"3) **Composés de coordination.**

Les composés de coordination des métaux comprennent généralement toutes les espèces, chargées ou non, dans lesquelles un métal est lié à plusieurs atomes (généralement 2 à 9 atomes) mis à disposition par un ou plusieurs ligands. La géométrie du squelette formé par le métal et les atomes qui y sont liés ainsi que le nombre de liaisons métalliques sont généralement caractéristiques pour un métal donné.

Les composés de coordination, autres que les produits relevant du Sous-Chapitre XI ou du n° 29.41, doivent être considérés comme "fragmentés" par clivage de toutes les liaisons métalliques, à l'exception des liaisons métal-carbone, et classés selon le fragment relevant du Chapitre 29, dans la position placée la dernière par ordre de numérotation. On en trouvera ci-après quelques exemples :

Le trioxalatoferrate (III) de potassium est à classer dans la position dont relève l'acide oxalique (n° 2917.11), correspondant au fragment obtenu après clivage des liaisons métalliques.

Le ferrocholate (DCI) est à classer dans la position dont relève la choline (n° 2923.10), qui est classée dans une position supérieure à celle de l'acide citrique correspondant à l'autre fragment entrant en ligne de compte pour le classement.

Budotitane (DCI): après clivage des liaisons métalliques, on obtient 2 fragments, l'un correspondant à l'éthanol (Chapitre 22), l'autre à la benzoylacétone (et ses formes énoliques) classée dans le n° 2914.39. Le budotitane (DCI) doit donc être classé dans le n° 2914.39.

Le point 3) actuel devient le point 4).

"(3) **Co-ordination compounds.**

Metal co-ordination compounds generally include all the types, whether or not charged, in which a metal is bound to several atoms (generally 2 to 9 atoms) made available by one or more ligands. The skeletal geometry formed by the metal and the atoms which are bound to it as well as the number of metal links are generally characteristic for a given metal.

Co-ordination compounds, other than products classifiable in Sub-Chapter XI or in heading 29.41, should be considered as being fragmented by "cleaving" of all metal bonds, apart from metal-carbon bonds, and should be classified according to the fragment falling in Chapter 29, in the heading occurring last in numerical order. Examples are shown below :

Potassium trioxalatoferrate (III) is classifiable in the heading in which the oxalic acid falls (subheading 2917.11), corresponding to the fragment obtained after cleaving of the metal bonds.

Ferrocholate (INN) is classifiable in the heading covering choline (subheading 2923.10), which is classified in a higher heading than citric acid corresponding to the other fragment that can be taken into account for classification purposes.

Budotitane (INN): After cleaving of the metal bonds, two fragments are obtained, one corresponding to ethanol (Chapter 22), the other to benzoylacetone (and its enol-function) classified in subheading 2914.39. Budotitane (INN) must therefore be classified in subheading 2914.39.

Note 1. Paragraphe introductif et sous-paragraphe a) et b).

Nouvelle rédaction :

"1.- Dans la Nomenclature, les termes *synthétiques* ou *artificiels*, appliqués aux matières textiles, s'entendent de polymères organiques obtenus :

[Alternative 1.

- a) par polymérisation de monomères organiques, pour obtenir des polymères tels que polyamides, polyesters, polyoléfines ou polyuréthanes. [Alternative 2.

- a) par polymérisation de monomères organiques, pour obtenir des polymères tels que polyamides, polyesters, polyoléfines ou polyuréthanes, ou par modification chimique de polymères obtenus par ce procédé (poly(alcool vinylique) obtenu par hydrolyse du poly(acétate de vinyle), par exemple);]

(Proposition du Secrétariat)

- b) par dissolution ou traitement chimique de polymères organiques naturels (cellulose, par exemple), pour obtenir des polymères tels que rayonne cupro-ammoniacale (cupro), lyocell ou rayonne viscosse, ou par modification chimique de polymères organiques naturels (cellulose, caséine et autres protéines, acide alginique, par exemple), pour obtenir des polymères tels qu'acétate de cellulose ou alginates."

Delete and substitute :

"1. - Throughout the Nomenclature, the term "man-made", when used in relation to textile materials, means organic polymers produced either :

[Option 1.

- (a) By polymerisation of organic monomers to produce polymers such as polyamides, polyesters, polyolefins or polyurethanes. The polymers produced by this process may be further chemically modified (for example, poly(vinyl acetate) is hydrolysed to produce poly(vinyl alcohol)); or]
