2. Northeast Fisheries Science Center, Woods Hole, MA
3. Woods Hole Oceanographic Institution, Woods Hole, MA

Talk Organization

- I. Background information - Atlantic Sea Scallops (Biology, the fishery, management)
- II. Dredge Surveys and Optical Surveys
 - What are they?
 - What information do they provide?
- III. How do dredge and optical surveys compare - A calibration experiment
- IV. Address question “Could optical surveys replace the traditional dredge survey?”
- V. Future research

Part I. Atlantic Sea Scallop Background

Placopecten magellanicus (Atlantic sea scallop)

From: http://seagrant.gso.uri.edu/research/georges_bank/Species_List/Pectinidae.htm

Atlantic Sea Scallop - Biology

(Placopecten magellanicus)

- Found in NW Atlantic (Newfoundland to N.Carolina)
- Filter Feeders
- Main Habitat: Sand and gravel bottoms
- Ideal temperature < 17 C
- Size: Typically < 17 cm (6.7 in); Depth: 25 - 200 m depending on location
- Life span: Up to 20 years.

Atlantic Sea Scallop

Atlantic Sea Scallops - Fishery

New Bedford Style Dredge;
Photo by Laura Oremland

- One of most valuable fisheries in U.S.
- Ex-vessel value in 2007: > ~\$385 M
- Primary U.S. Fishing areas include Gulf of Maine, Georges Bank, Mid-Atlantic
- Harvesting begins at age 4-5
- Fishery year around
- Primarily harvested by New Bedford Style Dredge

Sea Scallops and the Law

- Magnuson-Stevens Reauthorization Act of 2006 (MSRA)
 - Mandates management measures that:
 - (1) Prevent overfishing while achieving optimum yield from each U.S. (commercial) fishery
 - (2) Be based on the best scientific information available
 - (3) Minimize costs and duplication where practicable
 - In addition, MSRA reaffirms support for Cooperative Research

Sea Scallops and the Law

- Magnuson-Stevens Reauthorization Act of 2006 (MSRA)
 - Mandates the following requirements:
 - (1) Prevent overfishing while achieving optimum yield from each U.S. (commercial) fishery
 - (2) Be based on the best scientific information available
 - (3) Minimize costs and duplication where practicable
 - In addition, MSRA reaffirms support for Cooperative Research

What this means for scallops:

1. Monitor scallop populations (e.g., abundance, size)
2. Provide best available science to support scallop fishery management

The Importance of Scallop Size to Management

- Shell Height Distance in mm between the umbo and shell margin
- Important in stock assessments and fishery management
 - Scallops hard to age (false age annuli), size important
 - Biological reference points, fishing gear
- Size frequencies can indicate overfishing

Photo from:

http://www.mbl.edu/marine_org/marine_org.php?f_unc=reveal&myID=D165

Management Measures

- Gear Size Restrictions (scallop dredge ring size)
- Fishing Effort Limitations (# permits, DAS, Max crew size)
- Closed and rotational fishing areas

Part II. Sea Scallop Surveys: Dredge and Optical Methods

- Dredge Surveys
- Optical Surveys
 - Habcam
 - SMAST

New Bedford Dredge

Dredge Survey

- Conducted aboard R/V Sharp
- Former boat, Albatross, was recently retired from the scallop survey
- Conducted annually since late 1970s

R/V Hugh R. Sharp

Photo: Dvora Hart

Dredge Survey tow analysis

The NEFSC sea scallop survey has been conducted annually since 1979. The survey index is closely related to commercial landings and CPUE.

Optical Survey Options

HABCAM

- HabCam is short for “Habitat mapping camera system”
- Developed by WHOI scientists and Cape Cod scallop fishermen
- Looking for non-invasive survey method
- Tow body, takes images of sea floor to count and measure scallops on bottom
- Tows camera 3 m above bottom

HABCAM

- 300k images/day, 1 GB data/day
- Piece images together to form mosaic
- Collect raw .tiff images, process, color correct to end up w/ .jpg images of manageable size
- Matlab software (written by Amber York) to measure scallops and translate image to a true size measurement

SCALLOP IMAGES

Habcam shows Predatory/Prey Interactions

Predation of sea scallops by *Asterias vulgaris* sea stars

Predation of sea scallops by *Buccinum undatum* whelks

Habcam also shows other ecosystem interactions - mutualism

Red hake (*Urophycis chuss*) and sea scallops

Yellowtail
flounder

**Habcam is also a useful
tool for enumerating
demersal finfish**

Barndoor Skate

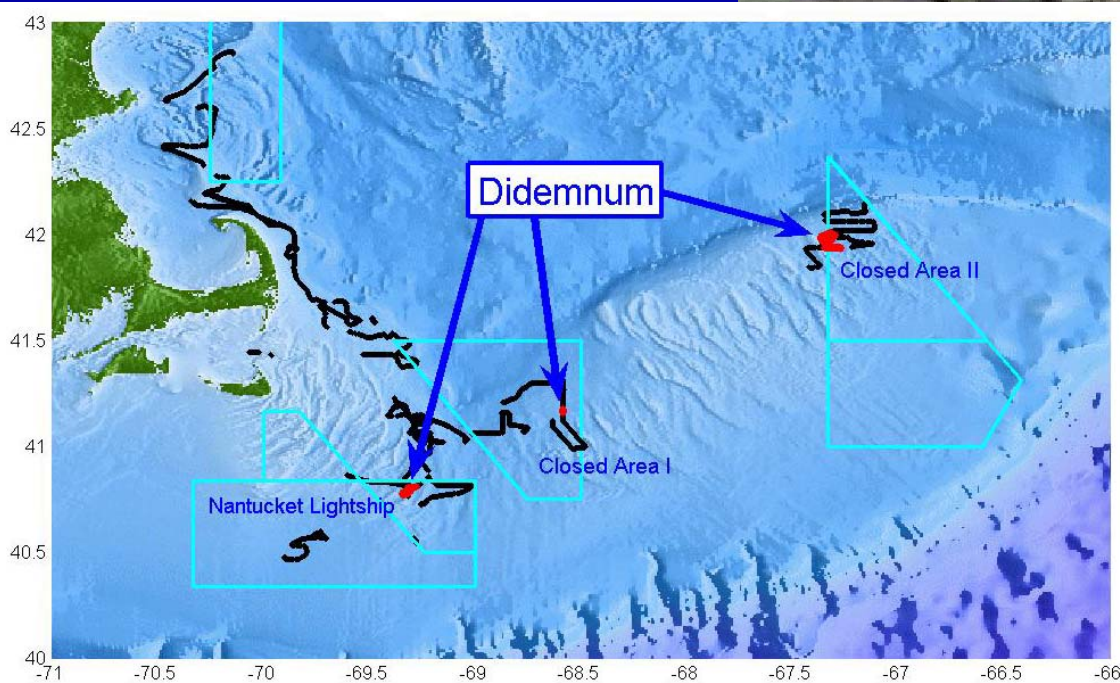

Monkfish

Invasive species

Didemnum sp. a.k.a., “the tunicate from hell”

University of MA, Dartmouth School for Marine Science and Technology (SMAST)

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

- Video Survey
conducted since 1999
- Conducted by joint
effort of SMAST
researchers and
commercial fisherman

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

SMAST Video Survey Objectives

Spatially Specific Estimates

Abundance / Density

Size Distribution

Recruitment

Natural Mortality

Benthos Mapping / Gear Impacts

Survey Characteristics

Cooperative

Inexpensive

Non-Invasive (vs. Mobile Gear)

Technologically Simple (Biologists not Engineers)

Adaptable to Management Changes (Spatial Management)

Step off the vessel with estimate (Real-Time)

SMAST Video Survey

Digital Still Camera = 1.3 m²

Large Camera = 3.2 m²

Small Camera = 0.8 m²

Side Camera

How do the dredge survey and
the Habcam optical survey
compare?

