Overview

The Pension Benefit Guaranty Corporation (PBGC) was established by the Employee Retirement Income Security Act of 1974 (ERISA) to ensure that participants in defined benefit pension plans receive their pensions if their plans terminate without sufficient assets to pay promised benefits. The PBGC administers separate insurance programs to protect participants in single-employer and multiemployer plans.

The PBGC has published the *Pension Insurance Data Book* annually since 1996 to present detailed statistics on PBGC program operations and benefit protections.

This edition of the *Pension Insurance Data Book* contains two short articles. The first is a brief description about recent trends in defined benefit pension plans and includes most of the graphs that were presented under the heading “PBGC Data and Trends” in previous editions of the *Pension Insurance Data Book*. The second article discusses how underfunding is measured in defined benefit pension plans. It also explains the assumptions underlying each of the five underfunding measures presented in the expanded table S-47 and the group of plans to which each measure applies.

A number of tables have undergone minor modifications. Table S-19 (“PBGC Claims by Industry”) now bases industry categories on the business codes associated with the North American Industry Classification System. Previously, they were based on the Standard Industrial Classification codes. This change had relatively little effect on PBGC claims from most industries. The participant coverage figures in table S-50 are now based on pension coverage and receipt data from the May 2003 Survey of Income and Program Participation interviews. Previously, the estimates were based on April 1993 Current Population Survey data. This change increased or decreased estimated participant counts for several states by 100,000 participants or more. Tables S-37 and M-16 reflect the PBGC premium increases enacted with the passage of the Deficit Reduction Act of 2005.

The *Data Book* is available on the PBGC’s Web site at:

www.pbgc.gov/publications/databook

*The number of payees includes those receiving a periodic pension benefit payment and those who received a lump sum benefit payment from the PBGC during FY 2005.

Recent Trends in Defined Benefit Pension Plans

Summary

During the past decade, the net financial position of the PBGC's Single-Employer Plan Insurance Program shifted from deficit to surplus and back to a record deficit. This movement was largely the result of the pattern of claims the PBGC received over the period. During the economic boom of the late 1990s, the PBGC received only a moderate level of claims annually. However, since 2000, it has recorded a number of extraordinarily large claims. More than 80 percent of all claims against the PBGC have come since 2000. The largest claims were from plans in two distressed industries, airlines and steel, which together accounted for 75 percent of the claims received over the FY2000-FY2005 period.

The record number of claims also brought to the PBGC a record number of plan participants owed benefits under the pension insurance program. In FY2000, the PBGC paid \$900 million in benefits to 243,000 participants. In FY2005, it paid \$3.7 billion in benefits to 698,000 participants. An additional 489,000 participants in the plans trustee by the agency will receive benefits from the PBGC when they become eligible to retire in the future.

The number of plans insured by the PBGC continued to fall, extending the trend that began in the mid-1980s. PBGC now insures only about one-fourth as many single-employer plans as it did in 1985. Plans of all sizes are declining in number, not just the smaller plans as was the case in the late 1980s and throughout the 1990s. It is also noteworthy that 9 percent of ongoing PBGC-insured plans have been frozen so that workers in those plans no longer earn additional credits toward retirement benefits.

Single-Employer Plans

The PBGC's Claims and Net Financial Position

The net financial position of the PBGC's single-employer program has been in deficit for 25 of the agency's 31 years of existence. (See figure 1.) The Corporation had a surplus only from 1996 to 2001, peaking at \$9.7 billion at the end of FY2000. The program's net financial position declined rapidly after FY2000 and at the end of FY2005 showed a deficit of \$22.8 billion with assets of \$56.5 billion to cover \$79.2 billion in benefit liabilities.

Figure 1

Net Position of the PBGC's Single-Employer Program

The PBGC's net financial position deteriorated primarily because of the large increase in claims received after FY2000. (See figure 2.)¹ From FY1975 through FY1999, PBGC received claims totaling \$6.3 billion. From FY2000 through FY2005, claims totaled more than \$25 billion, a four-fold increase. Of the 10 companies with the largest PBGC claims, only one—Pan Am Airways—defaulted on its pension obligations before FY2001. (See table S-5.)² The 33 trusted plans from these 10 companies accounted for almost two-thirds of the \$31.7 billion in total claims incurred by the PBGC during its 31 years. The largest claims were concentrated in just two industries, airlines (38.1 percent of all claims) and steel (32.7 percent of all claims). (See figure 3.)³ Old-line companies in these industries face substantial competition from lower cost competitors that do not, as a rule, provide defined benefit pension plans for their workers.

¹ The data in figure 2 are based on the date of plan termination, not the date the PBGC added the plan to its inventory of trusted plans and plans pending trusteeship. Typically, about half the plans added to this inventory are added in the year they terminate, about a third are added in the year following termination, and 10 percent the second year after termination. A small number of plans terminated three or more years before they were added to the inventory.

² Table cites are to tables in the appendices of this edition of the Data Book.

³ Claims from the plans of nonferrous primary metal companies are responsible for the other 2.6 percent of total claims shown for the primary metal companies in figure 3. The vast majority of these claims were also incurred after FY1999.

