

## CHAPTER 3

### GEODETIC CONTROL DESCRIPTIVE (GEOD DESC) DATA

#### INTRODUCTION

The purpose of the description of a survey point is to convey to the next user, in a concise and standard manner, information sufficient to locate and positively identify the survey point, and to record its suitability for various uses.

This chapter gives detailed instructions for the entry and interpretation of descriptive information for survey points of all types. A survey point (or station) may be a monumented control point, a reference mark or azimuth mark, a landmark, or a temporary, auxiliary, or eccentric point. A description must be submitted for every recoverable survey point which is observed in a project, and for each of its peripheral points (if it has any). A collection of these descriptions constitutes the GEOD DESC data set which must accompany any submitted project. Descriptions can also be submitted independently for miscellaneous recoveries of monumented points already present in the NGS data base.

NGS has begun the distribution of descriptions from the data base for use in the field. These descriptions can easily be modified to make them current, and can then be resubmitted as complete recovery descriptions. This practice will greatly improve the quality of descriptions available from the NGS data base, and will save work in the long run.

#### WRITING DESCRIPTIONS

A separate description is to be written for each monumented survey point, be it a "main" station, a reference mark, or azimuth mark. "Underground" marks are an exception. When a control point has reference marks which are included in the NGS data base, or are monumented well enough to carry geodetic control themselves, each is to have its own separate description. The descriptive text for each mark in such a group would include location references from the other marks in the group. Such a location reference to the described mark from a second mark would identify the second mark by agency and designation, and would not include a description of the second mark. Peripheral marks, points, or objects which are not included in the NGS data base and are not suitable for holding control need not be separately described. In this case a short descriptive phrase may be included in the location reference to the described mark from that object, if necessary.

When new text is submitted for a recovered mark, it must be complete in itself as if it were for an original description. **Text which merely amends a previous description will no longer be allowed for recovered marks used in a project.** Now that descriptions from the data base are being distributed in the same format in which they are collected, the previous description can simply be edited as necessary. If no editing is necessary (that is, if the description which was distributed from the data base is still current, is complete, and is a single report), the mark may be reported "recovered as described", and no new text need be submitted.

A six-character Permanent Identifier (PID, formerly known as ACRN) now serves as the primary means for matching recovery description data against the data base for marks known to NGS. Where the PID is known, it must be entered in the description. A mark newly set or new to NGS will not have a PID until it is loaded into the data base. Any description without a PID must be complete.

#### STRUCTURE OF THE GEOD DESC DATA SET

Descriptive data are organized into 80-column fixed-format records. The record type is identified by a code in columns 7-10 of each description record. Most descriptions must contain records coded \*10\*, \*13\*, \*20\*, \*26\*, and \*30\* and may also contain records coded \*15\*, \*28\*, and \*29\*. Specific locations within the records are reserved for the different data fields. Detailed explanations of the fields in each record type appear later in this chapter. All alphanumeric fields must be left-justified. All numeric data must be right-justified and zero filled. All alphabetic characters must be entered in upper case (capitals) only.

The first and last records of the data set (the Data Set Identification Record and the Data Set Termination Record) display the two-character alphanumeric job code preceded and followed by an asterisk in the field normally occupied by the first data code (columns 7-10). Unless a job code is specifically assigned to a project by NGS, this job code may be sequentially assigned (\*A1\*, \*A2\*, ..., \*ZZ\*) by the submitting agency. Other fields in the identification record include the name of the submitting agency and the date the data set was created. Detailed format definition of this record can be found on the first page of the format diagram section. In every record of the data set, columns 1 through 6 are reserved for a record sequence number.

Each description in a file is identified by its station serial number (SSN). The SSN is a unique four-digit number assigned to each mark in a project. It is given in the \*10\* record which begins the block of records for that station. Sample data sets appear at the end of the chapter, before the format diagrams.

#### RECORD DEFINITIONS

Each record type and the acceptable entries for each data field are explained in the following paragraphs. Diagrams of the formats are found at the end of the chapter.

#### TITLE AND COMMENT RECORDS

These records, if used, must appear immediately after the data set identification record.

