

**INFLUENZA** (flu) is a serious disease of the nose, throat, and lungs. It can make you sick for a week or longer with coughing, fever, aching, and more. And it can lead to pneumonia.

## Get your flu shot.

**People who are 50 years old or older.** Even if you are active and in good health, you have a higher risk of complications if you get the flu. Each year about 36,000 people in the U.S. die because of the flu.

People with chronic (ongoing) or long-term
health problems. You may look and feel healthy,
but if you have a condition like diabetes, heart
disease, kidney disease, or asthma, you are more
likely to have complications from the flu. If your
immune system is weakened by long-term problems
like cancer or HIV/AIDS, you need a flu shot (the flu
shot is safe for people with weak immune systems).

## Women who are pregnant during flu season (typically November through March).

Pregnant women are at risk of complications and hospitalization if they get the flu. The influenza vaccine is safe for pregnant women and their babies. Protect yourself and your baby by getting vaccinated.

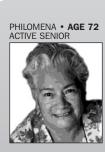

**Children under 5 years old.** Children under 5 years old have a high risk of emergency room visits and hospitalizations due to flu.

For more information, ask your healthcare provider or call
