Proposed Project: Mechanisms of Foodborne Infectious Disease Outbreaks—New—Epidemiology Program Office (EPO), Centers for Disease Control and Prevention (CDC).

This study will systematically determine how local and state health departments find out about disease outbreaks. While it is assumed that speed and accuracy of outbreak detection can be improved, there is little reported analysis of current detection methods at the state and local levels. Great attention is being focused on improving infectious disease outbreak detection in the United States (U.S.),

heightened by concerns of U.S. vulnerability to bioterrorist attack, and the inclusion of the development of enhanced syndromic surveillance systems. This information can be used to identify ineffective successful methods, and to motivate investments in alternative methods for outbreak detection.

The investigation will consist of a collection of available documentation about the outbreak and administration of a questionnaire to the local or state health department representative who identified each of 250 different outbreaks, which are sampled from the Electronic Foodborne Outbreak Reporting System (EFORS) database.

The questionnaire will consist of both closed- and open-ended items, and will be administered via Web-form or telephone interview. The initial 250 outbreak sample will be stratified by State, partly in order to reasonably distribute survey burden. With an anticipated 80% response rate, the final sample will be approximately 200 outbreaks (and respondents).

Additional efforts to reduce survey burden will include completion of as many of the questionnaire items as possible prior to administration (based on supporting documents), and Webform or telephone administration options. There will be no cost to respondents.

Respondents	No. of re- spondents	No. of re- sponses per respondent	Average bur- den per re- sponse (in hours)	Total burden (in hours)
State and Local Health Departments Representatives	200	1	1	200 200
