## Acknowledgments

The planning and operation of the Epidemiologic Followup Study to the first National Health and Nutrition Examination Survey (NHEFS) could not have been accomplished without the valuable assistance from many individuals and groups. Space constraints make it impossible to recognize all who participated in the planning, development, and conduct of the varied aspects of the survey; nonetheless, the authors are grateful for the support received, and apologize to those omitted.

Special thanks are extended to Dr. Joan Cornoni-Huntley of the National Institute on Aging, who played an important role in this survey. Without her persistence in the necessity for this study and her dedication in seeking financial support, this study would not have been conducted. The Epidemiologic Followup Study was jointly initiated by the National Institute on Aging and the National Center for Health Statistics, and has been developed and funded by the National Institute on

Aging; National Center for Health Statistics; National Cancer Institute; National Heart, Lung and Blood Institute; National Institute of Child Health and Human Development; National Institute of Mental Health; National Institute on Alcohol Abuse and Alcoholism; National Institute of Allergy and Infectious Diseases; National Institute of Arthritis, Diabetes, Digestive, and Kidney Diseases; and the National Institute of Neurological and Communicative Disorders and Stroke.

The contribution of Westat, the contractor who conducted this study, is also gratefully acknowledged. Directed by Mr. Thomas McKenna and Diane Cadell, Westat's dedicated research team carried out their assignments skillfully.

Finally, Dr. Doris Calloway (University of California, Berkeley) served as nutrition consultant and Dr. Nemat Borhani (University of California, Davis) was responsible for directing the blood pressure measurement.

## Background

In the first National Health and Nutrition Examination Survey (NHANES I) data were collected from a national probability sample of the civilian noninstitutionalized population. Participants of the survey were between the ages of 1 and 74 years. The survey, which included a standardized medical examination and questionnaires that covered various topics, took place from 1971 through 1974 and was augmented by an additional national sample in 1974-75. The NHANES I sample included 20,729 persons 25 to 74 years of age, of whom 14,407 ( 70 percent) were medically examined. ${ }^{1-3}$

Although NHANES I provides a wealth of information on the prevalence of health conditions and risk factors, the cross-sectional nature of the original survey limits its usefulness in studying the effects of clinical, environmental, and behavioral factors and in tracing the natural history of disease. Therefore, the NHANES I Epidemiologic Followup Study (NHEFS) was designed to investigate the association between factors measured at the baseline with the development of specific health conditions. ${ }^{4}$

The followup study originated as a joint project between the National Center for Health Statistics (NCHS) and the National Institute on Aging (NIA). The 1982-84 initial followup of the cohort was funded primarily by NIA, with additional financial support from the following components of the National Institutes of Health (NIH) and Public Health Service agencies: National Cancer Institute; National Institute of Mental Health; National Institute on Alcohol Abuse and Alcoholism; National Heart, Lung, and Blood Institute; National Institute of Neurological and Communicative Disorders and Stroke; National Institute of Arthritis, Diabetes, Digestive, and Kidney Diseases; National Institute of Allergy and Infectious Diseases; and the National Institute of Child Health and Human Development. All of these agencies were involved in both developing topics important to their specialty areas and designing procedures to collect data that would address these issues.

The size and scope of the population in NHEFS provides a unique opportunity to examine causal relationships in a large, heterogeneous, nationally distributed population. The followup study population included the 14,407 participants who were 25 to 74 years of age when first examined in NHANES I (1971-75). Data collection for the followup was conducted from 1982 to 1984, and included personal interviews with those traced (or with proxies for those who were incapaci-
tated or deceased); pulse rate, weight and blood pressure measurements for surviving participants; hospital and nursing home records; and death certificates for decedents.

Whereas NHANES I contains information gathered from physical exams, laboratory tests, and interviews, NHEFS is primarily an interview survey that relies on self-reporting of conditions. Attempts were made, however, to supplement the interview information by obtaining hospital records and death certificates.

Furthermore, a continued followup (consisting of telephone reinterviews and hospital record checks, as well as annual death clearance using the National Death Index) of the NHEFS population is planned to supplement the information already collected. The plan and operations for ongoing data collection efforts will be described in future NCHS reports.

## NHANES I sample design

To use the followup study data most effectively, it is necessary to understand the design, content, and procedures of the original NHANES I survey. NHANES I was a multistage, stratified, probability sample of clusters of persons. The successive sampling elements included a primary sampling unit (PSU), an enumeration district, a segment (or cluster of households), a household, an eligible person, and finally, a sample person. A randomly selected subset of the sample persons was examined in more detail and provided with additional questionnaire items. The design was further complicated by the oversampling of certain population subgroups, including persons living in poverty areas, women of childbearing age (25-44 years of age), and elderly persons ( 65 years of age and over). Oversampling of poverty areas was most pronounced for PSU's 1 through 35.

The first-stage sample consisted of 65 PSU's selected from approximately 1,900 PSU's into which the coterminous United States had been divided. Each PSU represented a county or a small group of contiguous counties. The 65 PSU's consisted of 15 self-representing large metropolitan areas with populations greater than $2,000,000$ persons, plus 2 PSU's from each of 25 other strata into which the 1,900 PSU's were grouped. The grouping was based on geographic region and population density.

In 1973 NCHS decided to extend the survey time period
and double the number of participants receiving the detailed examination during the 15 -month time period, July 1974 through September 1975. This 15 -month sample, known as the "Augmentation Survey," involved the selection of a national probability sample of 35 PSU's (sampling locations 66 through 100) so that the total sample locations 1 through 100 would constitute a national probability sample. The Augmentation Survey was similar to the first part of NHANES I except for some changes in the sample design and content. This second-stage sample of NHANES I included 3,059 persons $25-74$ years of age and did not involve oversampling of any special subgroups.

## NHANES I questionnaire and examination content (1971-75)

NHANES I included interview, medical examination, and laboratory components. (Appendix I contains a summary of the content for adults $25-74$ years of age.) The study focused on a number of index conditions that could be identified by examination and could also be associated with complaints and symptoms reported by the respondents selected for study. The symptoms included shortness of breath, chronic cough and phlegm production, joint pain, chest pain, skin problems, dental difficulties, and hearing and visual problems. The examination included aspects of pulmonary disease; cardiovascular disease; chronic disabling arthritis; dermatological disease; dental, oral, and ocular conditions; thyroid abnormality; auditory impairments; and visual impairments. (Appendix II provides a detailed list of data items collected for NHANES I adult subjects.)

The medical examination began with a general physical exam that had a nutritional emphasis and was conducted by a physician. After monitoring blood pressure and pulse, the physician examined the head and neck, looking particularly for lesions associated with nutritional deficiencies, especially the lack of vitamins A, B complex, C, and minerals. The chest, abdomen, and neurological and musculoskeletal systems were then evaluated for other vitamin and mineral deficiencies. Venipuncture was performed on all examinees. Persons in the detailed subsample received a comprehensive cardiovascular and musculoskeletal examination and the appropriate supplemental Medical History Questionnaire. Persons in sample locations 1 through 35 were given a thorough ophthalmologic examination. Next, dermatological and dental examinations were administered.

Laboratory and health technicians conducted the remainder of the examination, which included the following tests: hematology and urinalysis, measurements of height and weight, and body and skinfold measurements. In the detailed subsample, examinees received an electrocardiogram; audiometric, spirometric, single breath diffusion capacity, and goniometric tests; and x rays of the chest, hand, wrist, hips, and knees.

Several methods were used to collect nutrition information. The first was an assessment of food intake that consisted of a 24 -hour recall and food frequency questions. Second, a clinical appraisal by a trained physician was incorporated
into the examination to survey any nutritional deficiencies or malnutrition. Third, the nutritional biochemistry section of the exam consisted of determinations of blood serum levels for vitamins A and C, magnesium, serum iron, iron binding capacity, serum folate, total protein and albumin, and cholesterol (see appendix III for detail). Fourth, a Food Programs Questionnaire was used to obtain information about family participation in food stamp and commodity programs. Next, the relationship of body build and composition to nutritional status was evaluated. Relevant measurements included height, weight, triceps, and subscapular skinfolds (measures of obesity); elbow and bitrochanteric breadth (measures of bone structure); and sitting height (measure of trunk length). The final component of NHANES I was the dental examination, in which gums were examined for signs of malnutrition and related diseases. Participants were also asked questions about chewing foods to determine the relationship between dietary intake and dental conditions.

The content of the Augmentation Survey was revised in several respects. ${ }^{5}$ The dietary questionnaires and the dental, dermatologic, and ophthalmologic examinations were eliminated. Three new procedures, however, were added-a hearing test for speech comprehension, a visual acuity test, and a water sample collaborative study (in conjunction with NIH and the Environmental Protection Agency). In addition, several new sets of questions were provided. Questions from the 1971 National Health Interview Survey (NHIS) on vision and hearing were used to evaluate the relationship between survey response and clinical findings. Questions from the 1974 NHIS on hypertension were added to compare with blood pressure measurements. Also, a 20 -question depression scale developed at the National Institute of Mental Health was administered to participants. ${ }^{6}$ Serological tests for syphilis were added to the survey to monitor the prevalence of venereal disease.

As a result of these varied design features of NHANES I, not all of the followup study subjects received the same questions or examinations at baseline. All 14,407 respondents received the general medical examination, but only 6,913 respondents ( 3,172 men and 3,741 women) received the detailed medical examination. Those respondents who were given the detailed examination also may have received the arthritis, cardiovascular, or respiratory supplementary questionnaire, depending on their responses to screening questions. Moreover, only 11,348 persons in the NHEFS cohort (those in sampling locations 1 through 65) received the nutritional questionnaires described previously.

## Nonresponse in NHANES I

Nonresponse rates for the household interview and the examination in the mobile exam center are given in table A. The home interview nonresponse rate for those contacted initially was less than 2 percent and varied little by demographic characteristics. The examination nonresponse rate was considerably more, approximately 30 percent. Nonresponse rates for the examination are presented by sociodemographic characteristics in table B. Substantial differences in nonresponse rates were observed by age, race, and sex. Overall,

Table A. Number and percent of nonresponse to the first National Health and Nutrition Examination Survey household interview and examination of subjects 25-74 years of age, by sample location

${ }^{1}$ Includes races other than white or black.
examination nonresponse rates increased according to age, with 27 percent recorded for persons aged 25-34 years and 35 percent recorded for persons aged 65 and over. This trend was most evident for white female repondents. A notable exception occurs in the black male category, where persons aged 65 and over had the lowest examination nonresponse rates ( 25 percent).

The pattern of examination nonresponse rates according to place of residence is consistent across all race-sex groups with the highest rates recorded in the central cities of SMSA's having populations of more than $1,000,000$ persons ( 38 percent). As urbanization decreases, the rates also decrease, with the lowest occurring in areas not in SMSA's (21 percent).

