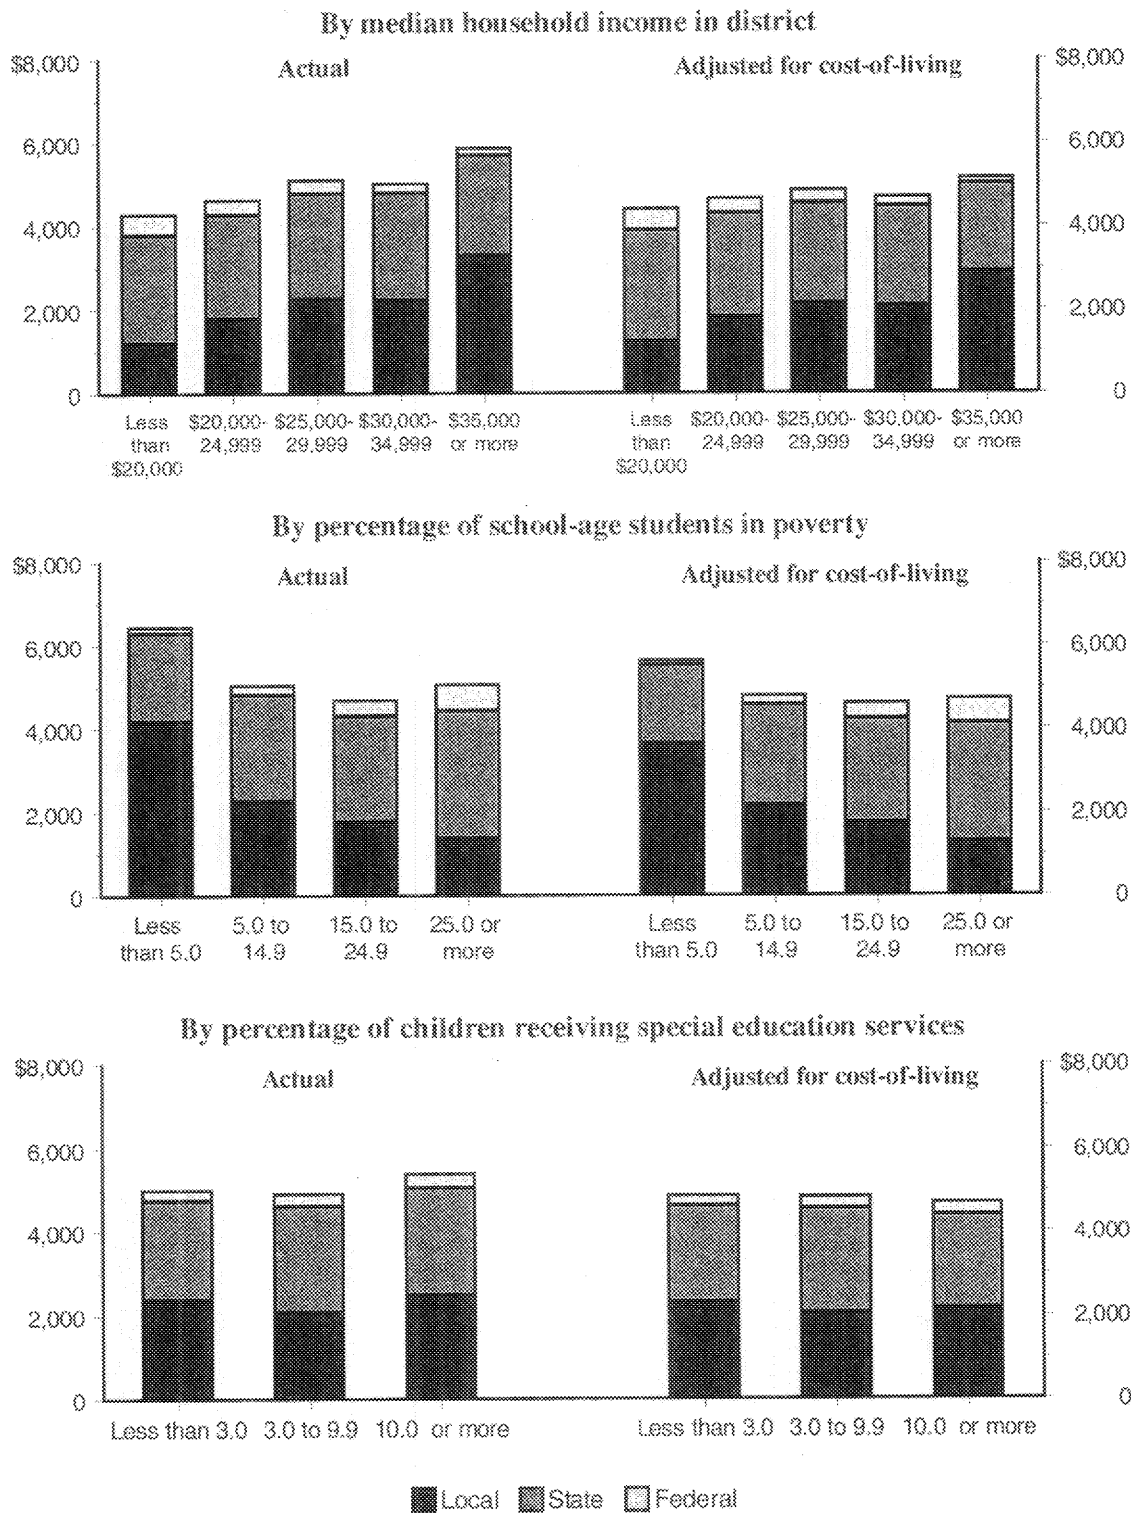

District characteristics	Percentage of enrollment	Unadjusted		Adjusted for cost of living		Revenue share

International comparisons of public expenditures for education

- ◆ Generally, among the G-7 countries, only Canada showed a higher level of public education expenditures than the United States.
- ◆ Public expenditures for the 1991–92 school year in the United States were 0.2 percent of Gross Domestic Product (GDP) for preprimary education, 3.5 percent for grades 1–12, and 1.2 percent for higher education. France and Italy spent a larger fraction for preprimary education, while the former West Germany spent the same fraction as the United States. Only Canada and the United Kingdom expended a larger fraction than the United States for 1st–12th grade education and only Canada expended more for higher education.
- ◆ In grades 1–12, public expenditures per student in the G-7 countries ranged from \$2,707 in Japan to \$4,935 in Canada and \$4,909 in the United States. In higher education, public expenditures ranged from \$2,358 in Japan to \$9,829 in Canada and \$6,984 in the United States.

Public education expenditures are an indication of public investment in education. In the United States and other countries, there are additional private expenditures for education. Three alternative measures allow examination of the magnitude of public investment in education. The first provides a measure of the fraction of a country's resources that are allocated to public education. The second provides a measure of the public investment in each child in the education system. The third provides a measure of public educational investment in each child compared to available resources per person in the country.

— Not available.

¹ Enrollment is in all institutions, public and private, and is based on headcount estimates for preprimary through 12th grade. For higher education, it is full-time-equivalent enrollment.

² Gross Domestic Product (GDP) is Gross National Product (GNP) less net property income from abroad.

³ Purchasing Power Parity (PPP) indices were used to convert other currencies to U.S. dollars. Because the fiscal year has a different starting date in different countries, within-country Consumer Price Indices (CPIs) were used to adjust the PPP indices to account for inflation.

⁴ Preprimary expenditures for Canada are grouped with elementary and secondary data.

⁵ Includes contributions to the pension funds of teachers who are civil servants. Expenditure data for publicly-supported private schools include capital expenditures.

⁶ Excludes expenditures on nursing and paramedical education.

NOTE: The fiscal year begins in different months in the above countries. See supplemental note to *Indicator 54* for an explanation of how expenditures were adjusted. See supplemental tables 54-1 through 54-5 for additional expenditure data and the supplemental note to this indicator for a discussion of these data.

Higher education expenditures per student

- ◆ Expenditures per student for instruction vary widely across types of higher education institutions. In 1992, they varied from \$2,859 at public 2-year colleges to \$12,304 at private universities.
- ◆ In 1992, expenditures for instruction varied from 33 percent of the total at private 4-year colleges to 50 percent of the total at public 2-year colleges (see supplemental table 55-2).
- ◆ Over the past 15 years, expenditures per student have increased at most types of higher education institutions, but the percentage they have increased varies widely by type of institution. For example, between 1977 and 1992, they increased by only 1 percent at public 2-year colleges, but they rose by 46 percent at private universities (see supplemental table 55-1).
- ◆ There have also been shifts in the distribution of expenditures across categories. For example, at private universities between 1977 and 1992, the share of expenditures for instruction was the same (38 percent), but it increased for administration (from 13 to 15 percent) and for scholarships and fellowships (from 8 to 11 percent), while declining for research (from 21 to 17 percent).

A majority of higher education institutional expenses are generated by faculty and staff salaries, administrative services, and institutionally-supported research. Understanding trends and variations in the mix of expenditures can provide an indication of the evolving organizational priorities of different institutional types and sectors.

Educational and general expenditures per full-time-equivalent (FTE) student (in 1994 constant dollars) of institutions of higher education, by selected expenditure categories and type of institution: Academic years ending 1977-92

Higher education revenues per student

- ◆ Revenue per full-time-equivalent (FTE) student varies substantially across types of higher education institutions. In 1992, revenue per FTE student varied from \$5,743 at public 2-year colleges to \$30,459 at private universities. Public 4-year colleges received \$11,785 and private 4-year colleges received \$14,230 per FTE student (see supplemental table 56-1).

The primary sources of revenue for institutions of higher education are tuition charged students and government appropriations. As costs rise so must revenue. If institutions of higher education ask for higher tuition or greater appropriations, they are likely to face increasing pressure from students and governments to provide higher quality education.

- ◆ With the exception of public 2-year colleges, revenue per FTE student (in 1994 constant dollars) increased at all types of higher education institutions between 1977 and 1992. At private institutions the increase over this period was particularly dramatic—from \$21,538 to \$30,459 at universities and from \$10,645 to \$14,230 at 4-year colleges (see supplemental table 56-1).
- ◆ While revenue per FTE student increased, government appropriations per FTE fell at all types of institutions between 1977 and 1992. At public institutions the decrease in appropriations was particularly large between 1990 and 1992, and even with significant increases in tuition revenue per FTE student, total revenue fell or remained steady during that period (see supplemental table 56-1).

Salaries of teachers

- ◆ Between 1980 and 1994, average overall public school teachers' salaries, adjusted for inflation, increased by 21 percent, rising from \$30,528 to \$36,495. In 1994, the average salary of public school elementary teachers was \$35,748, and the average salary of public school secondary teachers was \$37,314.
- ◆ Following a period of decline in the 1970s, public school teachers' salaries increased continuously throughout the 1980s and into the early 1990s, reaching a peak of \$36,668 in 1991. Since then, salaries have fluctuated slightly (see supplemental table 57-1).
- ◆ The average beginning salary for public school teachers increased 17 percent between 1980 and 1994, rising from \$21,028 to \$24,661.
- ◆ Percentage increases in public school teacher salaries between 1981 and 1994 ranged from a high of 54 percent in New England to a low of 10 percent in the Rocky Mountain states.

There has been much discussion about increasing the supply and quality of teachers. Education officials are experimenting with teacher salary structures, creating new career steps, career ladders, merit pay schemes, and new positions with greater authority and responsibility in order to attract and retain better teachers. In the past, such experiments have been associated with increases in teachers' salaries.

Average annual salary (in 1994 constant dollars) for public elementary and secondary school teachers: Selected school years ending 1960-94

School year ending	All teachers	Elementary teachers	Secondary teachers	Beginning teachers*
1960	\$25,227	\$24,319	\$26,647	—

Literacy of teachers

- ◆ In 1992, teachers had literacy skills similar to private-sector executives and managers, engineers, physicians, writers and artists, social workers, sales representatives, education administrators, and registered nurses. Scientists were the only professionals who had measurably higher prose literacy skills than teachers.
- ◆ Although teachers had literacy skills similar to college graduates in many other occupations, their earnings were often substantially less. However, the average number of weeks worked in 1991 was lower for teachers than for college graduates in many other occupations.

An important issue in the education reform debate is the effect of comparatively low salaries on teacher quality. Prose literacy scores are one of the best available measures of verbal ability, a factor identified by research as being associated with teacher quality. If teachers have lower prose literacy scores relative to college graduates in other occupations, this could indicate that relatively low salaries may not be attracting (or keeping) the most skilled college graduates to (in) the teaching profession. If, however, the literacy levels of teachers are no lower than those of their counterparts in other occupations, other benefits (e.g., job security, a shorter work year, the opportunity to work with children, good retirement benefits, etc.) may be more important for attracting quality teachers than salary alone.

Prose literacy scores, labor market outcomes, and other characteristics of full-time employed bachelor's degree recipients, by occupation: 1992

Occupation	Average prose literacy scores	Average annual earnings in 1991	Average weekly wage last week	Average weeks worked in 1991	Percentage with Average age	Percentage graduate degrees	Percentage female

Certification and education of full-time public secondary school teachers

- ◆ In 1991, more than 9 out of 10 full-time teachers in public secondary schools were certified to teach in their main assignment field. Seventy-seven percent of these teachers either majored or minored in this field, and 52 percent held a graduate degree in some field.
- ◆ In 1991, the percentage of teachers who majored or minored in their main assignment field varied across fields, from 62 percent for science teachers to 89 percent for social science teachers.
- ◆ Of those teachers with another assignment field in 1991, 64 percent were certified to teach in this field. This percentage was lower for those whose other teaching assignment was English and humanities (62 percent) than for those whose other assignment was mathematics and science (69 percent).
- ◆ Between 1988 and 1991, there was no change in the percentage of mathematics and science teachers who had majored or minored in their field, a slight increase in the percentage of English teachers who had done so, and a slight decrease in the percentage of arts and foreign language teachers who had majored or minored in their field.
- ◆ Teachers who taught in schools with less than 20 percent of minority students were more likely to have majored in their main assignment field and to be certified in their other assignment field than were teachers who taught in schools with minority student levels of 20 percent or higher (see supplemental table 59-1).

Concern about the quality of education in America has included an interest in the qualifications of teachers, especially in mathematics and science. Certification status and educational background are indirect measures of teacher qualifications. Whether a teacher is certified to teach in their field and either majored or minored in their field may indicate the breadth of knowledge in the subject matter they bring to the classroom.

Percentage of full-time public secondary school teachers with selected professional characteristics: School years ending 1988 and 1991

Assignment field	Certified in main assignment field		Certified in other assignment field ¹		Majored or minored in main assignment field		Graduate degree in any field	
	1987-88	1990-91	1987-88	1990-91	1987-88	1990-91	1987-88	1990-91
All teachers	93.3	95.2	66.7	64.2	79.0	76.8	51.5	52.1
English and humanities	94.2	95.6	68.0	61.5	83.4	83.0	51.6	49.4
English	93.7	96.0	69.3	64.0	76.8	81.0	51.3	50.1
Arts and foreign languages	94.8	95.1	66.1	58.4	92.5	85.6	51.9	48.5
Social science	95.0	95.9	67.7	60.7	86.8	88.8	54.7	56.0
Mathematics and science	91.8	94.6	71.4	68.8	69.5	68.7	52.7	54.1
Mathematics	92.1	94.2	74.7	71.0	75.4	74.9	50.6	51.5
Science	91.6	95.0	70.3	68.1	62.9	62.0	55.0	56.8
Education specialties ²	93.2	95.0	58.3	59.7	79.8	73.4	49.6	51.5

¹ Calculated only for those teachers who have another assignment field. Twenty-six percent of teachers reported having another assignment field in 1987-88, and 22 percent reported having another assignment field in 1990-91.

² Education specialties are elementary, home economics, physical, vocational, and special education.

NOTE: There are many ways to match major/minor field of study with teaching assignment fields. See the supplemental note for this indicator for definitions of certification and major/minor in assignment field used in this table and in supplemental tables 59-1 through 59-4. Also, see supplemental table 59-5 and the supplemental note for a stricter definition of majoring or minoring in teaching assignment field.

Attrition among full-time public and private school teachers

- ◆ More than 90 percent of public full-time teachers who taught during the 1990–91 school year returned to teach in the 1991–92 school year. The rate of private school attrition was almost double public schools', although private school attrition was still less than 10 percent of the full-time private school teacher work force.
- ◆ Full-time public school teachers were more likely to give retirement as their main reason for leaving the teaching profession than their private school counterparts; retirement accounted for one-third of the attrition from the public school work force, but less than 9 percent of the attrition from the private school work force.
- ◆ In 1991, approximately one out of every five full-time teachers left the teaching profession to pursue a career outside the field of education. Full-time secondary teachers were more likely than full-time elementary teachers to move to jobs outside of education, and full-time private school teachers were more likely than their public school counterparts to move to jobs outside of education (see supplemental table 60-1).
- ◆ Attrition was highest among full-time teachers age 60 and older and among those under 30, and was lowest among those in their 40s. Attrition of younger full-time teachers was more common in private schools than in public schools (see supplemental table 60-2).

Teacher attrition is the largest single factor determining demand for additional teachers each year in the nation's schools. Patterns of attrition vary considerably by age, reason for leaving, and other teacher characteristics. While the rate of teacher attrition is not as high today as it was in the 1960s and 1970s, it is still important to study these patterns as indicators of future demand for teachers.

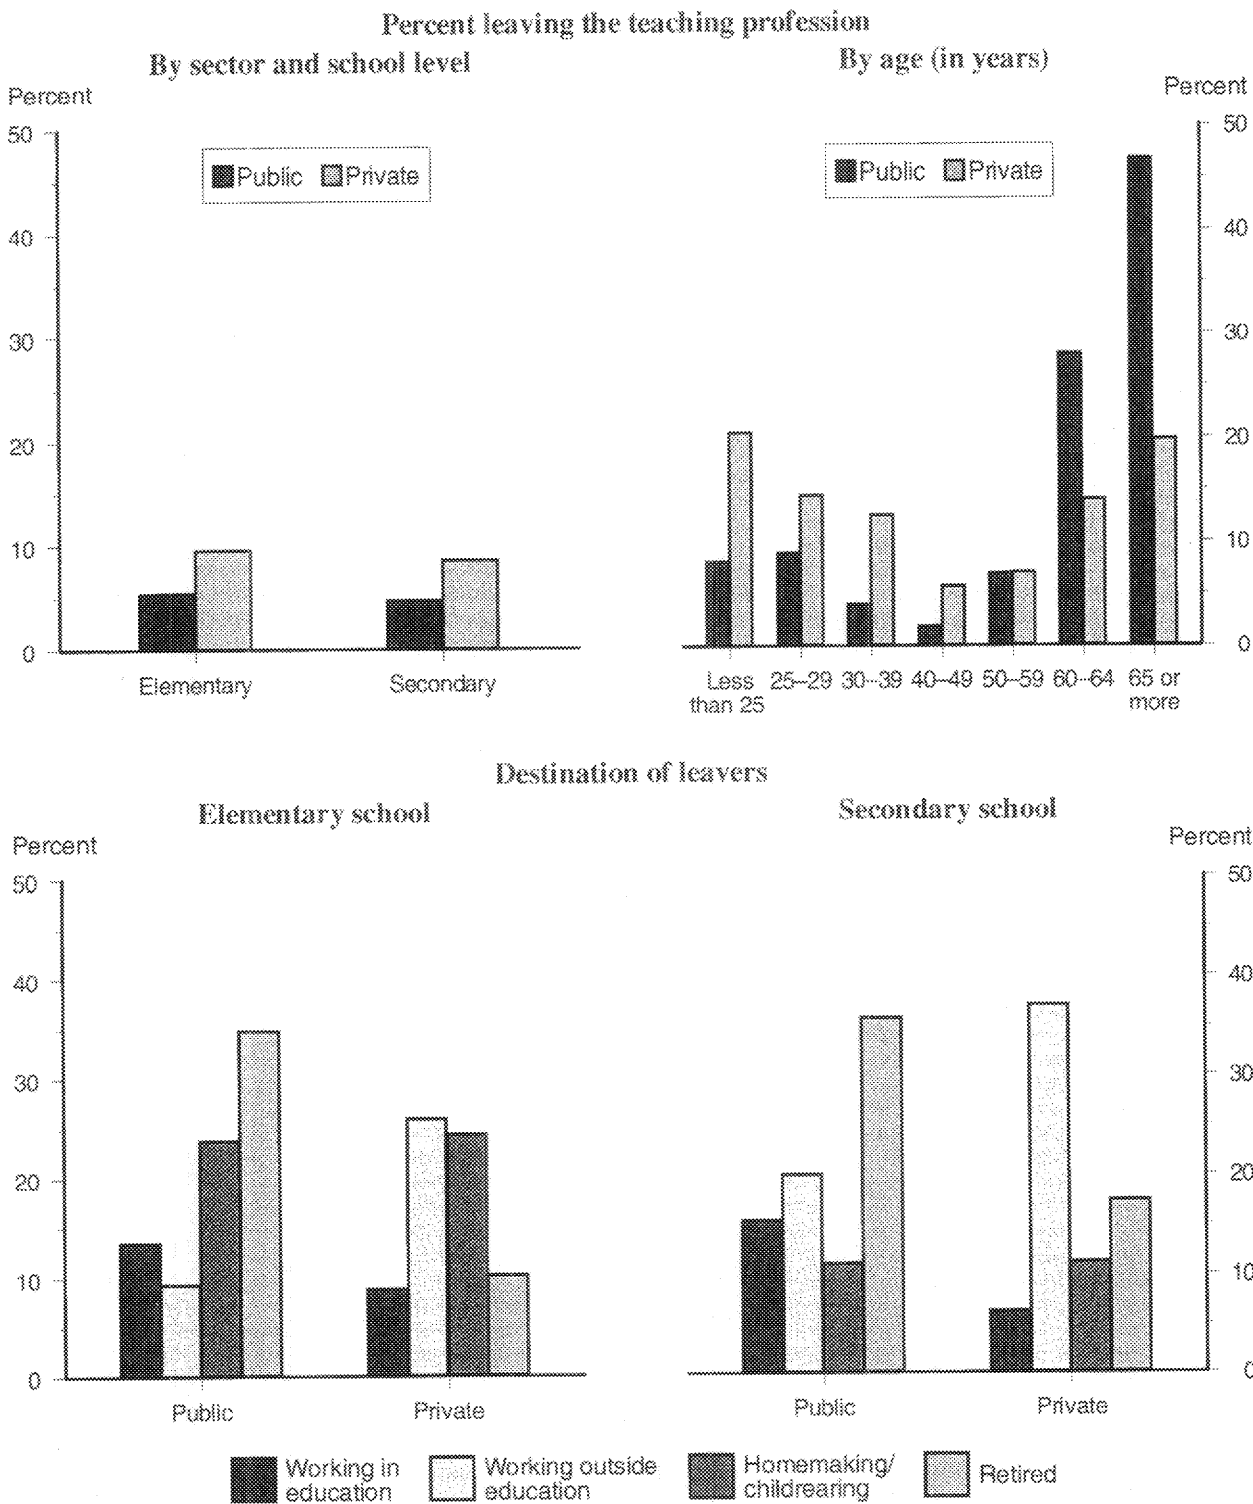

Change in teaching status of full-time teachers between the 1990–91 and 1991–92 school years, destination of leavers, and reason for leaving, by control and school level

Teaching status, destination, and reason for leaving	Public				Private			
	Total*	Full-time teachers			Total*	Full-time teachers

NOTE: In the October Current Population Survey (CPS), preschool enrollment is defined as full- and half-day enrollment in nursery school. Additional items were included on the October 1992 CPS that allow investigation of the effect of using a broader definition of preschool. Generally, enrollment increased about 11 percent for both the white and black children when the broader definition was used. For more information, see West, J., and Hausken, E., *Different approaches to counting early childhood program participation*, Proceedings of the 1994 Annual Meetings of the American Statistical Association, Social Statistics Section.

¹ Includes vocational/technical education after high school or some college.

² Includes college graduates, or 1 year or more of graduate or professional school.

³ Center-based programs include Head Start, nursery school, prekindergarten, preschool, and day care.

⁴ Only includes those students who attended kindergarten. Less than 1 percent of the surveyed population did not attend kindergarten.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1993.

Note on duration of time spent in center-based programs

In the National Household Education Survey (NHES), the duration of time spent in center-based preprimary programs is reported as the amount of time a child spends in center-based programs such as Head Start, preschool, nursery school, prekindergarten, or day care. The purpose of this measure is to show the length of time children are in center-based programs before entering kindergarten.

On the NHES questionnaire, parents are asked how long their first-graders participated in each of the following types of programs: Head Start or any nursery school, prekindergarten, preschool, or day care. On the questionnaire, Head Start is separated from the other types of center-based programs that are grouped together. Therefore, if a child was enrolled in nursery school program for 1 year and was simultaneously enrolled in day care, the parent would respond that the child was enrolled in the group of programs for 1 year.

However, if a child was enrolled in Head Start for 1 year and simultaneously enrolled in day care, the parent would respond that the child was enrolled in each program for 1 year; this, when summed together, would indicate that the child was enrolled in a center-based program for 2 years.

To eliminate the problem of inconsistent reporting of time spent in center-based preprimary programs, a decision was made to use the longest period of time a child spent in either Head Start or any of the other programs. Therefore, if a parent reported that a child was enrolled in Head Start for 1 year and was enrolled in any other program for 2 years, this child would be assigned a duration value of 2 years.

While this solution might tend to bias the duration data downwards, there is another anomaly in the data that could counteract this downward bias by biasing the data upward. The NHES sample is composed entirely of parents of first-graders who reported the center-based programs in which their children participated before first grade. This indicator, however, focuses on center-based care as an activity that occurs before kindergarten. Because day care is grouped with other forms of center-based care,

parents could be reporting the time spent in day care while the student was also enrolled in kindergarten. For example if a student attended a half-day kindergarten program and attended day care for the remainder of the day, because of the design of the questionnaire, the parent might report that the child spent an additional year in day care. Thus, while the duration data are interpreted to mean the amount of time spent in center-based care programs before entering kindergarten, there might be some overlap in the actual duration reported because of the way in which the questionnaire was designed. This problem may tend to overinflate the duration numbers.

In summary, there are two difficulties with the NHES duration data: one that would bias the numbers downward, and one that would bias the numbers upward. The hope is that neither bias is large enough to significantly distort the data.

Table 4-1 Skills and behaviors of 4-year-olds not enrolled in kindergarten, by race/ethnicity: 1993

Skills and behaviors	Total	Race/ethnicity		
		White	Black	Hispanic
		Percentage of children who can:		
Emerging literacy and numeracy ¹	11.4	12.4	11.1	6.0

Up to 5 ³	7.7	4.7	10.9	19.0
Write first name	70.3	73.7	62.9	58.8
Small motor development ⁴	71.6	71.9	76.6	61.3
Can button clothes	93.3	92.4	97.3	93.7
Hold pencil properly	93.9	93.5	96.5	93.6
Writes/draws rather than scribbles	77.9	79.2	79.2	66.9
Social and emotional development ⁵	28.8	31.3	30.4	17.8
Often has tantrums	23.1	20.0	24.2	37.1
Afraid to speak to strangers	42.6	44.4	30.0	44.0
Fidgets a lot	28.8	25.1	30.9	45.4
Has short attention span	23.1	19.8	23.9	40.6
Can be left with babysitter without fuss	90.6	94.6	86.9	75.4
Speech development ⁶	76.8	79.4	71.3	73.8
Speech understandable to strangers	92.4	93.8	88.7	91.6
Started speaking late	15.1	14.4	12.7	16.9
Stutters or stammers	7.3	5.3	11.0	13.3

¹ Percentages for emerging literacy and numeracy are based on children who can identify all colors, recognize all letters of the alphabet, count to 50 or more, and write their own name.

