

Childhood Cancer Tracking Initiative in Massachusetts:

Developing a New Electronic Tool

Presented by
Cathy Gallagher, Risk Communicator
Community Assessment Program (CAP)
Center for Environmental Health (CEH)
Massachusetts Department of Public Health (MDPH)

Childhood Cancer Tracking Initiative

“Develop methods for linking environmental databases with childhood cancer incidence data to identify possible areas for further public health intervention”

Center for Environmental Health (CEH)

- Responds to environmental health concerns from different groups
- Provides communities with epidemiological and toxicological health assessments

Community Assessment Program (CAP)

- One of nine programs within the CEH
- Takes the lead in responding/triaging calls to the CEH regarding suspected disease clusters
- Evaluate frequency and patterns of disease in the population
- Investigate possible associations between environmental exposure and disease

Center for Environmental Health

Who do we respond to?

- Residents
- Local health officials
- Legislators
- Media

Why do they contact us?

- Suspected disease clusters
 - Majority are related to cancer
- Suspected environmental exposures
 - General and site-related

Responding to Community Concerns

- Peer Reviewed Protocol
- Step-wise Process
 - Phase I: Preliminary review
 - Phase II: Descriptive study
 - Phase III: Analytical study

Community-Specific Environmental Health Investigations

- Health component
 - Massachusetts Cancer Registry (MCR)
- Environmental component
 - Potential for exposures
 - Drinking water quality
 - Sampling data (e.g., soil, air)

Geographic Information Systems (GIS)

- Geocoding individual case addresses to evaluate spatial distribution
 - *“What does the pattern of cancer look like around a point exposure?”*
 - *“Does the spatial pattern of disease suggest a relationship to a common environmental exposure?”*
- Creating spatial layers of environmental data
 - *“How complex and severe is environmental contamination in the area of concern?”*

Limitations

- Neighborhood level cancer incidence data are not readily available
- Significant effort required to calculate rates

Standardized Incidence Ratio (SIR) Calculator

- Automates calculation of census-tract (CT) level incidence rates for 23 different cancer types
- Provides a map with specific locations of individuals diagnosed with cancer to enable quicker analysis of spatial distribution