#### CODE \*00\*, \*01\*, \*02\*, \*03\*, \*04\* (PROJECT AND TITLE INFORMATION RECORDS)

These records are optional, and each can occur only once. Usage may vary. They may correspond to the \*10\* and \*11\* records in the horizontal observation data set documented in chapter 2, or to the \*10\* through \*14\* records in the vertical observation data set documented in volume II, chapter 6. When data are exported from the NGS data base, these records may indicate this, and give information about what marks are included. Do not split words between these records.

CODE \*05\* (COMMENT RECORD) (optional)

Comment records may contain additional text describing the data set or the project. Up to 11 are allowed. Again, do not split words between records.

DESCRIPTION RECORDS

CODE \*10\* (STATION LOCATION RECORD)

This first record primarily contains information pertinent to station location. The individual entries made in this record are as follows:

Station Serial Number (SSN) [CC 11-14] - This four-digit numeric field is the project-specific link between descriptive and observational data. The field must be unique for each station residing in the descriptive and observational data sets. Recovery descriptions for stations not included in the observational data set may reside in the description data set, but in no case should their station serial numbers correspond to station serial numbers in the companion observation data set.

DR Code [CC 15] - This one-character code indicates whether this description is an original description or a recovery description. The allowable entries are "D" and "R".

ENTRY DEFINITION

D An original description of a newly set mark.

R Everything else (includes recovered, not recovered, destroyed, and the first report to NGS of a pre-existing mark not in the NGS data base).

Recovery Type Code (optional) [CC 16] - This one-character code provides additional information about the type of recovery description being included in the description data set. It is used only when the DR Code = "R". The allowable entries are:

ENTRY DEFINITION

F A full recovery description of a survey point which you think is not included in the NGS Data Base.

M A recovery description which does not contain a complete textual description of the mark, but **may** contain updates or modifications to the most current description. This is used when a mark is **destroyed or not recovered**, or when the text of the previous description of this mark in the NGS data base requires no update (i.e., the text is in accord with current practice, and the situation at the mark has not changed).

T A complete re-description of a mark which is included in the NGS data base.

**Note:** The practice of submitting recovery notes for stations used in a project which give only text modifications to a previous description is no longer permitted.

Approximate Position [CC 17-31] - The approximate geographic position in degrees, minutes, and the nearest whole seconds of latitude and longitude must be entered. The latitude [CC 17-23] must begin with a hemisphere code (N=NORTH, S=SOUTH) and the longitude [CC 24-31] must begin with the direction-letter "W". Leading zeros must be entered where appropriate. If no other source is available, the point should be carefully plotted on the largest scale topographic map available and the respective latitude and longitude extracted therefrom. **Latitude and longitude are required under all circumstances.**

Approximate Height [CC 32-36] - An estimated height of the geodetic control point is entered here. If no other source is available, the height may be estimated by examining contour lines on the largest scale topographic map available on which the point is plotted. The entry should be made to the nearest whole unit of measurement used. The unit of measurement (M=METERS, F=FEET) is also recorded [CC 37].

Quad Identifier (Quadrangle or QID) (optional) [CC 39-45] - This was at one time part of the primary identification system adopted by the National Geodetic Survey Data Base for control points. The new Datum has rendered it obsolete. It will be phased out, but is still provided as a convenience in the interim. It is based on 1Ex 1E "quads" defined by integer-degree latitude and longitude gridlines (parallels and meridians) and on successive quadrangle subdivision of the basic 1Ex 1E quads into 30'x 30' quads, 15'x 15' quads, and 7½'x 7½' quads accomplished by successive halving of the latitude and longitude gridline intervals. For description purposes, only the 30' quad identifier will be recorded. This quad identifier is a seven-character symbol coded as HLLWWWA, where:

H=Hemisphere (N for Northern, S for Southern)  
LL=Latitude of SE corner of the 1Ex 1E quad (00E-89E<sub>N</sub>, 01E-90E<sub>S</sub>)  
WWW=Longitude of SE corner of the 1Ex 1E quad (000E-359E<sub>W</sub>)  
A=30' subdivision indicator (1-NE, 2-SE, 3-SW, 4-NW subquad)

Note that for some marks the Quad value based on the NAD 83 position will not be the same as the traditional Quad value based on the NAD 27 position. It is these latter values which were once published.

Figure 3-1 depicts this scheme in graphic format.