² Identify the colors red, yellow, blue, and green by name.

³ Includes children who cannot count at all.

⁴ Percentages for small motor development are based on children who can button clothes, hold a pencil properly, and write or draw rather than scribble.

⁵ Percentages for social and emotional development are based on children who do not have tantrums often, who are not afraid to speak to strangers, who do not fidget a lot, who do not have a short attention span, and who can be left with babysitters without a fuss.

⁶ Percentages for speech development are based on children whose speech is understandable to strangers, who did not start speaking late, and who do not stutter or stammer.

¹ Percentages for emerging literacy and numeracy are based on children who can identify all colors, recognize all letters of the alphabet, count to 50 or more, and write their own name.

² Identify the colors red, yellow, blue, and green by name.

³ Includes children who cannot count at all.

⁴ Percentages for small motor development are based on children who can button clothes, hold a pencil properly, and write or draw rather than scribble.

⁵ Percentages for social and emotional development are based on children who do not have tantrums often, who are not afraid to speak to strangers, who do not fidget a lot, who do not have a short attention span, and who can be left with babysitters without a fuss.

⁶ Percentages for speech development are based on children whose speech is understandable to strangers, who did not start speaking late, and who do not stutter or stammer.

¹ Not shown separately are non-Hispanics who are neither black nor white, but who are included in the total.

² The continuous attendance rate is the percentage of those enrolled the previous October who were enrolled again the following October. The grade level progression rate is the percentage of those enrolled two consecutive Octobers who advanced at least one grade level between one October and the next. At most grade levels, the continuous attendance rate is conceptually similar to the school persistence rate of table 6-1, but is numerically slightly different because of data used to measure grade level the previous October. However, the continuous attendance rate for grade 12 is the percentage of students in grade 12 the previous October who enrolled in college (or in grade 12 again) the following October. Similarly, the continuous attendance rate for grade 16 (4th year of college) is the percentage of students in grade 16 the previous October who enrolled in the 5th year of college (or in the 4th year again) the following October.

³ Too few sample observations for a reliable estimate.

Middle	9.9	1,764	51.9
High	2.7	190	5.6
Region			
Northeast	8.5	488	14.4
Midwest	8.8	674	19.8
South	13.0	1,424	41.9
West	12.5	809	23.8

¹ Status dropouts for 1993 are those persons ages 16-24 in October 1993 who have not completed high school and who are not enrolled at one point in time, regardless of when they dropped out.

² Not shown separately are non-Hispanics who are neither black nor white, but who are included in the total.

³ Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; middle income is the 60 percent in-between.

NOTE: Percentages may not add to 100 due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Dropout Rates in the United States: 1993*, table 8 (based on U.S. Department of Commerce, Bureau of the Census, Current Population Surveys, October 1993).

Note on persistence rates

The event dropout rate is the number of dropouts in the past twelve months (or from one October to the next) as a percentage of estimated 10th-, 11th-, and 12th-grade enrollment the previous October. The high school persistence rate is 100 minus the event dropout rate.

The high school persistence rate is defined as the proportion of students enrolled in grades 10, 11, and 12 the previous October who either enrolled again the following October or who graduated from high school. Calculating these rates requires estimating 1) the number who left high school before graduating (recent dropouts), and 2) the number of students enrolled in grades 10, 11, and 12 the previous October. Using the October Current Population Survey (CPS), the first is estimated as the number of persons 15 to 24 years old who were not enrolled during the month of the survey, but who were enrolled 1 year earlier, and who have not completed 12 years of schooling. The second is estimated by the sum of three groups of those enrolled the previous October: 1) recent dropouts, 2) those 15- to 24-year-olds enrolled in grades 11 and 12 during the survey month, and 3) those 15- to 24-year-olds who have completed 12 (or more) years of schooling and who indicate they graduated during the survey year. Those enrolled in special schools are counted as "not enrolled in regular school" and may be classified as recent dropouts if they had been enrolled in a regular school the previous October.

Change in reporting of educational attainment

From 1972 to 1991, educational attainment in the CPS is reported as "years of schooling completed." Individuals with 12 years of schooling completed are regarded as high school graduates, and those with 16 years completed as college graduates. Years of schooling completed is based on the responses to two questions: 1) "What is the highest grade . . . ever attended?" and 2) "Did . . . complete it?" For example, an individual who responds that the highest grade ever attended was the first year of college and that he/she did not complete it is regarded as having completed 12 years of schooling.

Beginning in 1992, the two questions were changed to a single question: "What is the highest level of school ... has completed or the highest degree ... has received?" The earlier high school levels are listed as single summary categories such as "9th grade, 10th grade, or 11th grade." Then, several new categories were added, including "12th grade, no diploma; H.S. graduate - diploma or equivalent; Some college - no degree." Finally, the different college degrees are listed by type, allowing for a more exact understanding of educational attainment. See note to *Indicator 22* for further discussion of the effects of this change in the measurement of educational attainment.

Table 7-1 Average undergraduate tuition, room, and board (in 1994 constant dollars) and as a percentage of the income of all families at selected family income percentiles, by control of institution: 1964-93

Year	Public institutions				Private institutions

¹ The four categories of family income correspond to the four quartiles of family income calculated separately for dependent and independent students. For dependent students, the dividing points between income categories are \$27,000; \$45,000; and \$60,000. For independent students, the dividing points are \$10,000; \$21,000; and about \$36,000.

² Includes budget allowances for student living expenses and is adjusted for less than full-time or full-year attendance.

³ Includes grants, loans, work-study earnings, and other forms of aid, such as PLUS loans to parents.

⁴ Total cost minus total aid.

⁵ Expected family contribution (EFC) is calculated using the Congressional Methodology (CM) and is dependent on family income and assets and number of siblings in college. The student is also expected to contribute from summer job earnings. However, there are exceptions and EFC can be zero.

⁶ Total cost minus total aid (excluding certain aid, such as PLUS loans to parents, that can be used to finance EFC) minus EFC. However, EFC is greater than net cost for many students, particularly those from high income families. "Additional family contribution" (AFC) is set to zero for those students. Thus, the average of AFC is greater than the difference between average net cost and average expected family contribution in the previous two columns.

NOTE: See supplemental note for further discussion of financial aid concepts and their calculation.

Supplemental note for Indicator 8

The following definitions are used in the tables of *Indicator 8* and may clarify who or what is included or excluded in the various statistics.

Family income: For dependent students, the four categories, "low income," "lower middle," "upper middle," and "high income" are calculated on the basis of the income of their parents and correspond to the four quartiles of the distribution of parental family income. For independent students, the calculation is the same but is based on the income of the student and their spouse. It is the sum of adjusted gross income for the 1991 calendar year and any untaxed income.

Dependency status: Students were considered independent of their parents for financial aid purposes if the institutional records indicated they were independent or if one of the following seven criteria were met: 1) the student was 24 years old on 12/31/92; 2) the student was a veteran; 3) the student was an orphan or a ward of the court; 4) the student had legal dependents other than a spouse; 5) the student was married and not claimed as a dependent on a parent's 1992 tax return; 6) the student was a graduate student and not claimed as a dependent on a parent's 1992 tax return; and 7) the student was single, an undergraduate, had not been claimed as a dependent on a parent's tax return for the previous 2 years, and was self-sufficient for 2 years prior to receiving any federal aid.

Tuition and fees: The actual amount of tuition charged the student for all terms attended at all institutions during the 1992-93 academic year.

Total cost: The sum of tuition, fees, and the student budget for nontuition expenses. The latter includes the cost of books and supplies, room and board, and commuting and other costs. The latter is also adjusted for students who attended less than full time for the full 1992-93 academic year. If the student was enrolled less than full time/full year, the student budget allowance for nontuition expenses was set equal to 75 percent of the allowance for full-time, full-year students during months the student attended at least half time but less than full time, and to 25 percent during months the student attended less than half time.

Grants: Total amount of all grants from federal, state, institutional, or other sources such as employer-paid tuition and National Merit Scholarships.

Net cost: Total cost (total student budget allowance, tuition and nontuition combined, adjusted for actual attendance status) minus total aid. Total aid is comprehensive and includes, for example, SLS loans (federal supplemental loans for students) and PLUS loans to parents (federal loans to parents with at least half-time dependent students) and aid received from the Veteran's administration and the Department of Defense.

Expected family contribution (EFC): Used to calculate a student's need for financial aid. The most widely used methodology during the 1992-93 academic year was the Congressional Methodology (CM). The CM EFC is the sum of two components: a student contribution, and a parent contribution. The student is expected to contribute from savings and from summer jobs. The amount the parents are expected to contribute depends on their income and assets and other children in college. The EFC variable used in this indicator was taken from the student's financial aid records if available, computed using the CM if all the needed information was available, and imputed using regression methods otherwise. This variable can be interpreted as what is a reasonable amount for the student and family to contribute from currently available resources toward the student's postsecondary education.

Additional family contribution: Equal to total cost (see above) minus total aid subject to EFC limitations minus EFC. Negative values were set to zero. Total aid subject to EFC limitations includes Pell grants, Stafford loans, federal campus-based aid, and any other grant aid. It does not include SLS and PLUS loans that may be used to finance EFC. This variable can be interpreted as the amount students and their families must finance in addition to the "expected family contribution" to meet estimated costs of attendance and student living.

Table 13-1 Explanations of levels of reading proficiency**Level 350: Learns from specialized reading materials**

Readers at this level can extend and restructure the ideas presented in specialized and complex texts. Examples include scientific materials, literary essays, and historical documents. Readers are also able to understand the links between ideas, even when those links are not explicitly stated, and to make appropriate generalizations. Performance at this level suggests the ability to synthesize and learn from specialized reading materials.

Level 300: Understands complicated information

Readers at this level can understand complicated literary and informational passages, including material about topics they study at school. They can also analyze and integrate less familiar material and provide reactions to and explanations of the text as a whole. Performance at this level suggests the ability to find, understand, summarize, and explain relatively complicated information.

Level 250: Interrelates ideas and makes generalizations

Readers at this level use intermediate skills and strategies to search for, locate, and organize the information they find in relatively lengthy passages and can recognize paraphrases of what they have read. They can also make inferences and reach generalizations about main ideas and the author's purpose from passages dealing with literature, science, and social studies. Performance at this level suggests the ability to understand specific or sequentially related information.

Level 200: Partial skills and understanding

Readers at this level can locate and identify facts from simple informational paragraphs, stories, and news articles. In addition, they can combine ideas and make inferences based on short, uncomplicated passages. Performance at this level suggests the ability to understand specific or sequentially related information.

Level 150: Simple, discrete reading tasks

Readers at this level can follow brief written directions. They can also select words, phrases, or sentences to describe a simple picture and can interpret simple written clues to identify a common object. Performance at this level suggests the ability to carry out simple, discrete reading tasks.

NOTE: This scale has a range of 0–500 with a mean of 250 and a standard deviation of 50.

¹ Modal grade is the most common grade level for students of a particular age. For example, the modal grade at age 9 is fourth grade. Nine-year-olds in fifth grade are above modal grade, and 9-year-olds in third grade are below modal grade for their age.

² Statistically significant difference from 1992.

³ Statistically significant difference from 1971.

⁴ Less than 0.5 percent.

NOTE: The modal grades are grade 4 at age 9, grade 8 at age 13, and grade 11 at age 17. The modal grade is lower for 17-year-olds because of differences in age definition and in the time of year the assessment is given, causing more students to be above the modal grade at age 17 than at any other age. For a more complete explanation, see table 13-1.

Note on NAEP cohorts

Three of the NAEP assessments, reading, math, and science, report trends in the progress of students by age. Proficiencies are reported for ages 9, 13, and 17. The modal grades for these age groups are 4th, 8th, and 11th grade. The fourth assessment, writing, is given to students in grades 4, 8, and 11, regardless of their age. In all four subjects, it would appear that the time span between the youngest and middle age/grade is greater than between the middle and oldest group. However, the way age is defined (on a calendar or fiscal year basis) and the time at which each age/grade is assessed (fall, winter, or spring) results in the same length of time (or years of schooling) between the three age groups. A discussion of this methodology follows.

Age is determined on a calendar year basis for 9- and 13-year-olds, but on a fiscal year basis for 17-year-olds. In other words, the reading, math, and science scores in 1992 represent students born in 1982 (9-year-olds), students born in 1978 (13-year-olds), and students born between October 1, 1974, and September 30, 1975 (17-year-olds). The writing scores represent students in grades 4, 8, or 11 at the time of the assessment regardless of age.

In addition to different age definitions, the time of the school year when the assessment is administered varies across age levels: 9-year-olds/4th-graders are tested in the winter; 13-year-olds/8th-graders are tested in the fall; and 17-year-olds/11th-graders are tested in the spring for all the assessments. Since 9-year-olds are tested between January and February of the year they turn 10, and 13-year-olds are tested between October and December of the year they turn 13, the 13-year-olds have had almost $3\frac{3}{4}$ more years of schooling than the 9-year-olds. Likewise, since 17-year-olds are tested between March and May, they will be between $16\frac{1}{2}$ and $17\frac{1}{2}$ at the time of the assessment (the difference is due to the age being determined on a fiscal year basis); thus, they have had about $3\frac{3}{4}$ more years of exposure to school than 13-year-olds.

These different means of determining a student's age and the various testing times have been adopted in order to measure a uniform period of growth among the three age/grade groups. Comparing age/grade cohorts over time can be more problematic, however. Nine-year-olds in 1988 generally represent the same age cohort as 13-year-olds in 1992, two points in time not quite 4 years apart. However, the 17-year-olds tested in 1992 were generally younger than the 1988 13-year-old age cohort was in 1992. Therefore, care must be taken when examining student cohorts across assessments in different years.

Table 14-1 Explanations of levels of writing task accomplishment

Level 350: Effective, coherent writing

The writing at this level provides clear complete responses to the assigned task. It tends to contain supportive details and discussion that contributed to the effectiveness of the response. This writing is also characterized by an overall unity and coherence not found at the lower levels.

Level 300: Complete, sufficient writing

Responses at this level tend to be complete and to contain sufficient information to accomplish the basic task.

Level 250: Beginning, focused, clear writing

Writing at this level tends to be more focused and clear, containing enough development and detail likely to accomplish the assigned task successfully.

Level 200: Incomplete, vague writing

The writing at this level, although clearer and more detailed than at the previous level, still tends to be vague and incomplete.

Level 150: Disjointed, unclear writing

Writing at this level tends to be too brief and disjointed to be considered a response to the task or, when longer, so vague and unclear that it was hard to understand.

NOTE: This scale has a range of 0-500, with a mean of 250 and a standard deviation of 50.

1984	13	294	67	296	220	267
1988	11	299	268	297	221	270
1990	11	295	364	292	325	270
1992	10	295	64	293	326	269

¹ Modal age is the most common age of students in a particular grade level. For example, the modal age in fourth grade is 9 years old. Ten-year-olds in fourth grade are above modal age, and 8-year-olds in fourth grade are below modal age.

² Statistically significant difference from 1992.

³ Statistically significant difference from 1984.

NOTE: The modal ages are age 9 at grade 4, age 13 at grade 8, and age 17 at grade 11. The modal age is relatively higher for 11th-graders because of differences in the time of year the test is given to the different grade levels, causing more students to be below the modal age at 11th-grade than at any other grade. For a more complete explanation, see the supplemental note to *Indicator 13*.

Table 15-1 Explanations of levels of mathematics proficiency

Level 350: Multi-step problem solving and algebra

Students at this level can apply a range of reasoning skills to solve multi-step problems. They can solve routine problems involving fractions and percents, recognize properties of basic geometric figures, and work with exponents and square roots. They can solve a variety of two-step problems using variables, identify equivalent algebraic expressions, and solve linear equations and inequalities. They are developing an understanding of functions and coordinate systems.

Level 300: Moderately complex procedures and reasoning

Students at this level are developing an understanding of number systems. They can compute with decimals, simple fractions, and commonly encountered percents. They can identify geometric figures, measure lengths and angles, and calculate areas of rectangles. These students are also able to interpret simple inequalities, evaluate formulas, and solve simple linear equations. They can find averages, make decisions on information drawn from graphs, and use logical reasoning to solve problems. They are developing the skills to operate with signed numbers, exponents, and square roots.

Level 250: Numerical operations and beginning problem solving

Students at this level have an initial understanding of the four basic operations. They are able to apply whole number addition and subtraction skills to one-step word problems and money situations. In multiplication, they can find the product of a two-digit and a one-digit number. They can also compare information from graphs and charts, and are developing an ability to analyze simple logical relations.

Level 200: Beginning skills and understandings

Students at this level have considerable understanding of two-digit numbers. They can add two-digit numbers, but are still developing an ability to regroup in subtraction. They know some basic multiplication and division facts, recognize relations among coins, can read information from charts and graphs, and use simple measurement instruments. They are developing some reasoning skills.

Level 150: Simple arithmetic facts

Students at this level know some basic addition and subtraction facts, and most can add two-digit numbers without regrouping. They recognize simple situations in which addition and subtraction apply. They also are developing rudimentary classification skills.

1992	324	3284	370	3313	36	3318

¹ Modal grade is the most common grade level for students of a particular age. For example, the modal grade at age 9 is fourth grade. Nine-year-olds in fifth grade are above modal grade, and 9-year-olds in third grade are below modal grade for their age.

² Statistically significant difference from 1992.

³ Statistically significant difference from 1973.

⁴ Less than 0.5 percent.

NOTE: The modal grades are grade 4 at age 9, grade 8 at age 13, and grade 11 at age 17. The modal grade is lower for 17-year-olds because of differences in age definition and in the time of year the assessment is given, causing more students to be above the modal grade at age 17 than at any other age. For a more complete explanation, see the supplemental note to *Indicator 13*.

Table 16-1 Explanations of levels of science proficiency**Level 350: Integrates specialized scientific information**

Students at this level can infer relationships and draw conclusions using detailed scientific knowledge from the physical sciences, particularly chemistry. They also can apply basic principles of genetics and interpret the societal implications of research in this field.

Level 300: Analyzes scientific procedures and data

Students at this level can evaluate the appropriateness of the design of an experiment. They have more detailed scientific knowledge, and the skill to apply their knowledge in interpreting information from text and graphs. These students also exhibit a growing understanding of principles from the physical sciences.

Level 250: Applies general scientific information

Students at this level can interpret data from simple tables and make inferences about the outcomes of experimental procedures. They exhibit knowledge and understanding of the life sciences, including a familiarity with some aspects of animal behavior and of ecological relationships. These students also demonstrate some knowledge of basic information from the physical sciences.

Level 200: Understands simple scientific principles

Students at this level are developing some understanding of simple scientific principles, particularly in the life sciences. For example, they exhibit some rudimentary knowledge of the structure and function of plants and animals.

Level 150: Knows everyday science facts

Students at this level know some general scientific facts of the type that could be learned from everyday experiences. They can read simple graphs, match the distinguishing characteristics of animals, and predict the operation of familiar apparatus that work according to mechanical principles.

1990	322	3260
1992	324	3263

¹ Modal grade is the most common grade level for students: fourth grade. Nine-year-olds in fifth grade are above modal their age.

² Statistically significant difference from 1992.

³ Statistically significant difference from 1977.

NOTE: The modal grades are: grade 4 at age 9, grade 8 at 17-year-olds because of differences in age definition and in above the modal grade at age 17 than at any other age. Indicator 13.

— Country did not participate at this age level.

¹ Schools in French-speaking Belgium only; students instructed in Flemish or German were excluded.

² Students in Government Native Indian schools were excluded.

³ Students in special schools for disabled students and institutions for specially talented students were excluded.

⁴ Swedish-speaking, special education, and laboratory schools were excluded.

⁵ Private schools were excluded (16 percent of 9-year-olds and 21 percent of 14-year-olds).

⁶ For 14-year-olds, 1.4 percent in evening schools were excluded.

⁷ International schools, ESF Foundation schools, schools not participating in Secondary School Places Allocation System (SSPA), and schools with class size of less than 20 were excluded.

⁸ Very small schools in remote areas and ungraded schools were excluded.

⁹ Schools where there were fewer than 5 students were excluded.

¹⁰ Private schools and schools with fewer than 5 students were excluded.

¹¹ Non-government schools were excluded.

¹² Schools for Lapps were excluded.

¹³ Schools in earthquake and insurgency areas (about 39 percent of the population) were excluded.

¹⁴ Students from schools with fewer than 10 students in the defined grade and from schools where medium of instruction was not Castilian Spanish were excluded.

¹⁵ Laboratory schools and schools controlled by the Department of Fine Arts and Culture were excluded.

¹⁶ Students in eligible schools not capable of taking the test (4.9 percent of each age group) were excluded.

¹⁷ Students attending private rural schools were excluded.

¹⁸ Students in special schools for disabled students and non-graded private schools were excluded.

— Country did not participate at this age level.

¹ Schools in French-speaking Belgium only. Students instructed in Flemish or German were excluded.

² Students in Government Native Indian schools were excluded.

³ Students in special schools for disabled students and institutions for specially talented students were excluded.

⁴ Swedish-speaking, special education, and laboratory schools were excluded.

⁵ Private schools were excluded (16 percent of 9-year-olds and 21 percent of 14-year-olds).

⁶ For 14-year-olds, 1.4 percent in evening schools were excluded.

⁷ International schools, ESF Foundation schools, schools not participating in Secondary School Places Allocation System (SSPA), and schools with class size of less than 20 were excluded.

⁸ Very small schools in remote areas and ungraded schools were excluded.

⁹ Schools where there were fewer than 5 students were excluded.

¹⁰ Schools outside of Java, Riau (Sumatra), and East Nusa Tenggara were excluded (30 percent of target population).

¹¹ Private schools and schools with fewer than 5 students were excluded.

¹² Non-government schools were excluded.

¹³ Schools for Lapps were excluded.

¹⁴ Schools in earthquake and insurgency areas (about 39 percent of the population) were excluded.

¹⁵ Students from schools with fewer than 10 students in the defined grade and from schools where medium of instruction was not Castilian Spanish were excluded.

¹⁶ Laboratory schools and schools controlled by the Department of Fine Arts and Culture were excluded.

¹⁷ Students in eligible schools not capable of taking the test (5 percent of each age group) were excluded.

¹⁸ Students attending private rural schools were excluded.

¹⁹ Students in special schools for disabled students and non-graded private schools were excluded.

NOTE: 800 is the highest score possible, and 200 is the lowest score possible on each section of the SAT. The term "college-bound seniors" refers to those students from each high school graduating class who participate in the College Board Admission Testing Program, and does not include all first-year college students nor all high school seniors.

Note on interpreting SAT test scores and the new version of the SAT

Interpreting Test Scores

According to the College Board, the Scholastic Aptitude Test (SAT) is designed to measure verbal and quantitative reasoning skills related to academic performance in college. SAT scores are statistically controlled to maintain the same meaning from year to year, and therefore useful comparisons over time can be made.¹

Since 1941, SAT scores have been expressed relative to the performance of a group of approximately 11,000 candidates who took the test in 1941.² The mean raw score of that group was given the scaled score of 500 with a standard deviation of 100. In order that scores could be compared to this reference group, a short set of common items is included in each year's forms. Each new form is then linked with a previous form through these common items, allowing the forms to be equated back to the 1941 form. Therefore, a score of 500 on any form of the SAT corresponds to the mean of the 1941 group. Likewise, a score of 600 falls one standard deviation above the mean of the 1941 group, and a score of 400 falls one standard deviation below the mean of the 1941 group.³

The decline or rise of test scores depends on many factors. Changes can involve variations in the composition of the test-takers. For example, between 1963 and 1970, a significant SAT score decline occurred. Because of a continuing increase in the proportion of high school graduates going to college over this period, the group of test-takers became progressively less selective, and this was likely a major factor in the score decline.⁴ The College Board notes that the relationship between SAT test scores and students' characteristics are "complex and interdependent."⁵ For example, educational, demographic, and socioeconomic factors might influence test scores. However, while these factors may be related, they are not necessarily causal. Moreover, changes in test scores can also be related to variations in performance among similar types of test-takers.

Standard Deviation Units

Performance on the SAT can be measured in a number of ways. Changes in standard deviation

units is one useful metric. Standard deviation units indicate how scores, on average, deviated from the mean. Since the standard deviation is measured on a *common scale* across different tests, it can also be used to compare score changes on a variety of measures.⁶

Once changes in scores across measures have been noted, the significance of these changes should be considered. Some have considered a decline of one standard deviation to be significant. This designation, however, is arbitrary.⁷ In *Investment in Learning*, Howard Bowen provides some guidelines for describing changes in standard deviation units (SDUs).⁸

Estimated changes as expressed in SDUs	Descriptive judgment
+ .75 or above	Extreme increase
+ .40 to .74	Large increase
+ .20 to .39	Moderate increase
+ .10 to .19	Small increase
-.09 to +.09	No change
-.10 to -.19	Small decline
-.20 to -.39	Moderate decline
-.40 to -.74	Large decline
-.75 or below	Extreme decline

Changes in standard deviation units are calculated using the following formula:

$$\frac{\mu_1 - \mu_2}{\sqrt{\frac{1}{2}(\sigma_1^2 + \sigma_2^2)}}$$

where μ_1 and μ_2 are the mean scores in years 1 and 2, respectively, and σ_1 and σ_2 are the standard deviations of scores in years 1 and 2, respectively.

For example, table 20-1 indicates that between 1980 and 1985, mean verbal scores increased 7 points, and between 1980 and 1987, mean mathematics scores increased 10 points.

Applying the above formula, the following standard deviation units are produced:

$$\text{Verbal: } 431-424/110.5 = +.063$$

$$\text{Math: } 476-466/119.5 = +.084$$

According to Bowen's template, the changes in standard deviation units suggest no significant change in scores during this period. Using the

same calculation, the declines in verbal and mathematics scores from 1972 to 1993 were $-.259$ and $-.050$, respectively — moderate and not significant declines.

The New Version of the SAT

A new version of the SAT, now called the Scholastic Assessment Test, was introduced in March of 1994. The SAT was divided into the SAT I: Reasoning Tests, and the SAT II: Subject Tests. The SAT I is organized into verbal and mathematics sections similar to the previous version of the SAT, while the SAT II replaces the achievement tests for specific subject areas. Scores on the mathematics section of the SAT I can be compared to those from the previous version of the test. The new mathematics section contains some grid-in (or fill-in-the-blank) items, and calculators can now be used during the test; however, otherwise relatively little has changed. Because only minor changes were made to the types of questions students must complete, scores on the new mathematics section are comparable to those from the previous test version, and the scores of the March 1994 test-takers were included in the results for the graduating class of 1994. However, the verbal test has changed significantly. The original version of the SAT contained four types of verbal items: reading comprehension, sentence completion, analogies, and antonyms. The new SAT contains only three types of verbal items: critical reading, sentence completion, and analogies. These changes do not provide subscores comparable to the previous subscores.

Therefore, the verbal scores reported for the graduating class of 1994 do not include the March test-takers who took the new version of the SAT, approximately 3 percent of all test-takers. Because the March population was excluded in 1994, the verbal scores from this year are not necessarily comparable to other years. Any student taking the SAT after March 1994 took the new version, and these scores will be reported in 1995.

