# National Ambulatory Medical Care Survey: 2006 Summary 

by Donald K. Cherry, M.S.; Esther Hing, M.P.H.; David A. Woodwell, B.A.; and<br>Elizabeth A. Rechtsteiner, M.S., Division of Health Care Statistics

#### Abstract

Objectives-This report describes ambulatory care visits made to physician offices in the United States. Statistics are presented on selected characteristics of the physician's practice, the patient, and the visit.

Methods-The data presented in this report were collected in the 2006 National Ambulatory Medical Care Survey (NAMCS), a national probability sample survey of visits to nonfederal office-based physicians in the United States. Sample data are weighted to produce annual national estimates of physician visits.

Results-During 2006, an estimated 902 million visits were made to physician offices in the United States, an overall rate of 306.6 visits per 100 persons. In over one-quarter of office visits, electronic medical records were utilized by physicians, while at 85.5 percent of visits, claims were submitted electronically. Since 1996, the percentage of visits by adults 18 years and over with chronic diabetes increased $40 \%$, and during the same time period, visits increased for chronic hypertension ( $28 \%$ ), and depression $(27 \%)$. Among visits by females, a Pap test was ordered or provided more frequently than a human papilloma virus DNA test ( 5.6 versus 0.6 percent). Private insurance visits were more likely to include liquid-based Pap tests ( 6.3 percent) compared with visits using conventional or unspecified tests ( 3.7 percent), whereas visits utilizing Medicaid and other sources of payment were equally likely to provide conventional or unspecified, and liquid-based Pap tests. Medication therapy was reported at 636.7 million office visits, accounting for 70.6 percent of all office visits. In 2006, there were about 1.9 billion drugs mentioned, resulting in an overall 210.3 drug mentions per 100 visits. Visits to primary care physicians at community health centers were more likely to document health education compared with office-based practices, whereas diagnostic or screening services, drug mentions, and any nonmedication treatment occurred at approximately the same proportion of visits for primary care providers in both type of settings.

Keywords: ambulatory care • physician office care • diagnoses • injury • medications • ICD-9-CM primary care $\cdot$ chronic disease

## Introduction

The National Ambulatory Medical Care Survey (NAMCS), which began in 1973, was inaugurated to gather, analyze, and disseminate information about the health care provided by office-based physicians. Ambulatory medical care is the predominant method of providing health care services in the United States, and occurs in a wide range of settings.

Ambulatory medical care in physician offices is the largest and most widely used segment of the American health care system (1), and in 2004 consumed approximately 25 percent of health care spending (2). Physician offices comprised about four-fifths of all ambulatory medical care delivered in 2006, and physician consultation services included everything from primary care to highly specialized surgical and medical care. This report describes care delivered in the offices of nonfederally employed physicians. It includes visits not only to private practices but also to other settings, such as freestanding clinics-including urgent

## Acknowledgments

This report was prepared in the Division of Health Care Statistics. Sarah Gousen in the Technical Services Branch contributed to the description of the sampling procedure. This report was edited by Gail V. Johnson, CDC/CCHIS/NCHM/Division of Creative Services, WriterEditor Services Branch, typeset by Zung T. Le, CDC/CCHIS/NCHM/Division of Creative Services, and the figures were produced by Sarah Hinkle, CDC/CCHIS/NCHM/Division of Creative Services.

care centers, public health clinics, family planning clinics, mental health centers, community health centers, and faculty practice plans. Although NAMCS has always included physicians in community health centers (CHCs), starting in 2006 CHCs were purposefully selected in the NAMCS as a separate sampling stratum. Although physicians, nurse practitioners, nurse midwives, and physician assistants were sampled at CHCs, only visits to physicians were included in this report. NAMCS does not include visits to hospital emergency or outpatient departments; freestanding ambulatory surgery centers; Department of Veterans Affairs medical offices; or industrial, occupational, or institutional clinics. Many of the estimates in this report are provided separately by physician specialty, as recent research has demonstrated that certain physician practice characteristics, such as volume, ownership, revenue, and practice patterns, can be significantly influenced by physician specialty $(3,4)$. Visits to CHC physicians were grouped according to their self-designated specialties determined at induction.

NAMCS is part of the ambulatory component of the National Health Care Survey, a family of surveys that measures health care utilization across various types of providers. More information about the National Health Care Surveys can be found at the National Center for Health Statistics (NCHS) website: www.cdc.gov/nchs/namcs.htm.

As in 2005, the emphasis in the 2006 survey year was on chronic conditions. Routine encounter data that were added in 2005 continued to be collected in the 2006 survey year and included items related to chronic conditions, such as a condition checklist, patient enrollment in a specific chronic disease management program, specific measurements for height and weight (in order to calculate body mass index (BMI) for analyses on obesity), and new diagnostic and screening service items that parallel the chronic conditions listed. Other additions carried over from the 2005 survey year included information on gestational age, health
education and nonmedication treatment items, new or continued status for each medication, and the ability to check more than one expected source of payment. Of particular interest on the 2006 survey, was stage of cancer, along with the various types of cancer screening tests. New additions related to cancer included:

- Stage of cancer: in situ, local, regional, distant, unknown.
- Pap test: conventional, liquid-based, and unspecified.
- Human papilloma virus (HPV) DNA test.

Other reports have highlighted visits to hospital outpatient departments (OPDs) (5) and emergency departments (EDs) (6). Detailed reports on physicianlevel estimates in the United States (3); medication use at ambulatory care visits (7); training for terrorism-related conditions in hospitals (8); and staffing, capacity, and ambulance diversion in emergency departments have also been published (9).

Additional information about physician office utilization is available from the NCHS Ambulatory Health Care website:
www.cdc.gov/nchs/namcs.htm.
Individual-year reports and publicuse data files are available for download from the website. Data from the 2006 NAMCS will also be available on CD-ROM. These and other products can be obtained from the NCHS Office of Information Services, Information Dissemination Staff at 1-800-232-4636 or the Ambulatory Care Statistics Branch at 301-458-4600 or by e-mail at CDCINFO@CDC.GOV.

## Highlights

## Physician office utilization

- In 2006 an estimated 902 million visits were made to office-based physicians, an average of about 306.6 visits for every 100 persons (Table 1).
- Less than a quarter of all visits were to general and family practice physicians. In excess of a third of combined visits were to physicians specializing in internal medicine, pediatrics, or obstetrics and gynecology. Visits to oncologists accounted for 1.6 percent of visits (Figure 1).

Figure 1. Percent distribution of office visits by physician specialty: United States, 2006

- Visits are also presented by specialty type, split into three major groups: primary care, surgical specialties, and medical specialties (see "Physician specialty groups" in "Methods"). In 2006, 58.3 percent of office visits were made to primary care specialists, 22.0 percent to medical specialists, and the remaining 19.7 percent to surgical specialists (Table 1).
- About 89 percent of office-based physicians were located in metropolitan statistical areas (10), and they provided 86.1 percent of annual physician office encounters (Table 1).

## Physician practice characteristics

- Overall, 83.4 percent of the visits were to practices that were either owned by a physician or a group of physicians. In contrast, a smaller proportion of visits, 72.3 percent, were made to physicians who owned the practice. Over one-half of the office visits ( 55.7 percent) were made to physicians who were part of a group practice, defined as having three or more physicians (Table 2).
- Less than one-quarter, or 21.7 percent, of visits occurred in multispecialty practices, and 46.1 percent were to single-specialty practices. Solo practitioners accounted for 31.8 percent of the remaining identified office visits (Table 2).
- In over one-quarter of office visits, patient information was documented using electronic medical records, while for 85.5 percent of the visits, claims were submitted electronically.