However, the pattern of nonresponse for the examination differs across the groups according to region and race. Among white persons, the highest nonresponse rates occurred in the

East (39 percent), with the Midwest and South having intermediate rates ( 28 percent), and the West having the lowest rates ( 23 percent). Among black respondents, the highest nonresponse rates also occurred in the East ( 37 percent) but the lowest rates occurred in the South ( 22 percent), not the West ( 30 percent). The Midwest also showed high nonresponse rates for black persons ( 34 percent).

The nonresponse rates were also examined according to the education of respondents. Among white persons, the examination nonresponse rates decreased with education ( 33 percent for those with less than 12 years of education compared with 25 percent for those with more than 12 years). By contrast, black persons with less than 12 years education had the lowest examination nonresponse rates ( 28 percent) and those with exactly 12 years had the highest rates ( 33 percent).

To examine how health variables may have affected nonresponses to the examination, a log linear model was fit to the cross-classification of age, sex, race, and selected self-reported health status measures. After steps were taken to adjust for age, race, and sex, no statistically significant differences in response rates were found when odds ratios (OR's) were computed for those individuals with or without a history of
heart disease ( $O R=0.97$ ), respiratory illness ( $O R=0.87$ ), diabetes ( $\mathrm{OR}=1.09$ ), high blood pressure ( $\mathrm{OR}=0.89$ ), or lack of exercise ( $\mathrm{OR}=1.09$ ). However, persons who had arthritis or trouble with their vision were less likely to be nonparticipants in the examination than those not so impaired (OR's of 0.69 and 0.61 , respectively, $\mathrm{P}<0.001$ ).

## Objectives and design

The primary purpose of NHEFS is to investigate the relationships of clinical, nutritional, and behavioral factors assessed in NHANES I to subsequent morbidity and mortality. More precisely, there are three major objectives of NHEFS:

- Morbidity and mortality associated with suspected risk factors. The study of the relationships between risk factors measured in NHANES I and subsequent morbidity and mortality is the major objective of NHEFS. Information is available from the baseline on blood pressure, smoking, cholesterol levels, alcohol consumption, nutritional deficiencies, estrogen use, impaired pulmonary function, weight, and psychological characteristics. Morbidity and mortality data are available from the interview, from hospital and nursing home records, and from death certificates.
- Changes in participants' characteristics. The followup questionnaire was also designed to evaluate changes in risk factors that occurred during the period between NHANES I and NHEFS. For example, changes in blood pressure attributed to respondents' advancing age can be studied in association with moderating variables.
- Natural history of chronic disease and functional impairments. Because a large proportion of the subjects over 60 years of age in the NHANES I interview reported having a chronic disabling condition and/or loss of visual acuity or hearing, the progression or remission over time of these conditions can be studied by comparing responses at followup with the original questions used in NHANES I. It is important to attempt to understand, for example, why certain individuals with radiological evidence of osteoarthritis (as determined in the baseline NHANES I exam) develop functional impairment and others with the same severity of disease do not. Extensive arthritis data were collected in both NHANES I and NHEFS. Furthermore, a performance scale on activities of daily living was developed specifically for NHEFS to measure functional status.

To address these objectives most effectively, NHANES I adult respondents were traced and interviewed during 198284. Hospital and nursing home records were also collected for any episode that occurred since the respondent's NHANES I examination, and death certificates were collected for those who had died. This sample will continue to be followed annually with the use of the National Death Index to obtain death certificates for respondents who have died after their followup interview. Moreover, as mentioned earlier, a continued tele-
phone followup of the elderly (those who were at least 55 years of age at the NHANES I examination) is currently in operation, and plans are being made for additional telephone followups of the entire cohort. These efforts will be described in future NCHS reports.

## Feasibility study

In January 1979, representatives from all participating institutes of NIH, NCHS, and consultants in nutrition, environmental health, behavioral sciences, and health services began planning for the followup study. The initial step was to design a feasibility study to address several fundamental survey design issues. For example, could NHANES I participants be located after the lengthy time interval that had already elapsed? Would subjects consent to be reinterviewed? Would they sign authorizations to allow for hospital record data collection efforts? Would hospitals participate? Could deaths in the cohort be identified? Could death certificates be obtained?

To answer these questions, a feasibility study was conducted in Baltimore, Md., beginning in January 1980. This 5-week study included 191 subjects who had been $25-74$ years of age at the time of the 1971 NHANES I pretest.

NCHS conducted the preliminary tracing for the feasibility study. The use of crisscross directories, U.S. Post Office change-of-address services, files of licensed drivers from the Maryland Department of Motor Vehicles, and the death certificate files from the Maryland Office of Health Statistics provided addresses for 134 ( 70 percent) of the cohort. An additional 33 ( 17 percent) were located by field tracing.

Figure 1 illustrates the results of the tracing efforts. Only 15 (8 percent) of the 191 persons in the study were lost to followup. Black male participants and persons in the youngest age group (25-34 years old at the 1971 pretest) tended to be the most difficult to trace.

Among the group of 176 traced subjects, 33 individuals had died. Almost one-half of these decedents were from the age cohort of 65-74 years at the time of NHANES I. Twentythree persons agreed to act as proxies for the decedents and to participate in an interview. Twenty-one ( 79 percent) of these proxy respondents signed authorization forms to permit the retrieval and use of medical and death records. Death certificates were obtained for 24 ( 80 percent of 30 in-State deaths) of the decedents.

Of the 143 traced survivors, 74 ( 52 percent) were living at the same address as during the 1971 pretest, 56 ( 39 percent) had moved locally (within a 50 -mile radius of the survey

Figure 1. Summary of tracing and interviewing success in Baltimore, Md., Feasibility Study, 1980
location), and 13 ( 9 percent) had moved outside of the Baltimore area. About 97 percent of the 130 subjects who lived in the survey area completed a 10 - to 15 -minute survey questionnaire. Ninety-one percent of the subjects who completed a questionnaire also signed medical records authorization forms.

Overall, vital status was determined for 92 percent of the 191 subjects in the cohort. Interviews were conducted with 78 percent of the original cohort with 95 percent of the attempted interviews completed. Thus, the results of the feasibility study indicated that sufficient numbers of subjects and proxy respondents for decedents could be located and interviewed, and that health facility and death records could be obtained for the NHANES I examinees.

## Study design

Data collection for NHEFS began in 1981 and concluded in August 1984. A detailed account of the training schedule is provided in appendix IV, and the time and location of the actual data collection are given in appendix V .

The design of NHEFS consisted of five steps:

- Tracing the subjects or their proxies to a current address.
- Performing in-depth interviews with the subjects or with their proxies.
- Taking pulse, blood pressure, and weight measurements of subjects.
- Obtaining hospital and nursing home records, including pathology reports and electrocardiograms.
- Acquiring death certificates.

Copies of all pertinent study materials (tracing materials, questionnaires, authorization forms, and health facility data collection forms) can be found in appendix VI.

Although each component of NHEFS represents a separate survey activity with its own set of procedures for data collection, processing, and reporting, the information gathered for any one part of the survey was used to field other components. Data from the different components were thus intended to be used together when appropriate. In addition, the information respondents provided directly enabled certain items that were obtained by observation or through proxy response in the NHANES I to be updated or modified (for example, race and age. Appendix VII contains a complete listing of those changes.)

A summary of the NHEFS design and the results of the data collection procedures for the cohort are presented in figure 2. The flow chart shows the relationship between each of the data collection activities and provides information on the number of subjects included in each component. The information summarized in figure 2 will be explained in detail in the following sections.

## Tracing

The first phase of the project was to trace and locate each subject. The NHANES I examinees had not been contacted in any way before the inception of NHEFS. Because the validity of longitudinal studies depends on the completeness of followup, a large variety of sources were used to trace subjects, including crisscross and city directories, telephone contacts, direct mail, U.S. Post Office address information requests, State Department of Motor Vehicle listings, State Vital Statistics files, and field visits to neighbors at last known address.

Attempts were made to trace all subjects in the cohort and to determine their vital status. Date and place of death were obtained for subjects who had died. This information was used to obtain a copy of the death certificate from the appropriate State Vital Statistics office. The tracing process was also used to obtain the current address of surviving subjects as well as to identify a knowledgeable proxy respondent for deceased subjects. (Throughout this report, the term "subject" refers to the individual examined as part of NHANES I and the term "respondent" refers to the person who provides the information at followup.)

Respondents who were identified and located through the tracing procedure were then contacted and asked to participate in a personal interview. In a few cases, respondents who had been traced successfully could not be relocated for the interview. Only vital status as of tracing was available for those subjects.

A subject was considered successfully traced if the person or a proxy (in the case of those deceased or incapacitated) correctly responded to a set of verification questions that established the subject's identity. First, the name of the subject
had to be verified. Then the respondent was asked to correctly supply at least two of the following three items:

- Date of birth-The date of birth was considered verified if the year of birth obtained in the NHEFS tracing was the same year reported at NHANES I, or if the month and day were the same, and the birth year was within 2 years of the year reported in NHANES I.
- Address at date of NHANES I exam-The address of the subject was considered verified if the respondent correctly reported the street name, city, and State of the address at the time of the NHANES I exam. It was not necessary that the house number match.
- Household membership at the time of the NHANES I exam-The household composition was considered verified if the subject or proxy recalled the name and relationship of at least one household member correctly. The household composition was asked only if the birthdate or address had not been supplied correctly.

## Lost to followup

All persons who could not be traced were considered lost to followup. The fact of death had to be confirmed by a death certificate or a proxy interview. In some cases, information about the death of a subject was obtained from neighbors or other tracing contacts. Although this information was noted in the record, these persons were considered lost to followup unless the information was verified by a proxy interview or a death certificate.

As of August 1984, 93 percent of the study population was located successfully. However, the success of the tracing efforts varied by age, race, and sex (tables $C$ and D). To summarize how demographic factors were related to tracing success, a multiple logistic model was fitted to the crossclassification of age, race, and sex, with the proportion of subjects who were lost to followup representing the dependent variable. Because there were few participants of "other" races (172), this analysis was limited to black respondents and white respondents. Terms were deleted from the saturated model to develop the simplest model that would fit the data. The smallest $P$ value (probability) for a deleted term was 0.10 . The final model included a main effect for age ( $\mathrm{P}<0.001$ ) and an interaction between sex and race ( $\mathrm{P}<0.001$ ). The number of persons lost to followup was highest for those under 35 years of age at the time of NHANES I, and then generally decreased with each 10 -year increase in age for all sex-race groups (odds ratios were $4.43,1.97,1.25,0.91$, relative to those 65 years of age and over).