QID = \*N 3 0 1 0 9 1\*1 1  
. ))))))v)))))))-  
30 Minute Quad  
Identifier

30 Minute indicator Identifier  
Numbers describe 30 minute area in clockwise direction.

Number range (1 thru 4)

15 Minute indicator  
Division shown by dashed lines  
Numbering same as 30 minute  
sequence.

7.5 Minute indicator  
Division shown by dotted line  
Numbering same as 30 minute  
sequence.

FIGURE 3-1 - QUAD IDENTIFIER.

State or Country Code [CC 47-48] - This is a two-letter code which indicates the political unit and/or geographic area in which the control point is located. For points in the United States or Canada, enter the appropriate code for the respective state, commonwealth, province, or territory. For points outside the United States or Canada, enter the appropriate code for the respective country, island group, or geographic area. A complete list of the two-letter codes is given in ANNEX A.

County [CC 49-68] - For points in the United States or Puerto Rico, enter the name of the county or equivalent in which the control point is located. The name of an independent city must be preceded by the prefix "C OF" (i.e., C OF RICHMOND for RICHMOND, VA). For points in other countries, leave the field blank.

Special Application Codes [CC 69-72] - Up to four alpha characters, left justified, are allowed in this field. These characters represent certain specialized information about the control point. All entries must be selected from the following list:

ENTRY	DEFINITION
F	Fault monitoring site
P	Site determined suitable for receiving satellite signals in connection with geodetic surveys
O	Other (see descriptive text)
T	Tidal station
N	Site not suitable for receiving satellite signals

Permanent Identifier (PID) (optional) [CC 73-78] - The PID is now the primary identification system used by NGS for control points. For a mark that had an ACRN, the ACRN is now the PID. The PID is a unique six-character identifier assigned to every monumented, recoverable survey point residing in the National Geodetic Survey Data Base. For an existing point, the PID assigned by NGS must be entered if it is available. If it cannot be determined, the field should be left blank. For a new point, this field must be left blank, and a PID will be assigned when the mark is loaded into the NGS data base.

#### CODE \*13\* (STATION IDENTIFICATION RECORD)

The second record required for geodetic control stations contains the agency name for the point. The entries made are as follows:

Designation [CC 11-50] - Up to 40 characters of alphanumeric data may be entered into this field. In the case of existing marks already included in the NGS data base, the designation should precisely reflect the published designation of the station. This is the official designation. As control points are added to the geodetic network, station designations should be unique within a clearly defined geographic locale (e.g., state, province). Where station monuments have been stamped, the designation is an edited version of what is stamped on the marker. This practice should be followed as nearly as possible. ANNEX D supplies detailed instructions

concerning naming conventions for geodetic control points. Assistance concerning determination of unique designations can be obtained by contacting NGS.

Underground Marker Type and Magnetic Property Code (optional) [CC 52-53] and [CC 55] - These codes are similar to the codes used for surface marker type and magnetic code on the setting record. If an underground marker exists and these codes can be determined for it, they are entered here. Entries must be left-justified. A complete list of the codes is contained in ANNEX I.

Setting Code (Underground Marker) (optional) [CC 57-58] - The setting code is from a comprehensive set of two-digit numerical codes covering a wide variety of possible settings for a survey point marker. A complete list of the setting codes is found in ANNEX I.

Transportation Code [CC 60] - This is a one-letter code that indicates the mode of transportation to reach the station. If backpacking is required to reach the station, the transportation code reflects the mode of travel used to reach the point where backpacking begins. A complete list of the specific transportation codes is given below. The possible entries are as follows:

CODE	TRANSPORTATION MODE
A	Light Airplane
B	Boat
C	Car (or Station Wagon)
F	Float Airplane
H	Helicopter
O	Other (See Descriptive Text)
P	Light Truck (Pickup, Carry-All, etc.)
T	Truck (larger than 3/4 ton)
W	Tracked Vehicle (Weasel, Snowcat, etc.)
X	Four-Wheel Drive Vehicle

Backpack-Time (optional) [CC 63-66] - Enter the time required to carry equipment on foot from the last point of transportation to the station, expressed in hours and minutes (HHMM). If the immediate vicinity of the station can be reached using the mode of transportation indicated by the preceding transportation code, enter zero in both the hours and minutes fields (0000).