## Patient characteristics

- The visit rate to physician offices was highest for infants under 1 year of age ( 756.9 visits per 100 persons) and the elderly 75 years and over (718.6 visits per 100 persons). The visit rate declined from infancy (1-4 years of age) to young adulthood (15-24 years of age), then rose again as age increased (Table 3).
- Overall, females made more visits than males, and sex differences were

SOURCE: CDC/NCHS, National Ambulatory Medical Care Survey.
Figure 2. Annual rate of office visits by patient age and sex: United States, 2006
observed for patients between the ages of 15 and 64 years of age (Figure 2).

- Private insurance was the most frequently recorded expected source of payment, accounting for 60.5 percent of visits. Individually, Medicare and Medicaid and State Children's Health Insurance Program (SCHIP) accounted for 23.6 percent and 14.0 percent of visits, respectively; however, visits made by patients with both Medicare and Medicaid represented 2.1 percent of all visits (Table 4). Visits by patients categorized as self-pay, no charge, or charity, an approximation of uninsured, constituted 4.4 percent of all office visits.

## Continuity of care

- In 48.9 percent of office visits, the physicians indicated that they were the patient's primary care provider (PCP); for 46.7 percent, the physician was not the patient's PCP; and at 4.4 percent of visits, it was unknown whether or not the physician was the PCP (Table 5).
- Of the visits to a provider other than the patient's PCP, one-third (32.7 percent) were referrals
(calculated from Table 5). Visits by new patients were more likely to be referrals than visits made by established patients ( 45.4 percent versus 11.1 percent).
- Among visits to non-PCPs, the specialties with visits most frequently referred by other physicians were neurology ( 56.4 percent), general surgery ( 56.2 percent), urology (41.1 percent), and cardiovascular diseases (37.9 percent) (Table 6).
- Established patients accounted for 87.8 percent of office visits. A majority of office visits ( 80.8 percent) were made by established patients who had at least one previous visit in the last 12 months (calculated from table) and 23.2 percent had six or more visits in the previous 12 months (Table 7). New patients accounted for 12.2 percent of visits, representing a $12.9 \%$ decrease since 1996 (14.0 percent).
- Primary care specialists ( 91.1 percent) were more likely to see established patients compared with medical ( 84.9 percent) and surgical (81.1 percent) specialists (Table 7).

## Patient reason for visit

- Examinations, including general medical, routine prenatal, gynecological, and well baby were four categories mentioned in the top 20 principal reasons for visit and accounted for 13.4 percent of visits. Cough ( 3.0 percent) was the most frequently mentioned reason regarding an illness or injury (Table 8).
- In contrast to the patient's reason for visit, the major reason for visit represents the provider's reason for the visit. The intent was to provide a better picture of the general nature of the physician visit whether for a new problem of less than 3 months onset; routine visit for a chronic problem; flare-up of a chronic problem; pre- or post-surgery visit; or for preventive care. Chronic conditions, including routine follow-up and flare-up problems, accounted for 37.0 percent of visits (calculated from Table 9). New problems, including infectious diseases and newly diagnosed chronic conditions, accounted for 35.4 percent of visits. The percentage of visits for new problems declined with patient age, whereas the percentage of visits for both types of chronic conditions, i.e., routine and flare-up, increased with patient age.
- Approximately 19.2 percent of all visits were for preventive care (Table 9). The female visit rate for preventive care ( 76.4 visits per 100 persons) was significantly higher than the rate for males ( 40.7 visits per 100 persons) (Table 10). The preventive care visit rate among infants under 1 year of age ( 390.7 visits per 100 persons) exceeded that of all other age groups. Persons with visits categorized as self-pay, no charge, or charity, an approximation of uninsured, had a significantly lower preventive care visit rate ( 20.2 visits per 100 persons) compared with persons with private or public health insurance, possibly placing them at a disadvantage for disease prevention and early diagnosis.

## Primary diagnosis at visit

- The physician's primary diagnosis for 20.1 percent of visits involved the supplementary classification used for preventive and follow-up care (i.e., general medical examination, routine prenatal examination, and health supervision of an infant or child), and other diagnoses not classifiable to injury or illness (Table 11).
- The most frequent medical diagnoses for office visits included essential hypertension, acute upper respiratory infections (excluding pharyngitis), arthropathies and related disorders, diabetes mellitus, and spinal disorders (Table 12). Hypertension has been the top ranked medical diagnosis by physicians at office visits eight times since 1996.
- There were an estimated 81.2 million visits related to injury, poisoning, or adverse effects of medical treatment in 2006, representing 9.0 percent of all visits and yielding a rate of 27.6 visits per 100 persons (Table 13). The injury or poisoning-related visit rate significantly increased with patient age. The rate for white patients was larger compared with the rate for

Black or African-American patients (30.3 versus 16.1 visits per 100 persons).

- Adverse effects of medical care, including surgical complications and adverse drug reactions, were responsible for 5.9 million visits ( 7.3 percent of injury visits) (Table 14).

## Comorbid conditions

- In 2006, 50.1 percent of office visits were made by patients with one or more chronic conditions (Table 15). Hypertension was the most frequent condition (22.4 percent), followed by arthritis ( 13.1 percent), hyperlipidemia ( 13.0 percent), diabetes ( 9.5 percent), and depression ( 7.9 percent).
- Since 1996, the percentage of visits made by adults 18 years and over with diabetes increased 40\% (Figure 3). During the same time period, visits by adults with hypertension and depression increased by $28 \%$ and $27 \%$, respectively. The percentage of visits by patients with arthritis, chronic obstructive pulmonary disease, and obesity has not changed significantly.

Figure 3. Percentage of office visits by adults 18 years and over with selected chronic comorbid conditions: United States, 1996 and 2006

## Services ordered or provided

- Diagnostic or screening services were ordered or provided at 85.5 percent of visits. The most frequently occurring examination was of the skin ( 12.6 percent) (Table 16). Females were more likely to have imaging ordered or provided compared with visits by males, a difference due mostly to mammography and ultrasound.
- For six decades, the Pap test has been used to detect cervical cancer and precancerous cells. Recent research found that the HPV DNA test along with the Pap test detected precancerous cells leading to cervical cancer earlier than the Pap test alone (11). In 2006, a Pap test ( 5.6 percent of female visits) was ordered or provided more frequently than the HPV DNA test ( 0.6 percent of female visits) (Table 16). Among visits with any Pap test, 10.1 percent of visits also had a HPV DNA test (data not shown).
- The liquid-based Pap test, an alternative to the conventional Pap test, has recently become popular with both medical professionals and insurance companies because of ease in microscopic interpretation, potential for additional medical interpretations, such as testing for HPV, and use of a specimen that is more appropriate for automated screening devices (12). Figure 4 shows the use of Pap tests both across and within various types of expected payment sources. Visits where private insurance was the expected source of payment had more Pap tests ordered or provided compared with other sources of payment, and these visits were more likely to be liquid-based ( 6.3 versus 3.7 percent). Visits with Medicaid and a group of combined payment sources were equally likely to use a conventional or liquid-based Pap test.
- Among the 5.6 percent of female visits where a Pap test was indicated, 19.0 percent were conventional Pap tests, and 60.0 percent were liquidbased Pap tests; and the remaining

* Figure does not meet standards of reliability or precision.