Figure 2

Concentration of PBGC Claims Single-Employer Program

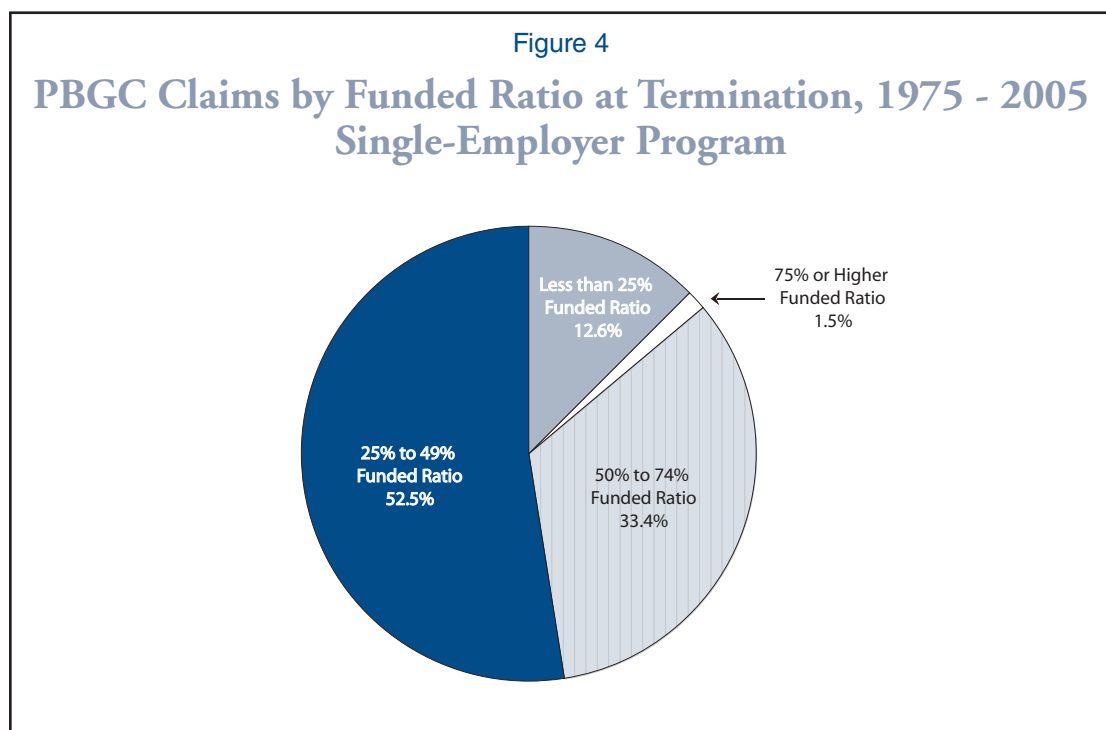

Figure 3

PBGC Claims by Industry, 1975 - 2005 Single-Employer Program

Typically, the plans trusted by the PBGC are only about 50 percent funded on a termination basis. Very few of the claims against the agency (only 1.5 percent) come from plans that are at least 75 percent funded. (See figure 4.) Recent financial deterioration of many current PBGC-insured plans is a cause for concern. Based on Form 5500 data, aggregate underfunding of guaranteed benefits in PBGC-insured single-employer plans increased from about \$7 billion in FY2000 to about \$313 billion in FY2003. (See table S-42.) The average funded ratio of PBGC-insured single-employer plans fell from 144 percent to a historical low of only 84 percent. This drop reflects a 26 percent decline in plan assets and a 28 percent increase in plan liabilities. Over this same 3-year period, the number of underfunded plans increased from less than 20 percent of all insured plans to more than 70 percent.

Payees

The recent increase in claims received by the PBGC resulted in a large increase in the number of people receiving benefit payments from the Corporation. During FY2000, the PBGC paid \$900 million in benefits to 243,000 participants and beneficiaries in the plans it had trusted. At that time, another 226,000 participants were in deferred payment status, generally because they were not yet old enough to receive benefits under the terms of their plan. From FY2001 through FY 2005, the PBGC trusted an additional 709 plans with 960,000 participants and beneficiaries. By FY2005, the number of payees and deferred payees had increased to 698,000 and 489,000 respectively and benefit payments from the agency had increased to \$3.7 billion. (See figures 5 and 6.)

Figure 5

Participants and Beneficiaries Receiving PBGC Payments Single-Employer Program

Figure 6

Total PBGC Benefit Payments Single-Employer Program

Trends in Plans and Participants⁴

The declining number of single-employer plans insured by the PBGC continues a trend that began 20 years ago.⁵ In FY1985, the agency insured about 112,000 single-employer plans. It now insures only one-fourth of that number. (See figure 7.) The decline has been primarily among small plans (fewer than 100 participants), whose numbers shrank 80 percent from 90,000 in FY1985 to 18,000 in FY2005. The number of larger-sized plans initially grew before declining as well, starting with the smaller of the medium-sized plans. Even the number of plans with 5,000 or more participants, which grew slowly until FY2001, has begun to decline. Financial distress in many plans suggests that this trend will continue into the foreseeable future.

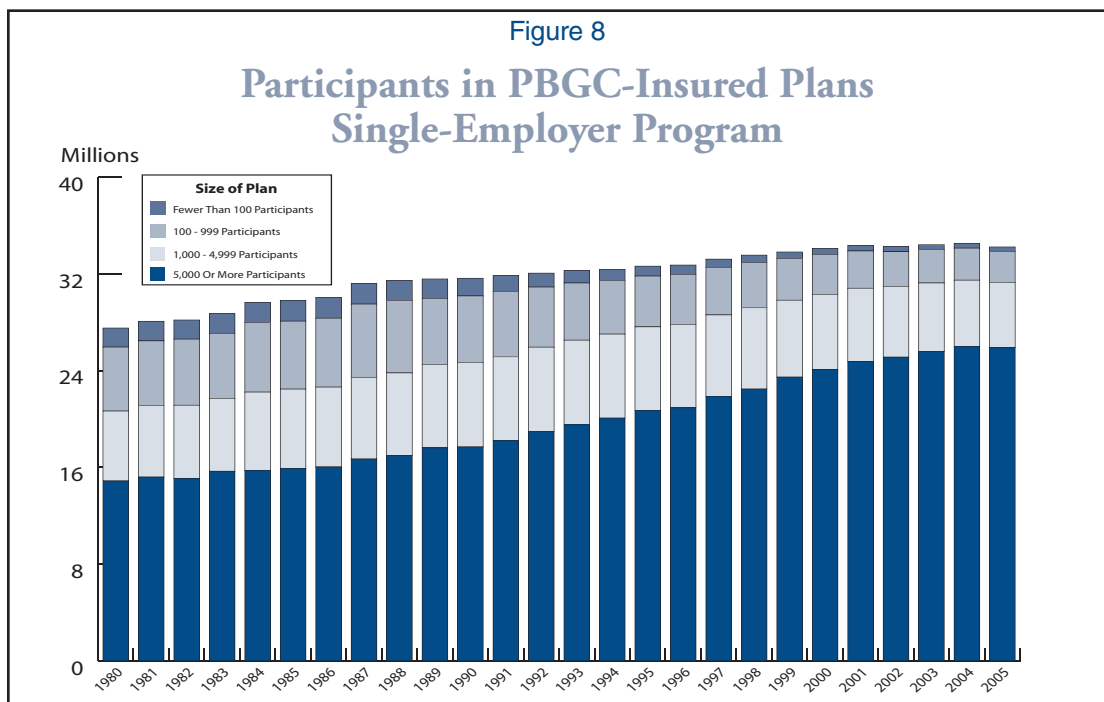

Most of the insured plans that have disappeared since FY1985 underwent a standard termination or merged with another, continuing plan. In a standard termination, which is available only to fully funded plans, the plan pays participants the present value of their accrued benefits either by purchasing annuities from private-sector insurance companies or in lump-sum distributions. Standard terminations represented about 98 percent of all terminations during this period. The other two percent were distress or involuntary terminations of underfunded plans. Upon termination, these latter plans are trusteed and administered by the PBGC.

⁴ The PBGC insures benefits in about two-thirds of private-sector defined benefit plans. It does not insure the plans of: individuals; professional service employers if they never had more than 25 workers; plans that primarily benefit owners and highly paid management; or plans established outside the United States that primarily benefit nonresident aliens. Church plans are not automatically covered by the single-employer program but may voluntarily elect such coverage.

⁵ Although the number of insured plans is dropping, new plans continue to enter PBGC coverage. Recently, the PBGC has been insuring several hundred new plans yearly.