Basic Comparisons

	Dredge Survey	Optical Survey (Habcam Specifics)
Platform	UNOLS Vessel (formerly NOAA vessel)	Commercial Vessel
Survey Gear	Modified New Bedford Dredge	High resolution video camera, towed by vessel
Station Selection	Stratified Random sampling	Continuous Imaging System
Sampling Method	Dredge tows (3.8 knots; over 4500 m ²)	Line, pinwheel Transects (5 knots); Best design up for question
Purpose	Scallop Biomass Estimate	R&D; Small scale surveys & investigations; Potential for widespread scallop biomass estimate

Cost comparisons

	Dredge Survey	Optical Survey (Habcam)
Cost	High: ~\$20K ✓	Lower: ~12K (60% less) ✓✓ BUT: High capital investment
Staff needed	20-22 (Boat:8; Scientific 12-14)	6-8 (3x less; Boat: 4; Scientific 2-4) ✓
Sampling Area Covered/Survey	Over 500 stations; 17,000 NM	TBD; Habcam can cover 2x area /day as Dredge survey ✓
Tow Analysis	<ul style="list-style-type: none"> ▪ 5 people ✓ ▪ 30-60 minutes to count, measure 1 tow ▪ Post Cruise QA/QC: 3-4 wks 	<ul style="list-style-type: none"> ▪ Depends on decimation, # of scallops; Range: 1-10 hrs/person/tow. If count 1/100 image, likely 1-2 hrs/tow ▪ Post Cruise: TBD
Survey DAS	32 - 36 per Summer ---	Unclear; Estimate 16-24 days ---

Information Comparisons

	Dredge Survey	Optical Survey (Habcam)
Scallop Biology	Scallop weights, shells for age and growth ✓	Limited biological sampling capacity
Ecosystem level information	Limited capacity	Obtains information on habitats, other species, & interactions ✓
Credibility	<ul style="list-style-type: none"> ▪Historic time series ✓ ▪Sampling methodology accepted 	<ul style="list-style-type: none"> ▪Support from industry ✓ ▪Appropriate survey design not yet understood
Causes habitat damage?	Yes	No ✓
Abundance?	Yes- Relative Index	Yes - Absolute Abundance ✓
Size frequency?	Yes, dredge efficiency, selectivity ✓	Yes, measurement error