* Based on revised procedures. Earlier procedures reported participants in international administration only. The later procedures included participants in international administration (including standby examinees) as well as special administrations at regional offices, Defense Activity for Non-Traditional Education Support (DANTES) for military personnel, and the Summer Institutional Testing Program (SITP). See Wah and Robinson (1990).

Note on educational attainment

The Current Population Survey, which is used for *Indicators 6, 22, 29, 30, 32*, and others, changed the questions used to determine a respondent's educational attainment beginning in 1992.

Before 1992, the questions were 1) "What is the highest grade or year of regular school ... has ever attended?" and 2) "Did ... complete the grade?" There were 19 response categories for grades 1 through 8: 1st through 4th year of high school, and 1st through 6th year of college.

If respondents attended, for example, grade 12 but did not complete it, it was assumed that they had completed grade 11. If the highest grade respondents had completed was 9, 10, or 11, they were classified as high school dropouts. If the highest grade completed was 12 or greater, they were considered to have completed high school. If it was the 4th year of college or greater, they were considered to have completed college.

Beginning in 1992, the two questions were changed to a single question: "What is the highest level of school ... has completed or the highest degree ... has received?" In the new response categories, several of the lower levels have been collapsed into a single summary category such as "1st, 2nd, 3rd, or 4th grades." At the high school level, a new category "12th grade, no diploma" was added. The biggest change was in the categories for high school completion and beyond, which are as follows:

- High school graduate—high school diploma or equivalent (for example, GED)
- Some college but no degree
- Associate's degree in college—Academic program
- Associate's degree in college—Occupational or vocational program
- Bachelor's degree (For example: BA, AB, BS)
- Master's degree (For example: MA, MS, MEng, MEd, MSW, MBA)
- Professional school degree (For example: MD, DDS, DVM, LLB, JD)
- Doctoral degree (For example: PhD, EdD)

The new question puts more emphasis on credentials received beginning at the high school level, and it puts less emphasis on the level attended or completed in college if that attendance did not lead to a credential.

These changes created some uncertainty about the comparability of measures, such as high school completion rates and college completion rates over time.

High school completion: The earlier education attainment question did not deal explicitly with high school equivalency certificates. Therefore, it is possible that a person who attended grade 10, dropped out without completing it, and later took the GED test and received a high school equivalency credential would not have been counted as a high school completer. The new question, however, explicitly treats these people as high school graduates. Since 1988, an additional question was added to the October Current Population Survey that explicitly asked respondents whether they had taken the GED. The vast majority of those who responded "yes" were classified as high school graduates using the attainment question.

The earlier education attainment question treated people who completed grade 12 as high school graduates. However, the new question added a new response category called "12th grade, no diploma," and these respondents were not treated as graduates. However, the number of people in this category has been very small. In summary, it appears that the change has had minor effects on measured high school completion rates.

College completion: With the increasing prevalence of people taking more than 4 years to finish college (i.e., receive a bachelor's degree), some analysts have worried that the college completion rate based on "4th year or higher of college completed" would overstate the bachelor's degree (or higher) completion rate. However, the college completion rates among 25- to 29-year-olds in 1992 and 1993 using the new question are very similar to the completion rates in 1990 and 1991 using the old questions. In summary, it appears that the change has had a very small effect on measured college completion rates.

Some college. With the new question, someone who attends college for only a few months should respond "Some college," but with the old questions they should have responded "Attended first year of college and did not complete it." In the past, the calculation of the percentage of the population with 1 to 3 years of college excluded these people. However, with the new question, the information to exclude them is not available, and those with only a few months of college are included in the category "Some college." So, in principle, the percentage of people with "Some college" or an associate's degree would be expected to be larger than the percentage with 1 to 3 years of college. Therefore, it does not appear useful to compare the percentage with "Some college or an associate's degree," using the new item, to the percentage who completed "1 to 3 years of college," using the old item.

Indicators 29 and 30 use labor force statistics for the civilian population and annual earnings for wage and salary workers with different levels of educational attainment. The discussion above suggests that the "high school graduate with no further education" category based on the new items is larger than before because it includes equivalency graduates but smaller than before because it excludes those who completed "12th grade, no diploma," and those with only a few months of college. The latter group is now included in the "1 to 3 years of college" category.

Nevertheless, the employment and earnings of the respondents who have been added and dropped from each category are similar; therefore, the net effect of the misclassification on employment rates and average annual earnings are likely to be minor. For this reason, it was decided that it would be useful to continue the series—that is, to compare the employment rates and average annual earnings of recent cohorts with "Some college or an associate's degree" to older cohorts who completed "1 to 3 years of college."

For further information on this issue, see Robert Kominski and Paul M. Siegel; "Measuring Education in the Current Population Survey," *Monthly Labor Review*, September 1993.

Rural/small town	3.8	82.3	2.5	42.2	2.2	22.0	11.3	19.8

¹ The fourth core subject is social studies.

² The lowest 25 percent are those with 1.8 percent or fewer and the highest 25 percent are those with 5.3 percent or more households headed by a single parent in poverty.

³ The Census Bureau defines these as households in which no members over age 13 speak English "very well," and all members over age 13 speak a language other than English at home.

⁴ The lowest 25 percent are those with median household income less than about \$24,000, and the highest 25 percent are those with median household income greater than about \$36,000.

NOTE: Estimates are weighted using district enrollment in grades 9-12. Districts with 3-year high school program requirements were excluded from the analysis. These districts comprised about 3 percent of the total. Districts that did not serve students in grades 10-12 were also excluded.

Wyoming ¹⁷	WY	0	0	1	0	1	0	0

¹ CA: One year of either foreign language or fine arts is required.

² CO: There are no state course-specific requirements, but for schools to be accredited, they must require 30 units among the core subjects and other specified subjects.

³ IL: Computer technology can be substituted for 1 unit of mathematics.

⁴ IA: In 1991 the only state-mandated requirement was physical education for every year in attendance.

⁵ KY: One additional year of mathematics, science, social science, or vocational education is required.

⁶ ME: Students must pass a computer proficiency test, but no specific coursework is required.

⁷ NE: State sets requirements for total core courses as a group, but local boards set subject-specific requirements.

⁸ NJ: Note that English must be taken during every year enrolled; therefore 4 years are required for those who finish high school in the normal 4 years, but different requirements apply for early or late graduates.

⁹ NM: Students must demonstrate computer proficiency, but no specific coursework is required.

¹⁰ ND: Fourth year of English may be replaced by upper-level foreign language; 1 year of mathematics may be business mathematics.

¹¹ PA: Computer science can be substituted for arts/humanities requirement.

¹² SC: One unit of computer science counts toward the mathematics requirement; science requirement can be met with 1 year of science plus 6 units in a specific occupational area.

¹³ UT: Computer literacy must be demonstrated, but no specific coursework is required.

¹⁴ VT: Five years total for mathematics and science are required (2+3 or 3+2).

¹⁵ VA: One additional unit of mathematics or science is required, but this can be met with a vocational education class or ROTC.

¹⁶ WV: One year of electives must be foreign language or applied/fine arts.

¹⁷ WY: In 1991, the state required only 1 year of social studies. New accreditation standards that will apply in 1997 require public high schools to require 4 years of English, 3 years of social studies, 2 years of mathematics, and 2 years of science.

NOTE: Elective requirements may encourage course taking in computer science or foreign language, but allow substitution with some other course. Such flexible requirements are not counted in these categories because they are not absolute. Additional and/or higher requirements were set for advanced/scholars' diplomas in many states.

SOURCE: Education Commission of the States, *Clearinghouse Notes*, 1993.

Supplemental note on high school graduation requirements

"Linguistically isolated" refers to households in which no members over age 13 speak English "very well," and all members over age 13 speak a language besides English.

The percentage of a district's residents who had not completed high school applies only to adults 20 years old and older.

District per-pupil spending figures reflect only current annual operating expenditures, excluding capital and other unusual expenditures.

The NCEE recommended in *A Nation at Risk* that students be required to complete 4 years of English; 3 years each of math, science, and social studies; and one-half year of computer science. In addition, for college-bound students, the Commission recommended 2 years of high school-level foreign language (not counting any foreign language study from earlier grades).

Table 25-1 Percentage of high school graduates taking 4 units in English, 3 units in social studies, 3 units in science, 3 units in math, and 0.5 units in computer science,* by student and school characteristics: 1982, 1987, 1990, and 1992

Note on High School Transcript Studies

Indicators 25 and 26 contain data from high school transcript studies conducted by the National Center for Education Statistics (NCES). Average course credits, or Carnegie units, for high school graduates are from the following studies: 1992 data are from the 1988 National Education Longitudinal Study (NELS:88) Second Follow-up High School Transcript Study; 1987 and 1990 data are from the 1987 and 1990 National Assessment of Educational Progress (NAEP) High School Transcript Studies; and 1982 data are from the High School and Beyond (HS&B) Transcript Study. A brief description of these studies, including descriptions of the sampled populations, follows.

The 1988 NELS Second Follow-up High School Transcript Study is a major longitudinal study sponsored by NCES. Transcripts were collected for 17,281 students selected to be in the second follow-up study. From this sample, a subsample was created that is nationally representative of 1992 high school graduates.

The 1990 NAEP High School Transcript Study was conducted using methodology and techniques nearly identical to those used in the 1987 NAEP High School Transcript Study. In the spring of 1991, transcripts were collected from 21,607 students who graduated from high school in 1990. These students attended 330 schools that had previously been sampled for the NAEP. The sample of schools was a nationally representative sample of schools teaching grade 12 or having 17-year-old students. The sample was also a representative sample of graduating seniors from each school.

Since the focus of the 1990 Transcript Study was high school graduates, schools with 17-year-olds but without 12th grade were not included in the subsample used in these analyses. Of the remaining schools, only those students who graduated were selected.

The sample of schools for the 1987 High School Transcript Study consisted of a nationally representative sample of 471 secondary schools selected for the 1986 NAEP for grade 11, age 17

students, of which 433 schools participated. The 1987 study was restricted to students who were in grade 11 in 1985–86. Data for 1987 and 1990 in *Indicators 25 and 26* are from the NCES publication *The 1990 High School Transcript Study Tabulations*.

High School and Beyond (HS&B) is a survey of high school sophomores and seniors. In 1982, high school transcripts were collected for members of the sophomore cohort who were selected to be in the second follow-up survey (about 12,000 transcripts). As in the 1987 and 1990 High School Transcript Studies, records were obtained from all types of high schools. However, because the 1982 HS&B used a different method of identifying handicapped students than the 1987 and 1990 High School Transcript Studies, students who had participated in a special education program were excluded from the tabulations in order to make the figures consistent. To better match the selection rules used to create the NELS Transcripts subsample, the 1982 HS&B data in *Indicators 25 and 26* are based on original runs and differ slightly from data published in *The 1990 High School Transcript Study Tabulations*.

Each of the transcript studies used the taxonomy of Classification of Secondary School Courses (CSSC), which contains approximately 1,800 course codes used to define course content and level. These studies also included additional course and student information, such as grade and credit received, grade level, graduation status, age, gender, and race/ethnicity.

¹ The female field concentration ratio is calculated as the percentage of women earning degrees who majored in a specific field divided by the percentage of men earning degrees who majored in the same field.

² Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

NOTE: See Glossary for full definition of "other technical/professional" fields.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, tables 239 and 240 (based on IPEDS/HEGIS surveys of degrees conferred).

Index of dissimilarity ²	34.0	33.6	32.9	33.1	33.2	32.8	33.7	33.8	33.6	33.9	34.0

¹ Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

² The index of dissimilarity is calculated as the sum of the absolute differences between the proportions of women and men earning degrees in each of the fields divided by 2. It was calculated here from the 10 most detailed categories shown above (does not include "other technical/professional"). Here, it represents the percentage of one sex who would have to change fields in order for it to have the identical field distribution as the other sex.

NOTE: Detail may not add to totals due to rounding. See Glossary for full definition of "other technical/professional" fields.

¹ The female field concentration ratio is calculated as the percentage of women earning degrees who majored in a specific field divided by the percentage of men earning degrees who majored in the same field.

² Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

NOTE: See Glossary for full definition of "other technical/professional" fields.

¹ Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

² The index of dissimilarity is calculated as the sum of the absolute differences between the proportions of women and men earning degrees in each of the fields divided by 2. It was calculated here from the 10 most detailed categories shown above (does not include "other technical/professional"). Here, it represents the percentage of one sex who would have to change fields in order for it to have the identical field distribution of the other sex.

NOTE: Detail may not add to totals due to rounding. See Glossary for full definition of "other technical/professional" fields.

* Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

NOTE: See Glossary for full definition of "other technical/professional" fields.

NOTE: Recent high school graduates are individuals aged 16–24 who graduated in the year of the survey. The labor force participation rate is the percent of the population either employed or unemployed. The employment rate is the percent of the population employed. The unemployment rate is the percent of the labor force unemployed. The unemployed are those without a job and looking for work. See supplemental note to this indicator for a comparison of these labor force statistics.

Note on Labor Force Statistics

The Bureau of Labor Statistics uses three categories to classify the labor force status of an individual: employed, unemployed, and not in the labor force.

An *employed* individual is someone who has a job and is working. Also included are those who are not working but who have jobs from which they are temporarily absent because of illness, vacation, labor-management disputes, bad weather, and personal reasons. Those in the military are also counted as employed. An *unemployed* individual is someone without a job, who is available for work, and who has made specific efforts to find employment some time during the prior 4 weeks. Also included are persons waiting to be recalled to a job from which they had been laid off or who are waiting to report to a new job within 30 days. Individuals who are neither employed nor unemployed are *not in the labor force*.

The *labor force* comprises all persons classified as employed or unemployed. The *unemployment rate* represents the number unemployed as a percent of the labor force. The *labor force participation rate* is the ratio of the labor force to the population. The *employment-population ratio* is the percentage of employed individuals in the population. We refer to the last statistic as the *employment rate* in *Indicator 28*.

Each of these statistics is typically reported in two forms, one that includes the military, and one that excludes them. For instance, the *civilian employment-population ratio* is the percentage of all employed civilians in the civilian noninstitutional population. The *civilian labor force participation rate* is the ratio of the civilian labor force to the civilian noninstitutional population. The labor force statistics reported in *Indicator 28* and its associated supplemental tables are all for the civilian noninstitutional population. *Indicator 28* reports the form that excludes the military.

Each of these measures can be computed for groups classified by age, sex, race, Hispanic origin, and so on.

Further elaboration on these labor force statistics is available in the explanatory notes of *Employment and Earnings*, published monthly by the Bureau of Labor Statistics of the U.S. Department of Labor.

Table 29-1 Percentage of the labor force* who were unemployed, by sex, educational attainment, and age: March 1994

Age	Male					Female				
	Total	Grades 9 to 11	High school diploma	Some college	Bachelor's degree	Total	Grades 9 to 11	High school diploma	Some college	Bachelor's degree

55-59	5.3	7.1	5.0	5.2	3.6	4.0	7.0	4.4	2.9	1.7
60-64	6.1	11.1	5.0	3.5	4.8	5.9	6.9	6.0	5.5	2.8

* Noninstitutionalized civilians.

NOTE: The labor force are those who are either employed or unemployed. The unemployed are those without a job and looking for work. Included in the total but not shown separately are those who have attained 8 or fewer years of schooling. Grades 9 to 11 include those who have attended 12th grade but have not received a diploma; high school diploma includes those who have received an equivalency certificate; some college includes those who have received an associate's degree; bachelor's degree includes those who have received advanced degrees.

Table 30-4 Ratio of median annual earnings of wage and salary workers 25 to 34 years old with 9-11, 13-15, and 16 or more years of school to those with 12 years of school, by sex: 1970-93

Year	9-11 years of school		13-15 years of school		16 or more years of school	
	Male	Female	Male	Female	Male	Female
1970	0.84	0.69	1.10	1.19	1.24	1.68
1971	0.85	0.73	1.06	1.15	1.23	1.67
1972	0.80	0.70	1.04	1.16	1.19	1.63
1973	0.84	0.71	1.01	1.22	1.17	1.64
1974	0.81	0.62	1.02	1.19	1.14	1.74
1975	0.78	0.64	1.07	1.24	1.17	1.72
1976	0.78	0.61	1.03	1.14	1.19	1.58
1977	0.77	0.63	1.02	1.23	1.18	1.53
1978	0.77	0.54	1.05	1.17	1.18	1.55
1979	0.76	0.70	1.06	1.19	1.16	1.55
1980	0.73	0.65	1.04	1.24	1.19	1.52
1981	0.73	0.61	1.07	1.23	1.29	1.54
1982	0.71	0.66	1.12	1.21	1.34	1.63
1983	0.70	0.66	1.13	1.24	1.35	1.67
1984	0.63	0.56	1.15	1.21	1.36	1.61
1985	0.70	0.63	1.19	1.18	1.50	1.69
1986	0.69	0.65	1.18	1.21	1.50	1.78
1987	0.72	0.67	1.13	1.25	1.49	1.78
1988	0.68	0.56	1.10	1.31	1.42	1.81
1989	0.70	0.63	1.12	1.32	1.45	1.93
1990	0.71	0.58	1.14	1.34	1.48	1.92
1991	0.64	0.64	1.14	1.32	1.53	1.90
1992	0.68	0.76	1.13	1.34	1.60	2.00
1993	0.67	0.59	1.12	1.31	1.57	1.99

NOTE: The ratio is most usefully compared to 1.0. For example, the ratio of 1.57 in 1993 for males with 16 or more years of school means that they earned 57 percent more than males with 12 years of school. The ratio of 0.67 in 1993 for males with 9-11 years of school means that they earned 33 percent less than males with 12 years of school.

Note on adult literacy proficiency levels and scale scores

For the National Adult Literacy Survey (NALS), literacy was defined based on three types of skills: prose, document, and quantitative literacy. Tasks were developed to measure these various literacy skills, and scales were created to report ability levels.

Tasks that measure each type of skill were assigned a difficulty value based on a scale that ranges from 0 to 500. The prose literacy scale contained 41 tasks with difficulty values that range from 149 to 468; the document literacy scale contained 81 tasks with difficulty values that range from 69 to 396; and the quantitative literacy scale contained 39 tasks with difficulty values that range from 191 to 436.

Literacy scale scores were placed on the same 0–500 scale by determining a person's ability to correctly answer questions of various difficulty values. The scores were then converted into proficiency levels that range from 1 through 5. Five divisions along the scales were created by making cutpoints 50 points apart along the continuous scale. A person's skill level was determined by first deriving a score based on the difficulty values of the questions answered correctly compared to the difficulty values of the questions answered incorrectly, and then mapping this score onto the proficiency levels. Adults included in level 1 were those who could consistently succeed at level 1 tasks, but not at level 2 tasks, as well as those who could not consistently succeed at level 1 tasks and those who were not literate enough in English to take the test at all. Adults in levels 2 through 4 were consistently able to succeed at tasks at their proficiency level, but not at tasks for the next more difficult level. Adults in level 5 were consistently able to succeed at level 5 tasks. Below is a description of the three literacy scales and the tasks required at each proficiency level:

Prose literacy. Prose refers to any written text such as editorials, news stories, poems, and fiction, and can be broken down into two types: expository prose and narrative prose. Expository prose consists of printed information that defines, describes, or informs, such as newspaper stories or written instructions. Narrative prose tells a story. Prose varies in its length, density, and structure (e.g., use of section headings or topic sentences for paragraphs). Prose literacy tasks include locating all the information requested, integrating information

from various parts of a passage of text, and writing new information related to the text.

Prose Level 1 (Difficulty values 0–225). Level 1 prose literacy tasks required a person to read a short passage of text and locate a single piece of information that is identical to or synonymous with the information given in the question. If plausible but incorrect information was present in the text, it tended not to be located near the correct information.

Prose Level 2 (Difficulty values 226–275). Prose literacy tasks at level 2 required a person to locate a single piece of information in the text, compare and contrast easily identifiable information based on criteria provided in the question, or integrate two or more pieces of information, when distractors were present or when low level inferences were required.

Prose Level 3 (Difficulty values 276–325). Prose literacy tasks at level 3 required a person to match literal or synonymous information in the text with that requested in the question, to integrate multiple pieces of information from dense or lengthy text, or to generate a response based on information that could be easily identified in the text. Distracting information was present, but was not located near the correct information.

Prose Level 4 (Difficulty values 326–375). Prose literacy tasks at level 4 required a person to search through text and match multiple features, and to integrate or synthesize multiple pieces of information from complex or lengthy passages. More complex inferences were required, and conditional information had to be taken into consideration for these tasks.

Prose Level 5 (Difficulty values 376–500). Prose literacy tasks at level 5 required a person to search through text and match multiple features contained in dense text with a number of plausible distractors, to compare and contrast complex information, or to generate new information making high-level inferences or using specialized background knowledge.

Document literacy. Documents are short forms or graphically displayed information found in everyday life, including job applications, payroll forms, transportation schedules, maps, tables, and

graphs. Document literacy tasks included locating a particular intersection on a street map, using a schedule to choose the appropriate bus, or entering information on an application form.

Document Level 1 (Difficulty values 0–225). Document literacy tasks at level 1 required a person to locate information based on a literal match to the question or to enter information from personal knowledge into a document. Little, if any, distracting information was present.

Document Level 2 (Difficulty values 226–275). Document literacy tasks at level 2 required the reader to match a piece of information either when several distractors were present or when low-level inferences were required. Tasks at this level also asked the reader to cycle through information in a document or to integrate information from various parts of a document.

Document Level 3 (Difficulty values 276–325). Document literacy tasks at level 3 required a person to integrate multiple pieces of information from one or more documents. Other tasks asked readers to cycle through complex tables or graphs and locate particular features. The displays contained information that was irrelevant or inappropriate to the task.

Document Level 4 (Difficulty values 326–372). Document literacy tasks at level 4 required a person to perform multiple-feature matches, cycle through documents, and integrate information, all of which required high-level inferences. Many of these tasks required readers to provide numerous responses but did not designate how many responses were needed. Conditional information was also present in the tasks at this level and had to be taken into account by the reader.

Document Level 5 (Difficulty values 376–500). Document literacy tasks at level 5 required a person to search through complex displays that contained multiple distractors, to make high-level text-based inferences, and to use specialized knowledge. Tasks required readers to integrate information, compare and contrast data points and to summarize the results.

Quantitative literacy. Quantitative information may be displayed visually in graphs or charts or in numerical form using whole numbers, fractions, decimals, percentages, or time units (hours and minutes). These quantities appeared in both prose and document form. Quantitative literacy refers to

locating quantities, integrating information from various parts of a document, determining the necessary arithmetic operation, and performing that operation. Quantitative literacy tasks included balancing a checkbook, completing an order form, and determining the amount of interest paid on a loan.

Quantitative Level 1 (Difficulty values 0–225). Quantitative literacy tasks at level 1 required a person to perform single, relatively simple arithmetic operations, such as addition, when the question included the numbers to be used and the arithmetic operation to be performed.

Quantitative Level 2 (Difficulty values 226–275). Quantitative literacy tasks at level 2 required a person to locate numbers by matching the required information with that given, infer the necessary arithmetic operation, or perform an arithmetic operation when the tasks specified the numbers and the operation to be performed. The quantities could be easily located in the text, and the operation could be determined from the format of the material.

Quantitative Level 3 (Difficulty levels 276–325). Quantitative literacy tasks at level 3 required a person to locate numbers by matching the required information with that given, infer the necessary arithmetic operation, and perform arithmetic operations on two or more numbers, or to solve a problem, when the numbers must be located in the text or document. The required operation(s) could be determined from the arithmetic-relation terms used in the question.

Quantitative Level 4 (Difficulty values 326–375). Quantitative literacy tasks at level 4 required a person to perform two or more sequential arithmetic operations or a single arithmetic operation, when the quantities could be found in different displays, or when the operations had to be inferred from semantic information given or drawn from prior knowledge.

Quantitative Level 5 (Difficulty values 376–500). Quantitative literacy tasks at level 5 required a person to perform multiple arithmetic operations sequentially, when the features of the problem had to be extracted from text or when background knowledge was required to determine the quantities or operations needed.

¹ Volunteering informally is defined as helping a neighbor, friend, or organization on an ad hoc basis, spending time caring for an elderly person, or baby-sitting children of a friend, but not as part of an organized group or for pay.

² Volunteering for a public or society benefit organization includes civil rights work, community and social action, advocacy (e.g., minority and women's equity issues); community improvement, community capacity planning; science; technology; technical assistance; volunteerism; philanthropy; charity between groups, e.g., Rotary, Kiwanis, etc.; consumer organizations, advocacy organizations, such as nuclear freeze, antipoverty boards, etc.

Description of source and definitions for community service, volunteering, and giving

Source Information

Data are from a national survey of 2,671 adult Americans commissioned by the Independent Sector and conducted by the Gallup Organization.¹ This is the third in a series of similar surveys conducted biennially beginning in 1988 to determine giving and volunteer behavior for all Americans. The sampling procedure is designed to produce an approximation of the adult civilian population, 18 years and older, living in the United States. The sample included oversamples of blacks, Hispanics, and affluent Americans (household incomes greater than \$60,000) in order to have enough respondents to carry out statistically reliable analyses of these groups.

The sample design is a replicated, multi-stage area probability sample down to the block level in urban areas, and to segments of townships in rural areas. Within each stratum (regions within size-of-community strata), the population is arrayed in geographic order and zoned into equal-sized groups of sampling units. Pairs of localities are selected in each zone, with probability of selection proportional to population size in the 1980 census, producing two replicated samples of localities. Within each subdivision, a sample of blocks or block clusters are drawn. In each cluster of blocks, a randomly selected starting point is designated on the interviewer's map of the area. From this point, interviewers follow a given direction in the selection of households until their assignment is complete.

The data are weighted in four stages: correcting for underrepresentation of persons difficult to find at home; corrections for oversamples; demographic and post-stratification adjustments based on the Current Population Survey (CPS); and a final adjustment also based on CPS estimates to ensure that the various demographic categories oversampled for this survey were represented in their appropriate proportions.

Definitions

Volunteering: The measures of volunteering were based on the responses of individuals who were given a list of organizations and types of volunteer work and were asked about their own activities that "in some way helped others for no monetary pay" in the past 12 months. They were also asked about the total number of hours they volunteered in the last month and total hours volunteered in the past week. The average hours per week per volunteer were calculated on an annual basis by multiplying the average hours volunteered monthly by the percentage of persons volunteering monthly to those volunteering annually divided by 4.33 weeks per month.

Giving: The amount of contributions to charitable organizations were based on responses about household contributions (as opposed to individual contributions) where respondents were asked a number of questions about the amount of household income they contributed to various religious and other organizations "not with the intention of making a profit, or obtaining goods or services for yourself."

Postsecondary education: This refers to any education beyond high school and includes 7 percent of the population who reported attending technical, trade, or business school. About 20 percent of the population were college graduates.

NOTES:

¹ Some of the data presented for this indicator are from a published report by the Independent Sector, *Giving and Volunteering 1992: Findings from a National Survey*, Washington, D.C., 1992.

— Data not collected as a separate field of study.

¹ Includes those for whom field of study was unknown.

² Primarily composed of agricultural sciences, business and management, communications, health sciences, and other occupationally oriented fields.

NOTE: Only new doctoral recipients with definite employment commitments in the United States are reported here. A "definite commitment" is defined as a signed contract, acceptance of a formal offer, etc. Employment in higher education includes positions in 4-year colleges or universities, medical schools, and junior or community colleges with the exception of postdoctoral fellowships.

SOURCE: National Research Council, Survey of Earned Doctorates, Doctorate Records File, various years.

¹ Beginning in fall 1980, data include estimates for the expanded universe of private schools.

