North Carolina Develops Regional Surveillance Teams

Highly trained public health responders support preparedness functions across the state.

The most significant innovation to enhance North Carolina's response ability to public health crises was the creation of the seven Public Health Regional Surveillance Teams (PHRSTs). These regional offices cover all 100 counties across the state to give the North Carolina Office of Public Health Preparedness and Response the capability to work closely with local public health departments and first responders in all aspects of preparedness planning, training, and exercise. In addition, these seven regional teams act as highly trained and organized epidemiology strike teams.

Each PHRST team includes an epidemiologist, an industrial hygienist, a nurse consultant, a pharmacist, a veterinarian, and an administrative support technician. These teams are essential in providing training to state and local health care providers, responding to hurricanes, supporting disease investigations, and assisting local health directors in public health emergencies. Together these teams provide a layered, scaleable response for local, regional, state, and national resources to protect and serve the residents of North Carolina.

According to the North Carolina Office of Public Health Preparedness and Response, the cooperative agreement is valuable because it has supported local and regional public health laboratory capacities, epidemiological capacity, and education and training of public health responders locally, regionally, and at the state level. Funding from the cooperative agreement also has allowed North Carolina to form a dedicated Office of Public Health Preparedness and Response.

Snapshot of Public Health Preparedness

Below are activities conducted by North Carolina in the area of public health preparedness. They support CDC preparedness goals in the areas of detection and reporting, control, and improvement; crosscutting activities help prepare for all stages of an event. These data are not comprehensive and do not cover all preparedness activities.

Disease Detection and Investigation

The sooner public health professionals can detect diseases or other health threats and investigate their causes and effects in the community, the more quickly they can minimize population exposure.

Detect & Report	Could receive and investigate urgent disease reports 24/7/365[1]	Yes
	- Primary method for receiving urgent disease reports*[2]	Telephone
	Linked state and local health personnel to share information about disease outbreaks across state lines (through the CDC *Epi-X* system)[3]	Yes
	Conducted year-round surveillance for seasonal influenza[4]	Yes

*Telephone, fax, and electronic reporting are all viable options for urgent disease reporting, as long as the public health department has someone assigned to receive the reports 24/7/365.

North Carolina

Public Health Laboratories

Public health laboratories test and confirm agents that can threaten health. For example, advanced DNA "fingerprinting" techniques and subsequent reporting to the CDC database (PulseNet) are critical to recognize nationwide outbreaks from bacteria that can cause severe illness, such as *E. coli* O157:H7 and *Listeria monocytogenes*.

Detect & Report	Number of North Carolina laboratories in the Laboratory Response Network[1]	5
	Rapidly identified *E. coli* O157:H7 using advanced DNA "fingerprinting" techniques (PFGE):[2]	
	- Number of samples received (partial year, 9/06 – 2/07)	24
	- Percentage of test results submitted to CDC database (PulseNet) within 4 days	96%
	Rapidly identified *Listeria monocytogenes* using advanced DNA "fingerprinting" techniques (PFGE):[2]	
	- Number of samples received (partial year, 9/06 – 2/07)	2
	- Percentage of test results submitted to CDC database (PulseNet) within 4 days	50%
	Had a laboratory information management system that could create, send, and receive messages[3] (8/05 – 8/06)	Yes
	- System complied with CDC information technology standards (PHIN)[3] (8/05 – 8/06)	No
	Had a rapid method to send urgent messages to frontline laboratories that perform initial screening of clinical specimens[3] (8/05 – 8/06)	Yes
Crosscutting	Conducted bioterrorism exercise that met CDC criteria[4] (8/05 – 8/06)	No
	Conducted exercise to test chemical readiness that met CDC criteria[4] (8/05 – 8/06)	Yes

Response

Planning provides a framework for how a public health department will respond during an emergency. The plans can be tested through external reviews, exercises, and real events. After-action reports assess what worked well during an exercise or real event and how the department can improve.

Control	Developed a public health response plan, including pandemic influenza response, crisis and emergency risk communication, and Strategic National Stockpile (SNS)[1, 2]	Yes
	North Carolina SNS plan reviewed by CDC[2]	In Progress
	- Score on CDC technical assistance review (1-100)	N/A
	Number of North Carolina cities in the Cities Readiness Initiative[3]	1
Crosscutting	Developed roles and responsibilities for a multi-jurisdictional response (ICS) with:[1] (8/05 – 8/06)	
	- Hospitals	Yes
	- Local/regional emergency management agencies	Yes
	- Federal emergency management agencies	Yes
	Public health department staff participated in training to support cooperative agreement activities[4]	Yes
	Public health laboratories conducted training for first responders[5] (8/05 – 8/06)	No
	Activated public health emergency operations center as part of a drill, exercise, or real event*[†6] (partial year, 9/06 – 2/07)	Yes
	Conducted a drill or exercise for key response partners to test communications when power and land lines were unavailable[†6] (partial year, 9/06 – 2/07)	Yes
Improve	Finalized at least one after-action report with an improvement plan following an exercise or real event[†6] (partial year, 9/06 – 2/07)	Yes

* Activation means rapidly staffing all eight core ICS functional roles in the public health emergency operations center with one person per position. This capability is critical to maintain in case of large-scale or complex incidents, even though not every incident requires full staffing of the ICS.

† States were expected to perform these activities from 9/1/2006 to 8/30/2007. These data represent results from the first half of this period only.
