

DISASTER SAFETY

Tetanus Prevention

The risk of tetanus among disaster survivors and emergency responders can best be minimized by following standard immunization recommendations and providing proper wound care.

Key points to remember:

Patients without a clear history of at least three tetanus vaccinations who have any wound other than clean and minor **NEED tetanus immune globulin** (TIG) not just Td.

Tetanus in the United States is most commonly reported in **older persons** who are less likely to be adequately vaccinated than younger persons. In 2004, 71% of the 34 cases reported were among persons >40 years of age and 47% were among persons >60 years of age.

Older **women** are especially susceptible; a majority of those > 55 years of age do not have protective levels of tetanus antibody.

Diabetics are at increased risk. Reported tetanus is about 3 times more common in diabetics and fatalities are about 4 times more common.

Non-acute wounds (e.g., chronic ulcers, gangrene, abscesses/cellulitis) account for about 1 in 6 cases of reported tetanus; 1 in 12 reported cases had **no reported injury or lesion**.

Wound management:

Vaccination history	Clean, minor wounds	All other wounds
Unknown or < 3 doses	Td or Tdap (Tdap preferred	Td or Tdap (Tdap preferred for ages 11-
	for ages 11-18)	18) PLUS tetanus immune globulin
		(TIG)
3 or more doses and ≤5 years		
since last dose		
3 or more doses and 6-10 years		Td or Tdap (Tdap preferred for ages 11-
since last dose		18)
3 or more doses and >10 years	Td or Tdap (Tdap preferred	Td or Tdap (Tdap preferred for ages 11-
since last dose	for ages 11-18)	18)

Routine vaccination:

Primary series of diphtheria, tetanus, acellular pertussis (DTaP) in infancy and childhood. (Recommended schedule is 2,4,6, months, 15-18 months, 4-6 years. See http://www.cdc.gov/nip/recs/child-schedule.htm

Tetanus Prevention

(continued from previous page)

Booster shots of tetanus, diphtheria (Td) or tetanus, diphtheria, acellular pertussis (Tdap) at age 11-12 and then every 10 years. (Tdap is preferred for adolescents 11-18 years of age http://www.cdc.gov/nip/pr/pr_tdap_jun2005.htm.)

Persons who did not receive DTP or DTaP as a child, or whose tetanus vaccination history is not known should receive a primary series of three doses of adult Td. The first two doses should be separated by 4 weeks and the third dose should follow the second by at least 6 months. For persons 11-64 years of age Tdap may be substituted for ONE of these doses, preferably the first dose. Tdap should be substituted for ONE of these doses for persons 11-18 years of age.

For more information, visit www.bt.cdc.gov/disasters, or call CDC at 800-CDC-INFO (English and Spanish) or 888-232-6348 (TTY).