Despite the decline in the number of PBGC-insured plans over the past 20 years, the total number of participants whose benefits the PBGC insures has increased. Most participants with PBGC-insured benefits work for large companies. The growth of participants in these large plans exceeded the loss of participants in the smaller plans that terminated. (See figure 8.) However, several factors, including the recent terminations of several large plans in the steel, airline, and textile industries and the conversion of many large insured plans to hybrid plans that typically pay benefits with lump sum distributions, caused the number of PBGC-covered participants to fall by 300,000 during FY2004.

Although the number of participants in single-employer plans generally has increased, the distribution of these participants among active workers, retirees, and separated vested participants has been shifting.⁶ (See figure 9.) In FY1985, 72 percent of those in single-employer plans were active participants (currently employed workers). By FY2005, less than half were active participants. The percentage who were retirees and beneficiaries increased by almost 50 percent over this 20-year period. One reason is longer life expectancies. Another is that more workers are choosing a joint-and-survivor annuity when they retire rather than taking a single-life annuity, which has increased the number of surviving beneficiaries. The fastest growing group, however, has been the separated vested participant group whose percentage of all participants has tripled in the past 20 years. This increase largely resulted from the legislated reduction in the maximum vesting period from 10 years to 5 years, which took effect in 1989 for most plans.

⁶ A separated vested participant is one who has worked long enough while covered by the plan to become vested (have a nonforfeitable right to earned benefits), but who stopped working in employment covered by the plan before he or she was eligible to retire.

Figure 9

PBGC-Insured Participants by Participant Status Single-Employer Program

The recent decline in the number of covered single-employer participants could well continue into the future, driven by the potential for continued terminations of large plans, companies freezing their plans or closing them to new entrants, and conversions of large plans to a hybrid format. When a plan is closed to new entrants, participants who die, retire or separate from employment are not replaced by new participants and the plan's size necessarily shrinks over time. Hybrid plans typically pay participants a lump sum upon termination of employment, ending the PBGC's guarantee of their benefits. Consequently, this form of benefit distribution portends fewer retired and terminated vested participants in hybrid plans in the future.⁷ If these departing workers are replaced, the hybrid plan's size may remain stable. However, if the retirees and separated participants had remained plan participants, the plan's size would have grown over time.

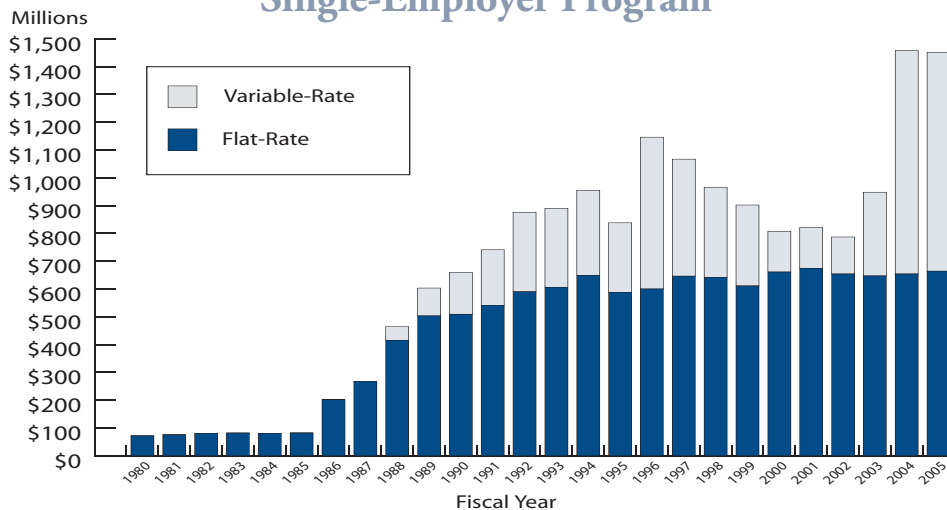

A decline in the number of covered participants will affect the PBGC's revenues. The PBGC's primary source of funds to cover claims and pay administrative expenses is premium income. The PBGC's single-employer premium has two components—a flat-rate premium of \$30 per participant per year and a variable-rate premium of \$9 per \$1,000 of plan underfunding.⁸ A plan can avoid paying the variable-rate premium if it

⁷ We have not yet seen a decline in the size of these plans. This is probably because most hybrid plans converted from traditional plans, often with grandfather provisions, and relatively few retirees and separated employees have had the opportunity to take their benefits in a lump sum. We expect these distributions to increase in the future.

⁸ The flat-rate component for 2006 was increased to \$30 per participant per year by the Deficit Reduction Act of 2005. After 2006, it will be indexed to increases in the national average wage index. The flat-rate premium previously had been \$19 per participant per year from 1991 through 2005.

Figure 10

PBGC Premium Revenue Single-Employer Program

meets one of several exemptions. As seen in figure 10, the bulk of the PBGC's premium income in most years has come from the flat-rate premium, which recently provided about \$650 million per year. A decline in covered participants would reduce revenue from this source.

Weaker plan funding in recent years has increased PBGC's revenues from the variable-rate premium. Still, the most prominent variable-rate premium exemption has enabled many large underfunded plans to avoid paying a variable-rate premium.⁹ The extent of plans' ability to avoid paying the variable-rate premium is shown in table S-47. Column E shows that the estimated total underfunding in PBGC-insured single-employer plans was more than \$430 billion in each of the last two years. Yet, about 80 percent of this underfunding was not subject to the variable-rate premium as shown by column B.¹⁰ Figure 11 shows that while 55 percent of the PBGC's premium revenues came from the variable-rate premium in FY2004, only 33 percent of participants were in plans paying the variable-rate premium. This implies that small plans are most likely to pay this component of the premium while large underfunded plans avoid it.

⁹ This is the full-funding-limit exemption. Many large plans will meet this exemption if they are 90 percent funded on a current liability basis, even if they are less than 90 percent funded on the premium basis.

¹⁰ See "Underfunding Measures in Table S-47" elsewhere in this Data Book for a discussion of how the various measures of underfunding in table S-47 are calculated.

Figure 11

Distribution of PBGC-Insured Participants and Premiums by Premiums Paid, 2004 Single-Employer Program

Figure 12

Net Position of the PBGC's Multiemployer Program

Multiemployer Plans

The PBGC's Net Financial Position and Financial Assistance to Insolvent Plans

The net financial position of the PBGC's multiemployer insurance program showed a surplus from FY1982 to FY2002. (See figure 12.) Between FY2002 and FY2005, the program's net financial position fell from a surplus of \$158 million to a deficit of \$335 million primarily due to an increase in expected future financial assistance for plans reclassified as probable losses.

The multiemployer program is structured differently than the single-employer program. Instead of PBGC trusteeship for terminated underfunded plans, with the agency taking responsibility for paying benefits to the plans' participants, the multiemployer program provides financial assistance in the form of loans to insolvent plans. The plans remain responsible for paying benefits to their retirees. In FY2005, this financial assistance totaled \$13.8 million to 29 insolvent multiemployer plans. Because several additional large multiemployer plans are approaching insolvency, the level of financial assistance is expected to increase dramatically. This assistance covers only guaranteed benefits plus administrative expenses. Most loans are not expected to be repaid (only one plan has ever repaid loans made under the program).