NOTES: Difference between percentage of private insurance visits with any Pap test and percentage relying on all other payment source categories is statistically significant ( $p<0.05$ ). Difference between percentage of private insurance visits with liquid-based pap test and percentage relying on all other payment source categories is statistically significant ( $p<0.05$ ).
'Other includes the following categories: Medicare, workers' compensation, self-pay, no charge or charity, unknown, and sources not elsewhere classified.
SOURCE: CDC/NCHS, National Ambulatory Medical Care Survey.
Figure 4. Percent of office visits by women 15-64 years of age by type of Pap test and primary expected source of payment: United States, 2006
21.0 percent were unspecified (calculated from Table 16).

- The patient's blood pressure (BP) was measured at 58.1 percent of all visits (Table 16) and at 66.2 percent of visits made by adult patients 18 years and over (Table 17). Among visits with a BP taken, measures were in the moderately high range (140-159 mmHg systolic, or $90-99 \mathrm{mmHg}$ diastolic) in 19.8 percent, and the severely high range $(160 \mathrm{mmHg}$ or greater systolic, or 100 mmHg or greater diastolic) in 6.3 percent of visits. The proportions of visits by age, sex, race, and ethnicity all follow the same pattern with mildly high initial BP occurring most frequently (majority greater than 40 percent), except for patients aged 18-24 years, where normal and mildly high readings are equally represented (43.2 and 39.5 percent) (Table 17). BP status was based on the Seventh Report of the Joint National Committee on prevention, detection, evaluation, and treatment of high BP (13).
- Health education was documented as ordered or provided at 36.5 percent of visits (Table 18). As in 1996, the most frequent counseling or education
provided at office visits related to diet or nutrition ( 13.5 percent) and exercise ( 9.5 percent).
- Nonmedication treatment was ordered or provided at 16.1 percent of visits (Table 19). Physical therapy was mentioned at 2.3 percent of visits, wound and orthopedic care were both mentioned at 2.0 percent of visits, followed by psychotherapy (1.7 percent).
- Durable medical equipment, home health care, and speech or occupational therapy were ordered or provided at 5.8, 2.1, and 1.9 million visits, respectively (Table 19).
- An estimated 65.0 million surgical procedures were ordered or provided during office visits (Table 20). At least one surgical procedure was performed at 6.6 percent of office visits (see Table 20 footnote 1). The two most common procedure categories were related to the digestive system ( 31.3 percent of procedures) and integumentary system (21.9 percent of procedures).

## Medications

- Medication therapy was reported at 636.7 million office visits, accounting for 70.6 percent of all office visits (Table 21). At 41.3 percent of all visits, 2-7 drugs were recorded, while at 5.7 percent of visits, eight or more drug mentions were recorded.
- Between 2005 and 2006, the number of drug mentions and percent of visits with drugs prescribed remained the same, despite implementation of the Medicare Prescription Drug Improvement and Modernization Act of 2003 Public Law 108-173 in January 2006. This legislation gave many Medicare enrollees access to prescription drug coverage. Among office visits made by elderly Medicare patients, the percent of drug visits in 2005 (74.9 percent) was not significantly different from 2006 (76.9 percent) (data not shown).
- During 2006, there were about 1.9 billion drugs mentioned, resulting in an overall drug mention rate of 210.3 mentions per 100 visits (Table 22). The percent of visits with at least one drug mention ranged from 92.0 percent for cardiologists to 40.8 percent for orthopedic surgeons.
- The 2006 survey year is the first year drug data were processed according to the Multum Lexicon database (for additional information see the website: www.multum.com/lexicon.htm). Based on the Multum terminology, drug mentions are displayed by therapeutic drug category in Table 23. Analgesics was the leading therapeutic category indicated in 11.1 percent of all drug mentions, followed by antihyperlipidemic agents (5.4 percent); antidepressants (4.5 percent); antidiabetic agents (3.6 percent); and anxiolytics, sedatives, and hypnotics ( 3.5 percent). Multum therapeutic categories are not comparable with classification used prior to 2006 (see "Methods").
- Aspirin was the most frequently mentioned drug ordered or supplied at office visits, occurring in 2.5 percent of drug mentions (Table 24). This was followed by
atorvastatin, metoprolol, and levothyroxine.
- For a majority of the 20 most frequently mentioned drugs, the patient was instructed to continue taking the drug; however, amoxicillin ( 84.2 percent) and azithromycin (85.7 percent) were both more likely to be new, while ibuprofen and acetaminophen were just as likely to be a new or continued drug (Table 24).
- Overall, drugs were more likely to be continued rather than new (68.6 versus 26.3 percent, respectively) (Table 24). Due to the diversity of vitamin products and lack of known specific components of many multivitamins, they are excluded from Table 24.

## Providers seen, disposition, and duration

- Overall, 96.3 percent of visits were attended by a physician (Table 25). Nurses (registered and licensed practical nurses) were seen at 24.4 percent of office visits. Physician assistants, nurse practitioners, or nurse midwives were seen at 6.2 percent of office visits.
- At less than two-thirds of visits (64.7 percent), patients were told to return to the office by appointment (Table 26). "Return if needed" and "no follow-up planned" were indicated at 25.7 and 7.6 percent of visits, respectively. Patients were referred to other physicians at 7.2 percent of visits.
- In 2006, 16.7 percent of office visits with face-to-face contact between the physician and patient had a duration of 10 minutes or fewer, while 46.3 percent had a duration of 16-60 minutes (Table 27). At 33.8 million visits, or 3.7 percent, there was no face-to-face contact between the physician and patient.
- Overall, the mean time spent with a physician was 21.8 minutes (Table 28). The visit duration for psychiatrists had the largest variability, a difference of 24.8 minutes between the third and first quartiles.

## Primary care versus community health center (CHC) physician services

- The 2006 survey year was the first year that visits to CHCs were oversampled in the NAMCS. An overwhelming majority of CHC visits were made to primary care specialists ( 95.4 percent) compared with non-CHC physician office visits (57.7 percent) (data not shown). When visits to non-CHC physicians were limited to those made to primary care specialists, and compared with CHC physicians, there was no difference in the percentage with any diagnostic or screening service, drugs prescribed, or nonmedication treatment ordered or provided. However, a higher percentage of health education services were documented as ordered or provided in CHCs than physician offices (Figure 5).

## Methods

## Data source

The data presented in this report are from the 2006 NAMCS, a national probability sample survey of nonfederal office-based physicians conducted by the Centers for Disease Control and Prevention's National Center for Health Statistics, Division of Health Care Statistics. The survey was conducted from December 26, 2005, through December 24, 2006. The NAMCS data collection is authorized under Section 306 of the Public Health Service Act (Title 42 U.S. Code), 242k. Participation is voluntary.

In April 2003, the Privacy Rule of the Health Insurance Portability and Accountability Act (HIPAA) was implemented to establish minimum federal standards for safeguarding the privacy of individually identifiable health information. Data collected in the NAMCS are consistent with HIPAA. No personally identifying information, such as patient's name, address, or Social Security number, is collected in the NAMCS. All information collected is held in the strictest confidence

Figure 5. Percent of office visits by type of service ordered or provided by physicians in primary care specialties in community health centers and physician offices: United States, 2006
according to law [Section 308(d) of the Public Health Service Act (42, U.S. Code, 242 m (d))] and the Confidential Information Protection and Statistical Efficiency Act (Title 5 of PL 107-347). Approval for the NAMCS protocol was renewed by the NCHS Research Ethics Review Board in January 2006. Waivers of the requirements to obtain informed consent of patients and patient authorization for release of patient medical record data by health care providers were granted.