Within each age group, the effect of sex on lost-to-followup rates depended on the race of the individual. Among white respondents slightly more women were reported lost to followup, but among black respondents, men had the higher rates in this category. Odds ratios relative to white men were 1.27 for white women, 3.17 for black men, and 2.27 for black women. Thus, the lowest lost-to-followup rates were found among white men 55 years of age and over, and the highest rates were reported for black men under 35 years of age.

Figure 2. Summary of data collection used in the NHANES I Epidemiologic Followup Study, 1982-84

Table C. Number of respondenis and percent distribution by status in the Epidemiologic Followup Study, according to sex and age at the first Health and Nulrition Examination Survey

| Sex and age ${ }^{1}$ | All respondents | Status at followup |  |  | Total | Status at followup |  |  |

${ }^{1}$ The sampling frame for the first Health and Nutrition Examination Survey included persons aged 1-74 years at the time of the interview. Several subjects reached their 75 th birthday between the interview and the examination. In addition, date of birth was incorrectly coded for several subjects. This was corrected in the followup, and, as a result, one subject is over 75 years of age but has been retained in the analysis.

Table D. Number of respondents and percent distribution by status in the Epidemiologic Followup Study, according to race, sex, and age at the first Health and Nutrition Examination Survey

${ }^{1}$ The sampling frame for the first Health and Nutrition Examination Survey included persons aged 1-74 years at the time of the interview. Several subjects reached their 75 th bithday between the interview and the examination. In addition, date of birth was incorrectly coded for several subjects. This was corrected in the followup, and, as a result, one subject is over 75 years of age but has been retained in the analysis.

Table E. Odds ratios, confidence intervals, and statistical significance for health characteristics on loss to followup based on multiple logistic regression with age, sex, and race included

| Characteristic | 95-percent confidence interval |  |  | Statistical significance (P-value) |
| :---: | :---: | :---: | :---: | :---: |
|  | Odds ratio | Lower bound | Upper bound |  |
| High blood pressure | 0.81 | 0.68 | 0.97 | 0.024 |
| High cholesterol | 1.03 | 0.86 | 1.23 | 0.754 |
| Overweight | 0.94 | 0.80 | 1.10 | 0.450 |
| Heart attack | 1.18 | 0.79 | 1.77 | 0.408 |
| Diabetes | 1.21 | 0.84 | 1.74 | 0.310 |
| Smoker | 1.86 | 1.52 | 2.28 | 0.001 |

Analysis using a multiple logistic regression was conducted to determine whether those persons lost to followup were at relatively high risk of death. Six health characteristics (in addition to age, race, and sex) that have been established as risk factors for mortality were considered: high blood pressure (systolic blood pressure of 140 millimeters of mercury or more), high cholesterol ( 260 milligrams per 100 milliliters or more), overweight (body mass index above the 85th percentile), history of heart attack, history of diabetes, and smoking status (smoker, nonsmoker, or unknown).

The results of this multiple logistic regression are presented in table E . Two risk factors were inversely associated with loss to followup: NHANES I examinees with high blood pressure were 19 percent less likely ( $\mathrm{P}=0.024$ ) and overweight examinees were 6 percent less likely to be lost to followup ( $\mathrm{P}=0.450$ ). High cholesterol had virtually no effect on tracing,
and persons with a history of heart attack or diabetes were approximately 20 percent more likely to be lost to followup (none of these differences were statistically significant). Smoking had the strongest effect on loss to followup-smokers were 86 percent more likely than nonsmokers to be untraced ( $\mathrm{P}<0.001$ ).

These results suggest that those subjects who were lost to followup were somewhat more likely to have died than those who were successfully traced. The strong association between smoking and lost-to-followup rates indicates that the effects of smoking on mortality, especially at younger ages, should be interpreted with caution. It should be noted, however, that among those aged 55 years and over the proportion lost to followup is quite small relative to the proportion deceased. Thus, in these age groups, there should be relatively little bias in mortality findings as a result of loss to followup.

## Interview data collection

## Interview procedures

An attempt was made to interview all subjects identified during tracing. Subjects and proxies were sent a letter in advance describing the followup study about 2 weeks before interviews were to begin in an area. Interviewers then called the subject or proxy to schedule an appointment for the interview. If the person could not be reached by telephone, the interviewer made an in-person attempt to interview or to schedule a future appointment.

Interviews were conducted wherever the subject resided, including in nursing homes, prisons, mental health facilities, or occasionally at some other convenient location (for example, a parent's home). After physical measurements were completed, the subjects were given written reports of the measurements. At the close of the interview, the respondent was asked to sign a form authorizing NCHS to obtain information from medical records. Subjects were remunerated $\$ 10$ for their participation in this approximately 2-hour interview.

Thorough quality control procedures were instituted, with the interviewer and the field office conducting field edits. Respondents were recontacted if there were discrepancies or missing sections in key items. Fifteen percent of the questionnaires were randomly selected for validation. This was done primarily by telephone and, if necessary, by mail. Additional questionnaires were selected for verification if the data were believed to be false. Ten percent of the telephone interviews were also validated.

Followup interviews first occurred in a pilot phase, referred to as phase 1. Twelve interviewers and three office support staff members were hired to conduct phase 1 using the NHANES I Philadelphia area sample (sample locations $1,51,86$, and 97). A 3-day program of physical measurements training and a 5 -day interviewer training program were held. (The schedule and locations of the training are given in appendix IV.) In-field tracing was conducted in conjunction with interviewing when necessary. Field tracing was performed to locate subjects or proxies not found through office tracing methods.

After phase 1, the questionnaires and field procedures were evaluated, and it was decided that, in most instances, proxy interviews for deceased subjects could be conducted most efficiently by telephone. The exceptions to this rule would occur when the proxy had no telephone or when the proxy was also a subject in the study. In the latter case, a personal interview was conducted with the subject, and then a proxy interview was conducted for the decedent.

Main data collection began in October 1982, 3 months after the pilot study interviews were completed. The field work for NHEFS was conducted regionally. Because the original NHANES I sample was clustered by sample location, most of the followup respondents were similarly clustered. Although some subjects had moved during the survey period and some proxy respondents did not necessarily live in the original clusters, the number of subjects located within the original set of clusters was sufficient to organize the field work around the original sample locations. Procedures were developed to secure interviews with those not living in the original areas. The 100 PSU's in the NHANES I national sample, excluding the phase 1 locations, were grouped into four approximately equal workload regions representing the North (Northeast), South, Midwest, and West. To ensure close contact with interviewers in the area, each region had a central field supervisor and three field offices with a supervisor and assistant in each office. The sample locations included for each region are listed in appendix $V$, along with the locations for the pilot study and the respective interviewing periods.

NHEFS interviews occurred first in the North in October 1982. Work began in the South in February 1983, followed by the Midwest in May and the West in August. The final interviews were completed in the West in December 1983.

Procedures were instituted to ensure that the necessary information was collected from respondents in a consistent manner. In each of the four regions, 50 to 60 interviewers, who were indigenous to the sample locations, were trained to meet the precise standards of the study. Interviewer candidates had to successfully complete the 3-day physical measurements training session and be certified to take blood pressure measurements before they were accepted for the intensive 8 -day interview training session. Interviewers were trained and certified to take blood pressure measurements according to the guidelines of the American Heart Association and the National Heart, Lung, and Blood Institute. The field supervisors in each region remained in close contact with the interviewers by telephone, and personal visits were made to observe each interviewer in the field. Interviewers were retested on the physical measurements procedures early in the interviewing phase.

Nonetheless, some NHEFS respondents were located in remote regions of the country, and the costs of securing these dispersed interviews were very high. Furthermore, although tracing occurred continually throughout the survey period and
field work was conducted regionally, some subjects would be located only after field work was completed in that region. A small cadre of traveling interviewers continued to handle these kinds of cases; however, it was impossible to field all cases that were traced, particularly those at the end of the field period. Thus, these subjects were interviewed by telephone to gain as much information as possible without incurring extreme costs. Certain sections of the questionnaire were omitted to ensure that the telephone questionnaire was of an acceptable length. Telephone interviews were completed for 131 subjects. This process was called the U.S. Sweep and was conducted early in 1984.

When one of these subjects could not be contacted by telephone, a mail form was sent. This form was designed to obtain the information necessary to verify the subject's identity, to obtain information for future tracing, and to collect the names of hospitals in which the subject had stayed and the dates of each stay. Mail forms were also sent to proxies for deceased subjects in cases when the proxy could not be reached by telephone and the costs associated with the personal interview would be too high. Forty-seven mail forms were received. The receipt of a mail form did not constitute an interview; however, the information was important for other survey components, for example, in verifying vital status and collecting hospital records and death certificates.

The initial followup interview consisted of two sections: a detailed questionnaire that was provided to all subjects and proxy respondents, and a physical measurement section in which selected physical measurements were taken on subjects only. Additional survey procedures that provided information and materials required by other survey components were performed at the time of the interview.

The personal interview was designed to gather information on selected aspects of the subject's health history since the time of the NHANES I exam. This information included a history of the occurrence or recurrence of selected medical conditions; an assessment of behavioral, social, nutritional, and medical risk factors believed to be associated with these conditions; and an assessment of various aspects of functional status. Whenever possible, the questionnaire was designed to retain item comparability between NHANES I and NHEFS as a measure of change over time. However, questionnaire items were modified, added, or deleted when necessary to take advantage of current improvements in questionnaire methodology. The revised questionnaire also included a complete history of hospital and nursing home use.

Two versions of the interview questionnaire were de-veloped-the subject questionnaire and the proxy questionnaire. The subject questionnaire was used when the subject was alive at the time of interview. Although the questionnaires were administered by trained interviewers, certain sections of the subject questionnaire were included in a special booklet to be self-administered.

If a subject was incapacitated or otherwise unable to take part in the interview, selected portions of the subject questionnaire were given to a proxy respondent. This version of the subject questionnaire is referred to as the "boxed" questionnaire (appendix VI). Questions on the subject questionnaire that were also included in the boxed questionnaire
were designated by the shaded boxes in which the question numbers were enclosed. In general, only objective questions were included in the boxed questionnaire. Questions that related to feelings, opinions, or perceptions were omitted.

The proxy questionnaire (appendix VI) was provided only when the subject was deceased. In most cases, proxy questionnaires were administered by telephone, whereas subject questionnaires were administered in person.

The distinction between a proxy respondent and the proxy questionnaire is important. To reiterate, a proxy respondent was asked to answer the proxy questionnaire when the subject was deceased or to assist with a subject questionnaire when the subject was unable to participate in the interview for other reasons. A proxy questionnaire, however, was given to a proxy respondent only when the subject was deceased. Proxy respondents completed 1,697 proxy questionnaires for decedents. In addition, proxy respondents completed 256 of the 10,523 subject questionnaires.

## Questionnaire content

Both the subject and the proxy questionnaires were divided into sections based on general topics. Where appropriate, entire sections and specific questions in other sections were omitted from the proxy questionnaire. General topics as well as specific question batteries were developed collaboratively by the participating agencies.

