

New Center Awarded January 2005!

The Cleveland Advanced Platform Technology (APT) Center develops advanced technologies that serve the clinical needs of veterans with motor and sensory deficits and limb loss to provide clinician-researchers within the VA with new tools for rehabilitation, treatment and scientific inquiry that lead to independence and enhanced societal participation. We accomplish this by collaborating with leading academic, industrial and clinical partners within and outside the VA system. The Cleveland APT Center will be a national leader in creating and delivering innovative products based on cutting edge technologies and a catalyst for the discovery and development of new technologies and techniques that can be employed in the rehabilitation process to provide independence for veterans and other individuals with disabilities.