The target universe of NAMCS includes visits made in the United States to the offices of nonfederally employed physicians, excluding those in the specialties of anesthesiology, radiology, and pathology, who were classified by the American Medical Association (AMA) or the American Osteopathic Association (AOA) as "office-based, patient care." Visits to private, nonhospital-based clinics and health maintenance organizations (HMOs) were within the scope of the survey, but those that occurred in federally operated facilities and hospital-based outpatient departments were not. Telephone
contacts and visits made outside the physician's office were also excluded.

The NAMCS utilizes a multistage probability sample design involving samples of 112 geographic primary sampling units (PSUs), physician practices within PSUs, and patient visits within physician practices. The PSUs are counties, groups of counties, county equivalents (such as parishes or independent cities), or towns and townships for some PSUs in New England. A sample of physicians was selected from the master files of AMA and AOA. The NAMCS sample for 2006 was slightly larger than previous years, as the National Center for Chronic Disease and Prevention and Health Promotion (NCCDPHP) sponsored the inclusion of an additional 150 primary care physicians (general and family practice, internal medicine, and obstetrics and gynecology), and the National Cancer Institute sponsored a supplementary sample of 200 oncologists.

This sample design typically includes too few CHC physicians for the estimates to be reliably presented. To improve the precision of CHC physician
estimates, starting in 2006, a dualsampling procedure was used to select CHC physicians and other providers. First, the "traditional" NAMCS sample of physicians was selected using established methods and sources. Second, a sample of 104 CHCs was selected, and within each center, up to three physicians, physician assistants, nurse midwives, or nurse practitioners were selected for survey participation. After selection, CHC providers followed the sampling procedure used by "traditional" NAMCS physicians in selecting patient visits. The list of CHCs is from the Health Resources and Services Administration and the Indian Health Service. To ensure that CHC physicians are included only once, all CHC physicians selected in the "traditional" NAMCS sample were omitted from the physician and visit files. For the purpose of this report, only sample CHC physicians were included. Sampled mid-level providers were excluded but will be presented in a future report.

In 2006, 2,268 physicians were in scope (eligible to participate in the survey). Of these, 1,455 physicians participated in NAMCS for an unweighted response rate of 64 percent. Sample physicians were asked to complete Patient Record forms (PRFs) (see Figure 6) for a systematic random sample of approximately 30 office visits occurring during a randomly assigned 1 -week reporting period. The number of PRFs completed was 29,392. Some physicians did not provide the expected number of visit records, thereby reducing the unweighted total visit response rate to 59 percent.

The U.S. Census Bureau, acting as the data collection agent for the survey, provided training to field representatives (FRs) throughout the nation. FRs oversaw data collection at the physician's office. They contacted physicians for induction into the survey after an advance letter was mailed by NCHS notifying the physicians of their selection in the survey. In many cases, physicians or their staffs completed the information requested on the PRFs. However, in 47.1 percent of the weighted visits, FRs abstracted the data
from medical records or computer printouts, either alone or with the doctor or office staff.

Data processing and medical coding were performed by Constella Group Inc., Durham, North Carolina. As part of the quality assurance procedure, a 10 percent quality control sample of survey records was independently keyed and coded. Coding error rates ranged between 0.2 and 1.4 percent for various survey items.

Verbatim medical data collected in the survey were coded as follows:

- Patient's reason for visit-The patient's main complaint, symptom, or reason for visiting the physician's office was coded according to $A$ Reason for Visit Classification for Ambulatory Care(RVC) (14). Up to three reasons could be coded per visit.
- Physician's diagnosis—Physicians or their staffs were asked to record the primary diagnosis or problem associated with the patient's most important reason for the current visit and any other significant current diagnoses. Up to three diagnoses were coded according to the International Classification of Diseases, 9th Revision Clinical Modification (ICD-9-CM) (15).
- Medications-Physicians or their staffs were instructed to record all new or continued medications ordered, supplied, or administered at the visit. This included prescription and nonprescription preparations, immunizations, desensitizing agents, and anesthetics. In this survey, recorded medications are referred to as drug mentions and are coded according to a classification system developed at NCHS (16). As used in the NAMCS, the term "drug" is interchangeable with the term "medication." The term "prescribing" is used broadly to mean ordering or providing any medication, whether prescription or over-the-counter. Visits with one or more drug mentions are termed "drug visits" in NAMCS. The 2006 survey year was the first where therapeutic classification of drugs was based on
the MULTUM Lexicon's second-level therapeutic categories, including any drug mentions coded at third-level therapeutic categories (see www.multum.com/lexicon.htm). Drugs may have more than one therapeutic application. Although MULTUM allows up to five therapeutic categories per drug, in this report a maximum of four therapeutic categories for each drug were examined, because the number of drugs with five therapeutic categories is small. Generic ingredients of drug mentions were coded according to the drug id nomenclature included in MULTUM.

## Physician specialty groups

This report classifies specific physician specialties into two general categorical schemes: physician specialty and type of specialty. The NAMCS survey design groups physicians into 16 strata, or specialty groups, for sampling purposes. The "physician specialty" classification includes the same strata as used for sampling purposes with the exception of the doctors of osteopathy stratum, which is combined with doctors of medicine, in the following 15 categories: general and family practice, internal medicine, pediatrics, general surgery, obstetrics and gynecology, orthopedic surgery, cardiovascular diseases, dermatology, urology, psychiatry, neurology, ophthalmology, otolaryngology, oncology, and a residual category of other specialties. The "physician specialty" classification is created using updated information from the AMA, as well as information provided by sampled physicians. Specific physician specialties used to create the 15 categories can be defined in text box A .

In this classification, a pediatric cardiothoracic physician, for example, is grouped with other pediatricians. On the other hand, the "specialty type" classification divides AMA specialties into three major categories: primary care, surgical specialties, and medical specialties and puts more emphasis on specialization type. For example, pediatric cardiothoracic physicians are
classified as a surgical specialty in this classification. The specific physicians specialties included in each of the three specialty types are provided in text box B.

It should be noted that "primary care specialist" as defined in the textbox differs from "primary care physician or provider (PCP)," which is reported by the survey respondent based on the question, "Are you the palient's primary care physician?" (Figure 6.) The intention is that a PCP coordinates the comprehensive health care of the patient and serves as the entry point for all of the patient's health care needs. PCPs may be advocates for the patient in coordinating the use of the entire health care system to benefit the patient (17). Typically, PCP visits include physicians in general and family practice, internal medicine, pediatrics, or obstetrics and gynecology. In the NAMCS, a checkbox defines a PCP visit; therefore, these visits may also include specialist physicians or nonphysicians, such as physician assistants or nurse practitioners.

## Estimation

Because of the complex multistage design of NAMCS, a sample weight is computed for each sample visit that takes all stages of design into account. The survey data are inflated or weighted to produce unbiased national annual estimates. The visit weight includes four basic components: inflation by reciprocals of selection probabilities, adjustment for nonresponse, population ratio adjustments, and weight smoothing. Starting in 2004, changes were made to the nonresponse adjustment factor to account for the seasonality of the reporting period.

The nonresponse adjustment additionally accounts for nonresponse from physicians by weekly visit volume, and for the variability in number of weeks participating physicians saw patients during the year (18). Prior to 2003, the nonresponse adjustment accounted only for nonresponse by physician specialty, geographic region, and MSA status.