Part A of the subject and proxy questionnaires includes questions on the subject's household composition. The first part of the Mental Status Questionnaire (MSQ) was administered to subjects 60 years of age and over. ${ }^{7}$ The MSQ was used to identify dementia and also to determine if the subject was capable of responding to the questionnaire. If the subject received a score of less than 3 , the interviewer immediately administered the second part of the battery, located in section H. If the subject scored less than 8 on both parts of the MSQ, the subject was asked to respond to parts I, J, and P , but the interviewer was instructed to enlist the aid of a proxy respondent, usually a relative or close friend, to assist the subject with the rest of the questionnaire. Potential proxy respondents answered a series of verification questions to determine whether they were knowledgable enough about the subject to complete the questionnaire. However, if the interviewer felt that the subject could provide valid responses or if a proxy respondent could not be located, the subject was asked to complete the questionnaire. Among those surveyed, 173 subjects scored less than 8 on the MSQ. In 81 of these cases, another person assisted the subject with the interview.

Part B of the NHEFS questionnaire contains information on the composition and vital status of the subject's family of origin and on the family's history of cancer. Questions on the vital status of the parents were omitted from the subject telephone interview.

Part C contains questions on the female medical history, including menstrual and pregnancy history, exposure to estrogens, and status of reproductive organs. Some questions on status of reproductive organs found in section C of the subject
questionnaire are also found in section $G$ of the proxy questionnaire.

Part D of the questionnaire contains a self-reported history of selected conditions. The conditions, which were selected on the basis of prevalence and severity, include hypertension, angina, myocardial infarction, claudication, stroke, gallbladder disease, cancer, and respiratory problems. The coronary heart disease questions were developed by Dr. Geoffrey Rose of the University of London. ${ }^{8}$ A diagram was included in the self-administration booklet to enable the subject to identify the location of the anginal pain. The respiratory scale was adapted from the questionnaire developed by the American Thoracic Society and the Division of Lung Disease of the National Heart, Lung, and Blood Institute. ${ }^{9}$ Each set of questions on a particular condition also included a question to ascertain whether or not the subject had been hospitalized for that condition since 1970. If there was a hospitalization, information on the name and address of the facility, the year of the stay, and the reason for the stay was recorded on a special chart in the questionnaire booklet. In addition, part D included a battery of questions on exposure to sunlight and the occurrence of bedsores attributed to bed confinement. Symptom questions were omitted from the boxed questionnaire and the proxy questionnaire.

Part E of the subject questionnaire relates to arthritis. The battery of questions is adapted from the Arthritis Supplement used in NHANES I. The symptom questions meet the American Rheumatism Association diagnostic criteria for rheumatoid and osteoarthritis. ${ }^{10}$ The battery includes a scale found in the self-administration booklet and is designed to measure the amount of joint pain the subject experienced. The battery was not included in the proxy questionnaire, but a global question on arthritis was added to part G in the questionnaire. The questions in part E of the subject questionnaire relating to the experience of pain or other symptoms were omitted from the boxed questionnaire.

Part F of the questionnaire concerns functional impairment. The battery consists of modified, selected items from the Fries Functional Disability Scale for arthritis, ${ }^{11}$ the RosowBreslau Scale, ${ }^{12}$ and the Katz Activities of Daily Living Scale. ${ }^{13}$ The questions are designed to measure the difficulty the subject has doing a set of everyday activities without the help of another person or mechanical aid. Information was also collected on whether or not help had been received and how this help affected the subject's ability to perform the activity. Thus, this information could be used to measure the impact of disease on functioning ability as well as the actual functioning level as affected by the receipt of help or use of aids. The items could thus be grouped in different ways to investigate different aspects of functional status. Part F was omitted from the proxy questionnaire and a shorter version was used for the subject telephone questionnaire.

Part G is a checklist designed to provide information on diseases and conditions not identified in other parts of the questionnaire. Conditions that were identified in the original NHANES I as having a high probability of being reported or conditions proposed for analysis were included in the list. Information was collected to determine if the subject was
diagnosed by a doctor as having the condition, the year of initial diagnosis, and whether or not the subject had been hospitalized since 1970 for that condition. Information was also gathered on any hospitalizations or stays in other health facilities that were not obtained previously. Questions on the subject's use of selected prescription medicines, aspirin, antacids, vitamins, minerals, and other nutritional supplements are also included in part G. The subject's social security number was also obtained in part $G$ of the subject questionnaire.

Part H of the NHEFS questionnaire contains the second portion of the Mental Status Questionnaire, described in the previous explanation of Part A. Part I includes the CES-D Depression Scale ${ }^{6}$ and selected items from the General Well Being Scale ${ }^{14}$ that correspond to the following variables: negative affect, positive affect, and health concern. Both scales are designed to be self-administered and, therefore, are included in the self-administration booklet. Social support questions are also included in this section.

Part J consists of questions regarding the bowel and bladder. This section is included in the self-administration booklet to reduce the possible sensitivity of this topic. The next section, part $K$, contains questions on changes in the subject's weight over a period of time.

Part L is designed to obtain a smoking history that identifies periods of smoking commencement and cessation, the average number of cigarettes smoked, the current amount smoked, and the use of cigars, pipes, snuff, and chewing tobacco. Because such smoking information was obtained only for subjects in the detailed NHANES I examination, these followup questions could be used to construct smoking status at baseline for the subjects who were not in the detailed sample.

Part M concerns consumption of alcoholic beverages. The questions are designed to obtain the subject's lifetime pattern of usual drinking. In addition, information was collected on binge drinking during the past year as well as the period of heaviest lifetime drinking.

Part N of the questionnaire contains an extensive battery of questions designed to identify aspects of the subject's usual diet. The section includes an expanded food frequency inventory covering the major food groups-meat, fish, poultry, grains, fruits, vegetables, dairy products, sweets, and snacks. The main criteria for inclusion of individual food items in this expanded food frequency was whether or not the food was high in fat, fiber, vitamin A, or vitamin C. The food frequency inventory also includes items on condiments, coffee, tea, soda, and alcohol. Questions on food preparation, use of prepared foods, special diets, frequency of meal eating and snacking, use of salt and eating problems are also included in this section. Part N was not a part of the proxy questionnaire or the subject telephone questionnaire.

In part O , information was gathered on sleeping problems and changes in sleep patterns. The questions were adapted from those used in the Stanford Sleep Study. ${ }^{15}$ These questions were not included in either the boxed or proxy questionnaires.

Part $P$ includes two scales designed to measure the traits
of extroversion and openness to experience. ${ }^{16}$ Measures of Type A personality are also included in this section. Part P was excluded from the boxed and proxy questionnaires.

Part Q contains a limited number of questions on physical activity. Physical activity items were taken from the second National Health and Nutrition Examination Survey, performed from 1976 through 1980. In addition, questions on jogging were added. Again, these items were excluded from both the boxed and proxy questionnaires.

Part R was used to identify the extent of tooth loss, the use of dental plates, and the use of fluoridated toothpaste. These items were repeated from the original NHANES I. The proxy questionnaire did not contain this section.

Part S includes questions to measure the subject's auditory abilities, and part T contains questions to measure visual abilities. The scales in both sections are repeated from NHANES I. Only selected questions from parts $S$ and $T$ were included in the boxed questionnaire.

Part U was provided to obtain background information on race; marital status; primary place of residence during the subject's lifetime; usual occupation; current activity; exposure to dust, fumes, or vapors when working or engaged in hobbies; sources of income; and maiden name for female subjects.

A final section, part $V$ of the proxy questionnaire, pertains only to deceased subjects and includes questions on the circumstances surrounding the subject's death. Items include information on whether the subject was confined to home or an institution prior to death, cause of death, who was present at the time of death, the experience of pain at death, and place of death.

## Interview nonresponse

Interviews with the participant or a proxy were completed for 85 percent of the original cohort or 91 percent ( 12,220 persons) of those successfully traced. Of the 1,697 proxy interviews, 1,206 were completed by telephone. In 131 cases, interviews with surviving NHANES I participants were conducted by telephone rather than in person. Telephone interviews were used if the respondent lived in a remote area or if the respondent was traced too late in the field period to conduct a personal interview.

Nonresponse rates for the interview by age, race, sex, and vital status are given in table F. Among traced, surviving participants, 7 percent were not interviewed, and proxy interviews could not be obtained for 16 percent of the deceased. The lower interview success rate for decedents compared with surviving NHANES I participants was apparent for all age-sexrace groups. This difference is attributed in part to the fact that many of the deceased were located from vital statistics files, and no proxy could be identified.

To summarize how demographic factors related to interview status, multiple logistic models were fitted to the crossclassification of age, race, and sex, with the proportion of subjects who did not complete the interview representing the dependent variable. Separate models were fitted for surviving and deceased persons. When nonsignificant terms were deleted from the saturated model (the smallest $P$ value for a deleted
term was 0.18 ), the final model for deceased persons included only a main effect for race ( $\mathrm{P}<0.001$ ). Nonresponse rates for the proxies of black decedents were substantially higher than those for whites (odds ratio of 2.40). The final model for surviving NHANES I participants included a main effect for age ( $\mathrm{P}=0.003$ ) and a marginally significant interaction between sex and race ( $\mathrm{P}=0.11$ ).

All other terms deleted from the model had $P$ values greater than 0.26 . Noninterview rates were lowest for those subjects $55-64$ years of age, but similar for all other age groups (odds ratios of 1.68 for those aged $25-34$ years, 1.46 for those aged 35-44 years, 1.47 for those aged $45-54$ years, and 1.63 for those aged $65-74$ years). Black men had the poorest interview completion rates, whereas the rates for the other race-sex groups were similar to each other. The odds ratios relative to white women were $1.08,1.52$, and 1.02 for white men, black men, and black women, respectively.

## Physical measurements

In part X of the questionnaire, at the end of the subject interview, the subject's pulse rate, three consecutive blood pressure readings, and a weight measurement were attempted. Measurements were obtained according to a specific protocol. Arm cuffs were available in child, adult, and large sizes and the interviewer selected the correct size. Blood pressure measurement procedures were adapted from Kirkendall ${ }^{17}$ and the Hypertension Detection and Follow-up Program. ${ }^{18}$

Physical measurements were not attempted for 131 subjects interviewed by telephone or for 161 subjects who were incapacitated and could not take part in the interview. (An additional 85 incapacitated subjects did not act as respondents to the interview but did participate in the physical measurement section.) Another 11 subjects ended the interview before the physical measurement section. Thus, physical measurements were not attempted for 303 of the 10,523 subjects who completed an interview. The percent of subjects not measured successfully for pulse, blood pressure, and weight are shown by race and age at the baseline in table $G$.