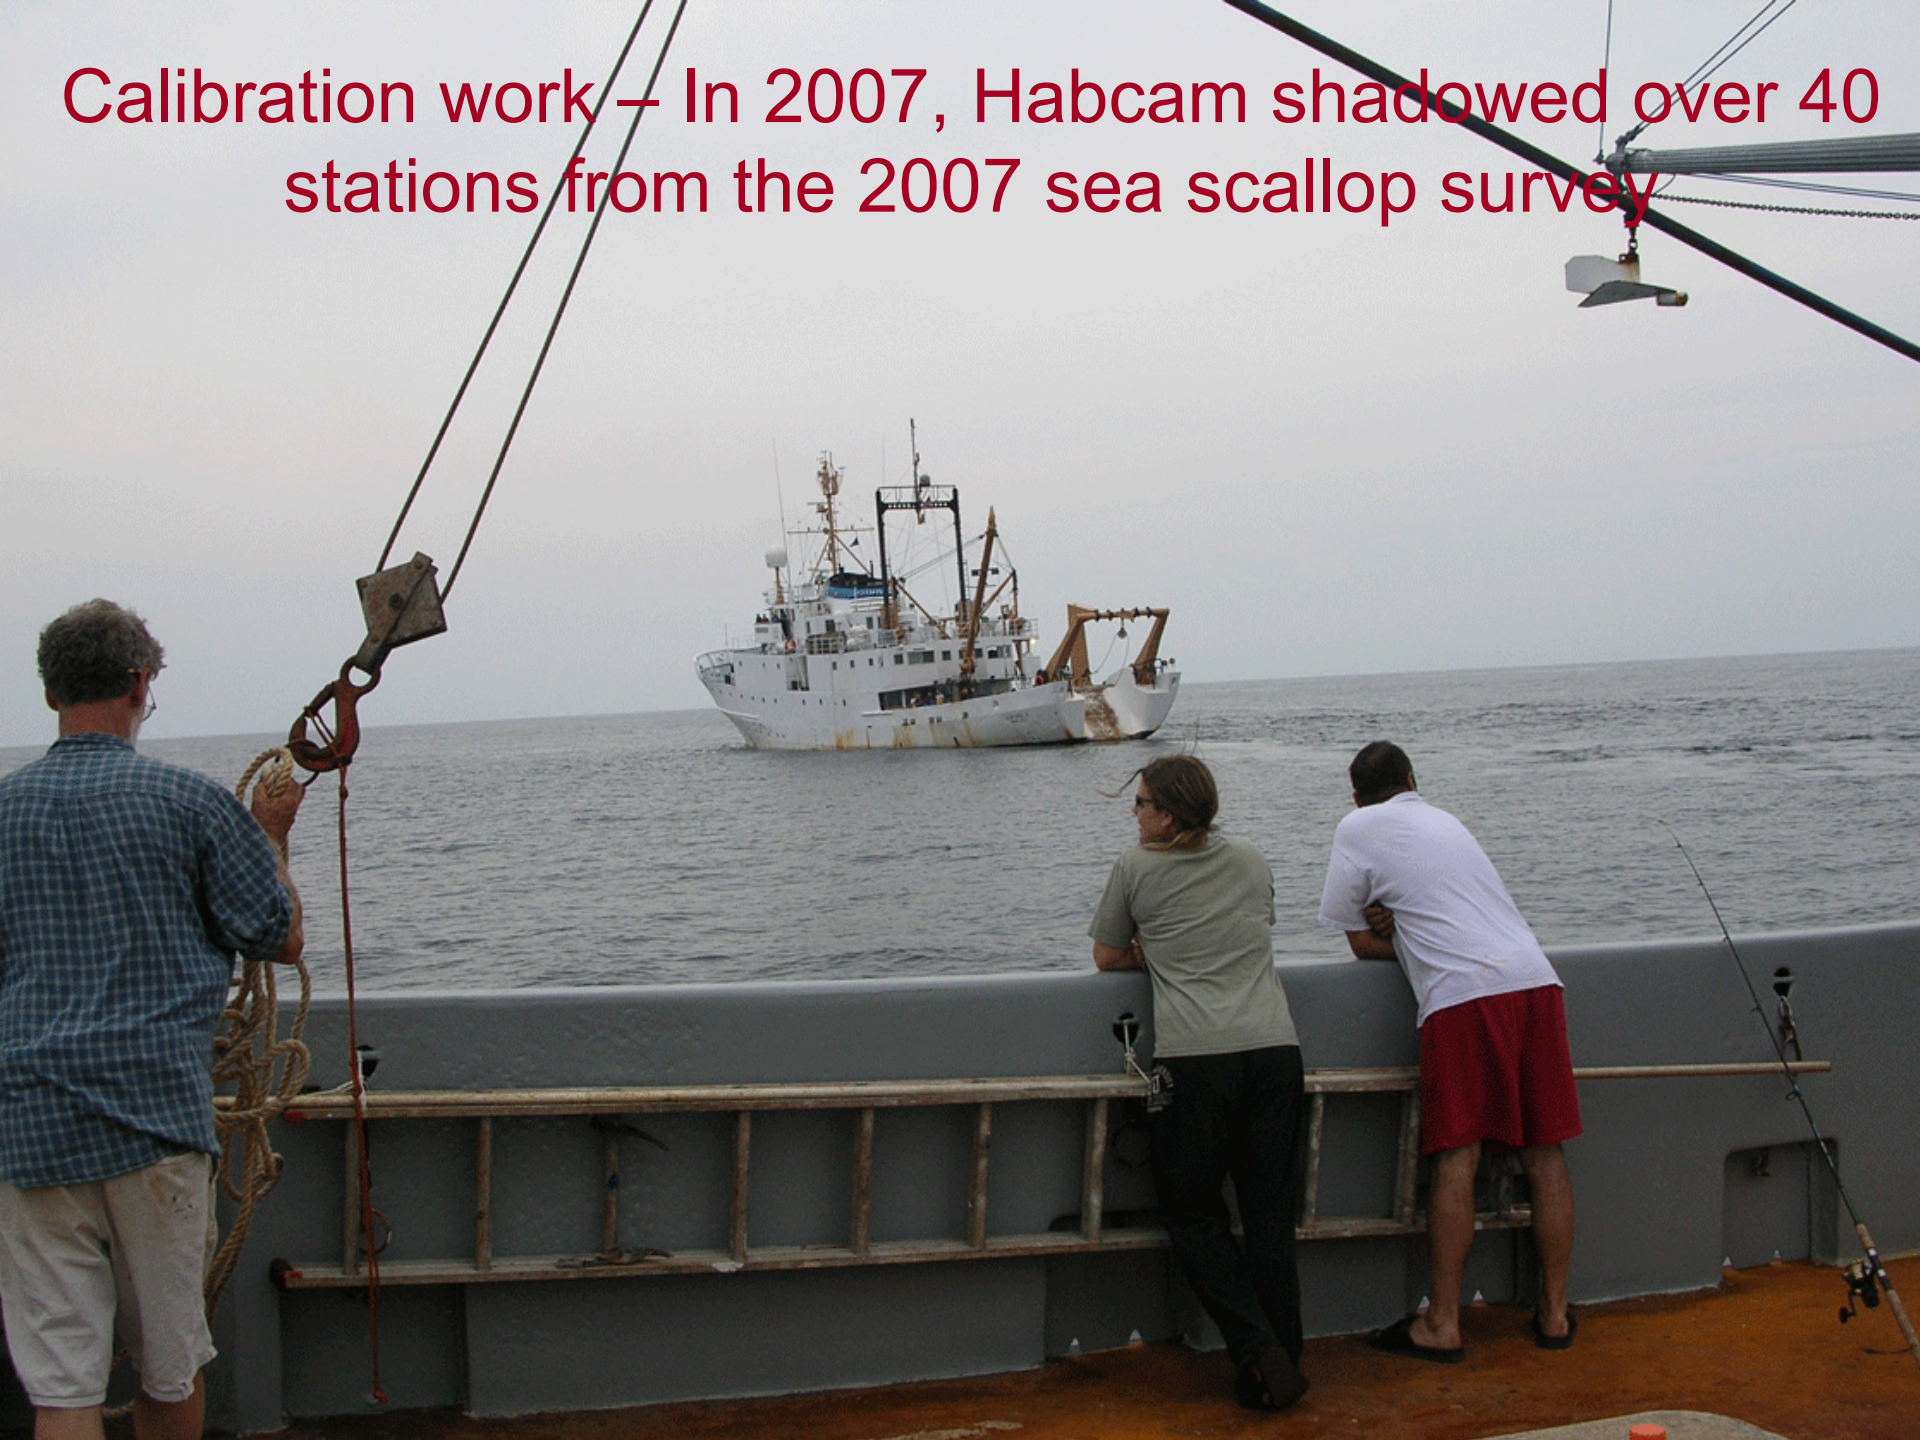

Comparison Overview

- Cost Winner: Habcam
- Information Winner: Both
 - Dredge and optical surveys each provide unique sets of information
- Habcam still in R&D phase; If both were to measure the same scallops in the same area, how would they compare?
- 2007 Calibration Experiment

Part III. Calibration Experiment between Dredge Survey and Optical Survey (Habcam)

2008 NRAP Project Focus

Calibration work – In 2007, Habcam shadowed over 40 stations from the 2007 sea scallop survey

Comparison of dredge survey and Habcam at the same sites

Calibration Requires Analysis of:

- Measurement Error
- Dredge Selectivity
- Dredge Efficiency

The first step is to look at
Measurement Error:
(2008 NRAP project)