## Text box A

| Physician specialty | Specific physician specialty |
| :---: | :---: |
| General practice | Family practice, general practice, geriatric medicine (family practice), sports medicine (family practice). |
| Internal medicine | Internal medicine. |
| Pediatrics | Adolescent medicine (pediatrics), developmental-behavioral pediatrics, internal medicine/pediatrics, medical toxicology (pediatrics), neonatal-perinatal medicine, neurodevelopmental disabilities (pediatrics), neurodevelopmental disabilities (psychiatry \& neurology), pediatric allergy, pediatric cardiology, pediatric critical care medicine, pediatric emergency medicine (pediatrics), pediatric endocrinology, pediatric gastroenterology, pediatric infectious disease, pediatric nephrology, pediatric pulmonology, pediatric rheumatology, pediatrics sports medicine (pediatrics). |
| General surgery | General surgery. |
| Obstetrics and gynecology | Critical care medicine (obstetrics \& gynecology), gynecology maternal \& fetal medicine obstetrics, obstetrics \& gynecology, reproductive endocrinology. |
| Orthopedic surgery | Adult reconstructive orthopedics, foot and ankle orthopedics, orthopedic surgery, orthopedic surgery of the spine, orthopedic trauma, pediatric orthopedics, sports medicine (orthopedic surgery). |
| Cardiovascular diseases | Cardiovascular disease. |
| Dermatology | Dermatology. |
| Urology | Pediatric urology, urology. |
| Psychiatry | Addiction psychiatry, child and adolescent psychiatry, forensic psychiatry, geriatric psychiatry, neuropsychiatry, psychiatry, psychoanalysis, psychosomatic medicine. |
| Neurology | Child neurology, clinical neurophysiology, endovascular surgical neuroradiology, neurology, neurology/diagnostic radiology/neuroradiology, vascular neurology. |
| Ophthalmology | Ophthalmology pediatric ophthalmology. |
| Otolaryngology | Otolaryngology, otology/neurotology, pediatric otolaryngology. |
| Other | Abdominal surgery, addiction medicine, adolescent medicine (internal medicine), aerospace medicine, allergy, allergy \& immunology, clinical and laboratory dermatological immunology, clinical laboratory immunology (allergy \& immunology), clinical and laboratory immunology (internal medicine), clinical and laboratory immunology (pediatrics), clinical biochemical genetics, clinical cardiac electrophysiology, clinical cytogenetics, clinical genetics, clinical molecular genetics, clinical pharmacology, colon \& rectal surgery, cosmetic surgery, craniofacial surgery, critical care medicine (internal medicine), dermatologic surgery, diabetes, emergency medicine, endocrinology diabetes and metabolism, epidemiology, facial plastic surgery, gastroenterology, general preventive medicine, geriatric medicine (internal medicine), hand surgery, head \& neck surgery, hematology (internal medicine), hepatology, immunology, infectious disease, interventional cardiology, legal medicine, medical genetics, medical management, medical toxicology (emergency medicine), medical toxicology (preventive medicine), nephrology, neurological surgery, nuclear cardiology, nutrition, occupational medicine, oral \& maxillofacial surgery, osteopathic manipulative medicine, pain medicine, pain medicine (psychiatry), palliative medicine, pediatric cardiothoracic surgery, pediatric emergency medicine (emergency medicine), pediatric rehabilitation medicine, pediatric surgery (neurology), pediatric surgery (surgery), pharmaceutical medicine, phlebology, physical medicine \& rehabilitation, plastic surgery, plastic surgery within the head \& neck, procedural dermatology, public health and general preventive medicine, pulmonary critical care medicine, pulmonary disease, rheumatology, sleep medicine, spinal cord injury medicine, sports medicine (emergency medicine), sports medicine (internal medicine), sports medicine (physical medicine \& rehabilitation), surgical critical care (surgery), thoracic surgery, transplant surgery, trauma surgery, underseas medicine (preventive medicine), urgent care medicine, vascular medicine, vascular surgery, other specialty, unspecified specialty. |
| Oncology | Gynecological oncology, hematology/oncology, medical oncology, musculoskeletal oncology, pediatric hematology/ oncology, surgical oncology. |

NOTE: Although the categories described above were used in creating NAMCS specialty estimates, not all were actually sampled in the 2006 survey year.

The standard error is primarily a measure of the sampling variability that occurs by chance because only a sample rather than an entire universe is surveyed. Estimates of the sampling variability for this report were calculated using Taylor approximations in SUDAAN, which take into account the complex sample design of NAMCS. A description of the software and its approach has been published (19). The standard errors of statistics presented in this report are included in each of the tables.

## Tests of significance

In this report, the determination of statistical inference is based on the two-tailed $t$-test. The Bonferroni inequality was used to establish the critical value for statistically significant differences ( 0.05 level of significance) based on the number of possible comparisons within a particular variable (or combination of variables) of interest.

## Nonsampling errors

As in any survey, results are subject to both sampling and nonsampling errors. Nonsampling errors include reporting and processing errors as well as biases due to nonresponse and incomplete response. The magnitude of the nonsampling errors cannot be computed. However, these errors were kept to a minimum by procedures built into the operation of the survey. To eliminate ambiguities and to encourage uniform reporting, attention was given to the phrasing of items, terms, and

## Text box B

| Physician specialty type | Specific physician specialty |
| :---: | :---: |
| Primary care specialties | Adolescent medicine (internal medicine), adolescent medicine (pediatrics), family practice, general practice, geriatric medicine (family practice), geriatric medicine (internal medicine), gynecology, internal medicine, internal medicine/pediatrics, maternal \& fetal medicine, obstetrics, obstetrics \& gynecology, pediatrics, sports medicine (family practice), sports medicine (internal medicine), sports medicine (pediatrics). |
| Surgical specialties | Abdominal surgery, adult reconstructive orthopedics, colon \& rectal surgery, cosmetic surgery, craniofacial surgery, critical care medicine (obstetrics \& gynecology), dermatologic surgery, endovascular surgical neuroradiology, facial plastic surgery, foot and ankle, orthopedics, general surgery, gynecological oncology, hand surgery, head \& neck surgery, musculoskeletal oncology, neurological surgery, ophthalmology, oral \& maxillofacial surgery, orthopedic surgery, orthopedic surgery of the spine, orthopedic trauma, otolaryngology, otology/neurotology, pediatric cardiothoracic surgery, pediatric ophthalmology, pediatric orthopedics, pediatric otolaryngology, pediatric surgery (neurology), pediatric surgery (surgery), pediatric urology, plastic surgery, plastic surgery within the head \& neck, procedural dermatology, sports medicine (orthopedic surgery), surgical critical care (surgery), surgical oncology, thoracic surgery, transplant surgery, trauma surgery, urology, vascular surgery. |
| Medical specialties | Addiction medicine, addiction psychiatry, aerospace medicine, allergy, allergy \& immunology, cardiovascular disease, child and adolescent psychiatry, child neurology, clinical and laboratory dermatological immunology, clinical and laboratory immunology (internal medicine), clinical and laboratory immunology (pediatrics), clinical biochemical genetics, clinical cardiac electrophysiology, clinical cytogenetics, clinical genetics, clinical laboratory immunology (allergy \& immunology), clinical molecular genetics, clinical neurophysiology, clinical pharmacology, critical care medicine (internal medicine), dermatology, developmental-behavioral pediatrics, diabetes, emergency medicine, endocrinology diabetes and metabolism, epidemiology, forensic psychiatry, gastroenterology, general preventive medicine, geriatric psychiatry, hematology (internal medicine), hematology/oncology, hepatology, immunology, infectious disease, interventional cardiology, legal medicine, medical genetics, medical management, medical oncology, medical toxicology (emergency medicine), medical toxicology (pediatrics), medical toxicology (preventive medicine), neonatal-perinatal medicine, nephrology, neurodevelopmental disabilities (pediatrics), neurodevelopmental disabilities (psychiatry \& neurology), neurology, neurology/diagnostic radiology/neuroradiology, neuropsychiatry, nuclear cardiology, nutrition, occupational medicine, osteopathic manipulative medicine, pain medicine, pain medicine (psychiatry), palliative medicine, pediatric allergy, pediatric cardiology, pediatric critical care medicine, pediatric emergency medicine (emergency medicine), pediatric emergency medicine (pediatrics), pediatric endocrinology, pediatric gastroenterology, pediatric hematology/oncology, pediatric infectious disease, pediatric nephrology, pediatric pulmonology, pediatric rehabilitation medicine, pediatric rheumatology, pharmaceutical medicine, phlebology, physical medicine \& rehabilitation, psychiatry, psychoanalysis, psychosomatic medicine, public health and general preventive medicine, pulmonary critical care medicine, pulmonary disease, reproductive endocrinology, rheumatology, sleep medicine, spinal cord injury medicine, sports medicine (emergency medicine), sports medicine (physical medicine \& rehabilitation), underseas medicine (preventive medicine), urgent care medicine, vascular medicine, vascular neurology, other specialty, unspecified specialty. |