In addition to those 303 subjects without physical measurements, 75 subjects did not have their pulse measured. The measurement was not attempted on 65 of these subjects because of refusals ( 8 cases), medical contraindications ( 32 cases), or other reasons ( 25 cases). A valid measure was not obtained for the remaining 10 subjects.

Three blood pressure measurements were attempted for each subject interviewed. Failure to obtain a reading was considered an attempt and could not be repeated. Either the second or third of the three blood pressure measurements attempted had to be successful for the procedure to be considered complete. During the followup, blood pressure could not be measured for 264 subjects (in addition to the previously mentioned 303 subjects without measurements). The blood pressure procedure was not attempted on 184 of these subjects ( 15 refusals, 117 medical contraindications, and 52 for other reasons) and the procedure was attempted, but not completed successfully, for the remaining 80 subjects.

Therefore, 5.4 percent of the NHEFS subjects with a completed interview had no blood pressure measurements.

${ }^{1}$ Percents are based on subjects who were successfully traced.
${ }_{3}^{2}$ See appendix VII for a discussion of revised race, corrected sex, and recalculated age. ${ }^{3}$ Includes races other than white or black.

Although no significant interactions occurred that involved age, race, or sex, the failure rate was associated with all of these variables. The odds ratios for no blood pressure measurement relative to those under 55 years of age were 1.66 for those aged 55-64 years and 3.32 for those 65 years of age and over. Women were 20 percent more likely than men to have no blood pressure measurement available, and black persons were 46 percent more likely than white persons to be without this measurement.

A total of 214 subjects did not have their weight measured, in addition to the 303 subjects noted previously. Weight was not measured in 203 cases as a result of 34 refusals, 134 medical contraindications, and 35 cases in which other reasons were noted. Measures were determined invalid in 11 other instances. Although the failure rate for weight was slightly higher than for pulse ( 4.9 percent compared with 3.6 percent), the patterns were similar. There was a significant age-sex interaction ( $\mathrm{P}=0.025$ ) as well as a significant race effect

${ }^{1}$ See appendix VII for a discussion of revised race, corrected sex, and recalculated age.
Percents are based on the total number of traced, living subjects with a completed subject interview. This includes 131 cases who were interviewed by telephone and on whom no measurements were attempted.
${ }^{3}$ Completed blood pressure measurement is defined as the successful completion of either the second or the third attempt to get a reading.
${ }^{\text {a }}$ Completed weight measurement is defined as a successful measurement taken on either of two attempts.
includes races other than white or black.
( $\mathrm{P}<0.001$ ). As compared with women under 65 years of age, the odds ratios were 1.21 for men under 65 years of age, 4.70 for women 65 years of age and over, and 3.04 for men 65 years of age and over. Black subjects were 48 percent more likely than white subjects to have no weight measurement.

## Health facilities and death certificate data collection

For the NHEFS, attempts were made to obtain a complete history of overnight stays in health care facilities (hospitals and nursing homes) and to collect death certificates for all subjects who were deceased. This information can be used to provide two crucial endpoints for epidemiologic study: a clinical measure of morbidity based on hospital discharge diagnosis and cause-specific mortality coded from the death certificate.

## Health facilities record collection

Parts D, E, and G of the subject, boxed, and proxy questionnaires all contain items to determine whether or not the subject had an overnight stay in a health care facility after 1970. If a stay was reported, information on the name and address of the facility, the date of the stay, and the reason for the stay was recorded on a special chart on the back cover of the self-administration booklet.

The hospital and nursing home survey portion of NHEFS was conducted from April 1983 through August 1984. As field interviewing in a region neared completion, all area hospitals and nursing homes in which stays were reported by study subjects were sent a medical records survey packet.

Consequently, eight hospital and nursing home survey mailings were necessary: two in both the Northeast and the South, one in both the Midwest and the West, and two for the U.S. Sweep. The first U.S. Sweep mailing included previously unidentified hospital stays that were reported by hospitals on the returned abstract forms. The second mailout included hospital or nursing home stays that subjects reported during the U.S. Sweep data collection.

As mentioned previously, information on hospital stays was elicited for the period from 1970 to the time of followup. Interviewers recorded the full name of the hospital, the hospital address, and the approximate dates of hospitalization. (Because respondents may not have remembered exact dates, the request to the hospital did not include the dates of hospitalization, but asked for all admissions from January 1 of the year of the NHANES I examination.) At the conclusion of the interview, respondents were asked to sign a Medical Authorization Form that would be used to request hospitals to release hospital record information to the study. These forms were retained on file and a photocopy was made for each hospital that the respondent had identified during the interview.

A list of all subjects who used a particular hospital was aggregated in each region. The hospitals and nursing homes in which study subjects reported stays were then contacted
and asked to provide information from their records on all subjects for all stays occurring from January 1 of the year of the NHANES I exam until the date of the followup interview. At the same time, a letter was mailed to the hospital administrator advising that information was being requested from the hospital's medical records department. A similar letter was sent to each nursing home identified during the interview. Abstract forms were mailed to the nursing home administrators requesting information on the dates and reasons for admission for each nursing home stay.

Some hospitals did not have the staff to answer these requests. In those cases an abstractor, usually someone at the hospital, was hired to collect the data. In only two cases did the NCHS contractor have to provide an abstractor to collect the data.

Limited data were requested on the hospital and nursing home abstract forms. The major data items requested were the dates of admission and discharge and the diagnoses. Additionally, a photocopy of the "face sheet" and "discharge summary" was requested for each hospital episode occurring in the relevant time period. For myocardial infarction diagnoses 410 codes in the International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM), ${ }^{19}$ a photocopy of the third day electrocardiogram was requested. For an admission where a malignancy was diagnosed, a photocopy of the pathology report was requested. All medical records were recoded by trained medical coders using ICD-9-CM.

Seventeen thousand, six hundred ninety-five hospital records and 433 nursing home records were received for 6,477 subjects. Table $H$ shows the results of the facility record collection. Among males, both the proportion of respondents with at least one facility report and the average number of facility reports received per person increased with age. Among females, the pattern of association is $J$-shaped because the age group under 35 years has a high hospitalization rate, primarily attributed to childbearing. These patterns correspond with those expected, based on national hospital discharge rates. ${ }^{20}$

Although these patterns are encouraging there are several indications that the hospital file is not complete. First, 190 of the 2,557 hospitals and 59 of the 409 nursing homes contacted for records refused to participate. Second, because several hospitals had closed and no information about the disposition of their records was obtained, these facilities could not be contacted. Third, some facilities did not return records either because the records were inaccessible or because the search for records was unsuccessful. Finally, authorization

${ }^{1}$ See appendix VII for a discussion of revised race, corrected sex, and recalculated age.
${ }^{2}$ Includes races other than white or black.
forms were not obtained for 3 percent of surviving participants and 13 percent of decedents.

It is difficult to measure precisely the extent to which the NHEFS facility record file is complete. To do so requires that reported stays and facility records be matched based on admission date and reason for stay. The accuracy of such a search depends on the respondent's ability to recall these events for the average followup period of 10 years. As this
kind of recall can be prone to error, this kind of match was not attempted.

It is possible, however, to identify one group of missing records. No hospital records were obtained for 1,825 surviving and deceased subjects who reported at least one hospitalization. In 48 percent of these cases, the hospital refused to supply the information, or was not contacted for other reasons. In another 9 percent of these cases, respondents refused to sign
the authorization forms. In the remaining cases, the hospitals were unable to locate the records. This latter failure may be a result of respondent's reporting errors. The name of the facility, for example, could have been misreported; or the date of a hospitalization might have been reported as occurring after the NHANES I examination when in fact it occurred prior to it. Therefore, the stay would have been excluded from consideration. A more extensive analysis is currently under way to evaluate the completeness of the record collection.

## Death certificate collection

Deaths identified by the National Death Index (NDI) or other tracing methods were verified by obtaining the death certificate from the State of death. These death certificates were coded by NCHS using the Ninth Revision of the International Classification of Diseases multiple cause-of-death codes.

Through inquiries, tracers were able to identify 2,022 deaths in the cohort. An NHANES I participant was considered deceased only if a death certificate was received or a proxy interview was completed to verify the death. Death certificates were obtained for almost 96 percent $(1,935)$ of all decedents by the end of the initial followup. Currently, efforts are being continued to locate the missing death records.

Both a death certificate and a proxy interview were available for 1,610 ( 80 percent) of the 2,022 decedents. A proxy interview only was available for 87 decedents ( 4 percent) and a death certificate only was available for the remaining 325 decedents ( 16 percent).

The percent by age, sex, and race for whom death certificates were not available are presented in table J. Death certificates were obtained for a high percent of decedents in most age and race groups (from 85.7 percent to 100 percent among cells with more than 10 deaths). The difference in age among the percent of decedents for whom no death certificate was obtained was slight. However, black decedents were 77 percent more likely than white decedents and females were 66 percent more likely than males to have no death certificate available.

## Ongoing activities

In addition to the analyses and data cleanup currently in progress for this study, public use data tapes are being produced. Four data tapes containing vital status, interview, health care facility, and mortality data from NHEFS will be available from the National Technical Information Service (NTIS) in 1988. These data tapes must be combined with the tape from the NHANES I survey (also available from NTIS) in order to investigate the effects of baseline measures on subsequent health status. The study identification number can be used to link the Epidemiologic Followup Study files to all NHANES I files.

Additional information will be available in future years. Periodically, the survivors of this cohort will be reinterviewed and additional data on functional status and morbidity will be ascertained. Searches using the National Death Index will add death certificate information to the data set.

