SUPPLEMENTARY INFORMATION:

I. Information About the Project/ Document

This report describes projected effects of climate change on aquatic ecosystems and provides a preliminary analysis of possible effects on river and stream bioassessment programs. The report is intended for managers and scientists working on biological indicators, bioassessment, and biocriteria to provide them with information on the potential effects of climate change on indicator organisms used, initial strategies for adapting their programs to accommodate these environmental changes, and highlight possible next steps. The first step described in the report is an approach for identifying biological indicators sensitive to climate change; a case study next analyzes bioassessment data to detect possible climate change effects; and, finally, another analysis discusses methods for continuing to detect impairment under climate change. The results show that (1) Some biological indicators may be particularly sensitive to climate change; (2) depending on species loss rates, magnitude of temperature changes, and number samples, effects may be detected in 15 to 100 years; and (3) climate change effects may decrease the ability of states to discriminate between reference and impaired sites. The report concludes with recommendations for

more in-depth assessments in different U.S. regions and further dissemination and coordination of information across EPA and states.