CODE \*15\* (ALIAS RECORD) (optional) [CC 11-50] - Up to 40 characters of text which represent an alternate form of the name used to identify the control point. These alias entries arise due to non-standard naming conventions used by various agencies and individuals. **NGS strongly discourages the use of aliases.**

CODE \*20\* (MONUMENTED/RECOVERED RECORD) - Entries in this record primarily provide historical information concerning creation of and subsequent return visits to the control point. The first four fields are normally used only when the DR Code = "D" and the remaining five fields are used only when the DR Code = "R". Acceptable entries for each field are defined as follows:

Monumenting Agency Group Code [CC 11] - The code for the monumenting agency group is a one-character alpha entry used to subdivide specific monumenting organizations into distinct groups. These codes follow:

CODE	GROUP
A	National Agencies
B	Inter-State or Inter-Province Agencies
C	State, Province, Commonwealth, and Territorial Agencies
D	County Agencies
E	Municipal Agencies (Cities)
F	Inter-City and Inter-County Agencies
G	Railroads
H	Utility and Natural Resource Companies
I	Surveying, Engineering, and Construction Industry
J	Educational Institutions
K	Professional and Amateur Associations
L	Miscellaneous Commercial or Private Firms
M	Non-Specific Designators

Monumenting Agency Symbol [CC 13-18] - This is the NGS-defined symbol of up to six (6) characters for the organization which set the monument (disk). It is required when the DR Code is "D", and is optional if the DR Code is "R". The symbols are given in ANNEX C. If the organization is not listed in ANNEX C, contact NGS to have a symbol assigned to that organization.

Year Monumented [CC 33-36] - Enter the year the marker was monumented. It is required when the DR Code is "D", and is optional if the DR Code is "R".

Chief of Party [CC 37-39] - Enter up to three initials for the person who was in charge of the survey party which monumented the control point. If this information cannot be determined, as in the case of recovery stations, leave the field blank. This field is always optional.

Recovering Agency Group Code [CC 42] - In a manner similar to that described for the Monumenting Agency Code, enter the appropriate group code from the list above for the recovering organization.

Recovering Agency Symbol [CC 44-49] - This is the NGS-defined symbol of up to six (6) characters for the organization which recovered the mark. It is required when the DR Code is "R", and is not allowed if the DR Code is "D".

Date Recovered [CC 64-71] - The exact date the control point was recovered is to be recorded in this eight-character field. The year,

month, and day of the month are to be recorded in that sequence (e.g., 19850815 would indicate August 15, 1985). It is required when the DR Code is "R", and is not allowed if the DR Code is "D".

Chief of Party [CC 72-74] - If DR Code = "R", enter up to three initials for the person who was in charge of the survey party which recovered the control point. This field is optional when the DR Code is "R", and is not allowed if the DR Code is "D".

Recovery Condition Code [CC 77] - If DR Code = "R", enter the appropriate one-letter code to indicate the condition of the control point. It is required when the DR Code is "R", and is not allowed if the DR Code is "D". The allowed values are as follows:

CODE	CURRENT CONDITION OF SURVEY POINT
G	Good
N	Not Recovered, Not Found
O	<b>Other (See descriptive text)</b>
P	Poor, Disturbed, Mutilated, Requires Maintenance
X	Destroyed (See Note Below)

Note: The control point should be reported as destroyed only when the actual marker is found separated from its setting (e.g., disk recovered from highway department personnel). If the marker was not found, notes concerning evidence of possible destruction should be entered as text records, but the recovery condition entry should be coded as "N".

CODE \*26\* (SETTING RECORD) - This record contains information about the setting of the surface marker, its stability, and in some cases, what identifying features are inscribed or cast (as opposed to hand-stamped) on the marker. The definition of each field is as follows:

Setting Code [CC 11-12] - This two-digit code is used to indicate the setting characteristics of the monument or mark. These characteristics include the type of setting (shallow or deep), the type of design and material used for the monument, and/or the natural or man-made object which serves as the setting for the control point. A complete list of the possible entries is found in ANNEX I.