Like single-employer plans, funding levels of multiemployer plans have deteriorated in recent years. In FY2000, 36 percent of insured multiemployer plans were underfunded with a total underfunding of \$21.1 billion. Overall, PBGC-insured multiemployer plans were 105 percent funded on average in FY2000. The funding levels in these plans fell dramatically over the next three years. In FY2003, 97 percent of multiemployer plans were underfunded by an aggregate of \$178 billion and the average funding level of all multiemployer plans was only 64 percent. (See table M-9.) Eighty percent of the plans were less than 80 percent funded and 30 percent were less than 60 percent funded. (See table M-13.)

Trends in Plans and Participants

From a peak of 2,289 in FY1982, the number of PBGC-insured multiemployer plans has declined slowly to 1,567 in FY2005. (See figure 13.) While the number of single-employer plans declined primarily because of plan terminations, the number of multiemployer plans has declined due to plan mergers.

Figure 13

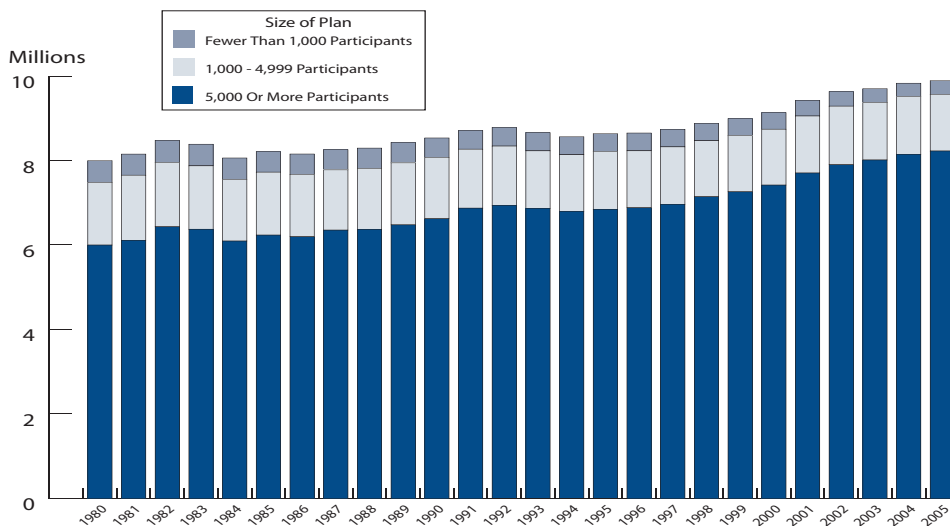

PBGC-Insured Plans Multiemployer Program

Conversely, the number of participants in the multiemployer universe has increased during the last 20 years, from 8.2 million in FY1985 to 9.9 million in FY2005. (See figure 14.) Unlike in the single-employer universe, there has been no recent decline in the number of multiemployer participants.

Figure 14

Participants in PBGC-Insured Plans Multiemployer Program

The shift in the distribution of participants in insured multiemployer plans mirrors the shift seen in single-employer plans. Active participants fell as a percentage of all insured-plan participants between FY1985 and FY2005 (from about 66 percent to less than 50 percent). (See figure 15.) The percentages that were retirees/beneficiaries and separated vested participants both grew. Again, separated vested participants grew faster as a group over the period than did retirees and beneficiaries.

Conclusion

The defined benefit pension system, as measured by the number of PBGC-insured plans, has been in decline for the past 20 years. This trend shows no sign of abating. In fact, the system has never been under greater stress.

The PBGC's deficit is at an all-time high; plan funding levels are at an all-time low; and sponsors are freezing or closing their plans to new entrants as never before. In addition, the number of participants in insured single-employer plans may be poised for a substantial decline. Eliminating PBGC's deficits will require additional premiums. Bringing the majority of plans to full funding will require additional contributions from sponsors. These additional costs, while temporary, will impose a burden on plan sponsors that not all are willing to bear. Congress is also considering a number of changes that may reduce the stresses on the system, but these changes must balance solving the current problems and retaining incentives for companies to sponsor defined benefit plans.

Underfunding Measures in Table S-47

Background

A defined benefit pension plan's funded status is measured by subtracting the value of the plan's liabilities from the value of its assets. If its liabilities exceed its assets, the plan is underfunded. If the plan's assets exceed its liabilities, the plan is said to be fully funded or overfunded. There are many ways to measure a plan's liabilities and assets. A plan's funded status can vary significantly depending on the particular measurements used. This section describes the measures included in table S-47 of the *Data Book*.

Assets

There are two commonly used measures of assets—fair market value of assets and the actuarial value of assets. The fair market value of assets is the value the plan could receive by liquidating its portfolio of assets (stocks, bonds, real estate, and other assets) on the valuation date.

The actuarial value uses a “smoothing” mechanism to level out the peaks and valleys that occur due to fluctuations in market value. The maximum permitted smoothing period is generally five years. Regardless of the method chosen, the actuarial value is constrained to be no more than 120 percent and no less than 80 percent of the fair market value of assets.

During periods of poor market performance, if a smoothed value is used to determine underfunding, a plan generally will appear to be better funded than it actually is.

Liabilities

Typically, defined benefit pension plans pay benefits as a lifetime annuity to the worker and perhaps a surviving spouse or other surviving beneficiary.¹ In simplest terms, the liability is the present value of the lifetime stream of these future benefits.

There are many ways to measure plan liabilities. The first question is “which benefits”? Is the calculation intended to measure the value of benefits that have been accrued to date, projected benefits including amounts yet to be accrued, or something in between? Are all benefits being valued or only those that are “vested” (i.e., benefits that a worker has a legal right to regardless of whether he continues to work)?

Next, many assumptions are needed to account for possible future contingencies.

¹ Cash balance defined benefit pension plans usually describe monthly benefits as the annuity equivalent of a hypothetical account balance. However, most cash balance benefits are paid in a lump sum distribution rather than as an annuity. Some traditional defined benefit plans also have a lump sum payment option.

For example, an interest rate assumption is needed to discount future payments, a retirement age assumption is needed to estimate when benefit payments will commence, and a mortality assumption is needed to predict how long benefits will be paid. Other assumptions may include a marital assumption (in situations where benefits continue to a survivor after the participant's death) and a turnover assumption (when participants forfeit benefits if they terminate employment before vesting).

Measuring Liabilities on a Termination Basis

The liability measure most relevant to the PBGC reflects assumptions appropriate for a terminating plan. Some of the assumptions used to determine a plan's termination liability will necessarily differ from those used to value liabilities for an ongoing plan. For example, the ages at which participants in a terminating plan will first receive benefits will generally be younger than those used for an ongoing plan because workers cannot increase their benefits by continuing to work after the plan terminates. Also, if the employer goes out of business, the expected subsidies for early retirement will be smaller because those participants who do not already qualify for these subsidies will no longer have the opportunity to qualify.

