A word for contacts

“No one likes to think they have given someone TB”

Anyone can get TB.

If you have TB disease, you are doing the right thing by sharing the names of people you spent time with when you were able to pass TB germs to others. By helping your healthcare worker do a contact investigation, you are helping your family and friends stay well. And you are helping to make sure your community stays healthy.

Here is what Kerry had to say about contact investigation:

“My healthcare worker asked for the names of my *contacts*, people I spent time with before I got treatment—when I could still pass TB germs on to others. My healthcare worker said she needed to do a *contact investigation*. This means calling or visiting people to let them know they should be tested for TB. I knew my friends and family needed to find out if they had TB, so, together we made a list of my contacts.”

The good news is that TB can be

How is TB spread?

TB germs are passed through the air when a person who is sick with TB disease coughs, laughs, sings, or sneezes. Anyone nearby can breathe in these TB germs and get TB infection. People with TB infection cannot pass TB germs to others. But if left untreated, TB infection can turn into TB disease.

Did you know?

People with TB disease can pass TB germs to others. But if they take the TB medicine the right way, they won't pass TB germs to others.

prevented, treated, and cured.

Follow Kerry's tips:

- Think about your contacts. Contacts are family members, friends, neighbors, co-workers, and others who spent time with you when you were sick.
- Give the names of your contacts to your healthcare worker. Don't let being embarrassed keep you from listing people you may have given TB germs.
- Think of how you are helping those around you stay well. Protect your family and friends.
- Learn all you can about TB.

Talking with your healthcare worker:

Your healthcare worker may ask you some or all of these questions during the contact investigation.

About your symptoms:

Your healthcare worker may ask: "How long have you been coughing? When did you first feel sick?"

About places you have been:

Your healthcare worker may ask, "Where did you spend time when you were feeling sick and coughing? Where did you live? Did you go to school? Where did you hang out when you were not at home or working?"

About people you spent time with:

Your healthcare worker may ask, "Who are the family members, friends, neighbors, and co-workers you spent time with while coughing?"

Get your questions answered.

Will my healthcare worker get in touch with all the people I listed?

Your healthcare worker will decide which people need to be contacted based on the information you give. It is important for your healthcare worker to be in touch with people you may have given TB germs. These friends, family members, co-workers, or classmates may have TB infection. This means they have dormant (sleeping) TB germs in their body, so they may not feel sick. If they get treatment for TB infection, they won't get sick with TB disease. If they already have TB disease, they will need treatment right away.

What about my privacy?

Some people with TB disease are afraid they will lose their job if others learn they passed TB germs to people at work. Others may be worried their friends and family will reject them. What you need to know is that the information you share with the healthcare worker is kept private and personal.

If your healthcare worker has to talk with your supervisor:

Your healthcare worker will be extra careful when talking to people at your work. In most cases, a contact investigation can be done without giving your name. Your name will ONLY be given to a supervisor if it is needed to make sure the right people get tested for TB. The healthcare worker will ask your supervisor to not give your name to your co-workers.

Your healthcare workers will do everything they can to protect your privacy.

- Your healthcare worker will take steps to make sure your name is not mentioned in a contact investigation. Even if your contact already knows that you have TB, your healthcare worker will not give out your name.
- Your healthcare worker will only give your name to doctors, nurses, and other healthcare workers who are taking care of you.

Your healthcare worker may:

- Call or visit the people you name.
- Talk to a group of people at your work, school, or place of worship.

Your healthcare worker will suggest the contact get a TB skin test and will provide information on where to get tested.

“A nurse told us we had been around someone with TB disease and we might have TB infection. She said if we do have TB infection and don’t get treatment, we can go on to get TB disease. And that can make us very sick. We’re going to the clinic today to get the TB skin test.”

A word for contacts:

What should you do if you have been named as a contact of someone with TB disease?

First: A healthcare worker will call you on the phone or come to see you. The worker will not tell you the name of the person who may have passed TB germs to you.

Next: After talking to you, a healthcare worker may suggest that you see a doctor or nurse for an examination. The exam may include a TB skin test and a chest x-ray.

Finally: If you have TB infection, take control now. Follow your healthcare worker's advice. Stop TB infection before you go on to get TB disease.

If a healthcare worker contacts you:

Talk with the healthcare worker.
Find out all you can about TB.
Get a TB skin test if the healthcare worker says you need one.

TB is a serious disease.

If you have TB disease, you are doing the right thing by giving names of people you have spent time with to your healthcare worker. If you know you have been around someone with TB disease, call your doctor or clinic and ask about getting a TB skin test.

Setting up an appointment for your TB skin test:

Date: _____

Time: _____

Location: _____

Phone: _____

Name of healthcare worker or clinic:

Take steps to control TB.

Do it for your health — do it for your family.

I took steps to protect my family.

“First I gave the names of people I spent time with to my healthcare worker. Then, my family got tested for TB. Everyone had a TB skin test. And we are following our doctor’s advice and taking steps to protect our health. And that’s important to us!”