NOTE: Although the categories described above were used in creating NAMCS categories, not all were actually sampled in the 2006 survey year.
definitions. Also, pretesting of most data items and survey procedures was performed. Quality control procedures and consistency and edit checks reduced errors in data coding and processing.

The weighted response rate for the 2006 NAMCS was 58.4 percent. Table 29 presents weighted characteristics of NAMCS respondents and nonrespondents, along with weighted response rates. Responding versus nonresponding physician distributions were similar for a majority of physician characteristic categories, with the exception of metropolitan status, type of doctor, practice type, and annual visit volume. Examining the weighted response rates, higher cooperation was gained among physicians in nonmetropolitan statistical areas (rural), CHCs, and physicians in the lowest and highest quartiles associated with visit volume compared with physicians grouped in the middle two visit volume quartiles. The effect of this differential response is minimized in
the visit estimates in most cases as NAMCS uses a nonresponse adjustment factor that takes annual visit volume, specialty, geographic region, MSA, and CHC status into account.

Item nonresponse rates in the NAMCS are generally low (5 percent or less). However, levels of nonresponse can vary considerably in the survey. Most nonresponse occurs when the needed information is not available in the medical record or is unknown to the person filling out the survey instrument. Nonresponse can also result when the information is available, but survey procedures are not followed and the item is left blank. In this report, the tables include a combined entry of unknown or blank to display missing data. For items where combined item nonresponse is between 30 and 50 percent, percent distributions are not discussed in the text. However, the information is shown in the tables. These data should be interpreted with caution. If nonresponse is random, the
observed distribution for the reported item (i.e., excluding cases for which the information is unknown) would be close to the true distribution. However, if nonresponse is not random, the observed distribution could vary significantly from the actual distribution. Researchers need to decide how best to treat items with high levels of missing responses. For items with nonresponse greater than 50 percent, data are not presented.

Weighted item nonresponse rates (i.e., if the item was left blank or the "unknown" box was marked) were 5.0 percent or less for data items, with the following exceptions: expected source of payment ( 5.6 percent), was patient referred for current visit ( 5.5 percent), was visit for injury/ poisoning/adverse effect of medical treatment ( 9.4 percent), enrollment in a disease management program (26.8 percent), and specific cancer stage for visits where cancer was an indicated medical condition ( 48.7 percent).

For some items, missing values were imputed by randomly assigning a
value from PRFs with similar characteristics and were based on professional identity, physician specialty, geographic region, and three-digit ICD-9-CM codes for primary diagnosis. Imputations were performed for the following variables-birth year ( 2.5 percent), sex ( 1.6 percent), race (27.0 percent), ethnicity ( 29.9 percent), has the patient been seen in this practice before ( 3.5 percent), how many visits in the last 12 months ( 7.1 percent), and time spent with physician ( 23.3 percent). In contrast to the imputation method used to impute race and ethnicity in previous years, a hierarchical procedure was used in 2006. Cases missing race (or ethnicity) were initially assigned a donor's value after matching donor and recipient by three-digit ICD-9-CM codes for primary diagnosis and ZIP code of patient making the sampled visit; if no donor was found after several matching rounds of increasing geographic size (county, state, region), traditional imputation procedures were applied. If both race and ethnicity were missing, both were imputed from the same donor.

## Use of tables

The tables present only the first-listed reason for visit and diagnosis. It should be noted that estimates differing in ranked order may not be significantly different from each other. For items related to diagnostic and screening services, procedures, providers seen, and disposition, physician office staff was asked to check all of the applicable categories for each item. Therefore, multiple responses could be coded for each visit.

In this report, estimates are not presented if they are based on fewer than 30 cases in the sample data; only an asterisk (*) appears in the tables. The relative standard error (RSE) of an estimate is obtained by dividing the standard error by the estimate itself. The result is then expressed as a percentage of the estimate. Estimates based on 30 or more cases include an asterisk (*) if the RSE of the estimate exceeds 30 percent.

In the tables, estimates of office visits have been rounded to the nearest thousand. Consequently, estimates will not always add to totals. Rates and percentages were calculated from original unrounded figures and do not necessarily agree with figures calculated from rounded data.

Estimates presented in the tables for specific race categories reflect visits where only a single race was reported. Denominators used in computing estimates of visit rates by expected source of payment were obtained from the 2006 National Health Interview Survey (NHIS). Individuals reporting multiple insurance categories in the NHIS were counted in each category they reported, with the exception of Medicaid and SCHIP, which were combined into a single category.

## . Category not applicable.

Figure does not meet standards of reliability or precision.
${ }^{1}$ Combined total of individual sources exceeds "all visits" because more than one may be reported per visit.
${ }^{2}$ SCHIP is State Children's Health Insurance Program.
${ }^{3}$ No insurance is defined as having only self-pay, no charge, or charity visits as payment sources.

* Figure does not meet standards of reliability or precision.
. . Category not applicable.
${ }^{1}$ PCP is patient's primary care provider as indicated by a positive response to question "Are you the patient's primary care physician/provider?"
${ }^{2}$ Referral status only asked for visits to nonprimary care physicians or providers.
NOTE: Numbers may not add to totals because of rounding.

* Figure does not meet standards of reliability or precision.
. . Category not applicable.
${ }^{1}$ Preventive care includes routine prenatal, well-baby, screening, insurance, or general exams (see question 4c in Figure 6).
${ }^{2}$ Other race includes visits by Asian, Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native, and multiple races. All race categories inlcude visits by persons of Hispanic and not Hispanic origin. Persons of Hispanic origin may be of any race. Starting with data year 1999, race-specific estimates have been tabulated according to 1997 Standards for Federal Data on Race and Ethnicity and are not strictly comparable with estimates for earlier years. The percentage of visit records with multiple race indicated is small and lower than what is typically found for self-reported race in household surveys.
${ }^{3}$ Combined total of individual sources exceeds "All visits" because more than one may be reported per visit.
${ }^{4}$ SCHIP is State Children's Health Insurance Program.
${ }^{5}$ Other includes worker's compensation, unknown or blank, and payments not classified elsewhere
NOTE: Numbers may not add to totals because of rounding.