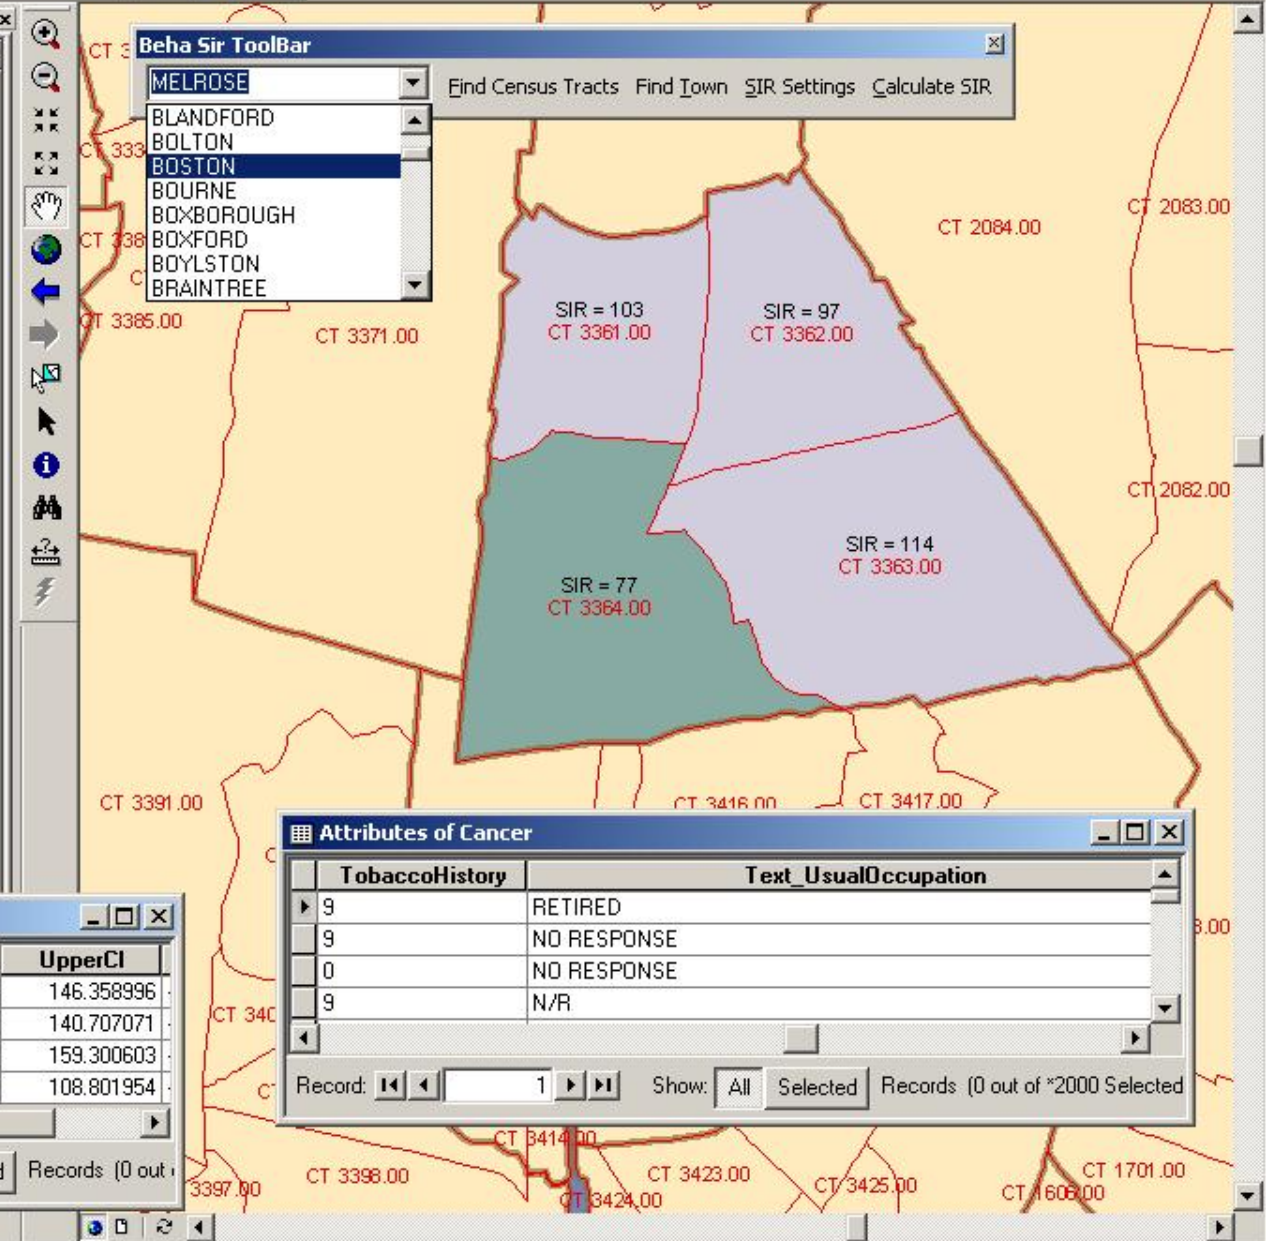

SIR Calculator

DATA LAYERS

- Massachusetts Cancer Registry
- U.S. Bureau of the Census
- GDT streets/political boundaries
- MassGIS

Layers

- CANCER_POINTS
 - Other
 - Pat_Gender, TobaccoHistory
 - M, non-smoker
 - M, current or former smoker
 - M, smoking status unknown
 - F, non-smoker
 - F, current or former smoker
 - F, smoking status unknown
- Streets
- Census Tract Map
 - 1990 CT Boundaries
 - Town Boundaries
 - SIR statistically significantly > expected
 - 1 <= n observed < 5
 - SIR Categories
 - USER_CAN_SIR.SIR
 - more than 100% above expected
 - 51% to 100% above expected
 - 15% to 50% above expected
 - within 15% of expected
 - 15% to 50% below expected
 - more than 50% below expected

Attributes of Cancer

TobaccoHistory	Text_UsualOccupation
9	RETIRED
9	NO RESPONSE
0	NO RESPONSE
9	N/R

Record: 1 Show: All Selected Records (0 out of *2000 Selected)

Attributes of USER_CAN_SIR

Observed	Expected	SIR	LowerCI	UpperCI
31	30.065647	103	70.043350	146.358996
28	28.761562	97	64.675004	140.707071
34	29.826215	114	78.931190	159.300603
32	41.521501	77	52.705319	108.801954

Record: 1 Show: All Selected Records (0 out of *2000 Selected)

SIR Calculator

“Streamlining the Process”

- Automated mapping for analysis of individual cancer diagnoses to determine spatial patterns or “clustering.”
- Simultaneous evaluation of cancer risk factors (e.g., age, cancer cell type, smoking status, and occupation).
- More staff time available for interpretation and communication of results to the public
- Will significantly improve response time for incoming requests for cancer cluster investigations
- Potential for future EPHT linkage opportunities

Special Considerations

- Security/confidentiality
- MCR database conversion
- Community-specific geocoding issues
- Provisions for incorporating more recent MCR data

SIR Calculator: Next Steps

- Finalize updated version with previous years of MCR data (i.e., 1982-2000)
- Possible future enhancements
 - Data refresh program
 - Improve reporting capabilities (i.e., summary tables)
 - Incorporate tool to improve active surveillance

Environmental Data Linkage

Next Steps:

- Work with federal, state, and local agencies to obtain available data
- Databases being considered for linkage include:
 - Drinking water quality (e.g. public and private)
 - Pesticide use
 - Outdoor air

Environmental Data Linkage

Challenges:

- Evaluate feasibility for linking environmental data with cancer incidence data
- Develop protocol for merging data sources

Questions?