² Includes most kindergarten and some nursery school students.

³ Estimates based on preliminary data.

NOTE: The private school enrollment figures from years 1971-75, 1979, 1981-82, 1984, and 1986-92 are estimated. Projections are based on data through 1991. Because of rounding, details may not add up to totals.

¹ Revised from previously published figures.

² Estimates based on preliminary data.

NOTE: Details may not add to totals due to rounding. Enrollment includes a relatively small number of prekindergarten students. The regions of the country for this indicator are those used by the Census Bureau in the Current Population Survey. The regions are as follows: Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont. Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin. South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia. West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

¹ The National Center for Education Statistics recognizes 10 first-professional degree fields: chiropractic, dentistry, law, medicine, optometry, osteopathy, pharmacy, podiatry, theology, and veterinary medicine.

² High school completers are the graduates of regular public and private day school programs and the recipients of GED credentials. Data for GED recipients are not available before 1974.

³ Revised from previously published figures.

* Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

NOTE: The engineering category includes degrees conferred in engineering technologies. At the bachelor's degree level, 21.1 percent of degrees in the engineering category for 1992 were conferred in engineering technologies, up from 15.6 percent in 1981 and 10.3 percent in 1971. Were engineering technologies excluded from the engineering category, the index of bachelor's degrees conferred in engineering for 1992 would be 96.7 and 70.9 in 1971.

* Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

NOTE: The engineering category includes degrees conferred in engineering technologies. At the bachelor's degree level, 21.1 percent of degrees in the engineering category for 1992 were conferred in engineering technologies, up from 15.6 percent in 1981 and 10.3 percent in 1971. Were engineering technologies excluded from the percentage of degrees conferred in engineering for 1992, the percentage of engineering degrees conferred at the bachelor's level would have been 5.4 percent, 6.8 percent in 1981, and 5.3 percent in 1971.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, tables 241, 242, and 243 (based on IPEDS/HEGIS surveys of degrees conferred).

¹ Foreign students are non-U.S. citizens on temporary visas. American students include non-U.S. citizens with permanent U.S. visas.

² Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics*, various years (based on IPEDS/HEGIS surveys of degrees conferred).

* Because of reclassification of Instructional Programs in 1991-92, the figures for earlier years have been reclassified when necessary to make them conform to the new taxonomy. Therefore, most numbers shown are revised from previously published figures. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

¹ In 1991-92 there was a reclassification of Instructional Programs. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" survey: "Business management" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services.

² Engineering technologies cannot be derived from the "Engineering" category by race/ethnicity.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1994*, tables 255 and 256, (based on IPEDS/HEGIS surveys of degrees conferred).

Table 40-1 Percentage of students in grades 1-12 who are black or Hispanic, by control of school and metropolitan status: 1970-93

Year	Public schools				Private schools

1991	28.1	52.9	19.6	15.9	14.3
1992	28.3	52.6	20.4	15.5	14.9
1993	28.4	53.8	20.2	16.0	16.7

— Not available.

NOTE: Control of school was not available in 1980. Residence of students was not available in 1984. The definition of metropolitan areas in the United States was changed in 1985. Because a small number of students (less than 1 percent) are both black and Hispanic, the percentages in this table are slightly smaller than the sum of the "percent black" and "percent Hispanic" columns shown in the text table of *Indicator 40*.

SOURCE: U.S. Department of Commerce, Bureau of the Census, *Current Population Reports*, Series P-20, "School Enrollment" various years; October Current Population Surveys.

*Data are from the Common Core of Data survey.

NOTE: Because data shown in this table are taken from surveys other than the Current Population Surveys, and because survey procedures and definitions differ, they are not comparable to the data in the other tables of this indicator. Enrollment includes kindergarten and a small number of prekindergarten students.

SOURCE: U.S. Department of Education, Office for Civil Rights, Elementary and Secondary School Civil Rights Survey, 1976, 1984, 1986, 1988, and 1990; and National Center for Education Statistics, Common Core of Data survey, 1992.

Table 40-3 Percentage distribution of enrollment in public elementary and secondary schools, by race/ethnicity and state: Fall 1992

Note on programs and services offered in schools

The following are definitions of programs and services indicated by schools in the Schools and Staffing Survey, 1993-94.

Bilingual education: Native language is used to varying degrees in instruction of students with limited English proficiency.

English as a second language: Students with limited English proficiency are provided with intensive instruction in English.

Remedial reading: Organized compensatory, diagnostic, and remedial activities designed to correct and prevent difficulties in the development of reading skills.

Remedial mathematics: Organized compensatory, diagnostic, and remedial activities designed to correct and prevent difficulties in the development of mathematical skills.

Programs for the handicapped: Instruction for the mentally retarded, specific learning disabled, physically handicapped, and other handicapped.

Programs for the gifted and talented: Activities designed to permit gifted and talented students to further develop their abilities.

Diagnostic and prescriptive services: Services provided by trained professionals to diagnose learning problems of students and to plan and provide therapeutic or educational programs based upon such services.

Extended day: Before- or after-school day care programs.

Medical and health care services: Services provided by trained professionals (e.g., physician, physician assistant, nurse, or nurse practitioner) to diagnose and treat health problems of students.

¹ Includes students served under Chapter 1 of the Education Consolidation and Improvement Act (ECIA) and Part B of the Individuals with Disabilities Education Act (IDEA).

² Includes preschool children aged 3-5 and 0-5 served under Chapter 1 and Part B of the IDEA, respectively.

³ Prior to 1987-88, these students were included in the counts by disabling condition. Beginning in 1987-88, states are no longer required to report disabled preschool students (0-5 years) by disabling condition.

⁴ Revised from previously published figures.

NOTE: Counts are based on reports from the 50 states and District of Columbia only (i.e., figures from the U.S. territories are not included). Increases since 1987-88 are due in part to new legislation enacted in fall 1986, which mandates public school appropriate education services for all disabled children ages 3-5. Detail may not add to totals due to rounding.

Highest	90.1	53.1	47.0	44.2	10.5	23.7	26.0	15.1

¹ Any activity is a measure of the percentage of students who reported that they had participated in at least one of the listed activities during the school year. This category includes only those activities shown in this table and cannot be compared to the "any activity" category in tables 43-1 or 43-2.

² SES quartiles provide a relative measure of the socioeconomic status of families. The middle two quartiles were collapsed, creating a three-level SES scale with the values "lowest" (lowest quartile), "middle" (the two middle quartiles), and highest (highest quartile). See Glossary for further explanation.

NOTE: Mobility measures the number of times a student changed schools, excluding changes due to a single grade or level promotion.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Education Longitudinal Study of 1988, Base Year (1988) and Second Follow-up (1992) Surveys.

Description of sources and definitions for student mobility

The tables and graphs in the student mobility indicator are based on data collected in the Base Year (1988) and Second Follow-up (1992) Surveys of the National Education Longitudinal Study of 1988 (NELS:88). The sample generated for this analysis consists of students who attended the eighth grade in 1988. These students and their parents were surveyed in 1988, and were resurveyed at 2-year intervals for each of the follow-up surveys.

For these analyses, students are classified according to the number of school changes they made after entering first grade and before the middle of eighth grade, and between the middle of eighth grade and spring 1992.

Student Mobility Before the Eighth Grade

This indicator classifies students according to whether or not they changed schools two or more times after entering first grade and before the middle of eighth grade. The data used to determine this index are derived from the NELS Parent Survey of 1988, where the parent was asked: "How many times has your eighth grader changed schools since he or she entered first grade? Do not count changes that occurred as a result of promotion to one grade or level or a move from one elementary school building to a middle school building in the same district."

Student Mobility During the Eighth Grade and After

This indicator classifies students according to whether or not they changed schools two or more times between the middle of eighth grade and spring 1992. The data used to determine this index are derived from the Student Survey of the Second Follow-up of 1992, where the student was asked: "How many times have you changed schools since January 1, 1988? Do not count changes that occurred as a result of promotion to one grade or level or a move from a middle school building to a high school building in the same district."

Background Characteristics Included

The tables and graphs show mobility patterns for students according to three background variables: race ethnicity, family composition, and family income. Data on these characteristics are derived from the Base Year survey conducted in 1988.

Race/Ethnicity

Students were classified into five racial/ethnic groups:

- White
- Black
- Hispanic
- Asian/Pacific Islander
- American Indian/Alaskan Native

Family Composition

Student responses about family composition at the time of the 1988 survey were classified into five groups:

- Living with mother and father
- Living with mother and an adult male, other than a biological father
- Living with father and an adult female, other than a biological mother
- Living with mother only
- Living with father only or in some other family arrangement

Family Income

Parent responses concerning annual family income at the time of the 1988 survey were classified into five categories:

- Less than \$10,000
- \$10,000–\$19,999
- \$20,000–\$34,999
- \$35,000–\$49,999
- \$50,000 or more

Note on student exposure to faculty at institutions of higher education

The 1988 National Study of Postsecondary Faculty (NSOPF-88) was a survey of faculty who had at least some instructional duties (such as teaching one or more courses) in for-credit higher education courses during the 1987 fall term.

Unlike NSOPF-88, which was limited to faculty whose regular assignments included instruction, the faculty universe for NSOPF-93 was expanded to include anyone who was designated as faculty, whether or not their responsibilities included instruction, and other (non-faculty) personnel with instructional responsibility. For the purposes of this indicator, analysis was restricted to faculty with at least some instructional responsibilities.

Both full- and part-time faculty are included in the analysis. Teaching assistants and medical faculty were not included in the estimates.

For the purposes of this indicator, institutions of higher education were divided into four types, and courses were separated into three divisions.

Types of Institutions

Research university: Institution that is among the 100 leading universities receiving federal research funds. Each of these universities awards substantial numbers of doctorates across many fields.

Doctoral university: Institution that offers a full range of baccalaureate programs and Ph.D. degrees in at least three disciplines, but tends to be less focused on research and receives fewer federal research dollars than the research universities.

Comprehensive institution: Institution that offers liberal arts and professional programs. The master's degree is the highest degree offered.

Liberal arts institution: Institution that is smaller and generally more selective than comprehensive colleges and universities. A liberal arts institution primarily offers bachelor's degrees, although some offer master's degrees.

Course Divisions

Undergraduate, lower division courses: Courses designed for students in the first or second year of a 4-year bachelor's degree program.

Undergraduate, upper division courses: Courses designed for students in the third or fourth year of a 4-year bachelor's degree program.

Graduate courses: Courses designed for students in a post-baccalaureate degree program, including a master's or doctor's.

Medical Faculty

For the purposes of this indicator, medical institutions, and their faculty, were excluded from the analysis. Health science faculty teaching at the institutions included in this study were also excluded.

¹ Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent of incomes in-between.

² Includes those with a job but not at work during the survey week.

NOTE: For college students who are under 25 years old and not married, the family income is presumed to be that of the parental family; for married students, it is presumed to be that of the individual or his/her spouse.

Note on calculation of national index of public effort to fund education

There are many indices of public investment in education available. Choosing the most appropriate measure has been an issue in international comparisons as well as national trends. The national index of public effort provides a measure of public investment in each student compared to available societal resources.

Public education revenues per student are the ratio of total public education revenues to public and private enrollment. Per capita income is the ratio of total personal income to total population. The index can be expressed algebraically, therefore, as a function of four variables:

$$\text{National effort index} = \frac{\text{Public education revenues per student}}{\text{Per capita income}} \times 100$$

or

$$\text{National effort index} = \frac{\text{Public education revenues} / \text{Total enrollment}}{\text{Total personal income} / \text{Total population}} \times 100$$

Revenue data from elementary/secondary and higher education are based on different accounting systems and are not entirely comparable. For example, elementary and secondary public revenues represent additions to assets (cash) from taxes, appropriation, and other funds, which do not incur an obligation that must be met at some future date (loans) in all public schools. These include revenues that are spent on construction of buildings and other investments in the physical plant. Because of the difficulty in constructing a comparable time series, public funds going to private schools (for Head Start, disabled children, etc.) have been excluded. For higher education, educational and general public revenues are those available from public sources at both public and private institutions for the *regular or customary activities* of an institution that are part of, contributory to, or necessary to its instructional or research program. These include salaries and travel of faculty and administrative or other employees; purchase of supplies or materials for *current* use in classrooms, libraries, laboratories, or offices; and operation and maintenance of the educational plant. In contrast to elementary/secondary public revenues, higher education public revenues, as defined in this indicator, do not include public funds that would be used for expansion of the physical plant. As a result, the reader should focus on the changes over time in the elementary/secondary and the higher education's measures rather than on comparisons across levels.

Enrollment is in all institutions, regardless of control. No adjustments were made for part-time enrollment.

Total education revenues are in 1994 dollars, based on the Consumer Price Index (CPI), prepared by the Bureau of Labor Statistics, U.S. Department of Labor, adjusted to a school-year basis. Personal income is in constant 1994 dollars.

Table 53-1 Total revenue per student adjusted for cost-of-living, educational needs of children, and revenue shares from local, state, and federal sources, by district characteristics: 1989-90

District characteristics	Percentage of enrollment ¹	Actual dollars	Cost-of-living adjusted dollars ²	Cost and need adjusted dollars ³	Revenue share ¹		
					Percent local	Percent state	Percent federal
Median value of owner-occupied housing							
Less than \$40,000	10.8	\$4,408	\$4,522	\$3,864	33.5	57.1	9.4
\$40,000-54,999	20.2	4,455	4,509	3,905	38.8	53.7	7.5

Less than 5.0	21.9	4,966	4,867	4,321	49.2	46.7	4.1

¹ Details may not add to 100 percent due to rounding.

² The methodology to adjust for cost-of-living involved extrapolating cost-of-living (COL) indices in a number of large cities to metropolitan and nonmetropolitan areas of all states based on the relationship between COL and per capita personal income, housing value, and percentage change in the population. For more information, see supplemental note to this indicator, pages D-10 to D-13 of the report cited below, and the references cited therein.

³ The methodology to adjust for educational needs of children involved increasing the effective number of children who need to be served by multiplying the number of children receiving special education services by 2.3, the number of limited-English-proficient students by 1.2, and the number of children living in poverty by 1.2. For more information, see the supplemental note to this indicator, pages D-14 to D-15 of the report cited below, and the references cited therein.

NOTE: See the supplemental note to this indicator for further discussion of issues in the measurement of educational resource disparity.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Disparities in Public School District Spending: 1989-90*, tables A1.1, A1.2, A2.1, and A2.2.

Special considerations used in the analysis of public school district funding

This indicator is drawn from the U.S. Department of Education, National Center for Education Statistics, *Disparities in Public School District Spending 1989–90* (1995). This note is condensed from appendix D of that report. More details appear in the report, including the methodology used in imputation of missing values. The report and this indicator utilize the entire population of school districts. Standard errors are not presented since sampling variation is nonexistent when reporting data from the population of all districts.

Note on Expenditure Differences

Revenue is only one side of the school district funding equation. As noted below, expenditures also vary across different types of students, such as special education, "Chapter 1," and limited-English proficient (LEP) students. Schools also may have differing costs of transportation and maintenance. Adjusting for these costs may allow for more precise measurement of the differences of resource availability across districts.

The report *Disparities in Public School District Spending 1989–90* (1995) does make some of these adjustments. The report also uses multivariate regression methods to account for different district characteristics. In general, the expenditure analysis shows that spending on students is more equitable than the unadjusted numbers show. The analysis also shows that poorer districts are spending less on maintenance, which may point to the emergence of physical facility problems in the future.

Note on Adjustments for Cost-of-Living

When educational expenditures per student are reported, comparable power to purchase education goods and services is assumed. Because of locational cost differentials, however, identical expenditures may not have the same purchasing power in different districts. To allow meaningful comparisons of revenues and expenditures per pupil across districts, it may be important to convert these nominal amounts (actual dollars) into amounts that reflect real purchasing power (cost-of-living adjusted dollars).

Although the concept of adjusting for cost differentials to make comparisons in expenditures and revenues across regions is generally accepted, the most appropriate set of adjustments to be used for these purposes has yet to be fully agreed upon or developed. One issue associated with the use of the indices included in this analysis is the relative lack of detail. For the majority of the states, only two indices were provided, metropolitan and nonmetropolitan areas. This level of aggregation masks a great deal of district-level variation and would seem to be of especially questionable use in state-level analyses. However, more detail was provided for the most populous states. For example, seven indices were calculated for California with unique indices provided for each of the five large cities (population greater than 1.5 million persons). The present analysis assumes this level of detail to be sufficient for the full universe of districts across the nation.

The most appropriate form of cost adjustment to be used with these fiscal data would be based on measures of variation in the cost-of-education resources in different locations throughout the country. Although work on the development of such cost-of-education differentials has been investigated by NCES, this type of cost-adjustment factor is not available for use at the current time. Lacking cost adjustments based on differences in the cost-of-education, a second option is to base the cost factors to be used in this indicator on differences in cost-of-living within states and across the nation. Although less preferable than cost-of-education measures, it has been shown that variations in the cost-of-living are highly correlated with differences in the cost-of-education (Chambers 1981; Chambers et al. 1993).

McMahon and Chang (1991) have produced a set of unique cost-of-living indices for each major metropolitan area that show urban/rural differentials across all of the states. These indices were derived from a regression analysis of the relationship between the cost-of-living and per capita personal income, housing value, and percentage change in population. Thus, in the absence of cost-of-education measures, the

McMahon and Chang measures were used to produce alternative sets of revenue values to accompany the actual values. These cost-of-living indices were attached to individual districts through the use of the metropolitan statistical area and metropolitan status codes for school districts from the NCES 1989–90 Common Core of Data (CCD) district file.

Note on Other Adjustments

The cost-of-living adjustments may not fully account for differences in resource availability between districts. For instance, school districts receive additional state and federal funds based on the number of students eligible for compensatory education programs. They may also receive additional revenue for LEP and special education students. Detailed budgetary data are not available that would allow a precise estimation of the additional revenue obtained by these programs. The report from which this indicator was drawn makes some assumptions about the amounts of revenue districts receive for special education, limited-English-proficient, and LEP and compensatory education students, and makes further assumptions that these revenues represent the best estimate for how much more expensive such students are to educate. In the case of special education students, the additional cost of educating these students was based on a study of expenditures. When these assumptions are made, actual dollar revenues per student can be adjusted for these varying degrees of student "need." The need-adjusted revenues per student exhibit wider differences than are exhibited by the actual dollar revenue differences for each category of district characteristics shown, except for proportion of minority enrollment. The need-adjusted revenues per student across districts with varying proportions of minority students are more equal than shown in the actual dollar amounts. Readers who are interested in a fuller discussion of these issues are encouraged to refer to the report cited above.

¹ Enrollment is in all institutions, public and private, and is based on headcount estimates for preprimary through 12th grade. For higher education, it is full-time-equivalent enrollment.

² Gross domestic product is gross national product less net property income from abroad.

³ Purchasing Power Parity Indices (PPP) were used to convert other currencies to U.S. dollars. Because the fiscal year has a different starting date in different countries, within-country Consumer Price Indices (CPI) were used to adjust the PPPs to account for inflation.

⁴ Expenditures for higher education include expenditures for vocational secondary education, as it is taught in institutions of higher education, and are from 1991-92. Expenditures for pre-primary, 1st-12th grades, and private higher education are from 1990-91.

⁵ Expenditure data for publicly-supported private schools include capital expenditures.

⁶ Includes contributions to the pension funds of teachers who are civil servants.

⁷ All expenditure figures include capital expenditures.

⁸ Expenditure data include only net expenditures for ancillary services.

⁹ Enrollment data from 1990-91.

¹⁰ Public expenditure for education is underestimated because a large part of the pension costs are not included.

¹¹ Excludes expenditures on nursing and paramedical education.

Note on international comparisons of current public education expenditures

The purpose of this indicator is to compare *public* support for education, based on Gross Domestic Product (GDP), population, and school enrollment, across the developed countries for which data are available.

Definitions

Public education expenditures include funds channeled to both public and private schools by federal, state, and local governments either directly or through students. This includes expenditures at public schools funded by public sources and subsidies to students at private schools from government agencies. *Private education expenditures* are expenditures financed by private sources—households, private nonprofit institutions, businesses, and corporations. For example, this includes expenditures supported by public and private school tuition and fees, and expenses for books and materials that must be purchased by students themselves.

Current expenditures are expenditures for educational goods and services whose life span should not in principle exceed the current year (salaries of personnel, school books and other teaching materials, scholarships, minor repairs and maintenance to school buildings, administration, etc.). Current expenditures exclude both capital expenditures (construction of buildings, major repairs, major items of equipment, vehicles) and the servicing of debt.

This indicator focuses on the portion of current education expenditures at both public and private schools funded by public sources.

Expenditures in the United States

Elementary and Secondary

For the United States, *current public expenditures for elementary and secondary education* include current expenditures in local public school districts funded by state and local taxes, federal programs administered by the U.S. Department of Education (ED), and federal programs operated outside of ED that are not administered by state or local education agencies, e.g., Head Start, Department of Defense Schools, and schools operated by the Bureau of Indian Affairs.

Also included are federal expenditures to operate ED and other activities, such as research, statistics, assessment, and school improvement, and state expenditures to operate state departments of education and other direct state expenditures, including state schools for the deaf and blind and reform schools.

Some expenditures, such as those for federal or state agency administration and those for ungraded special education programs, cannot be assigned to particular grade levels by any obviously universally superior method. These expenditures defy strict grade-level categorizations. Like some other countries, the United States has chosen to prorate these expenditures over the grade levels based on the relative size of enrollments, staffing, and salaries. Other countries, however, have chosen not to allocate such expenditures, classifying them, instead, as "undistributed."

Higher Education

Current public expenditures for higher education in the United States include expenditures at both public and private colleges and universities funded by federal, state, and local governments. The Integrated Postsecondary Education Data System (IPEDS), the core postsecondary education data collection program for NCES, gathers institutional reports for revenue received by both public and private institutions from both public and private sources. Current expenditures by public and private nonprofit institutions are separated into public and private expenditures based on the share of current fund revenues from federal, state, and local sources.

Most federal aid goes to students who then spend it on education (e.g., tuition) and noneducation (room and board) services. It was assumed that the 60 percent of federally administered Pell grants were spent by students on education expenditures.

With the exception of Pell grant money, public expenditures for less-than-2-year public and private institutions were not available; therefore, *current public expenditures for higher education* in the United States are biased downward. But the students participating in these institutions are

also excluded from higher education enrollments; as a result, the estimate of *public expenditures per student* would be biased upward if the per-student public expenditures in less-than-2-year institutions are less than those in other higher education institutions.

Private Expenditures

Per pupil expenditures are calculated as current public expenditures divided by enrollment in both public and private schools. This is a measure of average public investment per student in the education system, rather than a measure of the total resources a student receives, which would include private expenditures. For Canada, France, Germany, Japan, and the United States, private education expenditures are a significant portion of the GDP.

Total Expenditures on Education in 1992

Country	Percentage of GDP		Total
	Public sources	Private sources	
Canada	7.2	0.2	7.4
France	5.5	0.4	5.9
Former West Germany*	4.1	1.5	5.6
Spain	4.6	0.7	5.3
Japan	3.6	1.1	4.7
United Kingdom	5.2	—	—
United States	5.4	1.6	7.0

— Not available.

*Data for private sources from 1991.

NOTE: *Total expenditures* include current expenditures, capital expenditures, and interest on debt.

How Students Are Classified

The International Standard Classification of Education (ISCED) was designed as an instrument for presenting statistics of education internationally. Many countries report education statistics to UNESCO and the Organization for Economic Cooperation and Development (OECD) using the ISCED. In this classification system, education is divided into several levels.

The following are summary definitions used in this indicator:

- *Education preceding the first level*, where it is provided, usually begins at age 3, 4, or 5

(sometimes earlier) and lasts from 1–3 years. For the United States, this would primarily be nursery schools and kindergarten classes.

- *Education at the first level* usually begins at age 5, 6, or 7 and lasts for about 5 or 6 years. For the United States, this would start with grade 1 and finish with grade 6.
- *Education at the second level, first stage*, begins at about age 11 or 12 and lasts for about 3 years. *Education at the second level, second stage*, begins at about age 14 or 15 and lasts about 3 years. For the United States, second level would start with grade 7 and finish with grade 12.
- *Education at the third level* is provided at universities, colleges, and professional schools, and typically requires as a minimum condition of admission the successful completion of education at the second level (or equivalent knowledge). For the United States, third level includes junior colleges and degree-granting institutes in addition to 4-year colleges and universities.

For the United States, preprimary education includes enrollment in both public and private nursery schools and kindergartens. This is what is considered *education preceding the first level* using ISCED terminology. ISCED levels 1 and 2 are defined as total public and private enrollments in grades 1–12, and ISCED level 3 is defined as higher education for the purposes of this indicator. Expenditures reported by countries as "undistributed" or "other" are shown in table 54-4, and are not allocated across education levels in this indicator.

How Expenditures Are Compared Across Countries

To compare public expenditures per student in the United States to expenditures per student in other countries, expenditures must be denominated in a common currency. Conversion of other countries' expenditures to U.S. dollars facilitates comparison with expenditures in the United States. There are at least two methods of conversion: (1) market exchange rates, and (2) Purchasing Power Parity (PPP) indices.

The market exchange rate is the rate at which an individual can exchange the currencies of two countries. It is determined by confidence in the

government, the monetary system, and the economies of the two countries and by the relative demand for the commodities that the two countries trade. Market exchange rates can be highly volatile.¹

PPP indices are calculated by comparing the cost of a fixed market basket of goods in each country. Changes over time in the PPP index are determined by the rates of inflation in each country. The PPP index is not volatile.²

PPP indices for the GDP have been used in this indicator.²

Because the fiscal year has a different starting month in different countries, within-country Consumer Price Indices (CPIs) calculated by the International Monetary Fund were used to adjust educational expenditure per-pupil data to allow for inflation between the starting month of the fiscal year and July 1, 1990. See supplemental table 54-5 for both the PPP indices used in this indicator and the CPI adjustment ratios.

Problems in Comparing Education Expenditures Across Countries

There exists some variation in the coverage and the character of the education expenditure data that countries submit to OECD. Sometimes, an individual expenditure item may be included in the expenditure data from one country, but not included in the expenditure data from another. Discrepancies arise because one country may collect certain kinds of data that another country either does not collect, or does not collect in its "education" data collections. Or, one country may define what constitutes an "education" expenditure differently than another country does.

Discrepancies between which expenditure items are included in one country's expenditure figures and not in another's tend to arise in three general domains:

(1) **Non-instructional (or, ancillary) services:** Some countries provide fewer ancillary services in their schools and, thus, include fewer expenditures for such services in their education expenditure figures. Examples of ancillary services are school cafeterias; dormitories; schools sports programs; school health clinics or visiting school nurses; attendance (i.e., truancy) services; and speech or psychological therapy services. U.S. schools tend to subsidize relatively more

ancillary services through their education budgets than do schools in most other countries. In some countries (e.g., Germany), *none* of the aforementioned services are provided at the primary and lower secondary levels by many schools.

(2) **Private expenditures:** Some countries' education systems receive large private contributions. The most common forms of private contributions to education are student tuition or fees; organizational subsidies, such as those provided by religious denominations to their own schools; and corporate in-kind contributions, such as those provided by German and Austrian firms that provide vocational courses on the shop floor for participating youth apprentices. Private expenditures have not been included in the indicators used in this report, in part because precise figures for private education expenditures are not available for the U.S. nor for several other countries.