Table J. Number of deaths among NHANES I Epidemiologic Followup Study cohort members and percent of decedents without an available death certificate, by race, sex, and age at baseline examination

| Race, sex, and age ${ }^{1}$ | Number of deaths | Percent without a death certificate |

## Appendixes

## Contents

1. Content of NHANES I for subjects 25-74 years of age, 1971-75 ..... 22
II. Data items available from NHANES I subjects 25-74 years of age ..... 23
III. Serological, urological, and blood chemical tests conducted on selected NHANES I sample subjects, 1971-75 ..... 47
IV. NHANES I Epidemiologic Followup Study Schedule ..... 49
V. Sample locations by region of data collection ..... 50
VI. Study materials ..... 51
VII. Corrections and revisions to the NHANES I baseline data ..... 142

## Appendix I <br> Content of NHANES I for subjects 25-74 years of age, 1971-75

Additional for all sample persons in the detailed component

## Household Questionnaire

Food Programs Questionnaire ${ }^{1}$
General Medical History ${ }^{\top}$
Dietary Intake, 24-Hour Recall ${ }^{1}$
Dietary Intake, Food Frequency ${ }^{1}$
General Medical History Supplement
Supplement A, Arthritis; Supplement B, Respiratory; Supplement C, Cardiovascular. (Supplements A, B, and C depend on certain positive responses in other history questionnaires.)
Health Care Needs Questionnaire
General Well-Being Questionnaire
Depression Scale ${ }^{2}$
Water Usage Supplement ${ }^{2}$
1975 NHIS Questionnaire items on hearing, visuial acuity, reading, and hypertension ${ }^{2}$

## Examination procedures and measurements

General medical examination
Dental examination ${ }^{3}$
Dermatological examination ${ }^{\top}$
Ophthalmic examination
Anthropometric measurements
Laboratory determinations:

| Hemoglobin | Serum iron |
| :--- | :--- |
| Hematocrit | Iron binding capacity |
| Red cell count | Serum folates |
| White cell count | Cholesterol |
| Sedimentation rate | Glucose qualitative (urine) |
| MCV | Albumin qualitative |
| MCH | (urine) |
| MCHC | Occult blood qualitative |
| Vitamin A | (urine) |
| Vitamin C | Creatinine (urine) |
| Magnesium | Thiamine (urine) |
| Total protein | Riboflavin (urine) |
| Albumin | lodine (urine) |

Extended medical examination
$X$ rays of chest and major joints (hand-wrist, knee, hip)
Audiometry (air and bone)
Electrocardiography
Goniometry
Spirometry
Pulmonary diffusion
Tuberculin test ${ }^{3}$
Speech test ${ }^{2}$
Vision test ${ }^{2}$
Laboratory determinations:

| Bilirubin | Phosphorus |
| :--- | :--- |
| SGOT | W.B.C. differential count |
| Alkaline phosphatase | Serological tests for |
| Uric acid | amebiasis, measles, |
| Calcium | tetanus, diphtheria, |
| Thyroid (T-3, T-4) | rubella, polio |
| Serology for syphilis $^{2}$ | Blood urea nitrogen ${ }^{2}$ |

## Appendix II <br> Data items available from <br> NHANES I subjects 25-74 years of age

Detailed information is available on all of the data items collected in the baseline NHANES I examination. The complete list of information is organized according to four areas: (1) by source type, which refers to the method used to obtain the particular data item- $\mathrm{P}=$ physical exam, $\mathrm{H}=$ history, $\mathrm{L}=$ laboratory, $\mathrm{T}=$ test, $\mathrm{R}=$ record, and $\mathrm{O}=$ other; (2) by survey year, referring to the years during the $1971-75$ period in which that information was collected; (3) by "contents of this data field," which refers to a brief description of the specific data item; and (4) by data category, which refers to the general category of information. Provided below is a list of the data categories used, followed by the complete listing of all four types of NHANES I data items. Both listings are in alphabetical order according to data category.

## Data categories

| Abdomen | Ears | Mouth |
| :--- | :--- | :--- |
| Allergy | Endocrine | Musculoskeletal |
| Back | Extremities | Nasal |
| Behavior | Eyes | Neck |
| Body measurement | Gastroenterology | Neoplasm |

# Appendix III <br> Serological, urological, and blood chemical tests conducted on selected NHANES I sample subjects, 1971-75 

## Appendix III

## Serological, urological, and blood chemical tests conducted on selected NHANES I sample subjects, 1971-75-Con.

${ }^{1}$ Hemoglobin phenotyping was performed as a special study during NHANES I on 12,282 sample subjects, sample locations $37-100$. These subjects do not represent a scientific subsample of the NHANES I sample.

## Appendix IV <br> NHANES I Epidemiologic <br> Followup Study Schedule

Planning for NHEFS began in February 1979. As a result, a feasibility study was conducted from January 1980 through February 1980. OMB granted clearance for the study on February 12,1982 . The actual training schedule for the initial followup study is presented below.

## Training schedule for the followup

Type of training and region
Time of training

During the next several years, a very important followup study will be conducted with approximately 14,000 persons who took part in the first National Health and Nutrition Examination Survey (NHANES I) in the early 1970's.

## WHAT IS THE NHANES I EPIDEMIOLOGIC FOLLOWUP SURVEY?

The NHANES I Epidemiologic Followup Survey is a nationwide survey being conducted by the National Center for Health Statistics, a part of the U.S. Public Health Service, with the assistance of Westat, a national survey organization. The survey is being funded by the National Institute on Aging and other Institutes of the liatic. ai Institutes of Health.

We are interviewing persons who took part in the NHANES I survey to ask about their health status and hospital care since the earlier survey. If the original partizipant cannot be interviewed because of illness or death, we will be talking to relatives or close friends who know about the participant's health status since the earlier survey.

The interview will be conducted in person by specially trained interviewers who will ask questions about illnesses, dietary habits, and activities that might be related to health, such as work, smoking, and exercise.

The interviewer who calls on you will be a Westat employee representing the National Center for Health Statistics. When our interviewer arrives, be sure he or she presents a Westat identification card.

There will be no physical examination associated with the followup interview. However, blood pressure and weight will be measured.

## WHY SHOULD I PARTICIPATE?

The persons who took part in the first survey made up a group that represented all types of people in all areas of the United States. This is the first nationwide survey that will provide information on changes in health over time for people from all different backgrounds and regions. Each participant represents thousands of others with similar characteristics. Although participation in this survey is voluntary, it is important that you participate so that the results will represent a true scientific sample of the U.S. population.

All the information you give will be protected by the confidentiality requirements of the U.S. Public Health Service Act (42 USC 242m) and the Privacy Act of 1974 (5 USC 552a). Your answers will be used only by research staff working on the survey. Each of them must sign a statement pledging to keep confidential all information provided by respondents. No information that would permit the identification of any individual will be released or published. Survey results will be published only as statistical summaries. Your responses to the survey are entirely voluntary. There are no penalties for refusing to answer any questions.

## WHAT WILL BE DONE WITH THE INFORMATION?

The data from the NHANES I Epidemiologic Followup Survey, combined with the data from the earlier survey, will show how the health of the U.S. population changes over a period of time. In addition, the data will help to identify some of the factors that contribute to good health as well as illness. Health planners and medical experts will translate these findings into ways to improve the prevention and treatment of disease and delivery of health care.

## HOW CAN I HELP?

By voluntarily participating in the survey, you are helping us gather information in the best possible way. Your cooperation is the key to the success of this followup survey.

Any queries or correspondence should be directed to the following address:

NHANES I Epidemiologic Followup Survey<br>1650 Research Boulevard<br>Rockville, Maryland 20850<br>(301) 251-1500

## Dear Participant:

As you may recall we have been in touch with you this past year concerning a national survey that the National Center for Health Statistics is conducting. You participated in the first National Health and Nutrition Examination Survey in 1971-1975. The results of that survey have provided much needed information about the health needs and characteristics of the American people. We would like to express our appreciation to you for your part in making that survey a success, and, as we have indicated to you, we would like to have your help again.

To further use the findings from the original survey, the National Center for Health Statistics is planning another interview of all the adults who took part in that study. We have contracted with Westat, a national research firm, to conduct the survey for us. Within the next two weeks a Westat interviewer will contact you to set a time to visit you for the interview. When the interviewer arrives, be sure to ask him or her to show you a Westat identification card.

The interview will include questions about your health status and any hospital care you may have had. In addition, your blood pressure will be taken and you will be weighed. There will be no other physical examinadion. You will also receive $\$ 10.00$ for your participation in the study.

This survey is authorized by Title 42, United States Code 242 k . Your participation in this survey is completely voluntary. There are no penalties for refusing to answer any question.

As in the previous survey, any information you give will be kept confidential. No information that could be used to identify you or any individual will be released or published. Results of this study will be published only as statistical summaries.

Your participation is vital to the success of this survey, and your cooperation will be appreciated greatly.

Sincerely yours,

Robert A. Israel Acting Director

## PHYSICAL MEASUREMENT INTRODUCTION

I mentioned earlier that I would be measuring your pulse, blond pressure, and weight as a part of the interview. I would like to start the procedure now. As part of this procedure; you need to remain relaxed and seated for about fifteen (15) minutes. During this time, we will finish the question-
naire. If there are things you need to do before we start, such as going to naire. If there are things you need to do before we start, such as going to
the bathroom, I would like you to do that now. I would also suggest that the bathroom, I would like you to do that now. It would also suggest that should the phone or dight? [IF NECESSARY, ASK $\leq$ TO MOVE TO A SUITABLE LOCATION TO TAKE THE blood pressure reading.]

Various factors such as smoking, drinking alcohol and drinking coffee can affect your pulse and blood pressure. Therefore, I would like to request hat you do not smoke or drink corfee (or alcohol) dast 24 hours? [RECORD ON PMR.]

Now, I would like to explain what I am going to do. First, I will find the pulse in your right arm. Next, I will wrap the blood pressure cuff around your arm. At this point, we will finish the questionnaire. At the end of the interview, I will take your pulse and then inflate the cuff. You will be inf sensation of pressure on the a blood pressure, I would like to avoid any conversation. I will be happy to answer your questions before or after measurements are taken.

Is there any medical reason you know of why this procedure should not be done?
If yes, record on pmr and discontinue procedure and continue with the QUESTIONNAIRE.

OTHERWISE, ASK S TO REMOVE ANY OUTER CLOTHING/JEWELRY AND TO ROLL UP SLEEVE. OBSERVE SUBJECT'S ARM FOR CONDITIONS PREVENTING MEASUREMENT. IF CONDITIONS ARE PRESENT, RECORD ON PMR AND DISCONTINUE PROCEDURE.]

Have you had any needles or tubes in any veins in your arms in the last week? [IF YES, RECORD ON PMR AND DISCONIINUE IF BOTH ARMS ARE AFFECTED.] Then I will go ahead and lacate your pulse and place the cuff now. [PLACE CUFF.]

PART Q: PHYSICAL ACTIVITY
INTERVIEHER: $\quad$ BOX $N$

$\qquad$

## Pulse \& Blood Pressure Preparation

1. Read the Physical Measurements Introduction. Ask subject if has any
probleas that would inhibit the reading.
2. Position the subject.
3. Locate radial and brachial pulse.
4. Select and place the cuff.
5. Continue interview for fifteen minutes.

## Puise \& Blood Pressure Measurement

6. Obtain resting pulse and record.
7. Obtain MIL, deflate rapidly, disconnect the manometer tubing and record.
8. Wait thirty seconds.
. Place stethoscope in ears, ear pieces turned forward, and diaphragn over Infl rapay
9. Deflate 2 mm Hg per second, eyes level with midpoint of the manometer column. Read the point on the manomeser when the first sound is heard (systol ic) and
sound disappears (diastolic).
10. Continue deflation to 10 mm Hg below last sound.
11. Deflate rapidly to zero.
12. Remove stethoscope from ears.
13. Disconnect manometer tubing.
14. Record readings on PMR.
15. Kait thirty seconds
16. Repeat steps $9-17$ for two more readings.