Specific Setting Phrase [CC 14-45] - For setting codes 30 through 41, enter a more specific phrase describing the setting, but corresponding to the respective setting code chosen from the list in Annex I. A maximum of 32 characters, including imbedded blanks, may be entered. For the other setting codes, leave this field blank. **If the setting code or specific setting phrase does not adequately represent the setting of the mark, additional explanation should be given in the text.**

Surface Marker Type [CC 46-47] - This field identifies the object used to monument the geodetic control point. Landmark stations are represented by two (2) digit codes and all other markers represented by one or two character alpha codes. Entries must be left-justified. The most common types of surface marks are listed on the next page:

CODE	DESCRIPTION
A	Aluminum marker ( <u>other than a disk</u> )
B	Bolt
C	Cap-and-Bolt Pair
DB	Bench Mark Disk
DD	Survey Disk
DE	Traverse Station Disk
DH	Horizontal Control Disk
DJ	Tidal Station Disk
DO	Disk of Unspecified Type (See Text)
DQ	Calibration Base Line Disk
DR	Reference Mark Disk
DS	Triangulation Station Disk
DU	Boundary Marker Disk
DV	Vertical Control Disk
DZ	Azimuth Mark Disk
I	Metal Rod
N	Nail

A complete list of these codes is contained in ANNEX I.

Magnetic Code (Surface Marker) [CC 49] - This one-character code indicates the magnetic property of the mark or monument. ANNEX I details acceptable entries for the magnetic property code.

Vertical Stability Override Code (optional) [CC 51] - This one-character entry allows the default vertical stability codes to be overridden when appropriate. The codes are from the following list:

CODE	DEFINITION
A	Monuments of the most reliable nature, expected to hold their elevations very well.
B	Monuments which generally hold their elevations fairly well.
C	Monuments which may be affected by surface ground movements.
D	Monuments of questionable or unknown vertical stability.

Marker Inscription [CC 54-59] - This field is the **symbol** from ANNEX C for the agency or organization whose identity is inscribed or precast on the disk/monument. This entry is not the same as the stamping which usually reflects the station designation. If the appropriate organization is not listed in ANNEX C, contact NGS to have a symbol assigned to that organization. If it is not possible to contact NGS, a longer entry (up to 26 characters) may be made. If there is no agency identification inscribed or precast on the marker (such as a chiseled square, nail, or unidentified disk), enter "NONE".

CODE \*28\* (STAMPING RECORD) (optional) - The stamping field [CC 11-60] should contain the exact stamping as it appears on the geodetic control marker. The entry must not exceed 50 characters, including embedded blanks. If there is no stamping, make no entry here; however, if the marker is a type that is normally stamped, enter a short note about its being unstamped in the accompanying descriptive text.

CODE \*29\* (ROD/PIPE RECORD) (optional) - Inclusion of this record as a separate entity allows users to access specific information about this class of survey point. This record would be used in lieu of the phrase STAINLESS STEEL (or other material as per Setting code) ROD (OR PIPE) SET TO THE DEPTH OF \_\_\_\_ METERS (or FEET, depending on the UNITS CODE), IN A SLEEVE EXTENDING TO THE DEPTH OF \_\_\_\_ METERS (or FEET), ENCASED IN A PIPE FLUSH (F) WITH THE GROUND [or PROJECTING (P)/RECESSED (R) XX in centimeters (or XX in inches)] or, for an unsleeved rod mark, in lieu of the same phrase without reference to sleeve depth (if the sleeve depth field is left blank). For first-time recovery descriptions of pre-existing rod- or pipe-type markers, all pertinent data must be entered. Otherwise, enter any known information in the text instead of using a \*29\* Rod/Pipe Record. For example, if the actual rod depth is unknown, enter the projection/recession reference and a note (e.g., ROD DEPTH IS UNKNOWN), in the text. Left-justify any values recorded on this record. **NGS prefers metric values.**

UNITS CODE [CC 11] DEFINITION

E English - The units are feet and inches.

M Metric - The units are meters and centimeters.

CODE \*30\* (TEXT RECORDS) - Descriptive text provides information about the mark which is not captured in the coded fields. It is entered in multiple records with up to 70 characters per record. Words must not be split between records. In addition to the expected alphanumeric character set (A-Z and 0-9), the following special characters are allowed:

(*) asterisk	(+) plus sign
( ) blank or space	(-) minus sign
(,) comma	(=) equal sign
(\\$) dollar sign	(() left parenthesis
(/) slash	( )) right parenthesis
(.) period or decimal	

Every effort must be made to provide enough information for easy recovery of the point. A well written description should contain:

- (1) one or more references to some well known, readily available, location in terms of distances and directions. Intersections of prominent highways, landmarks, and public buildings in nearby towns are examples of such locations. In some cases, this location will require some description;
- (2) detailed directions concerning how one would proceed to the mark site from one or more of these prominent locations;
- (3) distance and direction to, inscription, and designation of any monumented reference marks which are in the NGS data base. Specific descriptions of these reference marks themselves are **not** to be included: **each reference mark must have a separate complete description of its own;**
- (4) distance and direction from one or more reference objects in the immediate locale should be noted. Examples of these reference objects are the centerlines of roads, fire plugs, telephone poles, chiseled marks in pavement, and survey marks which are not included in the NGS data base.