(3) **The boundaries of education:** There exist fewer (though, still some) inconsistencies in comparing just the *instructional* expenditures for *primary* and *secondary* public education in just the *academic* track. But, the "borderlands" of education cause comparability problems. The borderlands include: preprimary education and daycare; special education; adult education; vocational and technical education; and proprietary education. Some countries, for example, simply do not collect expenditure data for private "center-based" daycare as they do not define such to be "education." Indeed, in some countries, even public daycare is not managed by education authorities; rather, it is the responsibility of human services departments.

The exact location of each "boundary" also varies from country to country and even within each country. In Canada, for example, vocational/technical students in Quebec choose to enter vocational/technical college in the 12th grade, while in the other Canadian provinces with vocational/technical colleges, entry is in the 13th or 14th grade. Thus, vocational/technical students in the other provinces spend another year or two at the upper secondary level. The more time the average student spends in a level of education, the greater will be the expenditure at that level.

Even these three domains do not include all the possible comparability problems. There remain, for example, inconsistencies in how different countries treat public contributions to teacher retirement and fringe benefits, student financial aid, and university research and hospitals.

The National Center for Education Statistics (NCES) has sponsored two studies designed to examine the issue of the comparability of national figures of education expenditure. The studies involve 10 countries and examine, in detail, the content of their education expenditures, as they are reported to the OECD.

Thus far, participating education ministries have been receptive to the idea of improving comparability in the OECD data collection. Indeed, some countries have already modified their data submissions to the OECD for this latest year, thus improving the comparability of education expenditures across countries for the data collection used for this report. These changes were motivated in part by preliminary findings from the NCES expenditure comparability studies.³

NOTES:

¹For a further argument against using market exchange rates, see Edith M. Rasel and Lawrence Mishel, *Shortchanging Education*, Economic Policy Institute, January 1990.

²PPP indices for other aggregates such as private consumption expenditures are available. See Stephen M Barro, *International Comparisons of Education Spending: Some Conceptual and Methodological Issues*, SMB Economic Research, Inc., April 1990, for a discussion of the strengths and weaknesses of using various indices.

³See Stephen M. Barrow, *Preliminary Findings from the Expenditure Comparability Study*, SMB Economic Research, Inc., June, 1993.

¹ Includes institutional and academic support less libraries.

² Includes institutions with medical schools. Private doctoral institutions with a medical school have substantially higher instructional expenditures per FTE student than those without a medical school.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars and the CPI was used to forecast the HEPI to July 1994. Data in this table may differ slightly from data appearing in other tables. Data for academic years 1976-77 through 1985-86 include only institutions that provided both enrollment and finance data. Because of rounding, details may not add to totals.

* Federally supported student aid received through students (e.g., Pell grants) is included under tuition and auxiliary enterprises.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars and the CPI was used to forecast the HEPI to July 1994. Data in this table may differ slightly from data appearing in other tables. Data for 1976-77 through 1985-86 include only institutions that provided both enrollment and finance data. Because of rounding, details may not add to totals.

— Too few observations for a reliable estimate.

¹ The rule used to match assignment field to major was much stricter for this table than for the previous tables. See supplemental note for classification rules.

² Calculated only for teachers who have another assignment field. Twenty-two percent of teachers reported having another assignment field in 1990-91.

NOTE: Social studies was excluded because the questionnaire did not subdivide the specific categories for teaching assignment fields. See supplemental note for definition of assignment field.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1990-91 (Teacher Questionnaire).

Note on definitions of certification and major/minor in assignment field

There are many ways to match a major/minor field of study with teaching assignment fields. One method is to include both the general or specific field as well as the education major/minor parallel field as a match for a specific teaching assignment. For example, a teacher who majored or minored in mathematics or mathematics education would be defined as having majored or minored in the field of mathematics. A stricter definition would exclude the mathematics teachers who majored or minored in mathematics education. This stricter definition is used for the sciences (biology, chemistry, geology/earth sciences, and physics) in all tables.

Certification in Assignment Field

Certification, as defined here, includes advanced, standard, and probationary certification by a state or full certification by an accrediting body other than a state. Teachers with a temporary certification are classified as not certified.

Teachers Excluded from Tables 59-1 through 59-4

Teachers with the following assignment fields are excluded because of difficulties in matching the assignment field with the appropriate major/minor or because, in the case of computer science, a major in the field has been possible for only a few years: basic skills and remedial education; bilingual education; computer science; English as a second language; education of the gifted; reading; religion/philosophy; and unspecified. In addition, the following fields were also excluded because they were only included in the 1990–91 questionnaire, and comparable assignment fields were not available on the 1987–88 questionnaire: American Indian studies; dance; drama/theater; military science; and journalism.

Majored or Minored in Assignment Field for Tables 59-1 through 59-4

Teachers are classified as having majored or minored in their assignment field if they have a major/minor field in the second column corresponding to their assignment in the first column. All degree levels are considered in determining if a match has occurred.

<u>Assignment field(s)</u>	<u>Major/minor field(s)</u>
Art, music	Art, fine and applied, art education, music education
English/language arts	English (literature, letters, speech, classics), English education
Foreign language (1987–88)	Foreign languages, foreign language education
Foreign languages (1990–91): French, German, Latin, Russian, Spanish, other foreign language	French, German, Latin, Russian, Spanish, other foreign language, foreign language education
Mathematics	Mathematics, mathematics education
General and all other sciences	Biological/life sciences, science education, chemistry, physics, geology/earth sciences, other physical sciences
Biology	Biological sciences
Chemistry	Chemistry
Geology/earth sciences	Geology/earth sciences
Physics	Physics
Social studies/social sciences	Social studies/social sciences education, area and ethnic studies, psychology, public affairs and service, economics, history, political science and government, sociology, other social sciences

Special education (1987–88): Mentally retarded, emotionally disturbed, learning disabled, speech and hearing impaired, other special education	Special education (general), education of emotionally disturbed, education of mentally retarded, education of speech/hearing/vision, specific learning disabilities, other special education
Special education (1990–91): Special education (general), emotionally disturbed, mentally retarded, speech/language impaired, deaf and hard-of-hearing, visually handicapped, orthopedically impaired, mildly handicapped, severely handicapped, specific learning disabilities, other special education	Special education (general), emotionally disturbed, mentally retarded, speech/language impaired, visually handicapped, deaf and hard-of-hearing, orthopedically impaired, mildly handicapped, severely handicapped, specific learning disabilities, other special education
Vocational education (1987–88): Business education, home economics, industrial arts, vocational education	Agricultural education, home economics education, industrial arts, vocational and technical, agricultural and natural resources, architecture and natural resources, agriculture and environmental design, engineering, health professions, business and management, communications, business, commerce, distributive education
Vocational education (1990–91): Business marketing, home economics, industrial arts, accounting, agriculture, health occupations, trade and industry, technical and other vocational education	Agricultural and natural resources, business and management, architecture and environmental design, communications and journalism, engineering, agricultural educational, home economics education, industrial arts, vocational and technical, trade and industry education, industrial arts, vocational and technical, trade and industry education
Health, physical education	Health profession and occupations, physical education/health education

Teachers Excluded from Table 59-5

Teachers with the following assignment fields are excluded because of difficulties in matching the assignment field with the appropriate major/minor or because, in the case of computer science, a major in the field has been possible for only a few years: basic skills and remedial education; bilingual education; computer science; English as a second language; education of the gifted; reading; religion/philosophy; unspecified; American Indian studies; dance; and military science.

Majored or Minored in Assignment Field for Table 59-5

Teachers are classified as having majored or minored in their assignment field if the assignment field listed in the left-hand column below matches the major/minor field in the right-hand column. All degree levels are considered in determining if a match has occurred.

<u>Assignment Field</u>	<u>Major/minor field(s)</u>
Art	Art, fine and applied
Drama/theater	Drama/theater
English/language arts	English (literature, letters, speech, classics)
Journalism	Communications and journalism
Mathematics	Mathematics

Indicator 59

Music	Music
French	French
German	German
Latin	Latin
Spanish	Spanish
Biology/life sciences	Biology/life sciences
Chemistry	Chemistry
Geology/earth sciences/space science	Geology/earth sciences
Physics	Physics
General science	Other natural sciences, science education

*Because there are fewer degree-offering categories on the 1990–91 questionnaire than on the 1987–88 questionnaire, for comparability only the following categories were used: bachelor's degree, master's degree, education specialist or professional diploma, or doctoral and first-professional degree.

Table 60-1 Percentage of full-time teachers leaving the teaching profession who gave a reason for leaving, by control of school, school level, and reason for leaving: 1991-92

Sources of Data

The information presented in this report was obtained from many sources, including federal and state agencies, private research organizations, and professional associations. The data were collected using many research methods including surveys of a universe (such as all school districts) or of a sample, compilations of administrative records, and statistical projections. Users of *The Condition of Education* should take particular care when comparing data from different sources. Differences in procedures, timing, phrasing of questions, interviewer training, and so forth mean that the results are not strictly comparable. Following the general discussion of data accuracy below, descriptions of the information sources and data collection methods are presented, grouped by sponsoring organization. More extensive documentation of procedures used in one survey as compared to another does not imply more problems with the data, only that more information is available.

Unless otherwise noted, all comparisons cited in the text were tested for significance using *t*-tests and are significant at the .05 level. However, when multiple comparisons are cited, a Bonferroni adjustment to the significance level was made. When other tests were used, they are described in a note on the indicator page or in the supplemental note for the indicator.

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. In addition to such sampling errors, all surveys, both universe and sample, are subject to design, reporting, and processing errors and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

The estimated standard error of a statistic is a measure of the variation due to sampling and can be used to examine the precision obtained in a particular sample. The sample estimate and an

estimate of its standard error permit the construction of interval estimates with prescribed confidence that the interval includes the average result of all possible samples. If all possible samples were selected, each of these surveyed under essentially the same conditions, and an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average value from all possible samples; 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples; and 99 percent of all intervals from 2.5 standard errors below the estimate to 2.5 standard errors above the estimate would include the average value of all possible samples. These intervals are called 90 percent, 95 percent, and 99 percent confidence intervals, respectively.

To illustrate this further, consider the text table for *Indicator 1* and the standard error table S1 for estimates of standard errors from Census Current Population Surveys. For the 1992 estimate of the percentage of 3-year-olds enrolled in school (27.7 percent), table S1 shows a standard error of 1.2. Therefore, we can construct a 95 percent confidence interval from 25.3 to 30.1 ($27.7 \pm 2 \times 1.2$). If this procedure were followed for every possible sample, about 95 percent of the intervals would include the average for all possible samples.

Standard errors can help assess how valid a comparison between two estimates might be. The standard error of a difference between two sample estimates is approximately equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between sample estimate "a" and sample estimate "b" (if "a" and "b" are approximately independent) is:

$$se_{a-b} = \sqrt{se_a^2 + se_b^2}$$

It should be noted that most of the standard errors presented in the indicators and in the original documents are approximations. That is,

to derive estimates of standard errors that would be applicable to a wide variety of items and that could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

The preceding discussion on sampling variability was directed toward a situation concerning one or two estimates. Determining the accuracy of statistical projections is more difficult. In general, the further away the projection date is from the date of the actual data being used for the projection, the greater the possible error in the projection. If, for instance, annual data from 1977 to 1990 are being used to project enrollment in elementary and secondary education, the further beyond 1990 one projects, the more variability in the projection. One will be less sure of the 1996 enrollment projection than of the 1991 projection. A detailed discussion of the projections methodology is contained in *Projections of Education Statistics to 2004* (National Center for Education Statistics, 1993).

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors can arise in various ways: from respondents or interviewers interpreting questions differently, from respondents estimating the values that they provide, from partial to total nonresponse, from imputation or reweighting to adjust for nonresponse, from inability or unwillingness on the part of respondents to provide correct information, from recording and keying errors, or from overcoverage or undercoverage of the target universe.

Sampling and nonsampling error combine to yield total survey error. Since estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available. In almost all situations, the sampling error represents an underestimate of the total survey error, and thus an overestimate of the precision of the survey estimates.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both total and partial. An adjustment made for either type of nonresponse

is often referred to as an imputation—substitution of the "average" questionnaire response for the nonresponse. Imputations are usually made separately within various groups of sample members, which have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent.

In editions prior to 1992 of *The Condition of Education*, when reporting race-specific data from the Current Population Survey, Hispanics were usually included among whites and blacks (i.e., "Hispanics may be of any race."). Beginning with the 1992 edition, racial/ethnic data from the Current Population Survey excludes Hispanics from whites and blacks (e.g., whites are non-Hispanic whites and blacks are non-Hispanic blacks).

Unless otherwise noted, all dollar values in this volume are expressed in constant 1993 dollars. The Consumer Price Index (CPI) is used to convert current dollars for earlier years to 1993 dollars. The CPI index for calendar year 1994 is 148.4.

How to obtain standard errors for the supplemental tables

Adult Literacy in America

The National Adult Literacy Survey was created as a new measure of literacy and funded by the Department of Education and by 12 states. It is the third and largest assessment of adult literacy funded by the federal government. The aim of the survey is to profile the English literacy of adults in the United States based on their performance across a wide array of tasks that reflect the types of materials and demands they encounter in their daily lives.

To gather the information on adults' literacy skills, trained staff interviewed nearly 13,600 individuals age 16 and older during the first 8 months of 1992. These participants had been randomly selected to represent the adult population in the country as a whole. Black and Hispanic households were oversampled to ensure reliable estimates of literacy proficiencies and to permit analyses of the performance of these smaller subgroups. In addition, some 1,100 inmates from 80 federal and state prisons were interviewed to gather information on the proficiencies of the prison population. In total, over 26,000 adults were surveyed.

Each survey participant was asked to spend approximately an hour responding to a series of diverse literacy tasks as well as questions about his or her demographic characteristics, educational background, reading practices, and other areas related to literacy. Proficiency estimates for these scales were based on responses to the assessment tasks and reflect varying degrees of skill in prose, document, and quantitative literacy.

Beginning Postsecondary Student Longitudinal Study

The Beginning Postsecondary Student Longitudinal Study (BPS) provides information concerning persistence, progress, and attainment from initial time of entry into postsecondary education through leaving school and entering the workforce. BPS includes traditional and nontraditional (e.g., older) students and is representative of all beginning students in postsecondary education. BPS follows first-time, beginning students for at least 6 years at 2-year intervals, collecting student data, postsecondary transcripts, and financial aid reports. By starting with a cohort that has already entered postsecondary education, and following it for 6 years, BPS will be able to determine to what extent, if any, students who start postsecondary education later differ in their progress, persistence, and attainment.

Common Core of Data

The National Center for Education Statistics (NCES) uses the Common Core of Data (CCD) survey to acquire and maintain statistical data on the 50 states, the District of Columbia, and five outlying areas from the universe of state-level education agencies. Information about staff and students is collected annually at the school, LEA (local education agency or school district), and state levels. Information about revenues and expenditures is also collected at the state level, and NCES joins the Bureau of Census in collecting school district finance data. Data are collected for a particular school year (October 1 through September 30) via survey instruments sent to the states by October 15 of the subsequent school year. States have one year in which to modify the data originally submitted.

Since the CCD is a universe survey, the CCD information presented in this edition of *The Condition of Education* is not subject to sampling error. However, nonsampling error could come from two sources—nonreturn and inaccurate reporting. Almost all of the states submit all CCD survey instruments each year, but there are many delays in submitting data and the submissions are sometimes incomplete.

Understandably, when 56 education agencies compile and submit data for over 85,000 public schools and approximately 15,000 local school

districts, misreporting can occur. Typically, this results from varying interpretation of NCES definitions and differing recordkeeping systems. NCES attempts to minimize these errors by working closely with the state education agency representatives in the National Forum on Education Statistics and its state CCD coordinators.

The state education agencies report data to NCES from data collected and edited in the states' regular reporting cycles. NCES encourages the agencies to incorporate into their own survey systems the NCES items they do not already collect so that those items will also be available for the subsequent CCD survey. Over time this has meant fewer missing data cells in each state's response, reducing the need to impute data.

NCES subjects data from the education agencies to a comprehensive edit. Where data are determined to be inconsistent, missing, or out of range, NCES contacts the education agencies for verification. NCES-prepared state summary forms are returned to the state education agencies for verification. States are also given an opportunity to revise their state-level aggregates from the previous survey cycle.

Federal Support for Education

NCES prepares an annual compilation of Federal Funds for Education. Data for U.S. Department of Education program totals come from the *Budget of the U.S. Government*. Budget offices of other federal agencies provide information for all other federal program support except for research funds, which are obligations reported by the National Science Foundation in *Federal Funds for Research and Development*, fiscal years 1965 to 1992. Some data are estimated, based on reports from the federal agencies contacted and the *Budget of the U.S. Government*.

Except for money spent on research, outlays were used to report program funds to the extent

possible. Some tables are obligations as noted in the title of the table. Some federal program funds not commonly recognized as education assistance are also included in the totals reported. For example, portions of federal funds paid to some states and counties as shared revenues resulting from the sale of timber and minerals from public lands have been estimated as funds used for education purposes. Parts of the funds received by states (in 1980) and localities under the General Revenue Sharing Program are also included, as are portions of federal funds received by the District of Columbia. The share of these funds allocated to education was assumed equal to the share of general funds expended for elementary and secondary education by states and localities in the same year as reported by the U.S. Bureau of the Census in its annual publication, *Governmental Finances*.

All state intergovernmental expenditures for education were assumed earmarked for elementary/secondary education. Contributions of parent governments of dependent school systems to their public schools amounted to approximately 9 percent of local government revenues and local government revenue sharing in each year. Therefore, 9 percent of local government revenue-sharing funds were assumed allocated each fiscal year to elementary and secondary education. Parent government contributions to public school systems were obtained from the U.S. Bureau of the Census, *Finances of Public School Systems*.

The amount of state revenue-sharing funds allocated for postsecondary education in 1980 was assumed to be 13 percent, the proportion of direct state expenditures for institutions of higher education reported in *Governmental Finances* for that year.

The share of federal funds for the District of Columbia assigned to education was assumed equal to the share of the city's general fund expenditures for each level of education.

For the job training programs conducted by the Department of Labor, only estimated sums spent on classroom training have been reported as educational program support.

During the 1970s, the Office of Management and Budget (OMB) prepared annual reports on federal education program support. These were

published in *Budget of the U. S. Government [Special Analyses]*. The information presented in this report is not, however, a continuation of the OMB series. A number of differences in the two series should be noted. OMB required all federal agencies to report outlays for education-related programs using a standardized form, thereby assuring agency compliance in reporting. The scope of education programs reported here differs from that of OMB. Off-budget items such as the annual volume of guaranteed student loans were not included in OMB's reports. Finally, while some mention is made of an annual estimate of federal tax expenditures, OMB did not include them in its annual analysis of federal education support. Estimated federal tax expenditures for education are the difference between current federal tax receipts and what these receipts would be without existing education deductions to income allowed by federal tax provisions.

Recipients' data are estimated based on *Estimating Federal Funds for Education: A New Approach Applied to Fiscal Year 1980*, U.S. Department of Education, "Federal Support for Education, Fiscal Years 1980 to 1984," and *Catalog of Federal Domestic Assistance*. The recipients' data tend to undercount institutions of higher education (IHEs), students, and local education agencies (LEAs). This is because some of the federal programs have more than one recipient receiving funds. In these cases the recipients were put into a "mixed recipients" category, because there was no way to disaggregate the amount each recipient received.

High School and Beyond

High School and Beyond (HS&B) is a national longitudinal survey of 1980 high school sophomores and seniors. The base-year survey was a probability sample of 1,015 high schools with a target number of 36 sophomores and 36 seniors in each of the schools. A total of 58,270 students participated in the base-year survey.

Substitutions were made for noncooperating schools—but not for students—in those strata where it was possible. Overall, 1,122 schools were selected in the original sample and 811 of these schools participated in the survey. An additional 204 schools were drawn in a replacement sample. Student refusals and student absences resulted in an 82 percent completion rate for the survey.

Several small groups in the population were oversampled to allow for special study of certain types of schools and students. Students completed questionnaires and took a battery of cognitive tests. In addition, a sample of parents of sophomores and seniors (about 3,600 for each cohort) was surveyed.

HS&B first followup activities took place in the spring of 1982. The sample design of the first followup survey called for the selection of approximately 30,000 people who were sophomores in 1980. The completion rate for sophomores eligible for on-campus survey administration was about 96 percent. About 89 percent of the students who left school between the base year and first followup surveys (dropouts, transfer students, and early graduates) completed the first followup sophomore questionnaire.

In designing the senior cohort first followup survey, one of the goals was to reduce the size of the retained sample, while still keeping sufficient numbers of minorities to allow important policy analyses. A total of 11,227 (94 percent) of the 11,995 persons subsampled completed the questionnaire. Information was obtained about the respondents' school and employment experiences, family status, and attitudes and plans.

The sample for the second followup, which took place in spring 1984, consisted of about 12,000 members of the senior cohort and about 15,000 members of the sophomore cohort. The completion rates were 91 percent for the senior cohort and 92 percent for the sophomore cohort.

HS&B third followup data collection activities were performed in spring 1986. Both the sophomore and senior cohort samples for this round of data collection were the same as those used for the second followup survey. The completion rates for the sophomore and senior

cohort samples were 91 percent and 88 percent, respectively.

High School Transcript Studies

As part of the first followup survey of High School and Beyond, transcripts were requested in fall 1982 for an 18,152-member subsample of the sophomore cohort. Of the 15,941 transcripts actually obtained, 1,969 were excluded because the students had dropped out of school before graduation, 799 were excluded because they were incomplete, and 1,057 were excluded because the students graduated before 1982 or the transcript indicated neither a dropout status nor graduation. Thus 12,116 transcripts were used for the overall curriculum analysis presented in this publication.

All courses in each transcript were assigned a six-digit code based on *A Classification of Secondary School Courses* (developed by Evaluation Technologies, under contract with NCES). Credits earned in each course were expressed in Carnegie units. (The Carnegie unit is a standard of measurement that represents 1 credit for the completion of a 1-year course. To receive credit for a course, the student must have received a passing grade—"pass," "D," or higher.) Students who transferred from public to private schools or from private to public schools between their sophomore and senior years were eliminated from public/private analyses.

Transcripts of 1987 high school graduates were compared with transcripts of 1982 graduates to describe changes in course taking across this 5-year period. The analyses were based on approximately 22,700 transcripts of 1987 graduates obtained as part of the 1987 High School Transcript Study and 12,000 transcripts of 1982 graduates who participated in the HS&B project. A brief description of each study is provided below.

The sample of schools for the 1987 High School Transcript Study (conducted by Westat, Inc. for

the U.S. Department of Education, NCES) consisted of a nationally representative sample of 471 eligible secondary schools selected for 1986 National Assessment of Educational Progress (NAEP) for grade 11/age 17 students, of which 433 schools participated.

The 1990 High School Transcript Study was conducted using methodology and techniques nearly identical to those used in the 1987 study. The sample of schools was a nationally representative sample of schools teaching grade 12 or having 17-year-old students, and the sample of students was a representative sample of seniors graduating from each school. Approximately three-fourths of the sample for the transcript study had participated in NAEP assessments in 1990.

These analyses focused on high school graduates, so only those students who had graduated from high school were included—from the 1990 study, the 1987 High School Transcript Study, and from High School and Beyond. Because the methods of identifying and defining handicapped students were different for the later studies, and in order to make the samples as comparable as possible, it was necessary to restrict the samples to those students whose records indicated they had not participated in a special education program.

Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaces and supplements the Higher Education General Information Survey (HEGIS).

IPEDS consists of several integrated components that obtain information on where postsecondary education is available (institutions), who participates in it and completes it (students), what programs are offered and what programs

are completed, and what human and financial resources are involved in the provision of institutionally based postsecondary education. Specifically, these components include: institutional characteristics, including institutional activity; fall enrollment, including age and residence; fall enrollment in occupationally specific programs; completions; finance; staff; salaries of full-time instructional faculty; and academic libraries.

The higher education portion of this survey is a census of accredited 2- and 4-year colleges. From 1986–92, data from private less-than-2-year institutions (primarily vocational/technical institutions) were collected through a sample survey. Thus, some portions of all postsecondary institutional data will be subject to sampling and nonsampling errors, while that portion from accredited 2- and 4-year colleges will be subject only to nonsampling error. In 1993, IPEDS began to survey the universe of all postsecondary institutions eligible for Title IV student financial aid.

Prior to the establishment of IPEDS in 1986, HEGIS acquired and maintained statistical data on the characteristics and operations of institutions of higher education. Implemented in 1966, HEGIS was an annual universe survey of institutions listed in the latest NCES *Education Directory of Colleges and Universities*.

The trend tables presented in this report draw on IPEDS and HEGIS surveys, which solicited information concerning institutional characteristics, faculty salaries, finances, enrollment, and degrees. Since these surveys were distributed to all higher education institutions, the data presented were not subject to sampling error. However, they were subject to nonsampling error, the sources of which varied with the survey instrument. Information concerning the nonsampling error of the enrollment and degrees surveys draws extensively on the "HEGIS Post-Survey Validation Study" conducted in 1979.

Further information on IPEDS may be obtained from:

Roslyn Korb
Postsecondary Education Statistics Division
National Center for Education Statistics

555 New Jersey Avenue NW
Washington, DC 20208–5652

Fall Enrollment. This survey has been part of the IPEDS or HEGIS series since 1966. The enrollment survey response rate was relatively high; the 1990 response rate was 87.2 percent. Major sources of nonsampling error for this survey were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen, other first-time students, and unclassified students for both full-time and part-time categories. These problems occurred most often at 2-year institutions (private and public) and private 4-year institutions. In the 1977–78 HEGIS validation studies, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain aggregation levels.

Beginning with fall 1986, the survey system was redesigned with the introduction of IPEDS (see above). The new survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows the Center flexibility to release early data sets while still maintaining a more accurate final database.

Salaries, Tenure, and Fringe Benefits of Full-Time Instructional Faculty. This survey has been conducted for most years from 1966–67 to 1985–86, and in 1987–88 and 1989–90. Although the survey form was changed a number of times during those years, only comparable data are presented in this report. The data were collected from the individual colleges and universities.

Between 1966–67 and 1985–86 this survey differed from other HEGIS surveys in that imputations were not made for nonrespondents. Thus, there is some possibility that the salary averages presented in this report may differ from

the results of a complete enumeration of all colleges and universities. Beginning with the surveys for 1987–88, the IPEDS data tabulation procedures included imputations for survey nonrespondents. The response rate for the 1989–90 survey was 80.5 percent. The response rate for public colleges was substantially higher than the response rate for private colleges. Thus, it is probable that the public colleges' salary data are more accurate than the data for private colleges. Although data from these surveys are not subject to sampling error, sources of nonsampling error included computational errors and misclassification in reporting and processing. NCES checked individual colleges' data for internal and longitudinal consistency and contacted the colleges to check inconsistent data.

Completions. This survey was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970–71 and 1982–83. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970–71 through 1981–82 is directly comparable, care must be taken if information before or after that period is included in any comparison. For example, degrees-conferred trend tables arranged by the 1982–83 classification were added to the *Digest of Education Statistics, 1992* to provide consistent data from 1970–71 to 1988–89.

However, data on associate's degrees and other formal awards below the baccalaureate, by field of study after 1982–83, are not comparable with figures for earlier years. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was high, with the response rate for the 1989–90 survey at 92.3 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

The major sources of nonsampling error for this survey were differences between the NCES program taxonomy and taxonomies used by the colleges, classification of double majors and double degrees, operational problems, and survey timing. In the 1979 HEGIS validation study, these sources of nonsampling were found to contribute to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The

differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and Ph.D. programs in labor and industrial relations (20 percent and 8 percent); bachelor's and master's programs in art education (3 percent and 4 percent); bachelor's and Ph.D. programs in business and commerce, and in distributive education (5 percent and 9 percent); master's programs in philosophy (8 percent); and Ph.D. programs in psychology (11 percent).