Height

1. Place scale on hard surfaced floor and adjust to zero if necessary.
2. Stand to one side of scale looking directly domm onto face of scale.
3. Record meight on PHR.

Reporting to Subject

1. Record readings and identifying information on the Report of Physical Heasurement Finding and, using the Blood Pressure Value box, determina which statement to read to the subject.
2. Ask subject to sign form and give the top copy to the subject to keep.

| I-17. I had crying spells . . . | 0 | 1 | 2 | 3 |
| I-18. I felt sad. : . . . . . | 0 | 1 | 2 | 3 |
| I-19. I felt that people disliked me . . . . . . . | 0 | 1 | 2 | 3 |
| I-20. I could not get "going" . | 0 | 1 | 2 | 3 |

[G0 to next page

INSTRUCIIONS: Please circle one number for each question I-21 through I-39 which best answers or describes your feelings -- DURING THE PAST MONTH.

| I-21.How have you been feeling in <br> general, during the past <br> month? | 1 In excellent spirits <br> 2 In very good spirits <br> 3 In good spirits mostly <br> 4 I have been up and down in <br> spirits a lot  |
| :--- | :--- | :--- |
|  | 5 In low spirits mostly |
| 6 | In very low spirits |

INSTRUCTIONS: For questions I-27 through I-30 please circle the number which best indicates your feelings -- DURING THE PASI MONTH.

I-27. Haw concerned or worried about your HEALTH have you been, during the past month?

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Not <br> concerned <br> at all |  |  |  |  |  |  |  |  |  | Very <br> concerned |

I-28. How RELAXED or TENSE have you been, during the past month?

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  |  |
| Very |  |  |  |  |  |  |  |  |  |  |
| relaxed |  |  |  |  |  |  |  |  |  |  |

I-29. How much ENERGY, PEP, VITALITY have you felt, during the past month?

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| No energy <br> at all, <br> listless |  |  |  |  |  |  | Very <br> energetic <br> dynamic |  |  |

1-30. How DEPRESSED or CHEERFUL have you been, during the past month?

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Very <br> depressed |  |  |  |  |  |  |  |  |  | Very <br> cheerful |

INSIRUCIIONS: Please circle the number that is next to the answer that best describes your situation.

1-31. In general, about how many relatives and friends do you have that you feel close to? These are people with mhom you feel at ease, can talk to about private matters, and can call on for help.
None
One person
Two people
Three or four people
Five to nine people
Ten to nineteen people
Twenty or more people

INSTRUCIIONS: These next questions are about bowel and bladder habits For each question, please circle the number next to the answer that best describes your situation.

|  | Do you have trouble with your bowels which makes you constipated or gives you diarchea? | 1 I get constipated <br> 2 I get diarrhea <br> 3 I do not have trouble with my bowels |
| :---: | :---: | :---: |
| J-2. | How often do you usually have a bowel movement? | 1 Once a week or less often <br> 2 Two or three times a week <br> 3 Four to six times a week <br> 4 Once a day <br> 5 Iwo or three times a day <br> 6 Four or more times a day |
|  | Which of the following best describes your usual bowel movement; is it normal, loose or watery, or hard or very firm? | 1 Normal <br> 2 Loose or watery <br> 3 Hard or firm |
| J-4. | During the past few months, how often have you lost control over your bowels or had an accident; often, occasionally, or never? | 1 often <br> 2 Dccasionally <br> 3 Never |
| J-5. | How often do you use a laxative or stool softener? | 1 Every day <br> 2 Every other day <br> 3 Once or twice a week <br> 4 Once or twice a month <br> 5 Less than once a month <br> 6 Never |
| J-6. | During the past few months, how often have you lost control over your urine; often, occasionally, or never? | 1 Often <br> 2 Occasionally <br> 3 Never |
| J-7. | How often do you dribble, leak, or lose urine when you laugh, strain, or cough; often, occasionally or never? | ```1 Often 2 Occasionally 3 Never (STOP. RETURN BOOKLET TO INTERVIEWER.)``` |
| J-8. | Do you dribble or leak urine only when you laugh, strain, or cough? | 1 Yes <br> 2 No, I dribble or leak urine at other times |

## REPORT OF PHYSICAL MEASUREMENT FINDINGS

Resting pulse rate: $\qquad$ per minute

Weight: $\qquad$ pounds Blood pressure: $\qquad$Average of two measurements. Single measurement. Elevated systolic blood pressure by palpation of radial pulse only.
Read the statement circled below:
(1) Your blood pressure today is within the normal* range.
(2) Your blood pressure today is somewhat above normal.* We suggest you see your doctor within the next three months to have your blood pressure rechecked. Present this form to your doctor.
(3) Your blood pressure today is above normal.* We suggest you see your doctor within the next 30 days to have your blood pressure rechecked. Present this form to your doctor.
(4) Your blood pressure today is high.* YOU SHOULD SEE YOUR DOCTOR WITHIN THE NEXT FEW DAYS TO HAVE YOUR BLOOD PRESSURE RECHECKED. Present this form to your doctor.
(5) Your blood pressure today is quite high.* YOU SHOULD SEE YOUR DOCTOR OR CLINIC TODAY, OR GO TO A HOSPITAL EMERGENCY RODM TO HAVE YOUR BLOOD PRESSURE RECHECKED. Present this form to your doctor.

* According to the Joint National Committee on Detection, Evaluation and Treatment of High Blood Pressure.

Your pulse, blood pressure and weight were measured by a trained lay interviewer. These measurements were obtained as part of a survey and do not represent a medical diagnosis. Interpretation of these measurements must be made by a physician.

Should your physician/medical care organization wish to contact Westat they should be directed to:

## AUTHORIZATION TO OBTAIN INFORMATION FROM MEDICAL RECORDS

In connection with the health history of given as part of the National Health and Nutrition Examination Followup Survey, it may be necessary to obtain additional information from records and staff of hospitals or other inpatient health facilities. I hereby authorize the release of such information as the U.S. Public Health Service may need to request from any of these sources.

I understand that all information obtained will be held strictly confidential and will be used for statistical purposes only.

Hospital and inpatient health facility records could also be listed under the following names: $\qquad$

OR
Check box $\square$ if records would not be listed under any other name.
In case of death or disability:

## Dear Participant:

As you may recall we have been in touch with you this past year concerning a national survey that the National Center for Health Statistics is conducting. participated in the first National Health and Nutrition Examination Survey in 1971-1975. The results of that survey have provided much needed information about the health needs and characteristics of the American people. To further use this information, the National Center for Health Statistics is following up all the adults who took part in that study.

You will remember from our first contact that we asked if you could supply health and hospital care information for this person. You will receive $\$ 10.00$ for your participation in the study.

We have contracted with Westat, a national research organization, to conduct the interviews for us. Within the next two weeks a Hestat interviewer will contact you to set up a time to visit you for the interview. When the interviewer arrives, be sure to ask him or her to show you a Westat identification card.

This survey is authorized by Title 42, United States Code 242 k . Your participation in this survey is completely voluntary. There are no penalties for refusing to answer any question.

As in the previous survey, any information you give will be kept confidential. No information that could be used to identify you or any other individual will be released or published. Results of this study will be published only as statistical summaries.

Your participation is vital to the success of this survey, and your cooperation will be appreciated greatly.

Sincerely yours,

Robert A. Israel
Acting Director

| C-11. Altogether for about how many years did she take birth control pills? | C-11 | YEARS: $\qquad$ 1 $\qquad$ I <br> OR <br> MONTHS: $\qquad$ 1 $\qquad$ <br> DK. . . . . . . . . . . 98 |

PART D. HEALTH/DISEASES AND OPERATIONS
The questions I'm going to ask you now concern (SUBJECT'S) health as well as diseases and operations (he/she) may have had.

Begin DI

| D-1. (IF R IS NOT RELATIVE, ASK:) Do you think you can answer questions about (his/her) medical history? | D-1 | YES . . . . . . . . . . NO. . . . . . . . . . . 2 (Q.G-30) DK. . . . . . . . . . . |
| :---: | :---: | :---: |
| D-2. Did a doctor ever say that (he/she) had hypertension or high blood pressure? | D-2 | YES . . . . . . . . . . 1 NO. . . . . . . . . . . 2 (Q.D-6a) DK. . . . . . . . . . . 8 (Q.D-6a) |
| D-3. In what year was (he/she) first told that (he/she) had this condition? | D-3 | $\begin{aligned} & \text { YEAR: } 11\|9\| 1\|1\|(Q . D-5) \\ & \text { DK. . . } \end{aligned}$ |
| D-4. Can you tell me if it was less than a year before (his/her) death, between 1 and 5 years, between 5 and 10 years, or 10 or more years? | D-4 | ```LESS THAN ONE YEAR. . . 1 1 BUT LESS THAN 5 YEARS . . . . . . . 2 5 BUT LESS THAN 10 Years. . . . . . . } 10 OR MORE. . . . . . . } DK. . . . . . . . . . . 8``` |
| D-5. Since 1970, was (SUBJECT) hospitalized overnight for problems related to (his/ her) hypertension or high blood pressure? | D-5 | YES . . . . . . . . . . 1 (CHART) NO. . . . . . . . . . . 2 DK. . . . . . . . . . . 8 |

INTERVIEWER INSTRUCTIONS: READ COLUMN a TO R. IF THE ANSHER TO COLUMN a IS "YES," ASK COLUMN b FOR THE CONNDITION. IF "ND,"
ASK COLUMN a FOR THE NEXT CONDITION.

| D-10. Did a doctor ever say that (SUBJECT) had gall bladder disease? | D-10 | YES . . . . . . . . . . 1 NO. . . . . . . . . . . 2 (BOX B) DK. . . . . . . . . . . 8 (BOX B) |
| :---: | :---: | :---: |
| D-11. In what year was this condition first diagnosed? | D-11 | $\begin{aligned} & \text { YR: } 1191.1 \\ & \text { DK. . . } 9998 \end{aligned}$ |
| D-12. Did (he/she) have surgery or a surgical procedure for this condition? | 0-12 | YES . . . . . . . . . . 1 NO. . . . . . . . . . . 2 (Q.0-14) DK. . . . . . . . . . . 8 (Q.D-14) |
| D-13. In what year did (he/she) first have surgery for this condition? | D-13 |  |
| D-14. Since 1970, was (SUBJECT) hospitalized overnight for this condition? | D-14 | $\begin{aligned} & \text { YES . . . . . . . . . . } 1 \text { (CHART) } \\ & \text { NO. . . . . . . . . . . } 2 \\ & \text { DK. . . . . . . . . . . } 8 \end{aligned}$ |

## BOX C

INTERVIEWER: CIRCLE ONE:
S WAS FEMALE. . . . . . . . . . . . 1 (Q.D-15)
s WAS MALE. . . . . . . . . . . . . . 2 (Q.D-19)

| D-15. Did a doctor ever say that (SUBJECI) had a lump or cyst in her breast? | D-15 | YES . . . . . . . . . . 1 NO. . . . . . . . . . . 2 (Q.D-18) DK. . . . . . . . . . . 8 (Q.D-18) |
| :---: | :---: | :---: |
| D-16. Did a doctor ever say that a lump or cyst in her breast was cancerous or malignant? | D-16 | YES . . . . . . . . . . NG. . . . . . . . . . . DK. . . . . . . . . . . |
| D-17. Did she have one or both of her breasts removed? | D-17 | yes, one breast . . . . 1 <br> yes, Both breasts . . . 2 <br> NEITHER . . . . . . . . 3 <br> DK. . . . . . . . . . . 8 |
| $\mathrm{D}-18$. Since 1970 , was she ever hospitalized overnight for any type of breast condition, female problems, or a pregnancy? | D-18 | YES . . . . . . . . . . 1 (CHART) NO. . . . . . . . . . . 2 DK. . . . . . . . . . . 8 |
| D-19. Did a doctor ever say that (SUBJECT) had any cancer (other than the cancer we talked about)? (DON'T include skin cancer UNLESS MELANDMA.) | D-19 | YES . . . . . . . . . . 1 NO. . . . . . . . . . . 2 (PART G) DK. . . . . . . . . . . 8 (PART G) |

Now I'm going to read a list of medical conditions that (SUBJECT) may have had.

