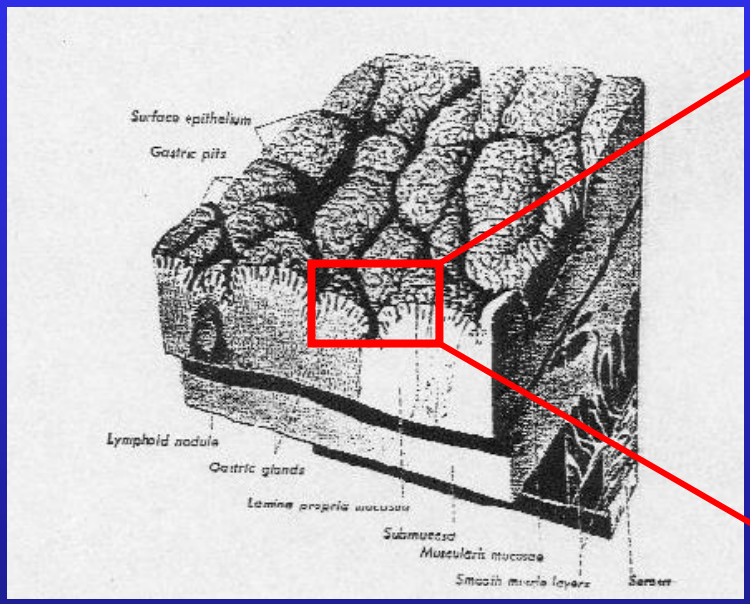
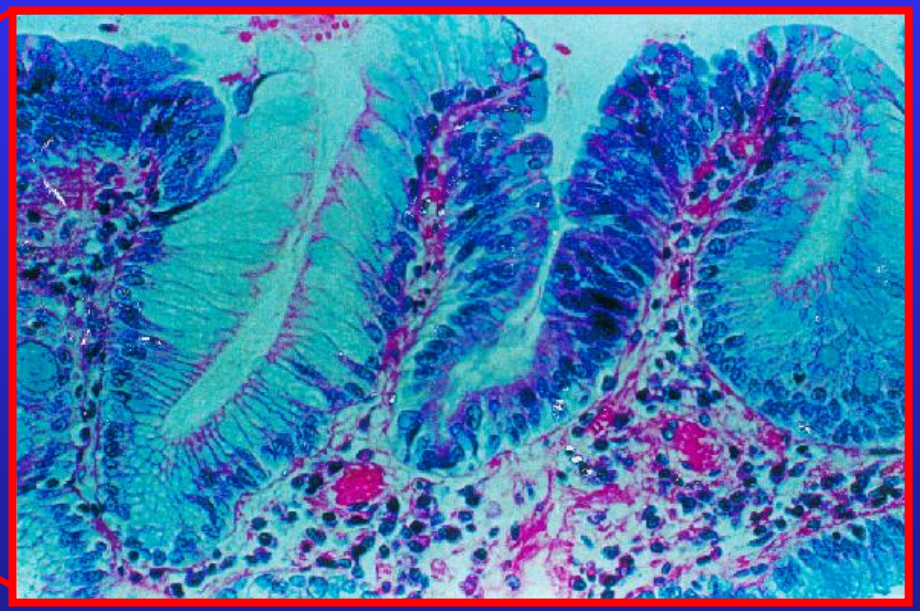
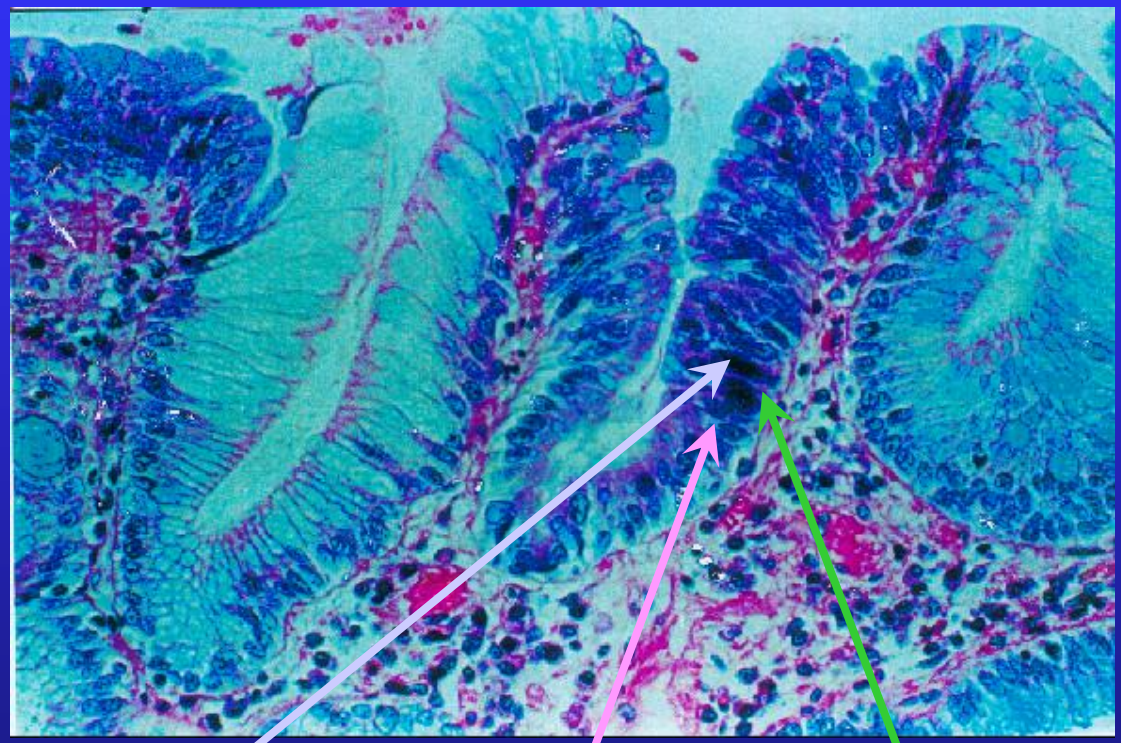
Morphology of Mucosal Tissue