Financial Statistics. This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell Grant data were collected on federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of IPEDS in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by subtracting the largely duplicative Pell Grant amounts from the later data to maintain comparability with pre-FY 82 data.

Possible sources of nonsampling error in the financial statistics include nonresponse, imputation, and misclassification. The response rate has been about 85–90 percent for most of the years reported. The response rate for the FY 1989 survey was 83.5 percent.

Two general methods of imputation were used in HEGIS. If the prior year's data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in

enrollments. If no previous year's data were available, current data were used from peer institutions selected for location (state or region), control, level, and enrollment size of institution. In most cases estimates for nonreporting institutions in IPEDS were made using data from peer institutions.

Beginning with FY 87, the new survey system (IPEDS, see above) has comprised all postsecondary institutions, but has also maintained comparability with earlier surveys by allowing 2- and 4-year HEGIS institutions to be tabulated separately. The finance data tabulated for this publication reflect totals for the HEGIS or higher education institutions only. For FY 87 through FY 89, in order to maintain comparability with the historical time series of HEGIS institutions, data were combined from two of the three different survey forms that make up the IPEDS survey system. The vast majority of the data were tabulated from Form 1, which was used to collect information from public and private nonprofit 2- and 4-year colleges. Form 2, a condensed form, was used to gather data for the 2-year proprietary institutions. Because of the differences in the data requested on the two forms, several assumptions were made about the Form 2 reports so that their figures could be included in the institutions of postsecondary education totals.

In IPEDS, the Form 2 institutions were not asked to separate appropriations from grants and contracts, nor state from local sources of funding. For the Form 2 institutions, all the federal revenues were assumed to be federal grants and contracts and all of the state and local revenues were assumed to be restricted state grants and contracts. All other Form 2 sources of revenue, except for tuition and fees and sales and services of educational activities, were included under "other." Similar adjustments were made to the expenditures accounts. The Form 2 institutions reported instruction, scholarship, and fellowship expenditures only. All other educational and general expenditures were allocated to academic support.

To reduce reporting error, NCES used national standards for reporting financial statistics. These standards are contained in *College and University Business Administration: Administrative Services* (1974 edition), published by the National

Association of College and University Business Officers; *Audits of Colleges and Universities* (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and *HEGIS Financial Reporting Guide* (1980), by NCES. Wherever possible, definitions and formats in the survey form are consistent with those in these three accounting texts.

Fall Staff. The fall staff data presented in this publication were collected in cooperation with the U.S. Equal Employment Opportunity Commission (EEOC). In 1989, survey instruments were mailed to 6,669 in-scope postsecondary education institutions, including 2,576 4-year schools, 2,739 2-year schools, and 273 public less-than-2-year schools. The universe of 5,002 less-than-2-year private institutions were represented by a sample of 1,071 institutions.

EEOC collects staff data through the Higher Education Staff Information (EEO-6) report from all higher education institutions with 15 or more full-time employees. NCES, through the IPEDS system, collects data from all other postsecondary institutions, including higher education institutions with less than 15 full-time employees. NCES and EEOC collect staff data biennially in odd numbered years in institutions of postsecondary education. The IPEDS file combines data from the two surveys to create the IPEDS "Fall Staff" data tape. For example, the IPEDS "Fall Staff" questionnaires were mailed out in July 1989 by NCES; the respondents reported the number of employees in their institution as of October 1, 1989. The EEO-6 questionnaires were mailed out by EEOC between October and November 1989; the respondents reported the employment statistics in their institution that cover the payroll period closest to October 1 or the survey year.

The 3,589 institutions of higher education (in the 50 states and the District of Columbia) in operation in 1989 form a subset of the universe of postsecondary institutions in this report. These institutions are accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education; these institutions previously were surveyed under HEGIS, which IPEDS supersedes.

The "Fall Staff" survey had an overall response rate of 77.4 percent. This response rate was

calculated as the ratio of the number of completed survey forms divided by the number of in-scope institutions. The response rate for higher education institutions was 89.6 percent.

Institutional Characteristics. This survey provided the basis for the universe of institutions presented in the *Education Directory, Colleges and Universities*. The universe comprised institutions that met certain accreditation criteria and offered at least a 1-year program of college-level studies leading toward a degree. All of these institutions were certified as eligible by the U.S. Department of Education's Division of Eligibility and Agency Evaluation. Each fall, institutions listed in the previous year's *Directory* were asked to update a computer printout of their information.

National Assessment of Educational Progress

The National Assessment of Educational Progress is a Congressionally mandated study funded by the Office of Educational Research and Improvement, U.S. Department of Education. The overall goal of the project is to determine the nation's progress in education. To accomplish this goal, a cross-sectional study was designed and initially implemented in 1969. Periodically, NAEP has gathered information about levels of educational achievement across the country. NAEP has surveyed the educational accomplishments of 9-, 13-, and 17-year-old students (and in recent years, grades 4, 8, and 12), and occasionally young adults, in 10 learning areas. Different learning areas were assessed annually and, as of 1980-81, biennially. Most areas have been periodically reassessed in order to measure possible changes in education achievement.

The reading, writing, mathematics, and science assessments presented in this publication were conducted by either the Education Commission of the States (1969-1983) or the Educational Testing Service (1983 to the present). NAEP in-school assessments were based on a deeply stratified three-stage sampling design to obtain a nationally representative sample by age and, beginning in 1983-84, by grade. The first stage of sampling entails defining and selecting primary sampling units (PSUs). For each grade level (4, 8, or 12), the second stage entails enumerating, stratifying, and randomly selecting schools, both public and private, within each PSU selected at

the first stage. The third stage involves randomly selecting students within a school for participation in NAEP. Assessment exercises were administered to small groups of students by specially trained personnel.

Information from NAEP is subject to both nonsampling and sampling error. Two possible sources of nonsampling error are nonparticipation and faulty instrumentation. The effects of nonparticipation are in some ways reduced through oversampling, although this does not assess the bias of nonparticipants. Instrumentation nonsampling error includes whether the NAEP assessment instruments measure what is being taught and in turn what is being learned by the students, ambiguous items or instructions, and insufficient time limits.

National Education Longitudinal Study of 1988

The National Education Longitudinal Study of 1988 (NELS:88) is the third major longitudinal study sponsored by the National Center for Education Statistics. The two studies that preceded NELS:88, the National Longitudinal Study of the High School Class of 1972 (NLS-72) and HS&B surveyed high school seniors (and sophomores in HS&B) through high school, postsecondary education, and work and family formation experiences. Unlike its predecessors, NELS:88 began with a cohort of eighth-grade students.

NELS:88 is designed to provide trend data about critical transitions experienced by young people as they develop, attend school, and embark on their careers. It complements and strengthens state and local efforts by furnishing new information on how school policies, teacher practices, and family involvement affect student educational outcomes (i.e., academic achievement, persistence in school, and participation in postsecondary education). The base-year NELS:88 was a multifaceted study questionnaire with four cognitive tests, and

Sources of Data

questionnaires for students, teachers, parents, and the school.

Sampling was first conducted at the school level and then at the student level within schools. The data were drawn from a nationally representative sample of 1,000 schools (800 public schools and 200 private schools, including parochial institutions). Within this school sample, 26,000 eighth grade students were selected at random. The first and second followups revisited the same sample of students in 1990 and 1992, when the 1988 eighth-graders were in the 10th and 12th grades. Similar followups are being conducted in 1994 and 1997.

National Household Education Survey

The National Household Education Survey (NHES) is the first major attempt by the National Center for Education Statistics to go beyond its traditional, school-based data collection to a household survey. Historically, NCES has collected data from teachers, students, and schools through school-based surveys and from administrative records data through surveys of school districts and state education agencies. NHES has the potential to address many issues in education that have not been addressed previously by NCES data collection activities.

NHES is designed as a mechanism for collecting detailed information on educational issues from a relatively large and targeted sample of households in a timely fashion. Data for the NHES are being collected through telephone interviews, a relatively new approach for gathering data related to education issues. NHES uses Random Digit Dialing (RDD) to select households and Computer Assisted Telephone Interviewing (CATI) to collect information from household members. The sample for the NHES is drawn from the non-institutionalized civilian population in households with a telephone in the 50 states and the District of Columbia.

During the spring of 1991, NCES fielded a full-scale NHES on early education. Approximately

60,000 households were screened to identify a sample of children 3-8 years old. The parents of these children were interviewed in order to collect information about their children's educational activities and the role of the family in children's learning. At the same time, an adult education supplement was fielded. Adult household members were sampled and questioned about their participation in adult education.

The adult education component was, for the most part, adapted from the previous Current Population Survey (CPS) adult education supplements. However, unlike the CPS, it collects information on both adult education participants and nonparticipants. At present, NCES plans to field the adult education component once every 4 years after 1991. The NHES:91 survey identified and screened more than 60,000 households. A knowledgeable adult was asked a series of questions to screen all household members for adult education participation in a sample of about 20,000 of these 60,000 households, resulting in interviews with approximately 9,800 adult education participants and 2,750 nonparticipants. The adult education component of NHES can be used to address many questions about the patterns of participation by demographic and labor force characteristics. It includes data on reasons for taking courses, on the providers of the courses, and the cost of the courses. Information was also collected from non-participants concerning barriers to their participation.

National Longitudinal Study of the High School Class of 1972

The National Longitudinal Study (NLS) of the High School Class of 1972 began with the collection of base-year survey data from a sample of about 19,000 high school seniors in the spring of 1972. Five more followup surveys of these students were conducted in 1973, 1974, 1976,

1979, and 1986. The NLS was designed to provide the education community with information on the transitions of young adults from high school through postsecondary education and the workplace.

The sample design for the NLS is a stratified, two-stage probability sample of students from all schools, public and private, in the 50 states and the District of Columbia, with a 12th-grade enrollment during the 1971-72 school year. During the first stage of sampling, about 1,070 schools were selected for participation in the base-year survey. As many as 18 students were selected at random from each of the sample schools. The sizes of the school and student samples were increased during the first followup survey. Beginning with the first followup and continuing through the fourth followup, about 1,300 schools participated in the survey, and slightly under 23,500 students were sampled. The response rates for each of the different rounds of data collection have been 80 percent or higher.

Sample retention rates across the survey years have been quite high. For example, of the individuals responding to the base-year questionnaire, the percentages who responded to the first, second, third, and fourth followup questionnaires were about 94, 93, 89, and 83 percent, respectively.

National Postsecondary Student Aid Study

The National Center for Education Statistics conducted the National Postsecondary Student Aid Study (NPSAS) for the first time during the 1986-87 school year. This survey established the first comprehensive student financial aid database. Data were gathered from 1,074 postsecondary institutions and approximately 60,000 students and 24,000 parents. These data provided information on the cost of postsecondary education, the distribution of financial aid, and characteristics of both aided

and non-aided students and their families, and the nature of aid packages.

In response to the continuing need for these data, NCES conducted the second cycle of NPSAS for the 1989-90 school year. In addition to replicating the earlier study, the 1990 NPSAS contains enhancements to the 1987 methodology that will fully meet the data needs of the financial aid community and of policymakers.

The 1990 in-school sample involved about 70,000 students selected from registrar lists of enrollees at 1,200 postsecondary institutions. The sample included both aided and nonaided students. Student information such as field of study, education level, and attendance status (part-time or full-time) was obtained from registrar records. Types and amounts of financial aid and family financial characteristics were abstracted from school financial aid records. Also, approximately 26,000 parents of students were sampled. Data concerning family composition and parent financial characteristics was compiled. Followup data collections are expected at 2-year intervals. Students enrolled in postsecondary education for the first time in 1990 will serve as the base for the longitudinal component of NPSAS.

National Survey of Postsecondary Faculty

The National Survey of Postsecondary Faculty (NSOPF-88) was a comprehensive survey of higher education instructional faculty in the fall of 1987. It was the first such survey conducted since 1963. It gathered information regarding the backgrounds, responsibilities, workloads, salaries, benefits, and attitudes of both full- and part-time instructional faculty in 2- and 4-year institutions under both public and private control. In addition, information was gathered from institutional and department-level respondents on such issues as faculty composition, new hires, departures and recruitment, retention, and tenure policies.

There were three major components of the study: a survey of institutional-level respondents at a stratified random sample of 480 U.S. colleges and universities; a survey of a stratified random sample of 3,029 eligible department chairpersons (or their equivalent) within the participating 4-year institutions; and a survey of a stratified random sample of 11,013 eligible faculty members within the participating institutions. Response rates to the three surveys were 88 percent, 80 percent, and 76 percent, respectively.

The universe of institutions from which the sample was selected was all accredited nonproprietary U.S. postsecondary institutions that grant a 2-year (associate's) or higher degree and whose accreditation at the higher education level is recognized by the U.S. Department of Education. This includes religious, medical, and other specialized postsecondary institutions as well as 2- and 4-year nonspecialized institutions. According to the 1987 IPEDS, this universe comprised 3,159 institutions. The universe does not include proprietary 2- and 4-year institutions or less-than-2-year postsecondary institutions.

Projections of Education Statistics

Since 1964, NCES has published *Projections of Education Statistics*, projecting key statistics for elementary and secondary schools and institutions of higher education. Data are included for enrollments, instructional staff, graduates, and earned degrees. *Projections* includes several alternative projection series and a methodology section describing the techniques and assumptions used to prepare them. Data in this edition of *The Condition of Education* reflect the intermediate projection series only.

Differences between the reported and projected values are, of course, almost inevitable. An evaluation of past projections revealed that, at the elementary and secondary level, projections of enrollment have been quite accurate: mean absolute percentage differences for enrollment

projections from 1 to 5 years into the future were less than 1 percent, while those for teachers were less than 4 percent.

Since projections of time series are subject to errors both by the nature of statistics and the properties of projection methodologies, users are cautioned not to place too much confidence in the numerical values of the projections. Important but unforeseeable economic and social changes may lead to differences. Projections are to be considered as indicators of broad trends.

Survey of Recent College Graduates

NCES has conducted periodic surveys of persons, about 1 year after graduation, to collect information on college outcomes. The "Recent College Graduates" surveys have concentrated on those graduates entering the teaching profession. To obtain accurate results on this smaller subgroup, graduates who are newly qualified to teach have been oversampled in each of the surveys. The survey involves a two-stage sampling procedure. First, a sample of institutions awarding bachelor's and master's degrees is selected and stratified by percentage of education graduates, control, and type of institution. Second, for each of the selected institutions, a sample of degree recipients is chosen. The response rates on the recent college graduates survey have tended to be low because of the great difficulty in tracing the students after graduation. Much more of the nonresponse can be attributed to invalid mailing addresses than to refusals to participate. Despite their shortcomings, the data are presented in this report because they provide valuable information not available elsewhere about college outcomes. Users should be cautious about drawing conclusions based on data from small samples. It is also likely that the data are somewhat biased since the more mobile students, such as graduate students, are the most difficult to track for the survey.

The 1976 survey of 1974–75 college graduates was the first and smallest of the series. The sample consisted of 209 schools, of which 200 (96 percent) responded. Of the 5,506 graduates in the sample, 4,350 responded, for a response rate of 79 percent.

The 1981 survey was larger, with a coverage of 301 institutions and 15,852 graduates. Responses were obtained from 286 institutions, for an institutional response rate of 95 percent, and from 9,312 graduates (716 others were determined to be out of scope), for a response rate of 62 percent.

The 1985 survey requested data from 18,738 graduates from 404 colleges. Responses were obtained from 13,200 students, for a response rate of 74 percent (885 were out of scope). The response rate for the colleges was 98 percent.

The 1987 survey form was sent to 21,957 graduates. Responses were received from 16,878, for a response rate of 79.7 percent.

The 1987 *Transcript Study* collected transcripts for each student who was part of the 1987 sample.

The 1991 survey sampled 18,135 graduates and 400 institutions. The response rates were 83 percent for the graduates and 95 percent for institutions.

International Assessment of Educational Progress

In 1990–91, a total of 20 countries assessed the mathematics and science achievement of 13-year-old students and 14 of the 20 countries assessed 9-year-old students in these same subjects. Some countries assessed virtually all age-eligible children in the appropriate age group; others confined their samples to certain geographic regions, language groups, or grade levels. The definition of populations often followed the structure of school systems, political divisions, and cultural distinctions. In some countries, significant proportions of age-eligible children were not represented because they did not attend school (see notes to supplemental tables 15:1–4

and 16:1–4). Also, in some countries, low rates of school or student participation mean results may be biased.

Typically, a random sample of 3,300 students from about 110 different schools was selected from each population at each age level; half were assessed in mathematics and half in science. A total of about 175,000 9- and 13-year-olds (those born in calendar years 1981 and 1977, respectively) were tested in 13 different languages in March 1991.

The achievement tests lasted 1 hour. The tests given to 9-year-olds included 62 questions in mathematics and 60 questions in science. Those for 13-year-olds included 76 questions in mathematics and 72 questions in science. In addition, students of each age group spent about 10 minutes responding to questions about their backgrounds and home and school experiences. School administrators completed a school questionnaire.

Initial analyses involved the calculation of the percentage of correct answers and standard errors for individual questions. For each population, the weighted percentage of correct answers was calculated for each question. The results of students who omitted questions at the end of sections because they did not reach them were excluded from the calculations for those questions. For each percentage correct, an estimate of its standard error was calculated using the jackknife procedure. Percentage and standard errors were calculated for subgroups within each population, including gender and grade. Statistics for Canada were calculated using an appropriately weighted sample of responses drawn from the individual Canadian populations.

Sources of Data

Schools and Staffing Survey

The school work force and teacher supply and demand are fundamental features of America's public and private school landscape. Yet, until recently, there has been a lack of data on the characteristics of our children's teachers and administrators and their workplace conditions. The Schools and Staffing Survey (SASS) was designed to meet this need. This survey is a comprehensive public and private, elementary/secondary education database that combines and expands three separate surveys NCES has conducted in the past. These included surveys of teacher demand and shortage, of public and private schools, and of public and private school teachers. The school administrator survey is a new addition to the NCES database.

Schools were the primary sampling unit for SASS, and a sample of teachers was selected in each school; public school districts were included in the sample when one or more of their schools was selected. The 1990–91 SASS included approximately 12,800 schools (9,300 public and 3,500 private), 65,000 teachers (52,000 public and 13,000 private), and 5,600 public school districts. The survey was conducted by mail with telephone followups.

The SASS sample has been designed to support the following types of estimates and comparisons: national and state estimates for public schools and teachers; estimates for private schools and teachers at the national level and for selected orientation groupings; and national comparisons of elementary, secondary, and combined schools and teachers. SASS was first conducted in the 1987–88 school year. Data collection at 2-year intervals began in 1990–91.

Another component of SASS is the Teacher Followup Survey (TFS). It consists of a subsample of SASS, and is implemented 1 year after the base-year survey. The survey identifies and collects data from various groups of teachers who were interviewed the previous year: (1) those persons who remain in the teaching profession, including those who remain in the same school as well as those who have moved; and (2) those persons who have left the teaching profession. These data are used to provide information about teacher attrition and retention

in the public and private schools and to project teacher demand during the 1990s.

Elementary and Secondary School Civil Rights Survey

The Office for Civil Rights (OCR) in the U.S. Department of Education conducts periodic surveys of elementary and secondary schools to obtain data on the characteristics of students enrolled in public schools throughout the nation. Racial/ethnic status, gender, limited English proficiency, and handicapping conditions are among the characteristics covered by recent surveys. Such information is required by OCR to fulfill its responsibilities under Title VI of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, and section 504 of the Rehabilitation Act of 1973. The 1976 survey was a complete census of public school districts in the nation. The 1984, 1986, and 1988 surveys were based on samples. The universe, from which the districts were to be sampled, was defined to be all public schools in the nation (50 states and the District of Columbia). A universe file maintained by the National Center for Education Statistics from its Common Core of Data was used. The selection factors used in selecting the sample were (1) minimum percent coverage of a specific population variable, and (2) maximum percent standard deviation of a projection of a population variable from the sample to the universe total.

Stratification also included district size and state. The 1984, 1986, 1988, 1990, and 1992 surveys are subject to sampling and nonsampling errors.

Annual Report to Congress on the Implementation of the Education of the Handicapped Act

The Education of the Handicapped Act (EHA) requires the Secretary of Education to transmit to Congress annually a report describing the progress in serving the nation's handicapped children. The annual report contains information on such children served by the public schools under the provisions of Part B of the EHA and on children served in state-operated programs (SOP) for the handicapped under Chapter I of the Education Consolidation and Improvement Act (ECIA). Statistics on children receiving special education and related services in various settings and on school personnel providing such services are reported in an annual submission of data to the Office of Special Education and Rehabilitative Services (OSERS) by the 50 states, the District of Columbia, and the outlying areas. The child count information is based on the number of handicapped children receiving special education and related services on December 1 of each year for EHA and October 1 for Chapter I of ECIA/SOP.

Since each participant in programs for the handicapped is reported to OSERS, the data are not subject to sampling error. However, nonsampling error can occur from a variety of sources. Some states follow a noncategorical approach to the delivery of special education services but produce counts by handicapping condition only because EHA-B requires it. In those states that do categorize their handicapped students, definitions and labeling practices vary. In each case, even though states must use the federal definitions of the handicapping categories for reporting purposes, there is no way to judge the accuracy of these states' relabeling of their students for the federal count. Some states also have reported combined counts for some of the smaller categories of handicap.

These variations in labeling practices may help explain why there have been inconsistencies both

year to year within a given state and from state to state in the ways in which students with more than one handicapping condition have been categorized. However, federal and state efforts to ensure that children are being classified and reported appropriately, and efforts to achieve greater consistency in classification and reporting among states help minimize these variations.

330 C Street SW
Washington, DC 20202

Current Population Survey

Current estimates of school enrollment and social and economic characteristics of students are based on data collected in the Census Bureau's monthly household survey of about 60,000 households, the CPS. The CPS covers 729 sample areas consisting of 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. The current sample was selected from 1980 census files and is periodically updated to reflect new housing construction.

The primary function of the monthly CPS is to collect data on labor force participation of the civilian noninstitutional population. (It excludes military personnel and inmates of institutions.) In October of each year, questions on school enrollment by grade and other school characteristics are asked about each member of the household.

The estimation procedure employed for the monthly CPS data involves inflating weighted sample results to independent estimates for the total civilian noninstitutional population by age, sex, race, and Hispanic origin. These independent estimates are derived from statistics from decennial censuses of the population: statistics on births, deaths, and immigration and

Sources of Data

emigration; and statistics on the strength of the Armed Forces. Generalized standard error tables are provided in the *Current Population Reports*. The data are subject to both nonsampling and sampling errors.

Further information is available in the *Current Population Reports*, Series P-20, or by contacting:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

School Enrollment. Each October, the CPS includes supplemental questions on the enrollment status of the population aged 3 and older. Annual reports documenting school enrollment of the population have been produced by the Bureau of the Census since 1946. The latest report is *Current Population Reports*, Series P-20, No. 469, *School Enrollment—Social and Economic Characteristics of Students: October 1991*. All sample surveys are subject to sampling and nonsampling error. The main sources of nonsampling error in the supplement are those inherent in any household survey. When a household respondent reports for all individuals in the household, is that person knowledgeable about the grade or level of school, type of school, or full-time status? In addition, some analysts believe social acceptability of response causes biased reporting, such as reluctance to report lack of a high school diploma; some dismiss it. Household-reported data may not be consistent with administrative data because definitions may not be the same. An additional source of variation in statistics reported may be a change in the survey universe over time. For example, a significantly larger proportion of young men were members of the Armed Forces in the late 1960s and early 1970s than before or after and, therefore, were not in the CPS universe. That caused a short-term increase in the school enrollment *rate* of young men, which was greater than the increase in numbers of enrollees would indicate. Other events may similarly affect survey data. The user must be mindful of external events as well as the character of the population being measured when describing survey trends.

An advantage of household survey data over administrative data is the availability of

demographic, social, and economic data for the student and family. Beginning with data for October 1981, tabulations have been controlled to the 1980 census. Estimates for earlier years were controlled to earlier censuses.

Questions concerning the CPS school enrollment data may be directed to:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Educational Attainment. Data on years of school completed are derived from two questions on the CPS instrument. Biennial reports documenting educational attainment are produced by the Bureau of the Census using March CPS data. The latest report is *Current Population Reports*, Series P-20, No. 451 *Educational Attainment in the United States, March 1989 and 1988*.

The usual constraints on use of household survey data apply. Reliability of response may depend on whether a proxy respondent was used, the recency and importance of the event, and the number and clarity of response categories. There is some evidence that years of school completed in the CPS may not measure completion of degrees as clearly as they once did. The number of persons who have completed 4 years of college has been increasing more rapidly than the number of bachelor's degrees added each year would suggest. While the number of years completed is not deteriorating in quality (that is, respondents are not exaggerating the number of years), more students than in the past are taking more than 4 academic years to complete a bachelor's degree. Also, although interviewers are instructed to count receiving a high school diploma by means of passing a GED exam as completion of the 12th grade, as the number of persons who have received a diploma in this way has increased the number counted appropriately may not have kept pace. The 1990 Census of Population contains a question on highest degree received rather than relying solely on a "years of school completed" item.

Beginning with the data for March 1980, tabulations have been controlled to the 1980 census. Estimates for earlier years were controlled to earlier censuses.

Questions concerning the CPS educational attainment data may be directed to:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Participation in Adult Education. In May of 1969, 1972, 1975, 1978, 1981, and 1984, the CPS included a supplemental inquiry on "Participation in Adult Education" (PAE). In addition to the questions on the CPS, interviewers asked if anyone in the household 17 years of age or older had participated in adult education in the 12-month period prior to the survey date. A survey form was filled out by the interviewer or left with a proxy member of the household for participants who were not at home at the time of the interview. In 1981, the supplement form was no longer left with the proxy but completed by the interviewer.

The PAE response rate of 94 percent in 1981 must be viewed in conjunction with the 96 percent response rate of the CPS. The overall response rate for the PAE survey in 1981 is then 90 percent.

Postsecondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208-5652

Voting and Registration. In November of election years, the CPS includes supplemental questions on voting and registration within the civilian noninstitutional population. CPS voting estimates exceed counts of the actual number of votes cast. On balance, the CPS overstates voting in Presidential elections by 10-20 percent of the total number of persons reported as having voted. Some of the possible reasons for the discrepancies are: (a) understatement of actual number of votes cast; (b) possible reluctance of some CPS respondents to admit to not voting; (c) nonresponse to the CPS survey; (d) CPS undercoverage of certain groups in the population in which nonvoting may be high; (e) use of a single household respondent to report on the voting and registration of all persons in the household. These reasons are discussed in greater detail in *Current Population Reports, Series*

P-20, No. 453, "Voting and Registration in the Election of November 1990," pp. 9-11.

Data on voter participation by social and economic characteristics of the population of voting age have been published since 1964 in *Current Population Reports, Series P-20*. The latest report is "Voting and Registration in the Election of November 1990," No. 453.

How Workers Get Their Training

In January 1983 and 1991, The Employment and Training Administration (ETA) funded supplements to the Census Bureau's Current Population Survey on worker training. The questions asked individuals to identify various types of training they needed to obtain their current or last job as well as the training used to improve their skills on those jobs.