Table 10. Number, percent distribution, and annual rate of preventive care office visits and percent of visits to primary care specialists with corresponding standard errors, by selected patient and visit characteristics: United States, 2006

* Figure does not meet standards of reliability or precision.
'Blood pressure levels were categorized using the following hierarchical definitions.
Severely high blood pressure is defined as 160 mm Hg systolic or above, or 100 mm Hg diastolic or above. Moderately high blood pressure is defined as $140-159 \mathrm{~mm} \mathrm{Hg}$ systolic or $90-99 \mathrm{~mm}$ Hg diastolic. Mildly high blood pressure is defined as $120-139 \mathrm{~mm} \mathrm{Hg}$ systolic or $80-89 \mathrm{~mm} \mathrm{Hg}$ diastolic. Low blood pressure is defined as less than 100 mm Hg systolic or less than 60 mm Hg diastolic. Normal blood pressure is defined as $100-119 \mathrm{~mm} \mathrm{Hg}$ systolic and $60-79 \mathrm{~mm} \mathrm{Hg}$ diastolic. Blood pressure (BP) classification was based on the Seventh Report of the Joint National Committee on Prevention, Detection, Evalutation and Treatment of High Blood Pressure (JNC-7)(14). "Mildy high" BP corresponds to the JNC-7 prehypertensive range. "Moderately high" BP corresponds to the JNC-7 stage 1 hypertensive range. "Severely high" BP corresponds to the JNC-7 stage 2 hypertensive range.
${ }^{2}$ Visits where blood pressure was taken represent 66.2 percent ( $\mathrm{SE}=1.7$ ) of all office visits made by adults ( $18+$ years of age). In 25.8 percent ( $\mathrm{SE}=1.6$ ) of visits by children ( $0-17$ years of age) a blood pressure was recorded.
${ }^{3}$ Other race includes visits by Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native, and multiple races. All race categories include visits by persons of Hispanic or not Hispanic origin. Starting with data year 1999, race- and ethnicity-specific estimates have been tabulated according to 1997 Standards for Federal Data on Race and Ethnicity and are not strictly comparable with estimates for earlier years. The percentage of visit records with multiple races indicated is smaller and lower than in household surveys.
NOTE: Numbers may not add to totals because of rounding.

Table 18. Number and percentage of office visits with corresponding standard errors, by health education services ordered or provided, and by patient's sex: United States, 2006

. . Category not applicable.

* Figure does not meet standards of reliability or precision.
${ }^{1}$ Based on the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) (15). At least one surgical procedure was ordered or performed at 6.6 percent of office visits.
${ }^{2}$ Includes operations on the endocrine system (ICD-9-CM codes 06-07), operations on the respiratory system (ICD-9-CM codes 30-34), and operations on the hemic and lymphatic system (ICD-9-CM codes 40-41).
NOTE: Included are responses to the write-in fields on the Patient Record form under Diagnostic/Screening Services (item 7.24, Scope procedures, and item 7.27, Other test/service) and NonMedication Treatment (item 9.13 and 9.14, Procedures). Up to two procedures could be coded for each category, for a total of eight procedures per visit. In addition to the surgical procedures shown in this table, there were an additional 180,016,000 nonsurgical procedures reported (ICD-9-CM, Volume 3, codes 00, 87-99).

Table 29. Characteristics of the 2006 National Ambulatory Medical Care Survey, physician respondents and nonrespondents-Con.

| Physician characteristic ${ }^{1}$ | Number of sampled in-scope physicians ${ }^{2}$ | Total sample percent distribution ${ }^{3}$ (weighted) | Responding physician percent distribution ${ }^{4}$ (weighted) | Nonresponding physician percent distribution ${ }^{5}$ (weighted) | Weighted response rate ${ }^{6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Annual visit volume ${ }^{7,11}$ |  |  |  |  |  |
| 0-25th percentile | 538 | 25.0 | 31.4 | 16.1 | 0.731 |
| 26th-50th percentile | 572 | 25.0 | 20.8 | 30.9 | 0.484 |
| 51st-75th percentile | 517 | 25.0 | 20.2 | 31.6 | 0.470 |
| 76th-100th percentile | 467 | 25.0 | 27.7 | 21.3 | 0.644 |

${ }^{1}$ Characteristic information is from the master files of the American Medical Association, the American Osteopathic Association, and the Health Resources and Services Adminstration (HRSA).
${ }^{2}$ In-scope physicians are those who verified that they were nonfederal and involved in direct patient care in an office-based setting or community health center (CHC), excluding the specialities of radiology, pathology, and anesthesiology.
${ }^{3}$ Total physicians are those who were selected from (a) the master files of the American Medical Association, (b) the American Osteopathic Association, and (c) physicians practicing in federally
funded or look alike CHCs. In-scope determination was also used for inclusion in the NAMCS.
${ }^{4}$ Responding physicians are those who were in-scope and agreed to participate in the NAMCS
${ }^{5}$ Nonresponding physicians are those where were in-scope and refused to participate in the NAMCS.
${ }^{6}$ Numerator is the number of in-scope physicians who participated in the NAMCS or who did not see any patients during their sampled reporting week. Denominator is all in-scope sampled physicians.
${ }^{7}$ Chi-square test of association is significant ( $p<0.05$ ) between responding versus nonresponding distribution and indicated physician characteristic.
${ }^{8}$ MSA is metropolitan statistical area.
${ }^{9}$ Physician specialty and specialty type are defined in "Physician specialty groups" section of "Methods."
${ }^{10} \mathrm{HMO}$ health maintenance organization.
${ }^{11}$ Low is the lowest third of annual visit volume, medium is the middle third, and high is the highest third.

[^0]:    Category not applicable.
    ${ }^{1}$ Visit rates for age, sex, race, and region are based on the July 1, 2006, set of estimates of the civilian noninstitutional population of the United States as developed by the Population Division, U.S. Census Bureau.
    ${ }^{2}$ Population estimates of metropolitan statistical area status are based on data from the 2006 National Health Interview Survey, National Center for Health Statistics, adjusted to the U.S. Census
    Bureau definition of core-based statistical areas as of Novermber 2005. See www.census.gov/population/www/estimates/metrodef.html for more about metropolitan statistical definitions.
    ${ }^{3}$ Physician specialty and specialty type defined in the "Physician specialty groups" section of Methods.
    ${ }^{4}$ Number of visits (numerator) and population estimate (denominator) include children under 15 years of age.
    ${ }^{5}$ Number of visits (numerator) and population estimate (denominator) include females 15 years old and over.
    ${ }^{6}$ MSA is metropolitan statistical area.
    NOTE: Numbers may not add to totals because of rounding.

    * Figure does not meet standards of reliability or precision
    ${ }^{1} \mathrm{HMO}$ is health maintenance organization.
    2"Other" includes owners such as local government (state, county, or city) and charitable organizations
    3"Other" includes the following office types: HMO , nonfederal government clinic, mental health center, federally qualified health center, and faculty practice plan. NOTE: Numbers may not add to totals because of rounding.

[^2]:    . Category not applicable.
    0.0 Quantity more than zero but less than 0.05 .
    ${ }^{1}$ Visit rates for age, sex, race, and ethnicity are based on the July 1, 2006, set of estimates of the civilian noninstitutional population of the United States as developed by the Population Division U.S. Census Bureau.
     Hispanic origin. Persons of Hispanic origin may be of any race. Starting with data year 1999, race-specific estimates have been tabulated according to 1997 Standards for Federal Data on Race and Ethnicity and are not strictly comparable with estimates for earlier years. The percentage of visit records with multiple races indicated is small and lower than what is typically found for self-reported race in household surveys.
    NOTE: Numbers may not add to totals because of rounding.