Other assumptions that have a significant impact on a plan's termination liability are the discount rate assumption and the mortality assumption. These two assumptions usually differ from the assumptions used to value an ongoing plan's liability. The two greatest risks facing a pension plan that pays annuities are longevity risk—the risk that participants will live longer and, therefore, receive more lifetime benefits than assumed—and investment risk—the risk that plan assets will earn less than assumed and that the plan will run out of money before all benefit obligations have been met.

If the mortality and investment assumptions turn out to be optimistic relative to actual experience, the plan will experience a shortfall in assets. In an ongoing plan, the company is there to make up any shortfall. However, once the plan terminates and annuities are purchased to cover the plan's liabilities, the company is no longer responsible for making up any shortfall in plan assets. Insurance companies that sell annuities are well aware of the longevity and investment risks and price the annuities they sell to account for these risks. As a rule, private-sector insurance companies use more conservative mortality and interest assumptions when pricing annuities than do ongoing plans, making termination liabilities larger than the liability measures for an ongoing plan. A plan's funded status on a termination basis will usually show the plan to be less well funded than on an ongoing basis.

Because the PBGC pays benefits to only participants of terminated underfunded plans, it uses termination assumptions as a measure of its potential exposure. The inter-

est assumptions the PBGC uses to value the termination liabilities of the plans it insures are derived from a periodic survey of market prices of group annuities. The PBGC uses its mortality assumptions to solve for the discount rates (which it refers to as interest factors) that would yield the average prices reported on the two most recent surveys. It is not important that these interest factors differ from the interest rates ongoing plans use to value their ongoing liabilities. One would expect them to be lower because they account for all components of the annuity price except mortality. What matters is that, when the PBGC assumptions are used to value the future stream of benefits promised by a plan, the resulting liability measure closely matches the price a private-sector insurance company would charge to annuitize that same benefit stream.

Table S-47

Table S-47 presents an historical summary of aggregate underfunding in single-employer plans insured by the PBGC. The table shows underfunding measured on five different bases:

- A. Form 5500 Filings
- B. Variable-Rate Premiums (VRP)
- C. Section 4010 Filings
- D. Reasonably Possible
- E. Total in PBGC-Insured Plans

Each of these measures represents a termination-type measure and is useful in analyzing the overall health of the pension system. However, the measures differ in both the number of plans included and how the underfunding amount is determined. Three measures (B, C, and D) represent subsets of the universe of underfunded plans insured by the PBGC. There is significant overlap among these subsets. The other two measures (A and E) represent the total universe of insured plans.

The following table highlights the key differences between the measures in table S-47.

Each of the five measures included in table S-47 is described in more detail in the following sections:

Table 1. Key Differences Between Underfunded Measures Included in Table S-47

	(A) Form 5500 Filings	(B) Variable-Rate Premium (VRP)	(C) Section 4010 Filings	(D) Reasonably Possible	(E) Total in PBGC- Insured Plans
Plans reflected	All	Plans that owed a VRP	Plans required to report under 4010	Plans with financially troubled sponsors	All
Benefits reflected	Vested (as proxy for guaranteed)	Vested (as proxy for guaranteed)	Vested (as proxy for guaranteed)	Vested (as proxy for guaranteed)	Total
Assets	Market	Actuarial	Market	Market	Market
Liability	Estimated termination-type liability	Modified current liability	Termination liability	Termination-type liability (partially estimated)	Termination-type liability (partially estimated)
Retirement age	Actuary's selected assumptions	Actuary's selected assumptions	PBGC assumptions	Part PBGC assumptions, part actuary's assumptions	Part PBGC assumptions, part actuary's assumptions

Column A—Form 5500 Filings

Plan sponsors are required to file a report annually with the federal government (the Form 5500) to provide certain information about the plan, including its funded status. While several measures of assets and liabilities are reported on this form, the measure shown in table S-47 is based on the plan's reported "current liability." Current liability is the present value of benefits accrued to date. For plans with more than 100 participants, it is one of the components used to determine both the minimum funding requirement and the maximum deductible limit.

When calculating the plan's current liability, the actuary must use a specified mortality table and select a discount rate from a range surrounding a specified rate. This rate is a four-year weighted average of a specified index.² The other assumptions used to calculate the current liability are generally the actuary's best estimates of future plan experience

and are based on the assumption that the plan will be an ongoing entity.

Vested current liabilities reported on line 2 of the Schedule B of Form 5500 are used as a proxy for guaranteed benefits. Termination liabilities are estimated by adjusting these vested current liabilities to reflect the mortality assumption and interest factors used by the PBGC to value termination liabilities. No adjustment is made to reflect differences between the actuary's retirement age assumption and the PBGC's assumption. The asset component of the underfunding is the market value of assets. The underfunding amount reported in column A of table S-47 is the aggregate underfunding in all underfunded plans.³

One advantage of this measure is that it provides asset and liability data for all PBGC-insured plans. A major disadvantage is that these data are over two years old by the time they become available to the PBGC and other government agencies. The lack of timeliness can be a problem, especially during periods when there are large changes in interest rates, annuity prices, or investment returns.

Column B—Variable-Rate Premiums

Plans are required to pay the PBGC an annual variable-rate premium (VRP) of \$9 per \$1,000 of underfunding, unless they meet one of several exemptions. Most plans qualify for an exemption.

Underfunding for VRP purposes occurs when a modified current liability measure exceeds the actuarial value of plan assets. This is the only underfunding measure in table S-47 that is based on the actuarial value of assets instead of fair market value. The modified current liability differs from actual current liability (1) because only vested benefits are reflected and (2) the discount rate is based on current market conditions rather than a four-year weighted average.⁴

Plans that are fully funded by this measure and plans that meet any of the VRP exemptions do not pay a VRP. Therefore, the underfunding reported in column (B) of table S-47 does not represent total underfunding among PBGC-insured plans but rather the underfunding for those plans that actually owed a VRP for the designated year. The underfunding amount reported in column (B) of table S-47 is calculated by multiplying the VRP premium by 111.11 (\$1,000/\$9).

² Until 2004, the index was the 30-year Treasury rate. For 2004 and 2005, it was a composite index of high-grade corporate bond rates. As of January 1, 2006, it returned to the 30-year Treasury rate. Legislation is pending in Congress that would extend the corporate bond rate for 2006.

³ This underfunding measure is also used in tables S-42 through S-46, S-48, and S-49.

⁴ For example, in 2006 the VRP rate is 85 percent of the 30-year Treasury rate for the month preceding the beginning of the plan year for which premiums are being paid.

Note—Before 1997, there was a cap on the variable-rate premium a plan would have to pay. Thus, for 1996 and earlier years, the underfunding reported in table S-47 underestimates the total underfunding in the plans actually paying the variable-rate premium.