In contrast with the 1983 survey, interviewers conducting the 1991 survey were instructed to obtain the information from each individual directly; proxy responses were not permitted. Primarily because individuals could not answer by proxy, a high proportion of eligible persons in the sample did not respond to the January 1991 training questions. In order to obtain data about

the population based only on information provided by respondents, the sample weight originally assigned each respondent was adjusted based on factors for specific age, sex, race, employment status, and occupational status. The adjusted weights were used to prepare published estimates.

The National Longitudinal Study of Youth

The National Longitudinal Study of Youth (NLSY) is a nationally representative sample of 12,686 young men and young women who were ages 14–21 in 1979 when they were first interviewed. Three independent probability samples, designed to represent the entire population of youth born in the United States between 1957 and 1964, were drawn for the NLSY: (1) a cross-sectional sample designed to be representative of the noninstitutionalized civilian segment of American young people age 14–21 as of January 1, 1979; (2) a supplemental sample designed to overrepresent civilian Hispanic, black, and economically disadvantaged non-Hispanic, non-black youth; and (3) a military sample designed to represent the population aged 17–21 as of January 1, 1979 and serving in the military as of September 30, 1978.

Response rates within the NLSY sample have remained at or above 90 percent for the first 12 years of interviews. By the end of 1990, 10,436 civilian and military respondents continued to be interviewed for an overall retention rate of 89.9 percent.

Higher Education Staff Information Survey (EEO-6)

The U.S. EEOC requires all public and private institutions of higher education with at least 15 full-time employees to file the Higher Education Staff Information (EEO-6) report biennially. Higher education institutions are those accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education.

The EEO-6 collects information on (1) the number of full-time and part-time employees, by occupation, race/ethnicity and sex; (2) the number of full-time faculty, by academic rank, tenure status, race/ethnicity, and sex; and (3) the salaries of full-time staff, by occupation, race/ethnicity, and sex.

Beginning in 1987, data from the EEO-6 have been combined with data collected by the NCES to create the Fall Staff survey. The Fall Staff survey is discussed under IPEDS and is conducted by NCES.

For additional information on the EEO-6 survey, contact:

Betty Wright
U.S. Equal Employment Opportunity
Commission
1801 L Street NW
Washington, DC 20507

National Crime Survey, School Crime Supplement

The National Crime Survey (NCS) conducted by the Bureau of Justice Statistics (BJS) collects data from a nationally representative sample of households. When a household is selected for inclusion in the sample, household members age 12 or older are interviewed every 6 months for 3 years. During each interview, information is obtained about the personal victimizations, if any, experienced by the interviewee in the 6 months preceding the interview. One member, generally over the age of 18, is also designated the household respondent, from whom information is obtained about all crimes committed against the household during the preceding 6 months.

The NCS measures both attempted and completed incidents of the violent crimes of rape, robbery, and aggravated and simple assault; personal thefts with and without contact; and the household crimes of burglary, household larceny, and motor vehicle theft.

The School Crime Supplement to the NCS contains data collected in interviews conducted from January through June of 1989 as a supplement to the NCS data collection program. It focuses on personal crimes of violence and theft that were committed inside a school building or on school property only.

The only eligible respondents for this school crime supplement were those household members who were between the ages of 12 and 19, had attended school at any time during the 6 months preceding the interview, and were enrolled in a school that would advance them towards the eventual receipt of a high school diploma.

Further information on the School Crime Supplement to the National Crime Survey may be obtained from:

Bruce Taylor
Bureau of Justice Statistics

Washington, DC 20531

Monitoring the Future

The National Institute on Drug Abuse is the primary supporter of the long-term study entitled *Monitoring the Future: A Continuing Study of the Lifestyles and Values of Youth*, conducted by the University of Michigan, Institute for Social Research. One component of the study deals with student drug abuse, another investigates student victimization at school. Results of a national sample survey have been published annually since 1975. Approximately 125 to 135 schools have participated each year. With the exception of 1975 when about 9,400 students participated in the survey, more than 15,000 students have participated annually. For the class of 1990, about 15,200 students responded to

the survey. Over the years, the response rate has varied from 77 to 84 percent.

The data in this survey represent only high school seniors. Understandably, there will be some reluctance to admit illegal activities. Also, students who were out of school on the day of the survey were nonrespondents. The survey did not include high school dropouts. The inclusion of these two groups would tend to increase the proportion of individuals who had used drugs. A 1983 study found that the inclusion of the absentees could increase some of the drug usage estimates by as much as 2.7 percent. (Details on that study and its methodology were published in *Drug Use Among American High School Students, College Students, and Other Young Adults*, by Lloyd D. Johnston, Patrick M. O'Malley, and Jerald G. Bachman, available from the National Clearinghouse on Drug Abuse Information, 5600 Fishers Lane, Rockville, MD 20857.)

Further information on this survey may be obtained from:

National Institute on Drug Abuse
Division of Epidemiology and
Statistical Analysis
5600 Fishers Lane
Rockville, MD 20857

National Health Interview Survey

The National Health Interview Survey (NHIS) is a continuous cross-sectional household interview survey. Each week a probability sample of the civilian noninstitutionalized population of the United States is interviewed by personnel of the U.S. Bureau of the Census. Estimates for certain health characteristics, such as limited activity and respondent-assessed status, are compiled yearly. Information on special health topics, such as health care coverage, health promotion, and disease prevention, is periodically collected for all or a sample of household members.

All information collected in the survey results from reports by responsible family members or unrelated individuals residing in the household. When possible, all adult members participate in

Sources of Data

the interview. However, proxy responses are accepted for family members who are not at home, and are required for all children (those under 18 years of age) and for all household members who are physically or mentally incapable of responding for themselves.

In 1982, the NHIS questionnaire and data preparation procedures of the survey were extensively revised. The basic concepts of NHIS changed in some cases, and in other cases the concepts were measured in a different way. Comparisons with earlier results should not be undertaken without carefully examining these changes.

In 1985, although several new sample design features were adopted for NHIS, conceptually the sampling plan remained the same. The major changes included (a) reducing the number of primary sampling locations from 376 to 198 for sampling efficiency, (b) oversampling the black population to improve the precision of the statistics, (c) subdividing the NHIS sample into four separate representative panels to facilitate linkage to other National Center for Health Statistics (NCHS) surveys, and (d) using an all-area frame not based on the decennial census to facilitate NCHS survey linkage and to conduct NHIS followback surveys.

The National Center for Health Statistics provides estimates and technical notes on methods for this survey in Series 10 publications, *Data from the National Health Interview Survey*.

National Center for Health Statistics
Division of Health Interview Statistics
6525 Belcrest Road
Hyattsville, MD 20782
(301) 436-7089

Survey of Earned Doctorates

The Survey of Earned Doctorates (SED) has been conducted annually, under contract, by the National Research Council for the U.S. Department of Education, the National Endowment for the Humanities, the National Science Foundation, and other federal agencies

since 1957. Information from the survey becomes part of the Doctorate Records File, which includes records for doctorates awarded since 1920 by regionally accredited universities and colleges. The universe consists of all recipients of doctoral degrees such as Ph.D. or D.Sc., but excludes the recipients of first-professional degrees such as the J.D. or M.D. Approximately 95 percent of the annual cohort of doctorate recipients have responded to the questionnaire, which is distributed through the cooperation of the Graduate Deans. Partial data from public sources are added to the file for nonrespondents. The data for a given year include all doctorates awarded in the 12-month period ending on June 30th of that year.

Data for the SED are collected directly from individual doctorate recipients. In addition to the field and specialty of the degree, the recipient is asked to provide educational history, selected demographic data, and information on postgraduate work and study plans. The National Center for Education Statistics' "Survey of Earned Degrees," part of its Integrated Postsecondary Education Data System, collected data from institutions, not individuals. Therefore, the number of doctorates reported in SED differs slightly from IPEDS/HEGIS totals. Also, SED data are restricted to research doctorates.

The differences between the two data series have been generally consistent since 1960. The ratio of IPEDS/HEGIS to SED totals for all Ph.D.s has ranged from 1.01 to 1.06.

Further information on this survey can be obtained from Summary Report: *Doctorate Recipients from United States Universities*, various years, published by the National Research Council, or by contacting:

Office of Scientific and Engineering Personnel
National Research Council
2101 Constitution Avenue NW
Washington, DC 20418

Survey of Doctorate Recipients

The Survey of Doctorate Recipients (SDR) is a biennial survey of individuals who have received doctorates in the humanities, sciences, and engineering over the past four decades. It has

surveyed scientists (including social scientists and psychologists) and engineers since 1973 and humanists since 1977. It is conducted by the National Research Council with support from the National Science Foundation, the National Endowment for the Humanities, the National Institutes of Health, the Department of Agriculture, and the Department of Energy.

The population for the survey consists of individuals who have received doctorates during a 42-year period. To maintain the length of this timespan for each biennial survey, the two most recent graduating cohorts of Ph.D.s are added to the population, and the two oldest are eliminated. It is a longitudinal survey—that is, individual members of the survey panel are resurveyed every 2 years—and contains historical data on employment status, employment sector, primary work activity, academic rank, tenure status, salary, and other characteristics.

For a more detailed discussion of the history of the SDR, the sample, and other methodological issues, see: National Research Council, *Methodological Report of the 1987 Survey of Doctorate Recipients*, National Research Council, April 1989 (prepared by Mary Belisle).

Scientific and Engineering Expenditures at Universities and Colleges Survey

The National Science Foundation's Scientific and Engineering Expenditures at Universities and Colleges Survey originated in 1954 and has been conducted annually since 1972. The population surveyed in most years has consisted of the 500–600 universities and colleges that grant a graduate science or engineering degree and/or annually perform at least \$50,000 in separately budgeted research and development (R&D). R&D is defined as current fund expenditures

designed to produce specific research outcomes and is funded either by an external agency to an institution or is separately budgeted by an internal institution unit. The institutions included in this survey population expend over

95 percent of the nation's academic R&D funds. In addition, approximately 17 university-administered, federally funded research and development centers (FFRDCs) that are engaged in basic or applied research, development, or management of R&D activities are surveyed.

Since 1984 this survey has been conducted as a sample survey consisting of two strata: a certainty stratum including all doctorate-granting institutions, all historically black colleges and universities with R&D, and all university-administered FFRDCs; and a probability stratum including a random sample of all nondoctorate-granting institutions that perform significant levels of research and development.

Further information on this survey may be obtained from *Guide to the National Science Foundation's Surveys of Academic Science and Engineering*, December 1990, published by the National Science Foundation, or by contacting:

Science and Engineering Activities Program

American College Testing Program

The American College Testing (ACT) Assessment is designed to measure educational development in the areas of English, mathematics, social studies, and natural sciences. The ACT Assessment is taken by college-bound high school students and the test results are used to predict how well students might perform in college.

Prior to the 1984–85 school year, national norms were based on a 10 percent sample of the students taking the test. Since then, national norms have been based on the test scores of all students taking the test. Moreover, beginning with 1984–85 these norms have been based on the most recent ACT scores available from students scheduled to graduate in the spring of the year they take the test. Duplicate test records are no longer used to produce national figures.

ACT standard scores are reported for each subject area on a scale from 1 to 36. The four ACT

standard scores have a mean (average) of about 19 and a standard deviation of about 6 for college-bound students nationally. A composite score is obtained by taking the simple average of the four standard scores and is an indication of student's overall academic development across these subject areas.

It should be noted that college-bound students who take the ACT Assessment are not representative in some respects of college-bound students nationally. First, students who live in the Midwest, Rocky Mountains and Plains, and the South are overrepresented among ACT-tested students compared with college-bound students nationally. Second, ACT-tested students tend to enroll in public colleges and universities more frequently than do college-bound students nationally.

The 1990 ACT assessment is significantly different from previous years. Consequently, it is not possible to make direct comparisons between scores earned in 1990 and those scores earned in previous years. To permit continuity in tracking of score trends, ACT has established links between scores earned on ACT tests administered before October 1989 and scores on the new ACT.

For further information, contact:

The American College Testing Program
2201 North Dodge Street
P.O. Box 168
Iowa City, IA 52243

American Federation of Teachers

The American Federation of Teachers (AFT) reports national and state average salaries and earnings of teachers, other school employees, government workers, and professional employees over the past 25 years. The AFT's survey of state departments of education obtains information on minimum salaries, experienced teachers reentering the classroom, and teacher age and experience. Most data from the survey are reported as received, although some data are confirmed by telephone. These data are available in the AFT's annual report *Survey and Analysis of Salary Trends*. While serving as the primary vehicle for reporting the results of the AFT's annual survey of state departments of education, several other data sources are also used in this report.

Further information on this survey can be obtained from:

American Federation of Teachers
555 New Jersey Avenue NW
Washington, DC 20001

College Entrance Examination Board

The Admissions Testing Program of the College Board comprises a number of college admissions tests, including the Preliminary Scholastic Aptitude Test (PSAT) and the Scholastic Aptitude Test (SAT). High school students participate in the testing program as sophomores, juniors, or seniors—some more than once during these 3 years. If they have taken the tests more than once, only the most recent scores are tabulated. The PSAT and SAT report subscores in the areas of mathematics and verbal ability.

The SAT results are not representative of high school students or college-bound students nationally since the sample is self-selected. Generally, tests are taken by students who need the results to attend a particular college or university. The state totals are greatly affected by the requirements of its state colleges. Public colleges in a number of states require ACT scores rather than SAT scores. Thus, the proportion of students taking the SAT in these states is very low and is inappropriate for any comparison. In recent years about 1 million high school students have taken the examination annually.

Further information on the SAT can be obtained from:

College Entrance Examination Board
Educational Testing Service
Princeton, NJ 08541

Gallup Poll

Each year the Gallup Poll conducts the "Public Attitudes Toward the Public Schools" survey, funded by Phi Delta Kappa. The survey includes interviews with approximately 1,600 adults representing the civilian noninstitutional population 18 years old and over.

The sample used in the 22nd annual survey was made up of a total of 1,594 respondents and is described as a modified probability sample of the nation. Personal, in-home interviewing was conducted in representative areas of the nation and types of communities. Approximately 67

percent of the respondents had no children in school, 30 percent were parents of children in public schools, and 6 percent had children attending nonpublic schools. This total is greater than 100 percent because some parents had children attending both public and nonpublic schools.

The survey is a sample survey and is subject to sampling error. The size of error depends largely on the number of respondents providing data. For example, an estimated percentage of about 10 percent based on the responses of 1,000 sample members has an approximate sampling error of 2 percent at the 95 percent confidence level. The sampling error for the difference in two percentages (50 percent versus 41 percent) based on two samples of 750 members and 400 members, respectively, is about 8 percent.

Further information on this survey can be obtained from:

Gallup Poll
Phi Delta Kappa
P.O. Box 789
Bloomington, IN 47402-0789

Graduate Record Examination Council

All students who have taken the Graduate Record Examinations (GRE) General Test were asked a series of background information questions. The responses and the test scores themselves form the basis for continuing GRE Program research. In addition, these data are compiled and included in an annual report. The 12th in the series is *A Summary of Data Collected From Graduate Record Examinations Test Takers During 1986-1987*.

The GRE cautions users of these data that "information in these reports is based solely on examinees who took the GRE General Test and should not be interpreted as being representative of any other group. The report does not present data for all baccalaureate degree recipients, for all graduate school applicants, or for all first-time graduate school enrollees." Nevertheless, the test-taking group is a large subset (albeit a self-selected one) of each of these groups.

Further information on this and previous editions of the report may be obtained by contacting:

Office of the GRE Program Director
Educational Testing Service
Princeton, NJ 08541

National Education Association Estimates of School Statistics

The National Education Association (NEA) reports revenues and expenditure data in its annual publication, *Estimates of School Statistics*. Each year NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA. Some tables in *The Condition of Education* used revised estimates of financial data prepared by NEA because it was the most current source. Since expenditure data reported to NCES must be certified for use in the U.S. Department of Education formula grant programs (such as Chapter I of the Education Consolidation and Improvement Act), NCES data are not available as soon as NEA estimates.

Further information can be obtained from:

National Education Association—Research
1201 16th Street NW
Washington, DC 20036

United Nations Educational, Scientific, and Cultural Organization

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) conducts annual surveys of education statistics of its member countries. Besides official surveys, data are supplemented by information obtained by UNESCO through other publications and sources. Each year, more than 200 countries reply to the UNESCO surveys. In some cases, estimates are made by UNESCO for particular items such as world and continent totals. While great efforts are made to make them as comparable as possible, the data still reflect the vast differences among the countries of the world in the structure of education. While there is some agreement about the reporting of first- and second-level data, the third level (postsecondary education)

presents numerous substantial problems. Some countries report only university enrollment while other countries report all postsecondary enrollment, including vocational and technical schools and correspondence programs. A very high proportion of some countries' third-level students attend institutions in other countries. While definition problems are many in this sort of study, other survey problems should not be overlooked. The member countries that provide data to UNESCO are responsible for their validity. Thus, data for particular countries are subject to nonsampling error and perhaps sampling error as well. Some countries may furnish only rough estimates while data from other countries may be very accurate. Other difficulties are caused by the varying periodicity of data collection among the countries of the world. In spite of such problems, many researchers use UNESCO data because they are the best available. Users should examine footnotes carefully to recognize some of the data limitations.

More complete information may be obtained from the *Statistical Yearbook* published by UNESCO or from:

Office of Statistics
UNESCO
Place de Fontenoy
75700 Paris, France

The International Association for the Evaluation of Educational Achievement
IEA Reading Literacy Study

In the period 1989–1992, the International Association for the Evaluation of Educational Achievement (IEA) conducted a Reading Literacy Study in 32 systems of education. The study focused on two levels in each of these systems, the grade level where most 9-year-olds were to be found and the grade level where most 14-year-olds were to be found.

To obtain comparable samples of students, multi-stage sampling was used in each country and schools or classes were typically drawn with a probability proportional to the size of the school or class.

Three major domains or types of reading literacy materials assessed at both age levels were as follows:

1. *Narrative prose*: Continuous texts in which the writers' aim is to tell a story—whether fact or fiction. They normally follow a linear time sequence and are usually intended to entertain or involve the reader emotionally. The selected extracts ranged from short fables to lengthy stories of more than 1,000 words.
2. *Expository prose*: Continuous texts designed to describe, explain, or otherwise convey factual information or opinion to the reader. The texts contained, for example, brief family letters and descriptions of animals as well as lengthy treatises on smoking and lasers.
3. *Documents*: Structured information presented in the form of charts, tables, maps, graphs, lists, or sets of instructions. These materials were organized in such a way that students had to search, locate, and process selected facts, rather than read every word of continuous text. In some cases, students were required to follow detailed instructions in responding to such documents.

To obtain raw scores, all correct answers were totaled for each student in each domain. The Rausch procedure was used to produce scales for each domain. Each scale was given a mean of 500 and a standard deviation of 100.

Further information is available in the IEA report *How in the World Do Students Read?* by Warwick B. Elley.

Organization for Economic Cooperation and Development

The Organization for Economic Cooperation and Development (OECD) publishes analyses of national policies in education, training, and economics in 23 countries. The countries surveyed are: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, United States, and Yugoslavia.

Since only developed nations, mostly European, are included in OECD studies, the range of analysis is limited. However, OECD data allow for some detailed international comparisons of financial resources or other education variables to be made for this selected group of countries.

Further information can be obtained from:

Glossary

Academic support: (See Expenditures.)

Adult education: College, vocational, or occupational programs, continuing education or noncredit courses, correspondence courses and tutoring, as well as courses and other educational activities provided by employers, community groups, and other providers.

Advanced degree: Any formal degree attained after the bachelor's degree. Advanced degrees include master's degrees, doctoral degrees, and professional degrees.

Advantaged urban: Students in this group live in metropolitan statistical areas and attend schools where a high proportion of the students' parents are in professional or managerial positions. Schools were placed into this category on the basis of information about the type of community, the size of its population, and an occupational profile of residents provided by school principals participating in the National Assessment of Educational Progress (NAEP).

Appropriations (federal funds): Budget authority provided through the congressional appropriation process that permits federal agencies to incur obligations and to make payments.

Appropriations (institutional revenues): An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Associate's degree: A degree granted for the successful completion of a sub-baccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Auxiliary enterprises: (See Revenues.)

Average daily attendance (ADA): The aggregate attendance of a school during a reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a

reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Baccalaureate degree: (See Bachelor's degree.)

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Carnegie unit: A standard of measurement used for secondary education that represents the completion of a course that meets one period per day for one year.

Catholic school: (See Orientation.)

Cohort: A group of individuals who have a statistical factor in common, for example, year of birth.

College: A postsecondary school that offers general or liberal arts education, usually leading to an associate's, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included under this terminology.

Combined elementary and secondary school: A school that encompasses instruction at both the elementary and the secondary levels. Examples of combined elementary and secondary school grade spans would be grades 1–12 or 5–12.

Computer and information science: A group of instructional programs that describes computer and information sciences, including computer programming, data processing, and information systems.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer price index (CPI): This price index measures the average change in the cost of a

fixed-market basket of goods and services purchased by consumers.

Control of institutions: A classification of institutions of elementary/secondary or higher education by whether the institution is operated by publicly elected or appointed officials (public control) or by privately elected or appointed officials and derives its major source of funds from private sources (private control).

Core subjects: *A Nation At Risk* asked that all students seeking a diploma be required to enroll in a core curriculum called "New Basics." The core subjects included in this plan are 4 units of English, 3 units of science, 3 units of social studies, 3 units of mathematics, and 0.5 units of computer science.

Cost of college attendance: Cost of living for students attending postsecondary institutions, including: tuition and fees, books, room and board, childcare, transportation, and other miscellaneous expenses.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures per pupil in enrollment: (See Expenditures.)

Current-fund expenditures: (See Expenditures.)

Current-fund revenues: (See Revenues.)

Dependent student: A student who under federal criteria is considered to be financially dependent on her or his parents or guardians. Most full-time students are considered dependent until they are 24 years old.

Disadvantaged urban: Students in this group live in metropolitan statistical areas and attend schools where a high proportion of the students' parents are on welfare or are not regularly employed. Schools were placed into this category on the basis of information about the type of community, the size of its population, and an occupational profile of residents provided by school principals participating in NAEP.

Doctor's degree: An earned degree carrying the title of Doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for

fulfilling specialized requirements in professional fields, such as education (Ed.D.) musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading. (See First-professional degree.)

Dropout: The term is used both to describe an event^{3/4}leaving school before graduating^{3/4}and a status^{3/4}an individual who is not in school and is not a graduate. Transferring schools, for example, from a public to a private school, is not regarded as a dropout event. A person who drops out of school may later return and graduate. At the time the person left school initially, he or she is called a *dropout*. At the time the person returns to school, he or she is called a *stopout*. Measures to describe these often complicated behaviors include the event dropout rate (or the closely related school persistence rate), the status dropout rate, and the high school completion rate.

Educational and general expenditures: (See Expenditures.)

Educational attainment: The highest grade of regular school attended and completed.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. A preschool or kindergarten school is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary/secondary school: As reported in this publication, includes only regular schools (i.e., schools that are part of state and local school systems, and also most not-for-profit private elementary/secondary schools, both religiously affiliated and nonsectarian). Schools not reported include subcollegiate departments of institutions of higher education, residential schools for exceptional children, federal schools for American Indians, and federal schools on military posts and other federal installations.

Employed: Includes civilian, noninstitutionalized persons who (1) worked during any part of the survey week as paid

employees; worked in their own business, profession, or farm; or worked 15 hours or more as unpaid workers in a family-owned enterprise;

or (2) were not working but had jobs or businesses from which they were temporarily absent due to illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were seeking another job.

Engineering and engineering technologies: Instructional programs that describe the mathematical and natural science knowledge gained by study, experience, and practice and applied with judgment to develop ways to utilize the materials and forces of nature economically for the benefit of humanity. Include programs that prepare individuals to support and assist engineers and similar professionals.

English: A group of instructional programs that describes the English language arts, including composition, creative writing, and the study of literature.

Enrollment: The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Expected family contribution (EFC): The amount that a family is expected to pay toward meeting costs of postsecondary attendance (students and parents of dependent students are both expected to make contributions). This amount is determined through an analysis of need (for example, the Congressional Methodology) and is based on taxable and nontaxable income and assets as well as family size, the number of family members attending postsecondary institutions, extraordinary medical expenses, and so forth. For dependent students, the EFC consists of both a parental contribution and a separately calculated student contribution. The minimum student contribution in 1988-89 was \$700 for freshmen and \$900 for other undergraduates.

Expenditures: Charges incurred, whether paid or unpaid, which are presumed to benefit the current fiscal year. For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other

than for retirement of debt, investment in securities, extension of credit, or as agency transaction. Also, government expenditures include only external transactions, such as the provision of prerequisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Academic support: This category of college expenditures includes expenditures for support services that are an integral part of the institution's primary missions of instruction, research, or public service. Includes expenditures for libraries, galleries, audio/visual services, academic computing support, ancillary support, academic administration, personnel development, and course and curriculum development.

Current expenditures

(elementary/secondary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs. Beginning in 1980-81, expenditures for state administration are excluded.

Current expenditures per pupil in

enrollment: (See Expenditures.) Current expenditures for the regular school term divided by the total number of students registered in a given school unit at a given time, generally in the fall of a year.

Current-fund expenditures (higher

education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships, fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Educational and general expenditures: The sum of current-fund expenditures on instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Instruction: The category including expenditures of the colleges, schools, departments, and other instructional divisions of higher education institutions, and expenditures for departmental research and public service, which are not separately budgeted. Includes expenditures for both credit and noncredit activities. Excludes expenditures for academic administration where the primary function is administration (e.g., academic deans).

Scholarships and fellowships: This category of college expenditures applies only to money given in the form of outright grants and trainee stipends to individuals enrolled in formal coursework, either for credit or not. Aid to students in the form of tuition or fee remissions is included. College work-study funds are excluded and are reported under the program in which the student is working. In the tabulations in this volume, Pell Grants are not included in this expenditure category.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as enrollment, average daily attendance, or average daily membership.

Family income: The combined income of all family members 14 years old and older living in the household for the period of one year. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income.

Federal aid: Student financial aid whose source is the federal government. This aid can either be provided by or administered by a federal agency. Federal agencies providing aid include the Department of Education, Department of Health and Human Services, Department of Defense, Veterans Administration, and the National Science Foundation. Federal aid can be in the form of grants, loans, and work-study aid.

Federal funds: Amounts collected and used by the federal government for the general purposes of the government. There are four types of federal fund accounts: the general fund, special funds, public enterprise funds, and intragovernmental funds. The major federal fund is the general fund, which is derived from general

taxes and borrowing. Federal funds also include certain earmarked collections, such as those generated by and used to finance a continuing cycle of business-type operations.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is usually based on a program requiring at least 2 academic years of work prior to entrance and a total of at least 6 academic years of work to complete the degree program, including both prior-required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry (D.D.S or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Pharm.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (J.D.), and theological professions (M.Div. or M.H.L.).

First-time teachers: People who are teaching full time in the nation's school system this year for the first time. These teachers include recent college graduates, former substitute teachers, or people who had other jobs besides teaching either inside or outside of the field of education.

Fiscal year: The yearly accounting period for the federal government, which begins on October 1 and ends on the following September 30. The fiscal year is designated by the calendar year in which it ends; for example, fiscal year 1992 begins on October 1, 1991, and ends on September 30, 1992. (From fiscal year 1844 to fiscal year 1976 the fiscal year began on July 1 and ended on the following June 30.)