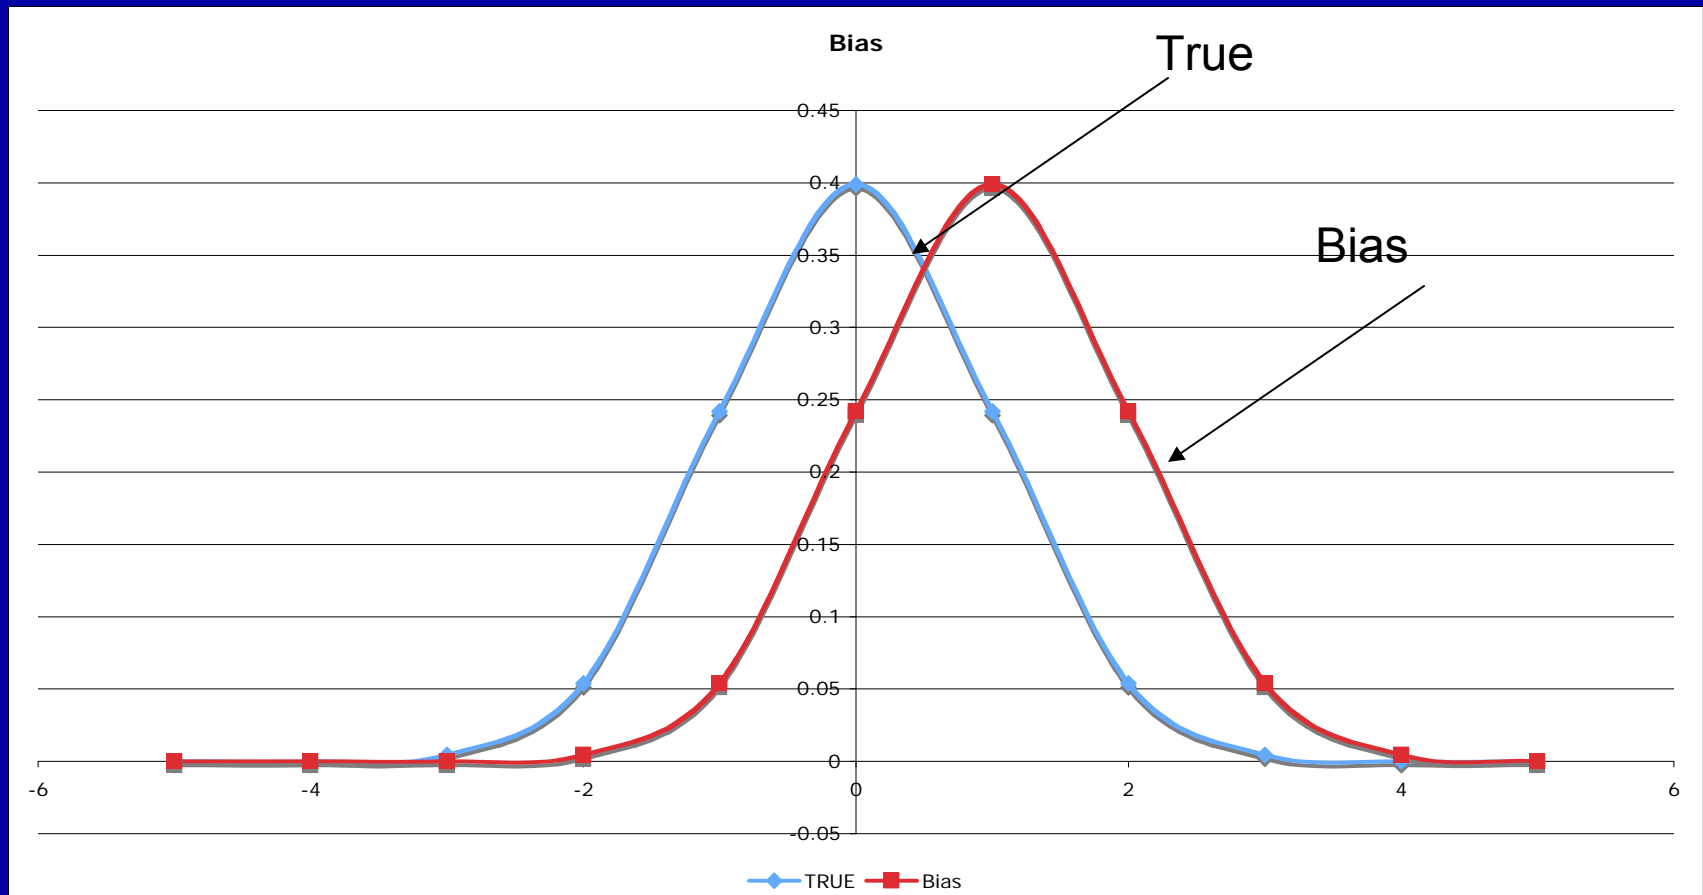

Measurement Error Analysis

Methodology based on recent, combined work of NMFS and SMAST researchers

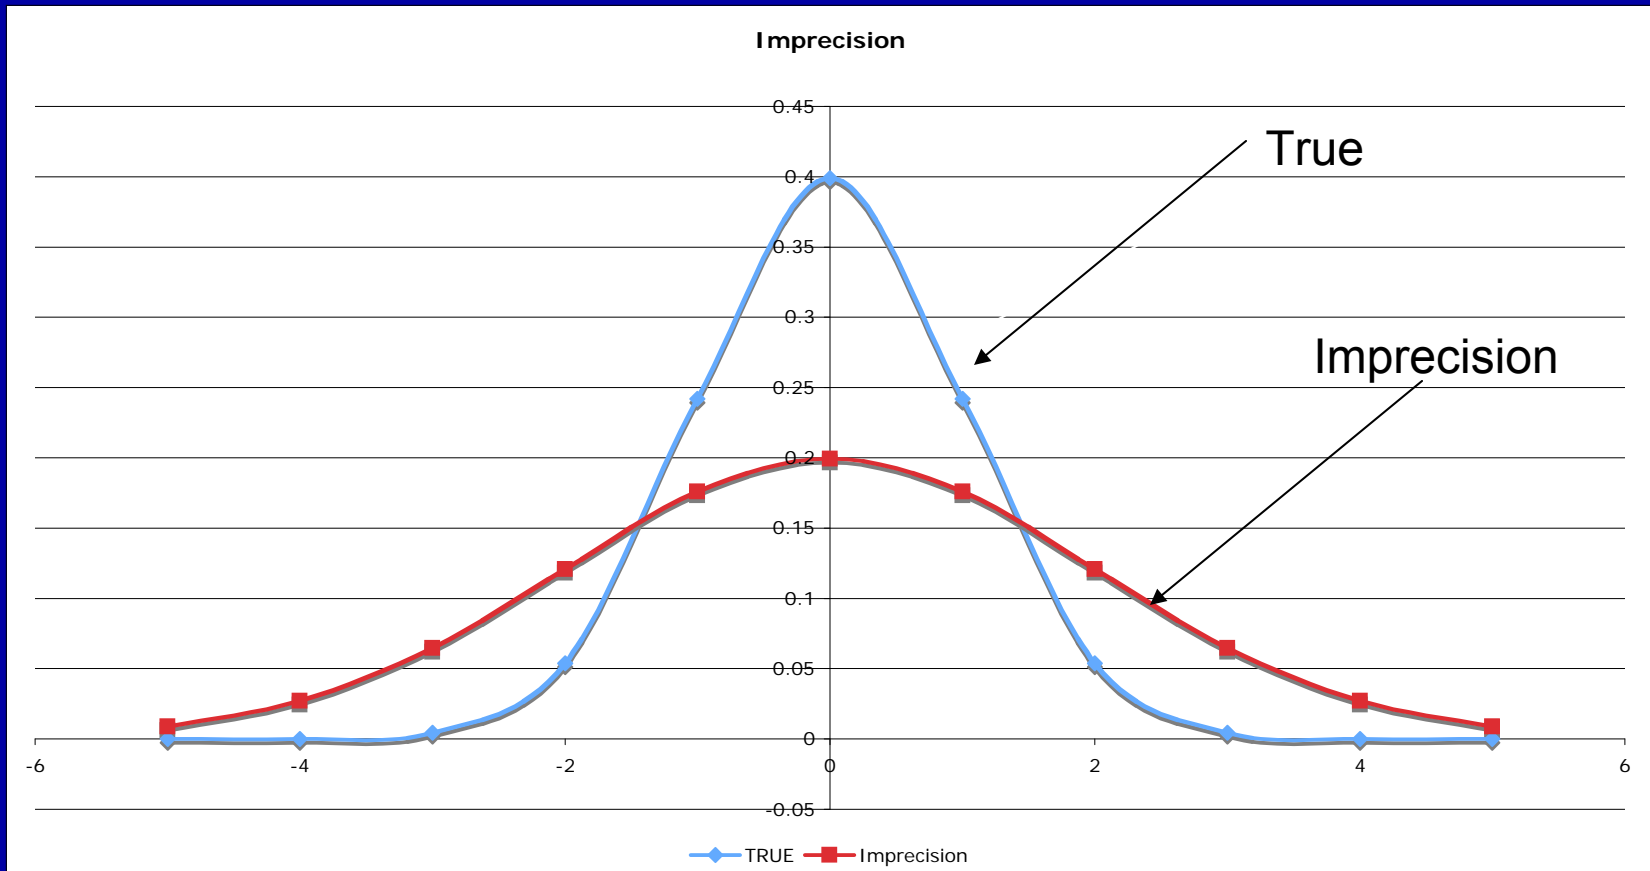

Two Types of Measurement Errors

- Bias: Systematic Error
 - Effects all observations equally; Shell height measurements off by a given amount on average
- Imprecision: Random error
 - Shell heights would fall within a given range of +/- mm on average
- Bias easier to correct

Types of Measurement Errors: Bias

Types of Measurement Errors: Imprecision

Methods

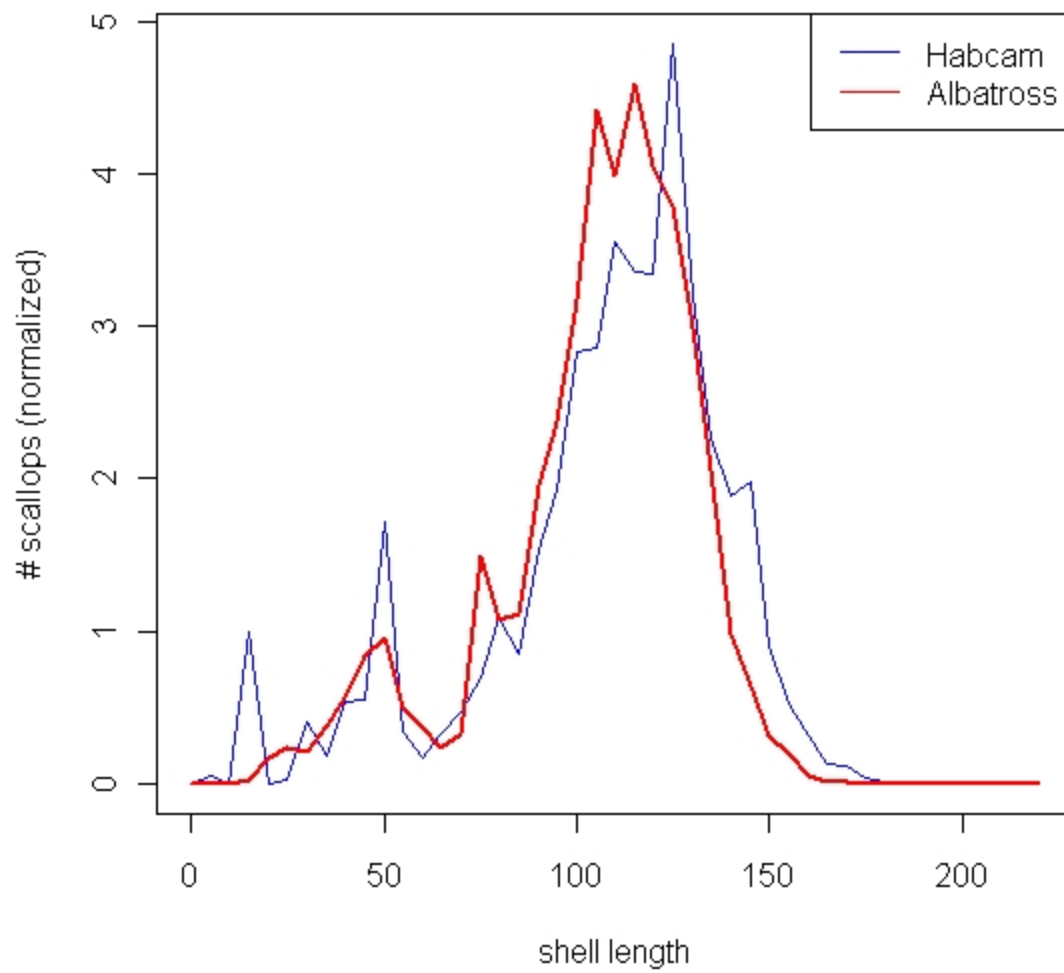

■ Overview

- R (Language and environment for stat computing and graphics)
- Determine, compare size frequencies for dredge and Habcam to nearest groups of 5mm (SH5)
- Standardize size frequencies per tow, by total number of scallops
- Assess for measurement error
- Determine possible sources of measurement error if it exists

Initial Comparison of Albatross
(Dredge) vs Habcam
using SH5 size classes
combined over all tows