INTERVIEWER INSTRUCTIONS: READ G-1a THROUGH G-29a FIRST. If RESPONSE = YES (1), ASK b AND e.

## ID NUMBER

# Hospital and Nursing Home Data Collection 

Dear Administrator:
I am writing to inform you of a request which has been made to your Medical Records department. A new research study is being carried out by the National Center for Health Statistics (NCHS), the National Institute on Aging, and other components of the National Institutes of Health.

A selected sample of the United States population volunteered to participate in the first National Health and Nutrition Examination Survey which NCHS conducted from 1971-1975. We have recently reinterviewed these participants to provide new information about the etiology of chronic disease. A crucial component of the study is a very limited hospital record data collection to augment information obtained from these participants. Participants who have been hospitalized have signed authorization forms to permit the release of diagnostic information from their hospital record.

NCHS has contracted with Westat, a national survey organization, to conduct the data collection operations of this survey. Westat has, therefore, sent a packet to your Director of Medical Records on behalf of the patients in the study. This survey is authorized by Title 42, United States Code 242k. Participation in this survey is completely voluntary. There are no penalties for refusing to answer any question.

The American Hospital Association has endorsed this study and urges your cooperation. Dr. Ross Mullner of the Association may be reached at (312) 280-6519 if you have any questions concerning this endorsement. If you have any questions concerning the data collection, don't hesitate to call Kathleen Parks at (301) 251-1500, ext. 8603.
Sincerely yours,

- Director

## Director of Medical Records:

A new research study is being carried out by the National Center for Heal th Statistics (NCHS), National Institute on Aging and other components of the National Institutes of Health.

A selected sample of the United States population volunteered to participate in the first National Heal th and Nutrition Examination Survey which NCHS conducted from 1971-1975. We have recently reinterviewed these participants to provide new information about the etiology of chronic disease. A crucial component of the study is a very limited hospital record data collection to augment information obtained from these participants. Enclosed are signed authorization forms specifically permitting us to obtain diagnostic data from their medical record.

This survey is authorized by Title 42, United States Code 242k. Participation in this survey is completely voluntary. There are no penalties for refusing to answer any question. NCHS has contracted with Westat, a national survey organization, to conduct the data collection operations of this survey. All information obtained will be held strictly confidential and will be used for statistical purposes only. No information that could be used to identify the participants or your hospital will be released or published. Results of this study will be published only as statistical summaries.

The American Hospital Association (AHA) has endorsed this study and urges your cooperation. Your hospital's participation is vital to the success of this study. If you have any questions concerning this project, please feel free to call Kathleen Parkes collect at (301) 251-1500, ext. 8603.

Sincerely yours,

Enclosure

NURSING HOME ADMINISTRATOR

## Dear Administrator:

I am writing to request your assistance in a new National Center for Health Statistics (NCHS) activity which is being supported by the National Institute on Aging and other components of the National Institutes of Health. We are conducting a followup study of the participants in the first National Health and Nutrition Examination Survey (NHANES I) to provide new information about the etiology of chronic disease.

A selected sample of the United States population volunteered to participate in the first National Health and Nutrition Examination Survey which NCHS conducted from 1971-1975. NCHS is now tracing and reinterviewing those 14,407 persons to study the relationship between physical measures (e.g., blood pressure or functional vital capacity), behavioral variables (e.g., smoking or dietary intake), and other risk factors identified in the NHANES I Survey and subsequent disease reported by the person at followup.

A crucial component of the study is a very 1 imited nursing home record data collection. Diagnostic information from the nursing home record will be used to verify and supplement each respondent's self-reported medical history. Each person or next of kin (in cases of death) has signed a form requesting the release of his/her nursing home care records to the survey researchers. (Copies of these authorizations are enclosed.)

This survey is authorized by Title 42, United States Code 242k. Participation in this survey is completely voluntary. There are no penalties for refusing to answer any question. NCHS has contracted with Westat, a national survey organization to conduct the data collection operations of this survey. All information obtained will be held strictly confidential and will be used for statistical purposes only. No information that could be used to identify the participants or your nursing home will be released or published. Results of this study will be published only as statistical summaries.

Your participation is vital to the success of this study. If you have any questions concerning this project, please feel free to call Kathleen Parkes collect at (301) 251-1500, ext. 8603.

Sincerely yours,

Manning Feinleib, M.D., Dr.P.H. Director

Admission Sheet

(Why not? )

# Appendix VII Corrections and revisions to the NHANES I baseline data 

Three demographic data items (date of birth, sex, and race) from the NHANES I baseline data tapes were corrected for a small number of subjects based on updated information received during the NHANES I Epidemiologic Followup Study. Consequently, the NHEFS Public Use Data Tapes will reflect the corrections noted in this section.

## Date of birth

Initially, the date of birth for each NHANES I respondent was recorded during the household interview and subsequently coded on the NHANES I data tapes. The household interview was usually conducted with one (or more) members of the household providing social and demographic information for all household members. The NHANES I sample was then drawn from these household listings. On arrival at the Mobile Examination Center (MEC), the subject was asked to supply his or her date of birth, which was entered on a record and later microfilmed. The date of birth on the MEC record was provided by the subject but was not coded on the NHANES I data tape. Thus, the original NHANES I date of birth is the one obtained during the household interview.

During the field work for the followup study, the MEC record (when availabie) was used to update the date of birth for all lost-to-followup respondents in the hope that it would improve tracing results. In addition, the MEC record was used to update the date of birth for decedents and incapacitated subjects who had been interviewed by proxy. Date of birth was also updated for all confirmed respondents who, during tracing, supplied a date of birth that differed from the date of birth provided at baseline. As a result, date of birth was corrected for a total of 677 subjects.

The age given at a baseline examination was then recalculated based on these corrected dates of birth. The recalculations of age at baseline examination resulted in 224 age changes of 1 year or more. For five respondents, recalculation resulted in ages outside the designated age range of $25-74$ years (two subjects were determined to be 24 years of age, one was

76, and two were 77). Nonetheless, these respondents will continue to be included in the cohort and are treated as 25 and 74 in cases where age is categorized. A cross-tabulation of the recalculated age at baseline examination by the original age at examination is presented below.

|  | Revised age at baseline examination |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Original age at | 25-34 | 35-44 | 45-54 | 55-64 | 65-74 |
| baseline examination | years | years | years | years | years |
| 25-34 years | 3,508 | 4 | 1 |  |  |

## Sex

One baseline sex code was changed from female to male. The original sex code was an error in the NHANES I Data Set.

## Race

A revised race variable was created to resolve discrepancies between the baseline interviewer-observed race and the followup respondent-reported race. These race codes are determined by a case-by-case adjudication of baseline and followup ethnicity responses and, in the case of deceased subjects, race as coded on the death certificate. Race was revised for 186 subjects. A cross-tabulation of revised race by the original baseline race variable follows.

|  | Revised race |  |  |
| :--- | ---: | ---: | ---: |
| Baseline race | White | Black | Other |
| White $\ldots \ldots \ldots$. | 11,998 | 25 | 30 |
| Black $\ldots \ldots \ldots$. | 11 | 2,174 | 10 |
| Other $\ldots \ldots \ldots$. | 27 |  | 132 |

SERIES 1. Programs and Collection Procedures-Reports describing the general programs of the National Center for Health Statistics and its offices and divisions and the data collection methods used. They also include definitions and other material necessary for understanding the data.
SERIES 2. Data Evaluation and Methods Research-Studies of new statistical methodology including experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. Studies also include comparison of U.S. methodology with those of other countries.

SERIES 3. Analytical and Epidemiological Studies-Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
SERIES 4. Documents and Committee Reports-Final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
SERIES 5. Comparative International Vital and Health Statistics Reports-Analytical and descriptive reports comparing U.S. vital and health statistics with those of other countries.

SERIES 10. Data From the National Health Interview Survey-Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, all based on data collected in the continuing national household interview survey.
SERIES 11. Data From the National Health Examination Survey and the National Health and Nutrition Examination SurveyData from direct examination, testing, and measurement of national samples of the civilian noninstitutionalized population provide the basis for (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.

SERIES 12. Data From the Institutionalized Population Surveys-Discontinued in 1975. Reports from these surveys are included in Series 13.
SERIES 13. Data on Health Resources Utilization-Statistics on the utilization of health manpower and facilities providing long-term care, ambulatory care, hospital care, and family planning services.

SERIES 14. Data on Health Resources: Manpower and FacilitiesStatistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities.
SERIES 15. Data From Special Surveys-Statistics on health and health-related topics collected in special surveys that are not a part of the continuing data systems of the National Center for Health Statistics.
SERIES 20. Data on Mortality-Various statistics on mortality other than as included in regular annual or monthly reports. Special analyses by cause of death, age, and other demographic variables; geographic and time series analyses; and statistics on characteristics of deaths not available from the vital records based on sample surveys of those records.

SERIES 21. Data on Natality, Marriage, and Divorce-Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports. Special analyses by demographic variables; geographic and time series analyses; studies of fertility; and statistics on characteristics of births not available from the vital records based on sample surveys of those records.
SERIES 22. Data From the National Mortality and Natality SurveysDiscontinued in 1975. Reports from these sample surveys based on vital records are included in Series 20 and 21 , respectively.
SERIES 23. Data From the National Survey of Family GrowthStatistics on fertility, family formation and dissolution, family planning, and related maternal and infant health topics derived from a periodic survey of a nationwide probability sample of ever-married women 15-44 years of age.
