# World Agricultural Production

## China Corn: Higher Area Offsets Lower Yields in Northeast China

China's 2007/08 corn production is estimated at 145.0 million tons, up 2.0 million or 1 percent from last month but down slightly from last year's revised crop of 145.5 million tons. Area is estimated at a record 28.0 million hectares, up more than 1 million hectares from last year, as rising worldwide demand for corn and high prices encouraged farmers to expand corn acreage. This is the third consecutive year of record planted area in China. The estimated yield of 5.18 tons per hectare is down from last year's record yield but close to the long term trend. Severe drought in Northeast China caused significant yield reductions, but other regions reported near to above normal yields this year.

According to preliminary harvest results, corn production in Jilin province dropped by 2 million tons in 2007/08 due to sharply lower yields. In Heilongjiang, production increased over last year only because the poor yields were offset by a major increase in planted area (up about 500,000 hectares). Lower yields were also reported in Inner Mongolia and Liaoning provinces due to drought. However, large corn crops are expected from other regions in China. Henan, Shandong, Hebei and other provinces on the North China Plain reported increased area and higher yields than last year, although untimely heavy rainfall in September may have caused some quality problems. Estimated production is higher than last year in the Sichuan basin, and normal yields are expected in southern China. (For more information, contact Paulette Sandene at 202-690-0133.)

## **China Wheat: Production Revised Upward**

China's 2007/08 wheat crop is estimated at 106.0 million tons, up 1.0 million or 1 percent from last month and up 1.5 million from last year's revised output of 104.5 million tons. Wheat area is unchanged this month at 23.1 million hectares, but yields were increased slightly to a record 4.59 tons per hectare. According to Chinese government statistics, the 2007/08 summer grain crop (mainly winter wheat) reached 115.35 million tons, up 1.5 million from the previous year, due to higher reported yields. Several key wheat-growing provinces (Henan, Hebei, Anhui, Shandong and others) reported bumper winter wheat crops for 2007/08. Among the reasons for the high yields were the expansion of area planted to high yield varieties, increased mechanization, and effective countermeasures against drought, pests, and diseases. *(For more information, contact Paulette Sandene at 202-690-0133.)*

## **China Rice: Higher Rice Area and Yields in 2007/08**

Rice production for 2007/08 is estimated at 129.5 million tons (milled basis), up 2.5 million or 2 percent from last month and 1 percent from last year's revised crop of 127.8 million tons. Rice area is unchanged at 29.6 million hectares, up 0.3 million from last year, while the estimated yield of 6.25 tons per hectare (rough basis) is up 2 percent from last month and up slightly from last year. The revision is based on preliminary harvest results from the national government and several important rice growing provinces.

According to the National Bureau of Statistics, the early rice crop reached an estimated 32.0 million tons in 2007/08, nearly unchanged from last year. Record rice production is expected in Northeast China due to expanded paddy area and excellent yields. Local officials reported that paddy rice production in Heilongjiang, Jilin, and Liaoning provinces increased by an estimated 3.5 million tons over last year. The high yields in the Northeast were achieved despite severe drought that caused corn and soybean yields to plummet. The single rice crop in the Huai River valley (Anhui, Jiangsu, and southern Henan) suffered from serious flooding this summer, but widespread replanting and aggressive countermeasures kept production losses to a minimum. Rice output in the Sichuan basin was reportedly better than last year's drought-impacted crop. In southern China, the late rice crop was hit by several typhoons in 2007, but overall growing conditions were generally favorable. Mostly dry and mild weather since mid-October has benefited the maturation and harvest of late rice south of the Yangtze River. *(For more information, contact Paulette Sandene at 202-690-0133.)*

## **Argentina: Record Yield Forecast for Wheat**

The USDA estimates Argentine wheat production for 2007/08 at 15.5 million tons, up 1.0 million from last month and up 0.3 million from last year. Area is estimated at 5.2 million hectares, up 0.2 million from last month and down 0.1 million from last year. Yield has increased nearly every year since 2002/03 and is forecast at a record 3.0 tons per hectare for 2007/08, marking a 44-percent increase over the past five years. The U.S. agricultural attaché in Buenos Aires reports that current conditions for wheat are excellent following beneficial rainfall and favorably warm weather. Crop conditions are similar to or better than last year in Buenos Aires, the country's top wheat province, and much better than last year in Cordoba, the second-largest wheat province. *(For more information, please contact Mark Lindeman at 202-690-0143.)*

## **Australia: Barley Production Lowered Following Persistent Dryness**

Australian barley production for 2007/08 is forecast at 5.5 million tons, down 0.7 million or 11 percent from last month, but up 1.7 million from last year. The area forecast is 4.0 million hectares, unchanged from last month, and unchanged from last year. Most winter barley areas recorded below average rainfall during the Australian summer. Opportunities for sowing barley diminished as the dryness persisted. The reduction in area resulting from dry planting conditions for barley was partially offset by the decision of some farmers to shift from wheat to barley. Barley can be sown later than wheat and this is done in years when rains do not arrive in time for timely wheat sowing, as occurred this season.

