Purpose:

DVD viewing on Linux based Operating Systems, where in as no commercial software DVD player is available to de-encrypt encrypted DVD's.

Argument:

As the digital age has come upon us. The need to diversify our self with a "more secure" operating system is paramount. Many users of Linux based operating systems have constantly been faced with patent issues that prevent the users from viewing legal copies of DVD's that have been encrypted. Currently there is no software legally available here in the US. Please assist us in our right to view our legally owned DVD's.