Foreign languages: A group of instructional programs that describes the structure and use of language that is common or indigenous to people of the same community or nation, the same geographical area, or the same cultural traditions. Programs cover such features as sound, literature, syntax, phonology, semantics, sentences, prose, and verse, as well as the development of skills and attitudes used in communicating and evaluating thoughts and feelings through oral and written language.

Free lunch eligibles: Families with school-aged children who fall below the poverty level and have no other significant assets are eligible to receive government assistance in the form of free or reduced-price school lunches.

Full-time enrollment: The number of students enrolled in higher education courses with total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time instructional faculty: Those members of the instruction/research staff who are employed full-time as defined by the institution, including faculty with released time for research and faculty on sabbatical leave. Full-time counts exclude faculty who are employed to teach less than two semesters, three quarters, two trimesters, or two 4-month sessions; replacements for faculty on sabbatical leave or those on leave without pay; faculty for preclinical and clinical medicine; faculty who are donating their services; faculty who are members of military organizations and paid on a different pay scale from civilian employees; academic officers whose primary duties are administrative; and graduate students who assist in the instruction of courses.

GED recipient: A person who has obtained certification of high school equivalency by meeting state requirements and passing an approved exam, which is intended to provide an appraisal of the person's achievement or performance in the broad subject matter areas usually required for high school graduation. (See General educational development test.)

General educational development (GED) test: A test administered by the American Council on Education as the basis for awarding a high school equivalency certification.

Geographic region: 1) The four regions used by the Bureau of Economic Analysis of the U.S. Department of Commerce, the National Assessment of Educational Progress, and the

National Education Association are as follows (note that the National Education Association designated the Central region as Middle region in its classification):

<i>Northeast</i>	<i>Southeast</i>
Connecticut	Alabama
Delaware	Arkansas
District of Columbia	Florida
Maine	Georgia
Maryland	Kentucky
Massachusetts	Louisiana
New Hampshire	Mississippi
New Jersey	North Carolina
New York	South Carolina
Pennsylvania	Tennessee
Rhode Island	Virginia
Vermont	West Virginia
<i>Central (Middle)</i>	<i>West</i>
Illinois	Alaska
Indiana	Arizona
Iowa	California
Kansas	Colorado
Michigan	Hawaii
Minnesota	Idaho
Missouri	Montana
Nebraska	Nevada
North Dakota	New Mexico
Ohio	Oklahoma
South Dakota	Oregon
Wisconsin	Texas
	Utah
	Washington
	Wyoming

2) The regions used by the U.S. Bureau of the Census in Current Population Survey tabulations are as follows:

<i>Northeast</i>	<i>Midwest</i>
(New England)	(East North Central)
Maine	Ohio
New Hampshire	Indiana
Vermont	Illinois
Massachusetts	Michigan
Rhode Island	Wisconsin
Connecticut	

(Middle Atlantic)

New York
New Jersey
Pennsylvania

(West North Central)

Minnesota
Iowa
Missouri
North Dakota
South Dakota
Nebraska
Kansas

*South**(South Atlantic)*

Delaware
Maryland
District of Columbia
Virginia
West Virginia
North Carolina
South Carolina
Georgia
Florida

West

(Mountain)
Montana
Idaho
Wyoming
Colorado
New Mexico
Arizona
Utah
Nevada

(East South Central)

Kentucky
Tennessee
Alabama
Mississippi

(Pacific)

Washington
Oregon
California
Alaska
Hawaii

(West South Central)

Arkansas
Louisiana
Oklahoma
Texas

Government appropriation: An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Government grant or contract: Revenues from a government agency for a specific research project or other program.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate record examination (GRE): Multiple-choice examinations administered by the Educational Testing Service and taken by applicants who plan to attend certain graduate schools. Two generalized tests are offered, plus specialized tests in a variety of subject areas. Ordinarily, a student will take only the

specialized test that applies to the intended field of study.

Grants: Also known as scholarships, these are funds for postsecondary education that do not have to be repaid.

Gross domestic product (GDP): Gross national product less net property income from abroad. Both gross national product and gross domestic product aggregate only the incomes of residents of a nation, corporate and individual, deriving directly from the current production of goods and services. However, gross national product also includes net property from abroad. (See also Gross national product.)

Gross national product (GNP): A measure of the money value of the goods and services available to the nation from economic activity. GNP can be viewed in terms of expenditure categories, which include purchases of goods and services by consumers and government, gross private domestic investment, and net exports of goods and services. The goods and services included are largely those bought for final use (excluding illegal transactions) in the market economy. A number of inclusions, however, represent imputed values, the most important of which is rental value of owner-occupied housing. GNP, in this broad context, measures the output attributable to the factors of production^{3/4}labor and property^{3/4}supplied by U.S. residents.

Guidance counselor: (See Staff, elementary/secondary education.)

High school: A secondary school offering the final years of high school work necessary for graduation, usually including grades 10, 11, 12 (in a 6-3-3 plan) or grades 9, 10, 11, and 12 (in a 6-2-4 plan).

High school program: A program of studies designed to prepare students for their postsecondary education and occupation. Four types of programs are usually distinguished^{3/4}academic, vocational, general, and personal use. An academic program is designed to prepare students for continued study at a college or university. A vocational program is designed to prepare students for employment in one or more semiskilled, skilled, or technical occupations. A general program is designed to provide students with the understanding and competence to

function effectively in a free society, and usually represents a mixture of academic and vocational components. A personal use program provides a student with general skills in areas such as health, religion, and military science.

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate's, baccalaureate, or higher degree.

Higher education institutions (general definition): Institutions providing education above the instructional level of the secondary schools, usually beginning with grade 13. Typically, these institutions include colleges, universities, graduate schools, professional schools, and other degree-granting institutions.

Higher education price index: A price index that measures average changes in the prices of goods and services purchased by colleges and universities through current-fund education and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Humanities: Instructional programs in the following fields: area and ethnic studies, foreign languages, letters, liberal/general studies, multi-/interdisciplinary studies, philosophy and religion, theology, and the visual and performing arts.

Independent operations: A group of self-supporting activities under control of a college or university. For purposes of financial surveys conducted by the National Center for Education Statistics, this category is composed principally of federally funded research and development centers (FFRDC).

Inflation: An upward movement in general price levels that results in a decline of purchasing power.

Institutional support: The category of higher education expenditures that includes day-to-day operational support for colleges, excluding expenditures for physical plant operations. Examples of institutional support include general administrative services, executive direction and planning, legal and fiscal operations, and community relations.

Instruction: (See Expenditures.)

Instructional staff: Full-time-equivalent number of positions, not the number of different individuals occupying the positions during the school year. In local schools, includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or in the improvement of the teaching-learning situation. Includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff. Excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

Labor force: Persons employed as civilians, unemployed, or in the armed services during the survey week. The "civilian labor force" comprises all civilians classified as employed or unemployed. (See Employed and Unemployed.)

Life sciences: Life sciences are instructional programs that describe the systematic study of living organisms. Life sciences include biology, biochemistry, biophysics, and zoology.

Limited English proficient: A concept developed to assist in identifying those language-minority students (children from language backgrounds other than English) who need language assistance services, in their own language or in English, in the schools. The Bilingual Education Act, reauthorized in 1988 (P.L. 100-297), describes a limited-English-proficient (LEP) student as one who

- 1) meets one or more of the following conditions:
 - a) a student who was born outside of the United States or whose native language is not English;
 - b) a student who comes from an environment where a language other than English is dominant; or
 - c) a student who is an American Indian or Alaskan Native and comes from an environment where a language other than English has had a significant impact on his/her level of English language proficiency; and
- 2) has sufficient difficulty speaking, reading, writing, or understanding the English language to deny him or her the opportunity to learn successfully in English-only classrooms.

In practice, many ways of making this determination about an individual student are being used by school systems across the United States. These include various combinations of home language surveys, informal teacher determination, formal interviews, and a number of types of assessment tests for classification, placement, and monitoring of progress.

Literacy: See supplemental note to *Indicator 31*.

Loan: Borrowed money that must be repaid.

Local education agency (LEA): (See School district.)

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, and an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Mathematics: A group of instructional programs that describes the science of logical symbolic language and its applications.

Metropolitan population: The population residing in metropolitan statistical areas (MSAs). (See Metropolitan statistical area.)

Metropolitan statistical area (MSA): A large population nucleus and the nearby communities that have a high degree of economic and social integration with that nucleus. Each MSA consists of one or more entire counties (or county equivalents) that meet specified standards pertaining to population, commuting ties, and metropolitan character. In New England, towns and cities, rather than counties, are the basic units. MSAs are designated by the Office of

Management and Budget. An MSA includes a city and, generally, its entire urban area and the remainder of the county or counties in which the urban area is located. An MSA also includes such additional outlying counties that meet specified criteria relating to metropolitan character and level of commuting of workers into the central city or counties. Specified criteria governing the definition of MSAs recognized before 1980 are published in *Standard Metropolitan Statistical Areas: 1975*, issued by the Office of Management and Budget. New MSAs were designated when 1980 counts showed that they met one or both of the following criteria:

- 1) Included a city with a population of at least 50,000 within their corporate limits; or
- 2) Included a Census Bureau-defined urbanized area (which must have a population of at least 50,000) and a total MSA population of at least 100,000 (or, in New England, 75,000).

Minority: Any racial/ethnic group that is non-white is considered minority. (See Racial/ethnic group.)

Modal grade: The modal grade is the year of school in which the largest proportion of students of a given age are enrolled. Enrolled persons are classified according to their relative progress in school, that is, whether the grade or year in which they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey.

A Nation at Risk: A report published by the U.S. Department of Education in 1983 highlighting deficiencies in knowledge of the nation's students and population as a whole in areas such as literacy, mathematics, geography, and basic science.

Natural sciences: A group of fields of study that includes the life sciences, physical sciences, and mathematics.

Nonmetropolitan residence group: The population residing outside metropolitan statistical areas. (See Metropolitan statistical area.)

Nonsupervisory instructional staff: Persons such as curriculum specialists, counselors, librarians, remedial specialists, and others possessing education certification but not

responsible for day-to-day teaching of the same group of pupils.

Nursery school: (See Preprimary.)

Obligations: Amounts of orders placed, contracts awarded, services received, or similar legally binding commitments made by federal agencies during a given period that will require outlays during the same or some future period.

Orientation (private school): The group or groups, if any, with which a private elementary/secondary school is affiliated, or from which it derives subsidy or support. Such organizations include the following:

Catholic school: A private school over which a Roman Catholic church group exercises some control or provides some form of subsidy. Catholic schools for the most part include those operated or supported by: a parish, a group of parishes, a diocese, or a Catholic religious order.

Other religious school: A private school that is affiliated with an organized religion or denomination other than Roman Catholicism or that has a religious orientation other than Catholicism in its operation and curriculum.

Nonsectarian school: A private school whose curriculum and operation are independent of religious orientation and influence in all but incidental ways.

Other technical/professional fields: A group of occupationally oriented fields, other than business, computer science, education, and engineering, which includes agriculture and agricultural sciences, architecture, communications, communications technologies, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Outlays: The value of checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load less than 75 percent of the normal full-time credit load.

Percentile (score): A value on a scale of zero to 100 that indicates the percent of a distribution

that is equal to or below it. A score in the 95th percentile is a score equal to or better than 95 percent of all other scores.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits and military pensions, but excludes transfers among persons.

Physical sciences: Physical sciences are instructional programs that describe inanimate objects, processes, or matter, energy, and associated phenomena. Physical sciences include astronomy, astrophysics, atmospheric sciences, chemistry, geology, physics, planetary science, and science technologies.

Postsecondary education: The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes vocational and adult basic education programs.

Poverty level: Poverty status is based on reports of family income on the March Current Population Survey. Families or individuals with gross incomes below the poverty threshold are classified as below the poverty level. Poverty thresholds in 1992 ranged from \$7,143 for a person living alone to \$28,745 for a family of four or more.

Prekindergarten: (See Preprimary.)

Preprimary: Elementary education programs for children who are too young for first grade. The year before first grade is called kindergarten; the year(s) before kindergarten is called preschool, nursery school, or prekindergarten. Not included in prekindergarten is essentially custodial care provided in private homes. Prekindergarten programs may be provided in regular elementary schools (with kindergarten, first- and higher

grade programs) or in preschools (with only prekindergarten programs.)

Private school or institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government, which is usually not supported primarily by public funds, and is not operated by publicly elected or appointed officials.

Proprietary institution: An educational institution that is under private control but whose profits derive from revenues subject to taxation.

Purchasing power parity: A method of converting other countries' expenditures to U.S. dollars in order to compare expenditure rates. Purchasing power parity indices are calculated by comparing the cost of a fixed-market basket of goods in each country.

Racial/ethnic group: Classification indicating general racial or ethnic heritage based on self-identification, as in data collected by the Bureau of the Census, or on observer identification, as in data collected by the Office for Civil Rights. These categories are in accordance with the Office of Management and Budget standard classification scheme presented below:

American Indian or Alaskan Native: A person having origins in any of the original peoples of North America and maintaining cultural identification through tribal affiliation or community recognition.

Asian or Pacific Islander: A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.

Black: A person having origins in any of the black racial groups in Africa. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly.

Hispanic: A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

White: A person having origins in any of the original peoples of Europe, North Africa, or the Middle East. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly.

Reentrants: Teachers who left the school system for a period of time, and have now returned to classroom teaching.

Remedial education: Instruction for a student lacking the reading, writing, or mathematics skills necessary to perform college-level work at the level required by the attended institution.

Revenues: All funds received from external sources, net of refunds, and correcting transactions. Noncash transactions such as receipt of services, commodities, or other receipts "in kind" are excluded as are funds received from the issuance of debt, liquidation of investments, and nonroutine sale of property.

Auxiliary enterprises: This category includes those essentially self-supporting operations that exist to furnish a service to students, faculty, or staff, and that charge a fee that is directly related to, although not necessarily equal to, the cost of the service. Examples are residence halls, food services, college stores, and intercollegiate athletics.

Current-fund revenues (higher education): Money received during the current fiscal year from revenue that can be used to pay obligations currently due, and surpluses reappropriated for the current fiscal year.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

Salary workers: Any person who worked one or more days during the previous year and was paid on the basis of a yearly salary is considered a salary worker.

Scholarships and fellowships: (See Expenditures.)

Scholastic Aptitude Test (SAT): An examination administered by the Educational Testing Service and used to predict the facility with which an individual will progress in learning college-level academic subjects.

School climate: The social system and culture of the school, including the organizational structure of the school and values and expectations within it.

School district: An education agency at the local level that exists primarily to operate public schools or to contract for public school services. Synonyms are "local basic administrative unit" and "local education agency."

School year: The 12-month period of time denoting the beginning and ending dates for school accounting purposes, usually from July 1 through June 30.

Science: The body of related courses concerned with knowledge of the physical and biological world and with the processes of discovering and validating this knowledge.

Secondary school: A school comprising any span of grades beginning with the next grade following an elementary or middle-school (usually 7, 8, or 9) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Social and behavioral sciences: A group of scientific fields of study that includes anthropology, archeology, criminology, demography, economics, geography, history, international relations, psychology, sociology, and urban studies.

Social studies: A group of instructional programs that describes the substantive portions of behavior, past and present activities, interactions, and organizations of people associated together for religious, benevolent, cultural, scientific, political, patriotic, or other purposes.

Socioeconomic status (SES): The SES quartile variable used for both High School and Beyond and the National Education Longitudinal Study of 1988 was built using parental education level, parental occupation, family income, and household items. Students were placed in quartiles based on their standardized composite score. By definition, one quarter of each cohort will reside in the bottom SES quartile, even if education levels, income, and the number of persons in more prestigious occupations increase. The terms high, middle, and low SES refer to the

upper, middle two, and lower quartiles of the weighted SES composite index distribution.

Staff assignments, elementary and secondary school:

District administrative support staff: Those personnel that are assigned to the staffs of the district administrators. They may be clerks, computer programmers, and others concerned with the functioning of the entire district.

District administrators: The chief executive officers of education agencies (such as superintendents and deputies) and all others with district-wide responsibility. Such positions may be business managers, administrative assistants, coordinators, and the like.

Guidance counselors: Professional staff whose activities involve counseling students and parents, consulting with other staff members on learning problems, evaluating the abilities of students, assisting students in personal and social development, providing referral assistance, and working with other staff members in planning and conducting guidance programs for students.

Instructional (teacher) aides: Those staff members assigned to assist a teacher with routine activities associated with teaching (i.e., those activities requiring minor decisions regarding students, such as monitoring, conducting rote exercises, operating equipment, and clerking). Volunteer aides are not included in this category.

Librarians: Staff members assigned to perform professional library service activities such as selecting, acquiring, preparing, cataloging, and circulating books and other printed materials; planning the use of the library by students, teachers, and other members of the instructional staff; and guiding individuals in their use of library books and materials that are maintained separately or as part of an instructional materials center.

Other support services staff: All staff not reported in other categories. This group includes media personnel, social workers, data processors, health maintenance workers,

bus drivers, security, cafeteria workers, and other staff.

School administrators: Those staff members whose activities are concerned with directing and managing the operation of a particular school. They may be principals or assistant principals, including those who coordinate school instructional activities with those of the local education agency (LEA) and other appropriate units.

Stopout: (See Dropout.)

Tax expenditures: Losses of tax revenue attributable to provisions of the federal income tax laws that allow a special exclusion, exemption, or deduction from gross income or provide a special credit, preferential rate of tax, or a deferral of tax liability affecting individual or corporate income tax liabilities.

Technical/professional fields: A group of occupationally oriented fields of study, other than engineering and computer science, that includes agriculture and agricultural sciences, architecture, business and management, communications, education, health sciences, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980-81, expenditures for state administration are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Tuition and fees: A payment or charge for instruction or compensation for services, privileges, or the use of equipment, books, or other goods.

Type of higher education institutions:

4-year institution: An institution legally authorized to offer and offering at least a 4-year program of college-level studies wholly or principally creditable toward a baccalaureate degree. In some tables a further

division between universities and other 4-year institutions is made. A "university" is a postsecondary institution that typically comprises one or more graduate professional schools. (See also University.)

2-year institution: An institution legally authorized to offer and offering at least a 2-year program of college-level studies that terminates in an associate's degree or is principally creditable toward a baccalaureate degree.

Undergraduate students: Students registered at an institution of higher education in a program leading to a baccalaureate degree or other formal award below the baccalaureate such as an associate's degree.

Unemployed: Civilians who had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

University: An institution of higher education that consists of a liberal arts college, a diverse graduate program, and usually two or more professional schools or faculties, and is empowered to confer degrees in various fields of study.

Urbanicity:

- (1) In the Schools and Staffing Survey school location is categorized based on the classification in both the Common Core of Data (CCD) and the Quality Education data (QED), as drawn from U.S. Census data and definition. The results are summarized in three variables:

Central city^{3/4}central city of an MSA (Metropolitan Statistical Area).

Urban fringe/large town^{3/4}area surrounding a central city but within a county constituting an MSA.

Rural/small town^{3/4}outside an MSA.

- (2) In the High School and Beyond Survey, urbanicity is classified based on the Curriculum Information Center code as follows:

Urban^{3/4}within a central city of an MSA.

Suburban¼within an MSA but outside the central city area.

Rural¼outside a designated MSA.

Vocational education: Organized educational programs, services, and activities that are directly related to the preparation of individuals for paid or unpaid employment, or for additional preparation for a career, requiring other than a baccalaureate or advanced degree.

Work-study: A generic term for programs designed to provide part-time employment as a source of funds to pay for postsecondary education as well as a federal program that is administered through postsecondary institutions.

Year-round, full-time worker: One who worked primarily at a full-time civilian job for 50 weeks or more during the preceding calendar year.

Index

Following each entry is the related indicator numbers (e.g., 29, 30), supplemental table numbers (e.g., 29-1), and, when not available in the current edition, the volume number, indicator number, and year in brackets when last published (e.g., 2:14 [1991]). Beginning in 1992, *The Condition of Education* was published as a single volume; references to the 1992 and following editions contain only the indicator number and the year in brackets (e.g., 26 [1992]). Indicators that are new to *The Condition of Education 1995* are referenced using an italicized typeface (e.g., *Center-based early childhood programs*).

 graduate degrees, 27-1, 27-2, 27-3, 27-4, 27-5, 27-6
 by American students, 42 [1993]
 by foreign students, 42 [1993]
 by sex, 27 [1992]
 undergraduate courses taken by teachers, 60 [1993]
 master's degrees, 27-1, 27-2, 27-3
 graduate field of study, by sex, 27, 27-1, 27-2, 27-3, 27-4, 27-5, 27-6
 new doctorates with job commitments in higher education, 34, 34-1, 34-2

Nonresident aliens (See Foreign students.)

Nonsectarian schools

- tuition, 10 [1992], 3 [1994]

Number of graduate degrees awarded

- average years of study required for graduation, 24-8
 by subject, 24-4
 doctor's degrees, 27-6
 master's degrees, 27-3
 with graduation requirements above NCEE recommendations, by subject, 24-6

P

Parent involvement in child's education

- by sex, 43 [1994]
 by students who receive free lunch, 43 [1994]
 types of contact with school personnel
 by achievement quartile, 44-4
 by control of school, 44
 by poverty level, 44, 44-3

- by parents' education level, 44-2
 by race/ethnicity, 44-1
 by reason for contact, 44, 44-1, 44-2, 44-3, 44-4, 44-5
 by school size, 44-5
 by urbanicity, 44-3

Parents' highest educational level

- and amount of time children spend on homework and TV, 46 [1993]
 and core course units earned by high school graduates, 25, 25-1, 25-2
 and types of contact with school personnel, 44-2
 and curriculum tracks in high school, 24 [1993]
 and enrollment choices of postsecondary students, 45 [1993]
 and skills and behaviors of 4-year-olds prior to entering kindergarten, 4-4
 and participation of first-graders in center-based early childhood programs, 3-4
 and Scholastic Aptitude Test scores, 20-5
 high school graduates taking selected mathematics and science course, 26-5
 mathematics proficiency, 15-4
 participation in extracurricular activities (high school seniors), 43-2
 reading proficiency, 13-4
 science proficiency, 16-4
 writing proficiency, 14-4

Part-time enrollment

- in higher education, 46 [1992]

Participation in extracurricular activities, 43, 43-1, 43-2, 43-3, 43-4

Perceptions of problems in public schools

- by eighth-grade students and teachers, 1:23 [1991]
 by teachers, 1:22 [1990]
 by the public, 1:24 [1991]

Persistent attendance

- in higher education, 4 [1993]
 for first-time postsecondary students, 10 [1994]
 in secondary education (high school students)
 by family income, 6
 by race/ethnicity, 6, 6-2, 6-3
 by sex, 6, 6-1, 6-2

Philosophy

- courses taken in college, 28 [1994]
 undergraduate courses taken by teachers, 60 [1993]

Physical sciences

- certification of teachers, 59 [1994]
 courses taken in college, 28 [1994]
 degrees earned
 bachelor's degrees, 39, 39-1, 39-2, 39-3, 39-4
 by sex, 26 [1992]
 by race/ethnicity, 39-4
 doctor's degrees, 27-4, 27-5, 27-6
 graduate degrees

- by American students, 42 [1993]
- by foreign students, 42 [1993]
- master's degrees, 27-1, 27-2, 27-3
- science and engineering degrees, by degree level*, 38-1, 38-2, 38-3
- new doctorates with job commitments in higher education*, 34, 34-1, 34-2
- students taking the GRE subject tests, 21-4
- undergraduate courses taken by teachers, 60 [1993]

Some publications are produced annually: *The Condition of Education* in June; *Dropout Rates in the United States* in September; *Digest of Education Statistics* in November; and *Projections of Education Statistics* in December. Please check with the **Order Desk** at the **U.S. Government Printing Office** for information on the latest edition. The telephone number is 202-512-1800. The U.S. Government Printing Office (GPO) order blank is on the back. 1995

U.S. Department of Education Online Library

Public Access via Internet through the National Library of Education's INet System

Individuals with access to the Internet can tap a rich collection of education related information at the U.S. Department of Education (ED), including:

- General Information about the Department's Mission, Organization, Key Staff, and Programs
- Information about Key Departmental Initiatives, such as GOALS 2000, Technology, Family Involvement, School-to-Work Programs, Standards, and Elementary and Secondary Schoolwide Projects
- Full-text Publications for Teachers, Parents, and Researchers
- Statistical Tables, Charts, and Data Sets
- Research Findings and Syntheses
- Directories of Effective Programs and Exemplary Schools
- Directory of Education-related Information Centers
- Announcements of New Publications and Data Sets
- Press Releases
- Selected Speeches and Testimony by the Secretary of Education
- Funding Opportunities
- Event Calendars
- Searchable ED Staff Directory
- Pointers to Public Internet Resources at ERIC Clearinghouses, Regional Laboratories, R&D Centers, and other ED-Funded Institutions
- Pointers to other Education Related Internet Resources

The Department's Internet site is maintained by the National Library of Education (NLE) in the Office of Educational Research and Improvement (OERI) on its Institutional Communications Network (INet). While still focusing primarily on research, improvement, and statistical information, INet also contains a substantial and steadily growing collection of information about programs and initiatives across the Department.

Our site is still relatively young (Gopher/FTP - October 93 and WWW - March 94) and you will continue to find sections under construction as we expand our collections and restructure them to facilitate access. We are committed to:

- Serve the needs of high end as well as low end users,
- Continue to expand our holdings of relevant and timely material,
- Explore ways to make our holdings more easily searchable.

Latest Developments

The GOALS 2000 legislation reauthorized OERI and created the National Library of Education (NLE), which is responsible for assembling and providing access to a comprehensive collection of education information, as well as promoting resource sharing and cooperation among libraries and other providers of education information. INet and ERIC are core components of a distributed electronic repository which NLE plans to develop in close collaboration with the National Education Dissemination System (NEDS), which also was established in OERI's reauthorization.

Latest Developments (continued)

In recent months, we have added significant full-text collections of legislation (GOALS 2000 and the Improving America's Schools Act) and standards documents. We are making more documents available in hypertext markup language (HTML) format on our World Wide Web server. The National Center for Education Statistics (NCES) has completely reorganized its Gopher server and added many survey data sets, reports, and tabulations.

Access Via Internet

Our WWW Server can be accessed at URL (uniform resource locator):

<http://www.ed.gov/>

The Gopher Server's address is:

<gopher.ed.gov>

or select **North America**→**USA**→**General**→**U.S. Department of Education**
from the All/Other Gophers menu on your system.

FTP users can access the information by ftping to:

<ftp.ed.gov> (log on anonymous)

E-Mail users can get our catalog and instructions on the usage of our Mail server by sending e-mail to:

almanac@inet.ed.gov

in the body of the message type **send catalog**

(avoid the use of signature blocks and leave the Subject line blank)

Please note that:

- We do not offer public access Gopher or WWW clients. You must either have an appropriate Gopher or WWW client, such as NCSA Mosaic or Lynx, at your site or be able to telnet to a public access client elsewhere.
- You cannot access our public servers by telneting to our site. You will be denied telnet access.
- Gopher and Mosaic/Lynx are the preferred access methods. Our FTP directories remain somewhat cryptic and the e-mail server is by its very nature a slow method to get documents.

Questions and Comments

If you have any suggestions or questions about the contents of the WWW, Gopher, FTP, and Mail servers, please use one of the following addresses:

E-mail:	inetmgr@inet.ed.gov	Telephone:	(202) 219-1547
	gopheradm@inet.ed.gov	Fax:	(202) 219-1817