Column C—Section 4010 Filings

Column (C) of table S-47 shows the underfunding for vested benefits in the plans of those sponsors required to file certain financial and actuarial information with the PBGC under the provisions of Section 4010 of ERISA. Companies are required to report termination liability and other information if the aggregate underfunding, on a VRP-basis, of all their PBGC-insured underfunded plans exceeds \$50 million; if the PBGC has liens against the sponsor for unpaid contributions of \$1 million or more; or if the sponsor has received funding waivers for \$1 million or more. Because of the size of these thresholds, Section 4010 filings are usually required only from large companies.

Underfunding in the “4010” column is determined by subtracting the market value of plan assets from the vested portion of the plans’ reported 4010 liabilities.⁵

The advantages of these data are that the reported 4010 liabilities are calculated using the PBGC’s termination assumptions including its interest factors, its expected retirement age assumptions, and its mortality assumptions; they are reasonably current; and they are available for the plans with the largest amount of underfunding. The disadvantage is that these data are not available for all underfunded plans insured by the PBGC.

Column D—Reasonably Possible

The accounting rules the PBGC follows require the agency to disclose its exposure to contingent losses in its financial statements. This exposure is divided into three categories according to the perceived likelihood that the PBGC will receive a claim from a particular plan. Those plans that are determined to be likely to terminate in a future year are designated as “Probables,” and the estimated loss is included as a liability in the PBGC’s financial statements. The next category of exposure, “Reasonably Possible,” includes plans that have financially troubled sponsors. The PBGC has not determined that these plans are likely to terminate. The exposure from Reasonably Possible plans is disclosed in the footnotes to the PBGC’s financial statements and is the measure of underfunding reported in column (D) of table S-47. Exposure from the third category

⁵ The PBGC calculates the vested portion of total 4010 liabilities by applying the ratio of vested current liabilities from the Schedule B of the Form 5500 to that form’s total current liabilities.

of plans, whose losses are classified as “Remote,” are not disclosed on the financial statements. The Remote exposure is the underfunding in plans sponsored by financially healthy companies.

A primary criterion for classifying a plan as Reasonably Possible is that the plan sponsor’s bond rating is below investment grade, although other criteria are used in conjunction with, or in place of, the sponsor’s bond rating.

Data for this calculation are obtained from several sources including filings and submissions with the government (including Section 4010 filings and PBGC premium filings) and corporate annual reports. To the extent the data do not reflect PBGC termination assumptions or the value of vested benefits, they are adjusted accordingly. Underfunding is determined by subtracting the market value of the plan’s assets from these termination-adjusted liabilities.

The Reasonably Possible underfunding is the underfunding for only a subset of all PBGC-insured plans. However, it is the underfunding in the plans of sponsors that are currently experiencing financial difficulties.

Column E—Total in PBGC-Insured Plans

Unlike the other underfunding measures, the liabilities used in calculating this measure are not restricted to PBGC-guaranteed liabilities. Liabilities for this measure represent all benefits, whether guaranteed by the PBGC or not.

This estimate of underfunding is largely based on termination liabilities and market value of assets as reported in the Section 4010 filings of those companies required by ERISA to make such reports. Data for plans not included in the Section 4010 filings are based on other filings and submissions with the government and from corporate annual reports for the prior fiscal year.

The measure has the advantages that the underlying liability measure is based largely on the 4010 data which are calculated using the PBGC’s termination assumptions and it is a measure of the underfunding in all single-employer plans insured by the PBGC.

Conclusion

Underfunding in defined benefit pension plans is an easy concept to grasp in a general sense, but it can be bewildering because there are so many different ways to measure it. Each measure is designed for a particular purpose. Using the wrong measure can lead to confusion and, perhaps, inappropriate action.

From the PBGC's perspective, the appropriate liability measure is termination liability. That is what the agency insures. Likewise, the appropriate asset measure is the market value of assets. Once the PBGC trustees a plan, the sponsor is no longer responsible for funding that plan and measures associated with ongoing plans are no longer relevant. The PBGC needs to know the termination-funded status of ongoing plans because it needs to be able to evaluate the exposure it faces from these plans should they terminate. The funded status of a plan measured on an ongoing basis tends to overstate the funded status on a termination basis and provides a misleading perspective of the adequacy of the current level of plan assets to cover benefits accrued to date.

Most of the underfunding measures in table S-47 are based on liabilities that are either measured on a termination basis or have been converted to an estimated termination basis. Two of the measures represent the entire universe of PBGC-insured single-employer plans. The others represent overlapping subsets of underfunded PBGC-insured plans. The population of plans included in each subset will vary from year to year, depending on which plans meet the criteria for inclusion under that measure. The important points to note about these subsets are that none are intended to measure all underfunding and they are not mutually exclusive measures. Total underfunding in PBGC-insured plans cannot be estimated by adding the underfunding of these three measures.

APPENDIX S

Single-Employer Data Tables

PBGC's Single-Employer Program

Under its single-employer program, PBGC insures the pension benefits of participants in most private sector, single-employer, defined benefit pension plans. A single-employer plan is a plan that was not established pursuant to a collective bargaining agreement between the plan's participants and two or more unrelated employers. A defined benefit plan is a pension plan other than an individual account plan. In a typical single-employer defined benefit plan, benefits are based on a formula that typically includes as inputs years of service and either a flat dollar amount or the participants' average compensation.

An insured plan pays PBGC a yearly premium of \$30 per participant for pension benefit insurance coverage. Plans that are underfunded (based on PBGC premium calculations) also have to pay PBGC an additional premium of \$9 per \$1,000 of underfunding to cover the additional exposure they create for the insurance program.

If a plan terminates with insufficient assets to pay all promised benefits, PBGC will usually trustee the plan and become responsible for paying benefits to the plan's participants and their beneficiaries. PBGC pays benefits according to the provisions of each individual pension plan, subject to certain guarantee limits. The vast majority of the participants in PBGC-trusted plans receive all the benefits they were promised by their plan. Benefits for some participants may be cut back if 1) their benefits exceed PBGC's maximum guarantee limit, 2) a benefit increase occurred within five years of the plan's termination, or 3) a part of their benefit is a supplemental benefit. While relatively few participants have their benefits reduced by any of these guarantee limits, some of those who do will experience substantial benefit cuts. PBGC will pay some nonguaranteed benefits when the plan has sufficient assets to do so or when there are recoveries from employers.

PBGC does not index benefit payments. However, by law it must increase the maximum guarantee limit each year to reflect the increase in national wages. For plans terminating in 2006, the limit is \$3,971.59 per month or \$47,659.08 per year for a single-life annuity beginning at age 65. The limit on the maximum guarantee is adjusted for retirement ages other than 65. The age-adjusted limit that will apply to a given participant is the limit for his or her age at plan termination, if he or she has already retired, or the limit for the age when he or she actually retires. The limit is reduced if the benefit is not paid as a single-life annuity. For example, the limit is reduced if the benefit is paid as a joint-and-survivor annuity.