Habcam vs Albatross - All Stations Combined[SH5]

Assess for Measurement Error

Assessment of Measurement Errors - Step 1

How to compare Albatross and Habcam

- Assumption: Dredge survey scallop size measurements are “true values”
- Apply measurement error estimates to dredge size distribution and try to best fit Habcam data
- Easy to add measurement errors; difficult to remove them
- Imprecision: Affects spread of data; Measured by Standard Deviation
- Bias: Affects mean of the data

Assessment of Measurement Errors - Step 2

3 Indices of Goodness of Fit

Observed = Habcam

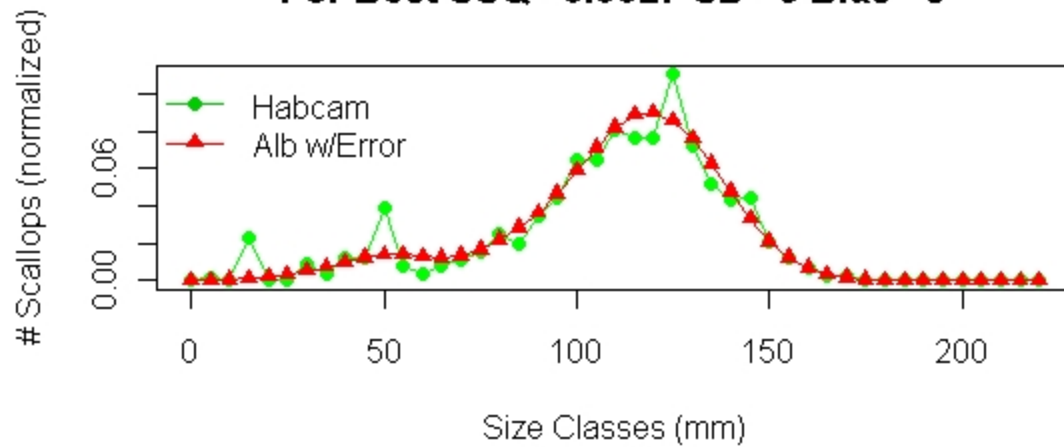

Predicted = Albatross w/Meas Errors Applied

- Sum of Squares (SSQ)
 - $(\text{Observed} - \text{Predicted})^2$
- Sum of Logarithmic Differences (SSQL)
 - $(\text{Log}[\text{Observed}] - \text{Log}[\text{Predicted}])^2$
- Negative Log Likelihood (L)
 - = $-n * (\sum_{j=1}^z p_j \ln(\Omega_j))$
 - Symbols (n =# tows; z =# of size classes; p_j = observed proportions (habcam) (j); Ω_j = predicted proportions (Albatross w/ meas error))

