a cSV or GIS-ready data file. Map the field containing the
total ner
a CSV or GIS-ready data file. Map
total number of cattle per county.

This map is a general planning aid based on the best available
data, and does not necessarily reflect the actual number of data, and does not necessarily reflect the actual number of cattle in any given county in 2007. For counties witho only on
catte farm or dairy, the number of cattle in that county was catie farm or dairy
mapped as zero. A regional legend based on cattle populations in Gulf Coast
and Easter Seaboard states was developed. Clases were
computed using the geometric interval classification scheme computed using the geometric interval classification schene,
then rounded for ease of interretation. Not all classes will
appear in every state.