Reproduced from Bloom and Fawcett “A Textbook of Histology”

Biopsy Slide of Dysplastic Barrett's Esophagus



Criteria used by pathologists

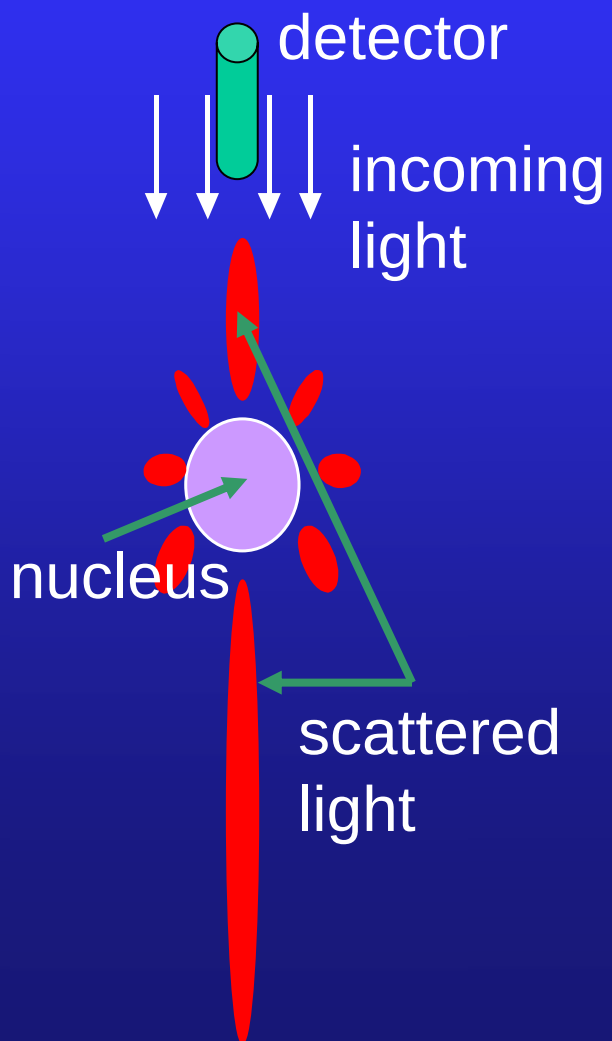
- Early precancerous changes occur only in epithelium