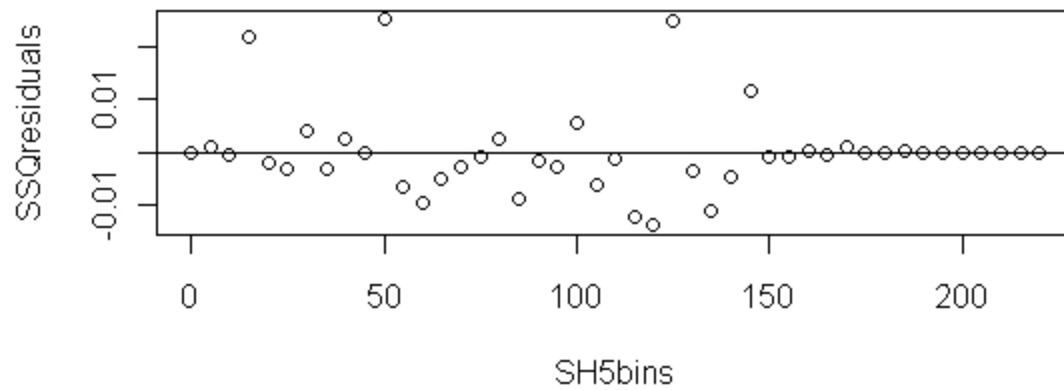

Assessment of Measurement Errors - Step 3

- Apply different combinations of standard deviation (imprecision) and bias to minimize SSQ, SSQL, L
 - SD: 0 - 15 (+/- 15 mm)
 - Bias: -10 to 10 (range of 20 mm)
- Minimize SSQ, SSQL, L
- Review the residuals of SSQ, SSQL, L by size class

