§ 120.312 Power sources on vessels of more than 19.8 meters (65 feet) in length carrying more than 600 passengers or with overnight accommodations for more than 49 passengers.

A vessel of more than 19.8 meters (65 feet) in length carrying more than 600 passengers or with overnight accommodations for more than 49 passengers must have:

- (a) Two generator sets;
- (b) An electrical power system that complies with the requirements of §§111.10-4, 111.10-5, 111.10-9, 111.10-11 in subchapter J of this chapter;
- (c) A final emergency power source, as defined by §112.01-20 in subchapter J of this chapter, with sufficient capacity to power the loads listed in §112.15-5 in subchapter J of this chapter for three hours; and
- (d) The final emergency power source located outside the machinery space.

§ 120.320 Generators and motors.

- (a) Each generator and motor must be:
- (1) In a location that is accessible, adequately ventilated, and as dry as practicable; and
- (2) Mounted above the bilges to avoid damage by splash and to avoid contact with low lying vapors.
- (b) Each generator and motor must be designed for an ambient temperature of 50°C (122°F) except that:
- (1) If the ambient temperature in the space where a generator or motor will be located will not exceed 40° C (104° F) under normal operating conditions, the generator or motor may be designed for an ambient temperature of 40° C (104° F); and
- (2) A generator or motor designed for 40° C (104° F) may be used in 50° C (122° F) ambient locations provided the generator or motor is derated to 80 percent of the full load rating, and the rating or setting of the overcurrent devices is reduced accordingly.
- (c) A voltmeter and an ammeter, which can be used for measuring voltage and current of a generator that is in operation, must be provided for a generator rated at 50 volts or more. For each alternating current gener-

ator, a means for measuring frequency must also be provided.

- (d) Each generator must have a nameplate attached to it containing the information required by Article 445 of the National Electrical Code (NEC) (National Fire Protection Association (NFPA) 70), and for a generator derated in accordance with paragraph (b)(2) of this section, the derated capacity.
- (e) Each motor must have a nameplate attached to it containing the information required by Article 430 of the NEC (NFPA 70), and for a motor derated in accordance with paragraph (b)(2) of this section, the derated capacity.
- (f) Each generator must be protected by an overcurrent device set at a value not exceeding 115 percent of the generator full load rating.

[CGD 85-080, 61 FR 928, Jan. 10, 1996, as amended at 62 FR 51352, Sept. 30, 1997]

§ 120.322 Multiple generators.

When a vessel is equipped with two or more generators to supply ship's service power, the following requirements must be met:

- (a) Each generator must have an independent prime mover; and
- (b) The generator circuit breakers must be interlocked to prevent the generators from being simultaneously connected to the switchboard, except for the circuit breakers of a generator operated in parallel with another generator when the installation meets §§111.12–11(f), and 111.30–25(d) in subchapter J of this chapter.

§ 120.324 Dual voltage generators.

- (a) A dual voltage generator installed on a vessel shall be of the grounded type, where:
- (1) The neutral of a dual voltage system must be solidly connected at the switchboard's neutral bus; and
- (2) The neutral bus shall be connected to ground.
- (b) The neutral of a dual voltage system must be accessible for checking the insulation resistance of the generator to ground before the generator is connected to the bus.
- (c) Ground detection must be provided that:
