Re: Gulf of Mexico Synthetic Based Muds Monitoring Program

Dear Dr. Trefry,

Enclosed are results for methyl mercury in sediment samples received May 17, 2002. All samples listed on the enclosed letter were received in good condition, with cooler temperatures of -18.7 °C and -19.1 °C. Following receipt, the samples were placed directly into frozen storage until sample preparation could take place.

Methyl mercury in sediments was prepared by acid bromide/methyl chloride extraction and analyzed by aqueous phase ethylation, isothermal GC separation, and CVAFS detection (Frontier SOP's FGS-045, FGS-070). All results are reported on both a wet and dry weight basis.

Overall, no significant analytical difficulties were encountered. There are some items to note, separated according to analytical batch identifier.

- MHG7-020530-1 During the preparation of the samples, the sample designated for matrix spikes was not spiked. The extract was spiked to accommodate this error, and after the remaining preparation and analysis the matrix spike recoveries were 102.4% and 102.3%. As the recoveries were in control and all subsequent preparations displayed good matrix spike recoveries, no further action was taken.
- MHG7-020606-1 The 0.1 ng calibration standard displayed low recoveries and was removed from the calibration curve. In order to assure that there were no issues with the trap or bubbler used to purge the standard, independent 0.1 ng recovery checks were performed on the bubbler and trap. As the recoveries were in control at 101.2% and 94.9%, the system was determined to be in control and analysis was resumed.

fax 206 622 6870  
email: info@Frontier.WA.com  
[www.FrontierGeosciences.com](http://www.FrontierGeosciences.com)

- MHG1-020611-1 The matrix replicate performed on sample MC496-FF6 was above the control limit of 25% RPD with a recovery of 57%. The sample was re-purged and analyzed yielding an RPD of 5.2%. One of the initial replicates was in good agreement with both re-run values while the other initial value was substantially lower. The initial out of control RPD is attributed to preparation error.

Please feel free to contact me if you have any questions regarding these results.

Best Wishes,

Lucas Hawkins  
Project Manager

Re: Gulf of Mexico Synthetic Based Muds Monitoring Program

Dear Dr. Trefry,

Enclosed are results for methyl mercury in sediment samples received May 23, 2002. All samples listed on the enclosed letter were received in good condition, with cooler temperatures of -11.3 °C and -10.0 °C. It was noted upon receipt that the sample listed on the COC as EI346 MF2 was labeled on the bottle as EI346 MF6. Upon discussion with the client, it was determined that EI346 MF6 was the correct sample ID. Following receipt, the samples were placed directly into frozen storage until sample preparation could take place.

Methyl mercury in sediments was prepared by acid bromide/methyl chloride extraction and analyzed by aqueous phase ethylation, isothermal GC separation, and CVAFS detection (Frontier SOP's FGS-045, FGS-070). All results are reported on both a wet and dry weight basis.

Overall, no significant analytical difficulties were encountered. There are some items to note, separated according to analytical batch identifier.

- MHG1-020613-1 The 0.100 ng calibration standard recovered low and was removed from the curve. In order to assure that there were no issues with the trap and bubbler involved, a 0.100 ng recovery check was performed using the same bubbler/trap combination. As the recovery was acceptable at 97.6%, analysis was resumed. The initial low recovery was attributed to a loose or improper bubbler seal.
- MHG7-020613-1 The continuing calibration verification standard (CCV1) recovery was above the control limit of 120% with a recovery of 124.4%. Additional standards were immediately prepared to investigate if the bubbler or trap were responsible for

Hello John,

I have revised your data tables to include the analytical run identifier that corresponds to each result. For instance, MHG7-020611-1 indicates Methyl Hg analyzer #7 ran on June 11, 2002 (YYMMDD format). The -1 extension simply refers to the first analytical calibration of the day for the associated instrument.

Best regards,

Lucas Hawkins

Hello John,

Below is a list of the analysis that you requested - the dataset ID numbers are in parenthesis.

For samples received 5/17/02:

May 30, 2002 (MHG7-020530-1)  
June 5, 2002 (MHG7-020605-1)  
June 6, 2002 (MHG1-020605-1 and MHG7-020606-1)  
June 11, 2002 (MHG1-020611-1 and MHG7-020611-1)

For samples received 5/23/02:

June 11, 2002 (MHG7-020611-1)  
June 13, 2002 (MHG1-020613-1 and MHG7-020613-1)  
June 14, 2002 (MHG7-020614-1)  
June 25, 2002 (MHG1-020625-1)

Please let me know if there is any other information that you need.

Take care,

Lucas Hawkins

## Appendix III

### Data for Statistical Tests

Note:

Results of the t-tests presented here are for alpha = 0.05. Both one-tail and two-tail results are shown. The t-test data presented here are based on unequal variances (as tested with F test) that are observed because of much greater variability in concentrations of total Hg, MeHg and TOC in nearfield sediments versus farfield sediments.

In each table, when two means are significantly different, the t-statistic in the table is shown in **bold in a shaded block**. When the two means are not significantly different, the t-statistic is shown in **(bold in parentheses in a shaded block)**.

t-Test: Two-Sample Assuming Unequal Variances  
**MP299 THg all NF vs FF**

	Variable 1	Variable 2