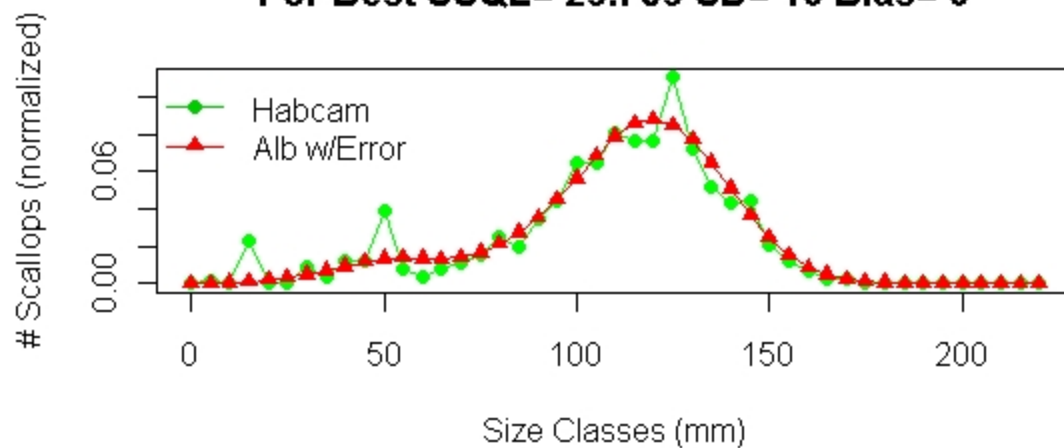

For Best SSQ= 0.0027 SD= 9 Bias= 5

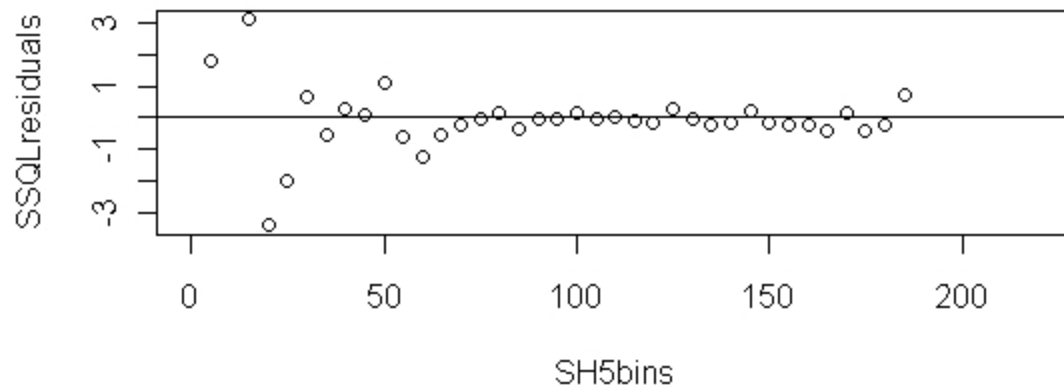

Best SSQ Residuals

For Best SSQL= 29.759 SD= 10 Bias= 6

Best SSQL Residuals

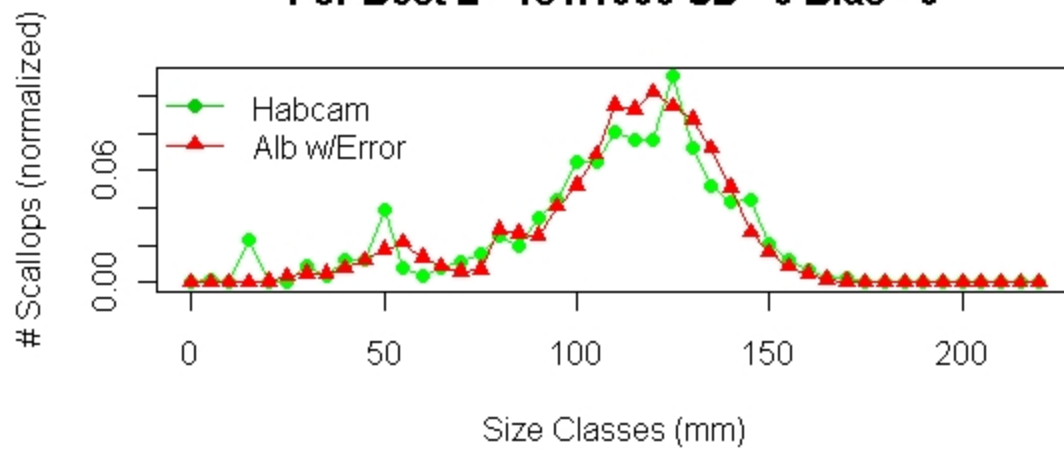

For Best L= 131.9264 SD= 1 Bias= 8

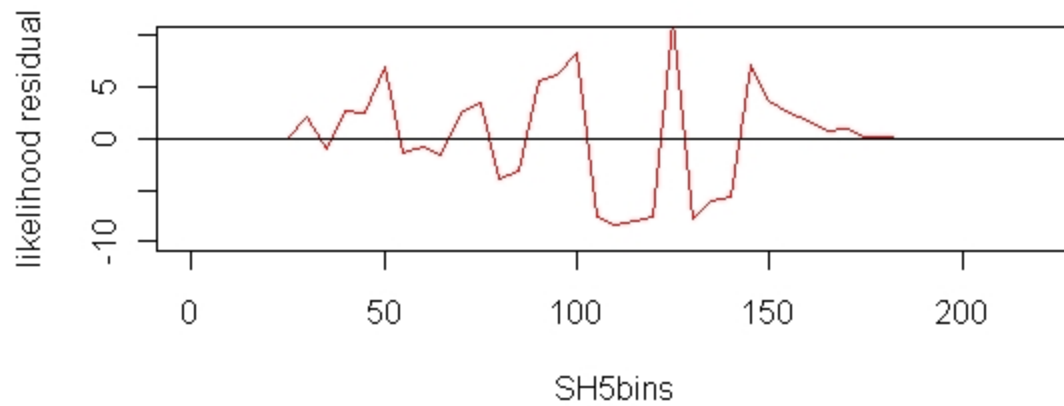

Best L Residuals

For Best L= 131.4006 SD= 0 Bias= 6

Best L Residuals

Preliminary Summary of Error Analysis

	Minimum Value	Standard Deviation	Bias
SSQ	.0027	9	5
SSQL	29.76	10	6
L - Best	131.40	0	6
L- Alternative	131.9	1	8

The possible range of parameters to describe measurement errors over a normal distribution is then

- Imprecision:
 - Either High (+/- 9 -10 mm)
 - Or Low (+/- 0-1 mm)
- Bias
 - Range: [5 -8 mm]

What can we say then about measurement error?

- Estimates for bias and variance are correlated if there are good fits to a wide range of parameter values
 - The data are unclear on this point
- L provides an interesting perspective (no variance, high bias) but results seems surprising
- Differences between the answers probably results from how well we fit the low proportions which have low expected variance in the L-based solution

If Measurement Error exists in Habcam, what could be the source?

Possible Sources of Measurement Error

- Scallop size only a function of altitude
- Sensitivity of size measurements to pixel variations is unknown
 - Could lead to up to 3 mm measurement error, though it may vary by altitude
- Scallops at angles on bottom

LAO

So, can an Optical Survey Replace the Dredge Survey?

- Not by itself
- BUT, the combination of a dredge and optical survey would obtain the best possible information on scallop populations
- Combined surveys would:
 - Maintain historical dredge survey time series
 - Obtain relative and absolute abundance estimates
 - Biological sampling
 - Ecosystem information and Interactions
 - Reduce bottom damage

Conclusions

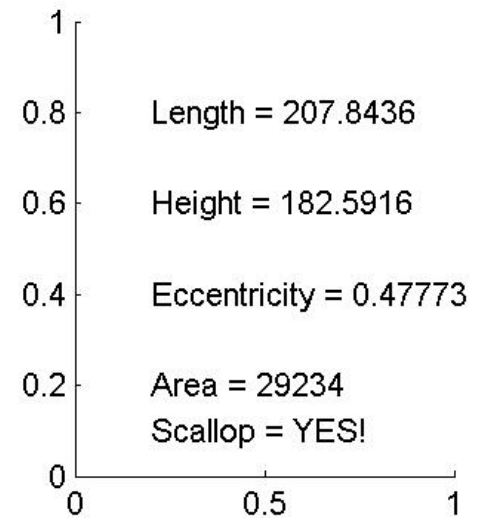

- Scallop Surveys of the future
- A unique combination of dredge and optical survey methods that:
 - Maximizes information on scallop populations
 - Provide ecosystem information (e.g., scallops, habitats, other species of interest)
 - Minimizes fiscal costs

Ongoing work with Habcam also includes

- New stereo imaging system being developed would reduce potential measurement errors
- Automated image classification
- **Combination of Habcam with sidescan and multibeam sonar**
- **More calibration work**

Automated image classification

3. Woods Hole Oceanographic Institution, Woods Hole, MA

From (Jacobson et al., 2008 submission) to CJFAS

- How variance due to errors in body size measurements tends to smooth the underlying distribution of body size data
- Can smooth modes (recruitment events) by moving individuals from size bins with relatively high numbers to adjacent bins w/ lower numbers
- Random Meas Errors also tend to expand range of observed sizes by decreasing the smallest observation and increasing the largest
- Bias degrades body size data also by making measurements consistently larger or smaller than the true value

Accurate "true" caliper shell height measurements with imprecision (sd=6.1 mm) and bias (-4.1 mm) in various combinations

Comparison Set 1

Dredge Surveys

	Albatross	Sharp	Habcam	SMAST
Platform	NOAA Vessel	UNOL vessel	Commercial vessel	Commercial Vessel
Survey Gear	New Bedford Dredge (2.44 m w; 5.1 cm rings, 3.8 cm liner)	Same as Albatross with some modifications	High resolution video camera, towed by vessel	3 video cameras and supplemental digital camera
Station Selection	Stratified Random sampling	Stratified Random Sampling	Cont. imaging system	Systematic Grid
Sampling Method	Dredge tows (Each 15 min @ 3.8 knots over ~ 4500 m ²)	Same as Albatross	Transects (e.g., line, pinwheel); Best design is up for question	4 quadrats (3 m ² each) per station

Comparison Set 2

Dredge Surveys

	Albatross	Sharp	Habcam	SMAST
Stations or Area Sampled Per survey	Over 500 stations; Survey area= 17,000 NM, Sample area is >2.25Million m ²	Same as Albatross	TBD; Habcam can cover 2x area /day that Dredge survey can sample	1800 stations (21.6K m ²)
Tow Analysis	5 people, 30-60 minutes to count/measure 1 tow on ave	Same as Albatross	Depends on decimation, # of scallops; Range: 1-10 hrs/person/tow. If count 1/100 image, likely 1-2 hrs.	Best estimate: 1-2 people, 20 - 60 min per station
Survey DAS	~ 30/summer	32- 36/ summer	Unclear; Estimate 16-24 days	54 days (6 9-day cruises)
Post cruise data analysis	3-4 wks (2-4 staff) for QA/QC	Same as Albatross	TBD; Tow analysis (above) and QA/QC	Unknown

Comparison Set 3

Dredge Surveys

	Albatross	Sharp	Habcam	SMAST
Boat Crew Required	18	8	4	Best estimate: 4
Science Personnel Required	12-14	12-14	2-4	Best estimate: 2
Cost/day of boat and crew only	\$15-20K	\$13K	\$8K	Best estimate: \$8k
Cost/day of Science Personnel	\$6K	\$6K	\$2.4K	Best estimate: \$1 - 2.4K
Cost/day supplies	\$1.5-2K	\$1.5-2K	Unknown	Unknown

