Airport Safety Self-Inspection DVD

The airport self-inspection program is critical to airport safety. The certificate holder is responsible for establishing, implementing, and maintaining an appropriate self-inspection system and schedule. Having the right equipment and qualified personnel that know specifically what to inspect is essential in a successful program. While some hazardous airport conditions occur instantaneously, others develop gradually. The airport operator must have a self-inspection program that identifies and monitors changing airport conditions and provides for prompt corrective actions.

The FAA has recently published a DVD for airport operators to assist in training personnel responsible for airport self-inspection. This DVD is intended to supplement your airport's current training program as required under 14 CFR 139.327. Methods and procedures for conducting airport self-inspections can also be found in Advisory Circular 150/5200-18C, *Airport Safety Self-Inspection*.

This DVD is <u>NOT</u> copyright protected and therefore can be reproduced by airport operators. To obtain additional copies of this DVD contact your respective Airport Certification Safety Inspector.