Sources: PBGC Fiscal Year Closing File (9/30/05) and PBGC Case Administration System.

Due to rounding of individual items, numbers may not add exactly across columns.

Claims figures shown in this table are calculated on a plan basis and identified with fiscal year of plan termination for each plan.

The annual numbers of trusteed terminations shown in this table may differ from those reported elsewhere as they reflect the fiscal year of plan termination rather than the fiscal year in which the loss was incurred. For example

during FY 2005. The rest had termination dates in earlier fiscal years and are allocated to those years.

Values are subject to change as PBGC completes reviews, establishes termination dates and determines recoveries.

Sources: PBGC Fiscal Year Closing File (9/30/05), PBGC Case Administration System and PBGC Participant System (PRISM).

Due to rounding of individual items, percentages may not add up to 100%.

Data in this table have been calculated on a firm basis and include all plans of each firm.

Values and distributions are subject to change as PBGC completes its reviews and establishes termination dates.

* Does not include 1986 termination of a Republic Steel plan sponsored by LTV.

Claim values and distributions are subject to change as PBGC completes reviews.

Claims calculations represent aggregated and average counts of plans, claims, and participants over the period 1975-2005.

The number of vested participants and claims values are calculated as of date of plan termination.

Claims in 2005 dollars are calculated using Consumer Price Index - Urban Consumers.

Sources: PBGC Participant System (PRISM), fiscal year calculations, PBGC Management Reports and PBGC Benefit Payment Reports.

Lump sum payments include cash-outs of pensions with de minimis present values and backpayments to current pensioners.

Since some payees received both pensions and lump sum payments, total number of payees may be less than the sum of pensioners and lump sum recipients.

Excludes participants in plans that are in probable termination status as of end of fiscal year.

Hybrid plans incorporate elements of both defined benefit and defined contribution plans but are treated as defined benefit plans. They often express benefits in terms of an account balance. The two most common types of hybrid plans are Cash Balance Plans and Pension Equity Plans. 2004 figures are estimates from PBGC internal calculations. 2003 figures reported last year have been updated to reflect actual Form 5500 filings.

Hybrid plans incorporate elements of both defined benefit and defined contribution plans but are treated as defined benefit plans. They often express benefits in terms of an account balance. The two most common types of hybrid plans are Cash Balance Plans and Pension Equity Plans. Because most hybrid plans converted from traditional defined benefit plans, not all participants will receive benefits based on the hybrid plan design. 2004 figures are estimates from PBGC internal calculations. 2003 figures reported last year have been updated to reflect actual Form 5500 filings.

Table S-37

PBGC's Historic Premium Rates Single-Employer Program

For Plan Years Beginning	Flat-Rate Premium <i>(per participant)</i>	Variable-Rate Premium*	Premium Rate for Certain Terminated Plans <i>(per participant)</i>
September 2, 1974 - December 31, 1977	\$1.00	---	---
January 1, 1978 - December 31, 1985	2.60	---	---
January 1, 1986 - December 31, 1987	8.50	---	---
January 1, 1988 - December 31, 1990	16.00	\$6 per \$1,000 of unfunded vested benefits (Maximum of \$34 per participant)	---
January 1, 1991 - June 30, 1994	19.00	\$9 per \$1,000 of unfunded vested benefits (Maximum of \$53 per participant)	---
July 1, 1994 - June 30, 1995	19.00	\$9 per \$1,000 of unfunded vested benefits (Maximum of \$53 per participant plus 20% of uncapped variable premium in excess of \$53 per participant)	---
July 1, 1995 - June 30, 1996	19.00	\$9 per \$1,000 of unfunded vested benefits (Maximum of \$53 per participant plus 60% of uncapped variable premium in excess of \$53 per participant)	---
July 1, 1996 - December 31, 2005	19.00	\$9 per \$1,000 of unfunded vested benefits (No maximum)	---
On or after January 1, 2006	30.00**	\$9 per \$1,000 of unfunded vested benefits (No maximum)	---
January 1, 2006 - December 31, 2010	---	---	\$1,250 per year for 3 years***

* Only vested liabilities are used when determining underfunding for variable-rate premium payment purposes. These vested liabilities generally have been calculated using a specified percentage of the 30-year Treasury bond rate for the month preceding the month in which the plan year begins. The specified percentage has changed over time. It was 80 percent for plan years beginning from January 1988 to June 1997; 85 percent for plan years beginning from July 1997 to December 2002; and 100 percent for plan years beginning from January 2003 to December 2003. From January 2004 through December 2005, the vested liabilities were calculated using an interest rate equal to 85 percent of the Composite Corporate Bond Rate, as reported by the U.S. Department of the Treasury. Starting in January 2006, vested liabilities were again calculated using 85 percent of the 30-year Treasury bond rate.

** This amount will be adjusted annually after 2006 based on changes in the national average wage index (as defined in section 209(k)(1) of the Social Security Act). However, the premium rate will not decline even if the national average wage index declines. The adjusted premium rate will be rounded to the nearest multiple of \$1.

*** Applies to underfunded plans that undergo distress or involuntary terminations during the indicated period. Does not apply to underfunded plans terminated while the sponsor is in bankruptcy proceedings if the bankruptcy filing date was before October 18, 2005.

Source: Internal Revenue Service Form 5500

Estimates for 2002 reported last year have been updated.

Due to rounding of individual items, numbers may not add up across columns.

* Vested liabilities have been adjusted to the PBGC rate that, along with an assumed mortality table, reflects the cost to purchase an annuity at the beginning of the relevant year.
The assumed mortality table was UP-84 for 1980-1992 and GAM-83 for 1993-2003.

2005	---	87.44	289.64	108.04	431.8

Definitions:

(A) Underfunding calculated from Internal Revenue Service Form 5500 Series Filings for single-employer plans. Vested liabilities have been adjusted to the PBGC rate that, along with an assumed mortality table, reflects the cost to purchase an annuity at the beginning of the relevant year. The assumed mortality table was UP-84 for 1990-1992 and GAM-83 for 1993-2005. Vested liabilities are used as a proxy for PBGC-guaranteed benefits.

(B) Underfunding data from PBGC premium filings used to calculate the Variable-Rate Premium. Underfunding is based on vested benefits. Numbers reported last year have been revised.

(C) Data from filings made under Section 4010 of ERISA, which requires that companies annually provide PBGC with information on their underfunded plans if the firm's aggregate underfunding exceeds \$50 million or there is an outstanding lien for missed contributions exceeding \$1 million or an outstanding funding waiver of more than \$1 million. Underfunding is based on an estimate of vested benefits.

(D) Underfunding for plan sponsors with less than investment-grade bond ratings. Underfunding is based on estimated vested benefits.

(E) Estimated total liabilities are based on all plan liabilities, whether vested or not.