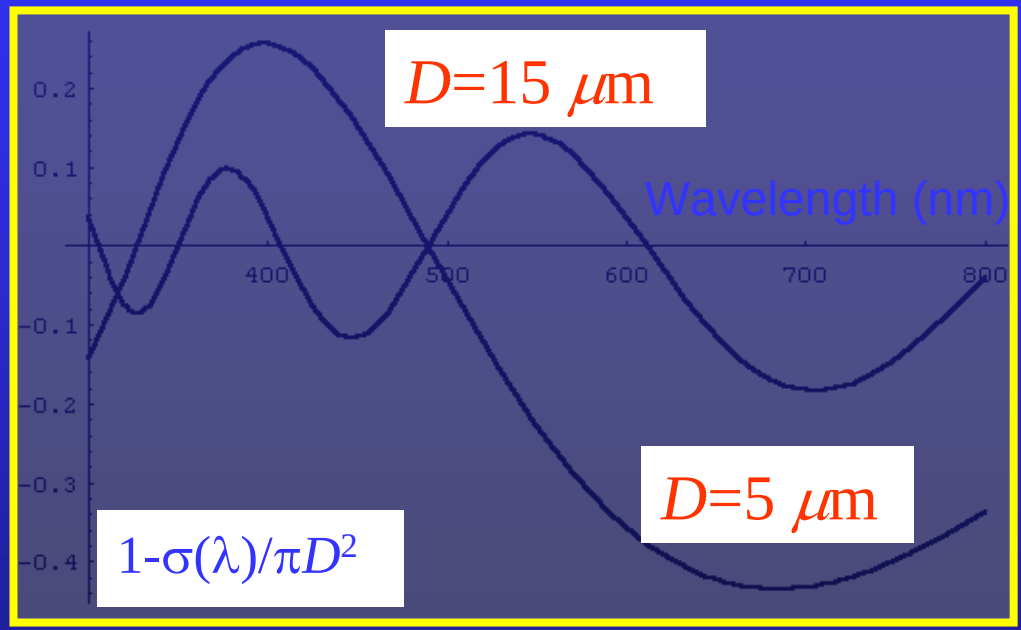
- Enlarged nuclei
- Crowding
- Hyperhromaticity
- Stratification
- Architectural changes

Dysplasia & Biopsy

- Precursor of cancer
- Most tumors are curable if diagnosed on the stage of dysplasia
- Detection of dysplasia requires removal of tissue via biopsy, followed by analysis via pathology
- Biopsy
  - ✓ Random - can easily miss dysplastic changes
  - ✓ Invasive - needs tissue removal
- Develop technique capable to detect invisible precancerous changes
  - ✓ Minimally Invasive
  - ✓ Real Time
  - ✓ Over Large Tissue Areas
- Light Scattering Spectroscopy has potential to do all of that

Light Scattering Spectroscopy





$$\sigma_s(\lambda, r) = \frac{\pi D^2}{2}\left(1 - \frac{\sin(2\delta/\lambda)}{\delta/\lambda} + \left(\frac{\sin(\delta/\lambda)}{\delta/\lambda}\right)^2\right)$$

$\delta = \pi D(n\text{-}1)$

n - relative refractive index (n=1.06)

Conclusions

Light scattering spectroscopic techniques

- require no exogenous labels
- are noninvasive and nondestructive
- are capable of quantitative measurement of microscopic morphological and biochemical changes in various tissues on submicron scale
- can be an important tool for early detection of disease in various organs of human body and for image guided interventions
