Up to 50 T

- Anisotropic scaling at intermediate angles
- Correlated pinning near the crystalline axes

Vortex melting indicates the emergence of a smectic phase for $T < 80\text{K}$ for $H > 40\text{T}$ with $H \parallel ab$.

The layered structure of $\text{YBa}_2\text{Cu}_3\text{O}_7$ leads to the formation of a smectic vortex phase.

Angular dependent transport in the 50 T pulsed magnet, NHMFL-LANL.