Comparison Set 4

Dredge Surveys

	Albatross	Sharp	Habcam	SMAST
Purpose	Scallop Biomass estimate	Scallop Biomass estimate	Small scale surveys & investigations; R&D; Potential for widespread scallop biomass estimate	Scallop Biomass Estimate
Image Collection	N/A	N/A	4 images/sec	8 images/hr (best estimate)
Image Capacity	N/A	N/A	2006 Alone: 2.2 Million images over 672 Nautical Miles in 163 hours	1999-2003: 17,000 images per 7500 km ²

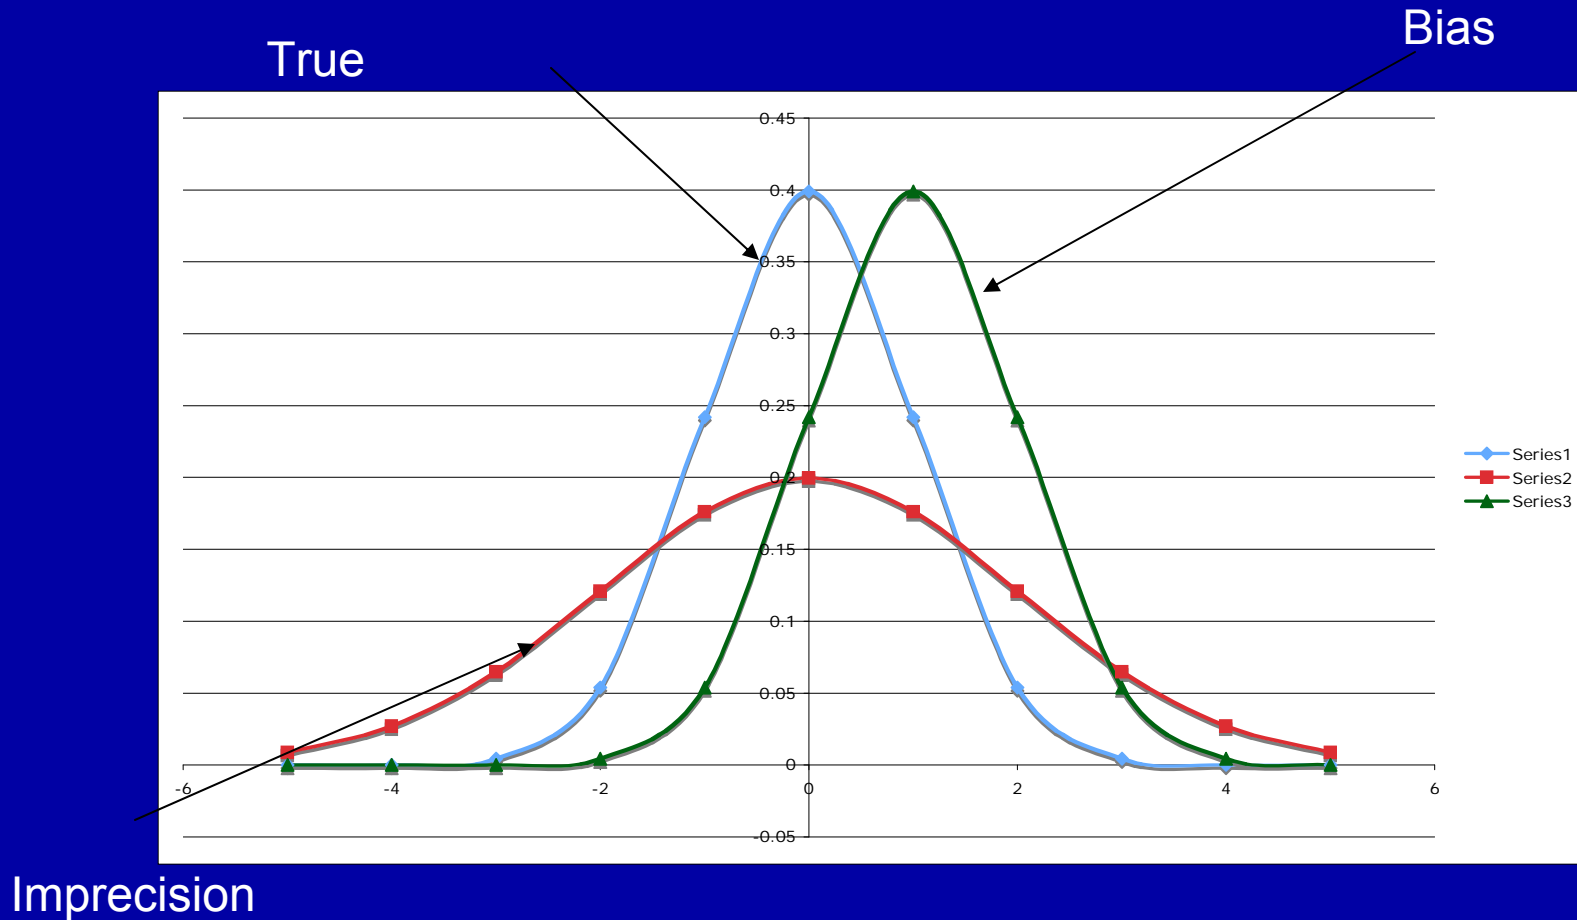

Comparison Overview

	Dredge	Habcam	SMAST
Unique Capabilities	<ul style="list-style-type: none"> ▪ Sampling History ▪ Minimal Measurement Error ▪ Bio Sampling (e.g., weights, shells for age/growth) ▪ Stratified Random Sampling significant; Adaptive sampling 	<ul style="list-style-type: none"> ▪ In -situ ▪ Absolute abundance ▪ Non-invasive ▪ Cooperative Research ▪ Provides ecosystem info (e.g., habitats, other spp.) ▪ Images high resolution ▪ Low operating cost ▪ Sample greatest area in least amt of time 	<ul style="list-style-type: none"> ▪ In situ ▪ Absolute abundance ▪ Non-invasive ▪ Coop. Research ▪ Provides ecosystem info ▪ Low-tech/less up front capital
Drawbacks	<ul style="list-style-type: none"> ▪ Labor Intensive ▪ High Cost ▪ Relative index of abundance only ▪ Dredge efficiency uncertain ▪ Habitat damage 	<ul style="list-style-type: none"> ▪ Lacks bio sampling ▪ Measurement Error ▪ Add. Time required for tow analysis ▪ Appropriate survey design not understood ▪ High capital investment 	<ul style="list-style-type: none"> ▪ Lacks bio sampling ▪ Measurement Error, but less due to fixed camera position ▪ Low res. images ▪ Covers Small sampling area

Conclusion Part 1

- Each survey method captures unique and important information about scallop populations
 - The survey methods are complimentary
- Dredge Surveys:
 - Historical data
 - Minimal measurement error
 - Biological sampling
- Optical surveys
 - Provide additional information on habitat
 - Provide additional information on ecosystem relationships

Types of Measurement Errors: Imprecision and Bias

But current Habcam progress may reduce potential Measurement Errors...

- New stereo imaging system being developed would reduce potential measurement errors
- Automated image classification