This item is more important when no monumented reference marks are associated with the geodetic control point;

- (5) distance and direction to any witness post that was set or if any witness post was set;
- (6) if applicable, a vertical reference to some nearby object (or the ground) stating the relationship to the object should be recorded. Distance above, below, or about flush with the object should be noted; and
- (7) any information about the specific setting or exact location of the mark if the coded values are not sufficient to describe it completely.

When distance estimates or measurements are given in metric units, English equivalencies must follow in parentheses. Property ownership and contact point telephone numbers are desirable when private property must be crossed or occupied.

Varying styles of descriptive text are used by some local and regional agencies. This will not present a problem as long as the content is as specified. Examples of descriptive text are included in the sample data sets which follow.

000480\*30\*AND SIGN (T-16). TURN LEFT AND GO EAST FOR 0.5 KM (0.3 MI) ON THE  
000490\*30\*PAVED ROAD, PASSING CUTTER AVIATION, TO A DIRT ROAD LEFT AND SIGN  
000500\*30\*(T-13). TURN LEFT AND GO NORTH FOR 0.2 KM (0.1 MI) ON THE DIRT ROAD,  
000510\*30\*CROSSING TWO RAMPS TO A TAN BRICK BUILDING (RUNWAY LIGHTING VAULT)  
000520\*30\*WITH TWO GREEN ELECTRICAL BOXES AND THE STATION ON THE SOUTH SIDE OF  
000530\*30\*BUILDING.  
000540\*30\*THE STATION IS THE TOP CENTER OF A ROUND METAL PLATE THAT IS  
000550\*30\*UNSTAMPED, AFFIXED TO THE TOP OF A 15.24 M (50.00 FT) LONG STEEL  
000560\*30\*H-BEAM DRIVEN TO A DEPTH OF 14.0 M (45.9 FT), PROJECTING 1.2 M  
000570\*30\*(3.9 FT) ABOVE GROUND, ENCASED IN A 2.1 M (6.9 FT) LONG  
000580\*30\*INSULATION-FILLED PVC PIPE 45 CM IN DIAMETER SET AT A DEPTH OF 0.9 M  
000590\*30\*(3.0 FT) PROJECTING 1.2 M (3.9 FT) ABOVE GROUND, SURROUNDED BY A  
000600\*30\*SQUARE CONCRETE SLAB 1.2 M (3.9 FT) ON SIDE FLUSH WITH GROUND.  
000610\*30\*LOCATED 45.4 M (148.9 FT) WEST FROM THE SIXTH BLUE TAXIWAY LIGHT  
000620\*30\*ALONG TAXIWAY 14 (SOUTH OF TAXIWAY 2), 32.3 M (106.0 FT)  
000630\*30\*EAST-NORTHEAST FROM THE APPROXIMATE CENTER OF THE DIRT ROAD, 21.8 M  
000640\*30\*(71.5 FT) SOUTH FROM THE SOUTHEAST CORNER OF THE RUNWAY LIGHTING  
000650\*30\*VAULT AND 21.5 M (70.5 FT) SOUTHEAST FROM THE SOUTHWEST CORNER OF THE  
000660\*30\*RUNWAY LIGHTING VAULT.  
000670\*30\*NOTE--THERE IS AN INVERTED THREADED BOLT AFFIXED TO THE TOP CENTER OF  
000680\*30\*ROUND METAL PLATE. FOR GPS OCCUPATION, ANTENNA TRIBRACH WAS SCREWED  
000690\*30\*ON THE BOLT AND ANTENNA MEASUREMENT WAS REFERENCED TO TOP OF ROUND  
000700\*30\*METAL PLATE.

**The following several descriptions illustrate how a cluster of related marks  
should be described. Note that NCMN is not an agency, but a usage, like TIDAL.**