[^3]:    Category not applicable.
    ${ }^{1}$ PCP is patient's primary care provider as indicated by a positive response to the question "Are you the patient's primary care physician/provider?"
    NOTE: Numbers may not add to totals because of rounding.

[^4]:    . Category not applicable.
    ${ }^{1}$ Specialty type defined in "Physician specialty groups" section in "Methods."
    NOTE: Numbers may not add to totals because of rounding.

[^5]:    . . Category not applicable.
    ${ }^{1}$ Based on A Reason for Visit Classification for Ambulatory Care (RVC)(14).
    ${ }^{2}$ Based on $533,292,000$ visits made by females.
    ${ }^{3}$ Based on $368,662,000$ visits made by males.
    NOTE: Numbers may not add to totals because of rounding.

[^6]:    See footnotes at end of table.

[^7]:    Category not applicable.
    ${ }^{1}$ Visit rates for age, sex, race, and ethnicity are based on the July 1, 2006, set of estimates of the civilian noninstitutional population of the United States as developed by the Population Division, U.S. Census Bureau. Visit rates for expected source(s) of payment are based on the 2006 National Health Interview Survey estimates of health insurance.
    ${ }^{2}$ Primary care specialty defined in specialty type classification found in "Physician specialty groups" section of "Methods."
    ${ }^{3}$ Preventive care includes routine prenatal, well-baby, screening, insurance, and general exams (see question 4c in Figure 6).
    ${ }^{4}$ Other race includes Asian, Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native, and multiple races. All race categories include visits by persons of Hispanic and not
    Hispanic origin. Persons of Hispanic origin may be of any race. Starting with data year 1999, race-specific estimates have been tabulated according to 1997 Standards for Federal Data on Race and Ethnicity and are not strictly comparable with estimates for earlier years. The percentage of visit records with multiple races indicated is small and lower than what is typically found for self-reported race in household surveys.
    ${ }^{5}$ Total exceeds "all visits" because more than one source of payment may be reported per visit.
    ${ }^{6}$ SCHIP is State Children's Health Insurance Program.
    ${ }^{7}$ The visit rate was calculated using "uninsured" as the denominator from the 2006 estimates of health insurance coverage from the National Health Inteview Survey.
    ${ }^{8}$ Other includes worker's compensation, unknown or blank, and sources not elsewhere classified.
    NOTE: Numbers may not add to totals because of rounding.

[^8]:    Category not applicable.
    ${ }^{1}$ Based on the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) (15).
    ${ }^{2}$ Includes general medical examination, routine prenatal examination, and health supervision of an infant or child, and other diagnoses not classifiable to injury or illness.
    ${ }^{3}$ Includes diseases of the blood and blood-forming organs (280-289); complications of pregnancy, childbirth, and the puerperium (630-677); congenital anomalies (740-759); certain conditions originating in the perinatal period (760-779); and entries not codable to the ICD-9-CM (e.g., illegible entries, left against medical advice, transferred, entries of "none," or "no diagnoses").
    ${ }^{4}$ Includes blank diagnoses.
    NOTE: Numbers may not add to totals because of rounding.

[^9]:    Category not applicable.

    * Figure does not meet standards of reliability or precision.
    ${ }^{1}$ Based on the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) (15). However, certain codes have been combined in this table to form larger categories that better describe the utilization of ambulatory care services.
    ${ }^{2}$ Based on 533,292,000 visits made by females.
    ${ }^{3}$ Based on $368,662,000$ visits made by males.
    NOTE: Numbers may not add to totals because of rounding.

[^10]:    Category not applicable

    * Figure does not meet standards of reliability or precision
    ${ }^{1}$ Visit rates for age, sex, race, and ethnicity are based on the July 1, 2006, set of estimates of the civilian noninstitutional population of the United States as developed by the Population Division U.S. Census Bureau.
    ${ }^{2}$ Injury visits included injury, poisoning, or adverse effects of medical treatment based on item 2 of the PRF. Injury visits represent 9.0 percent (SE $=0.5$ ) of all office visits.
    
     Race and Ethnicity and are not strictly comparable with estimates for earlier years. The percentage of visit records with multiple races indicated is small and lower than what is typically found for self-reported race in household surveys.
    NOTE: Numbers may not add to totals because of rounding.

[^11]:    * Figure does not meet standards of reliability or precision Category not applicable.
    ${ }^{1}$ Presence of comorbid chronic conditions were based on checkbox responses.
    ${ }^{2}$ COPD is chronic obstructive pulmonary disease.
    ${ }^{3} \mathrm{CHF}$ is congestive heart failure.

[^12]:    Category not applicable.

    * Figure does not meet standards of reliability or precision.

    Combined total of individual sources exceeds "all visits" because more than one may be reported per visit.
    ${ }^{2}$ Based on $533,292,000$ visits made by females.
    ${ }^{3}$ Based on $368,662,000$ visits made by males.
    ${ }^{4}$ CBC is complete blood count.
    ${ }^{5} \mathrm{HgbA} 1 \mathrm{C}$ is glycohemoglobin.
    ${ }^{6}$ PSA is prostate-specific antigen.
    ${ }^{7}$ EKG or ECG is electrocardiogram
    ${ }^{8}$ DNA is deoxyribonucleic acid. HPV is human papilloma virus. Based on visits made by females.
    ${ }^{9} \mathrm{MRI}$ is magnetic resonance imaging. CT is computed tomography. PET is positron emission tomography

[^13]:    Category not applicable.
    *Figure does not meet standards of reliability or precision
    0.0 Quantity more than zero, but less than 0.05 .
    ${ }^{1}$ Combined total of individual treatments exceeds all visits because more than one may be reported per visit.

[^14]:    . . Category not applicable.
    ${ }^{1}$ Based on $533,292,000$ visits made by females.
    ${ }^{2}$ Based on $368,662,000$ visits made by males.
    ${ }^{3}$ Includes prescription drugs, over-the-counter preparations, immunizations, and desensitizing agents.
    ${ }^{4}$ Also defined as drug visits.
    NOTE: Numbers may not add to totals because of rounding.

[^15]:    .. Category not applicable.
    1 Visits at which one or more drugs were provided or prescribed by the physician.
    ${ }^{2}$ Number of drugs mintiten
    ${ }^{2}$ Number of drugs mentioned at visits (up to eight per visit).
    ${ }^{3}$ Percent of visits that included one or more drug mentions (number of drug visits divided by number of office visits multiplied by 100).
    ${ }^{4}$ Average number of drugs that were mentioned per 100 visits (number of drug mentions divided by total number of visits multiplied by 100)
    NOTE: Numbers may not add to totals because of rounding.

[^16]:    Based on Multum Lexicon second-level therapeutic drug category (see www.multum.com/lexicon.htm)
    ${ }^{2}$ Based on an estimated 1,897,015,000 drug mentions at office visits in 2006.
    ${ }^{3}$ Includes narcotic and nonnarcotic analgesics and nonsteroildal anti-inflammatory drugs.

[^17]:    Category not applicable.

    * Figure does not meet standards of reliability or precision
    ${ }^{1}$ Based on Multum Lexicon terminology, drug name reflects the active ingredient(s) of a drug mention.
    ${ }^{2}$ Based on Multum Lexicon second-level therapeutic drug category (see www.multum.com/lexicon.htm).

[^18]:    . . Category not applicable.
    ${ }^{1}$ Combined total of individual dispositions exceeds "all visits" because more than one may be reported per visit.
    ${ }^{2}$ P.R.N. is "as needed."

[^19]:    ${ }^{1}$ Only visits where a physician was seen are included