Only (A) and (E) represent the universe of PBGC-insured plans. Plans included in the column (B), (C) and (D) totals may vary from year to year.

Source: Internal Revenue Service Form 5500 Series Filings for single-employer plans.

Due to rounding of individual items, percentages may not add up to subtotals within categories.

Industry classifications are based on principal business activity codes used in the North American Industry Classification System.

* Vested liabilities have been adjusted to an interest rate that, along with the GAM-83 mortality table, reflects the cost to purchase an annuity at the beginning of 2003.

Source: Internal Revenue Service Form 5500 Series Filings for single-employer plans.

Due to rounding of individual items, totals may not equal those in other tables or add up exactly across columns.

Funding data is reported by state or country of plan administration.

*Vested liabilities have been adjusted to an interest rate that, along with the GAM-83 mortality table, reflects the cost to purchase an annuity at the beginning of 2003.

**Less than \$500,000.

The Employee Retirement Income Security Act contribution and benefit base.

The maximum guarantee applies to workers who receive earlier retirement or electing survivor's benefits.

In

ts in excess of the maximum guarantee.

APPENDIX M

Multiemployer Data Tables

PBGC's Multiemployer Program

PBGC administers a separate guarantee program for multiemployer defined benefit pension plans. Multiemployer plans are established pursuant to collective bargaining agreements involving two or more unrelated employers. Multiemployer plans are common in industries such as construction, trucking, mining, the hotel trades, and segments of the grocery business. Some multiemployer defined benefit plans use a “unit benefit” formula that multiplies a participant’s years of service times a fixed dollar amount (such as \$15 times the participant’s years of service) to set the monthly benefit. In most cases, plan trustees establish benefit levels but some plans set benefits in the collective bargaining process. Multiemployer plans pay PBGC a yearly premium of \$8.00 per participant for benefit insurance coverage.

Unlike the single-employer program, a multiemployer plan termination does not trigger the PBGC guarantee.¹ A terminated plan continues to pay full plan benefits so long as it has sufficient assets to do so. A plan that does not have enough assets to pay full plan benefits is allowed to reduce or suspend payment of that portion of the benefit that exceeds the PBGC guarantee level. The current PBGC monthly benefit guarantee level for multiemployer plans is 100 percent of the first \$11 of the plan-designated dollar amount multiplied by the participant’s years of service under the plan plus 75 percent of the next \$33 of the dollar amount multiplied by the participant’s years of service. The dollar levels in this benefit guarantee formula are not indexed.

If a plan becomes insolvent despite benefit cutbacks, PBGC will provide financial assistance to the plan—typically as a loan—in an amount necessary to pay guaranteed benefits and administrative expenses. Few plans receiving financial assistance from PBGC are likely to recover sufficiently to repay all the monies lent to them. An allowance has been established on PBGC’s books to account for financial assistance that is not expected to be repaid.

¹ PBGC trustee 10 multiemployer plans prior to October 1980 and continues to pay monthly benefits to participants in these plans.

Table M-1

Net Financial Position of PBGC's Multiemployer Program (1980-2005)

Fiscal Year	Assets <i>(in millions)</i>	Liabilities <i>(in millions)</i>	Net Position <i>(in millions)</i>

Sources: PBGC Annual Reports and internal calculations.

⁽¹⁾ A number of plans received financial assistance in more than one year.

⁽²⁾ Lump sum closeout payments were made to these insolvent multiemployer plans.

⁽³⁾ These plans received periodic payments before receiving lump sum payments.

⁽⁴⁾ Total for plan columns represents the total number of multiemployer plans that ever received the stated type of financial assistance from PBGC's Multiemployer Insurance Program.

⁽⁵⁾ Only one plan has repaid any of its past financial assistance. That plan repaid only the principal amount of the loans it received.

Source: Internal Revenue Service Form 5500 Series Filings for multiemployer plans. Data for plan years prior to 1999 include only plans with 100 or more participants.

Estimates for 2002 reported last year have been updated.

Due to rounding of individual items, numbers may not add up across columns.

* Vested liabilities have been adjusted to an interest rate that, along with an assumed mortality table, reflects the cost to purchase an annuity at the beginning of the relevant year.

The assumed mortality table was UP-84 for 1980-1992 and GAM-83 for 1993-2003.

Due to aggregation and rounding of individual items, totals may not add up to totals in other tables and percentages may not add up to 100%.

*Vested liabilities have been adjusted to an interest rate that, along with the GAM-83 mortality table, reflects the cost to purchase an annuity at the beginning of 2003.

** Less than 0.05 of one percent.

*** Less than \$500,000.

Table M-15

PBGC Maximum Guaranteed Benefits (1980-2006) Multiemployer Program

Date of Plan Insolvency	Monthly Benefit Formula	Maximum Monthly Guarantee <small>(30 Years of Service)*</small>	Maximum Annual Guarantee <small>(30 Years of Service)*</small>
September 27, 1980, to December 21, 2000	The participant's years of service multiplied by the sum of: (1) 100% of the first \$5 of the monthly benefit accrual rate -plus- (2) 75% of the next \$15 of the monthly benefit accrual rate	\$487.50	\$5,850.00
On or after December 22, 2000**	The participant's years of service multiplied by the sum of: (1) 100% of the first \$11 of the monthly benefit accrual rate -plus- (2) 75% of the next \$33 of the monthly benefit accrual rate	\$1,072.50	\$12,870.00

* The formula presumes that the workers' monthly benefits are calculated by multiplying the monthly benefit accrual rate (a plan-specified dollar amount) times years of service. If the monthly benefit accrual rate prior to December 22, 2000, was less than \$20 per year of service or if the accrual rate after December 21, 2000, is less than \$44 per year of service then the maximum benefit guarantee for a participant with 30 years of service will be lower than the amounts shown. Note that there is no cap on applicable years of service -- 30 years was selected for illustrative purposes only.

** The increased guarantee does not apply to multiemployer plans that received financial aid from PBGC between December 22, 1999, and December 21, 2000. The original, lower monthly benefit guarantee continues to apply to participants in these plans.

Table M-16

PBGC's Historic Premium Rates Multiemployer Program

For Plan Years Beginning	Premium Rate <i>(per participant)</i>
September 2, 1974 - August 31, 1979	\$0.50
September 1, 1979 - September 26, 1980	\$0.50 for plan years beginning in September 1979, growing gradually to \$1.00 for plan years beginning September 1, 1980, to September 26, 1980
September 27, 1980 - September 26, 1984	\$1.40
September 27, 1984 - September 26, 1986	\$1.80
September 27, 1986 - September 26, 1988	\$2.20
September 27, 1988 - December 31, 2005	\$2.60
On or after January 1, 2006	\$8.00*

* This amount will be adjusted annually after 2006 by changes in the national average wage index (as defined in section 209(k)(1) of the Social Security Act). However, the premium rate will not decline even if the national average wage index declines. The adjusted premium rate will be rounded to the nearest multiple of \$1.