In the largest producing state of South Australia, a favorable start to the season was spoiled by mostly dry weather that continued into September causing a significant decline in crop condition. Scattered October rains were unable to offset the otherwise widespread dryness. Western Australia, the second major producing state, experienced the most favorable conditions of the season relative to the other states. Substantial rainfall in September and October provided some benefit to the Western Australia crop. In the third ranked producing state of New South Wales a severe drought has decimated the crop. Additional rainfall will not help the barley crop at this time though it would be beneficial for summer crops. Persistent dryness and lack of subsoil moisture in a major portion of Australia's barley region contributed to an estimated 15-percent drop in barley yield from the five-year average. The yield of 1.38 tons per hectare is the third lowest in the past 10 seasons. The two lowest yields occurred in the severe drought years of 2002/03 and 2006/07. *(For more information, please contact Jim Crutchfield at 202-690-0135.)*

## Australia's Dry October Reduces Estimated Yield

Australia wheat production for 2007/08 is forecast at 13.0 million tons, down 0.5 million or 4 percent from last month, but up 3.1 million or 31 percent from last year. The area forecast is 12.2 million hectares, unchanged from last month, but up 1.0 million or 9 percent from last year. Seasonal conditions have been variable across the major cropping regions of Australia. Since major sowing operations commenced in May, periods of dryness have plagued the Australian wheat producing states. September precipitation is the most influential factor for determining Australia wheat yield and was far below average for all wheat areas with the exception of Western Australia. October rainfall likely benefited crops in the west and northeast, but did not offset the continuation of the extremely dry situation of southeast Australia.

In the largest producing state of Western Australia, an unusually dry start to the season delayed sowing operations until rainfall arrived during July. August conditions were mostly warm and dry accompanied by low soil moisture reserves. Substantial September and October rainfall significantly benefited Western Australia's winter grain crop. In the southeastern producing states of Victoria and South Australia, crop conditions worsened despite some scattered rains during the past month. In the second largest producing state of New South Wales, an abnormally dry September and October severely reduced yield potential with no rain received in large expanses of the state's wheat belt. The persistent dryness and lack of subsoil moisture in a major portion of Australia's wheat region contributed to an estimated 28-percent drop in wheat yield from the five-year average. The yield, forecast at 1.07 tons per hectare, is the third lowest in the past 10 seasons, with the two lowest yields occurring in the severe drought years of 2002/03 and 2006/07. (*For more information, please contact Jim Crutchfield at 202-690-0135.*)

## India Rapeseed Loses Ground to Wheat

India's 2007/08 rapeseed production is forecast at 5.7 million tons, down 1.4 million from last month and down 0.1 million from last year. Area is estimated at 6.0 million hectares, down 1.4 million from last month and down 0.6 million from last year. According to the latest government data, the *rabi*/winter season rapeseed sowing progress is below that of last season for the same time period. The drop in rapeseed area from last season is due to recent changes in support price policy. Since the Minimum Support Price (MSP) established by the Government of India in October of this year is anticipated to favor wheat planting over rapeseed this season, as rapeseed area will likely shift into wheat particularly in the provinces of Haryana and Rajasthan. The wheat MSP for the current season was raised from 750 Rupees per 100 kilograms to a new high of 1000 Rupees. This is a 33 percent increase year-to-year; in contrast, the rapeseed MSP rose marginally by 5 percent on the year. Yield is currently forecast at 950 kilograms per hectare, slightly above the five-year average and 9 percent above last season. Rapeseed is predominantly a rain-fed winter crop and yield is heavily dependent on weather conditions from November until the flowering period which typically occurs in February. Sowing of the 2007/08 India rapeseed crop is currently underway and will be completed by December 2007. The main harvest will take place in March 2008. (*For more information, please contact Jim Cornfield at 202-690-0135.*)

## **Mexico: Sorghum Production Forecasted to Increase by 11 Percent from Previous Estimate**

The USDA forecasts Mexican sorghum area up by nearly 7 percent to 1.6 million hectares and production at 6 million metric tons or up 11 percent from the last month. According to Ministry of Agriculture (SAGARPA), planted area of spring/summer sorghum for 2007/08 has increased by 100,000 hectares. Producers are expanding production because of higher prices. The U.S. agricultural attaché in Mexico City reports that livestock producers switched from corn to sorghum as a result of higher corn prices, which contributed to a sorghum shortage in the country.

The increase in planted area occurred mainly in the state of Michoacán, Sinaloa, and Tamaulipas. Ideal growing conditions in these regions are expected to result in increased yields. Sorghum yields are forecast to increase by 4 percent from the last month. *(For more information, contact Arnella Trent 202-720-0881.)*

## **Nigeria's 2007/08 Corn Production Down Sharply from Last Year's Bumper Crop**

Nigeria's 2007/08 corn production is forecasted at 6.5 million tons, down 2.5 million tons from last month and down 1.3 million from last year. The reduction in production is due to several factors: less corn area planted as a result of very poor financial returns from last year's bumper crop; low prices at the time of planting this year; and high fertilizer prices. Corn area for 2007/08 is forecasted at 4.0 million hectares, down 1.2 million hectares from last month and down 0.7 million from last year. The estimated yield of 1.63 tons/ha is below last year's yield of 1.66 tons/ha and slightly below the 5-year average yield of 1.63. Insufficient and erratic rainfall in the northern grain belt was another factor impacting the reduced corn crop. Rains arrived in time for planting but a subsequent long dry spell forced many farmers to plant later than usual. After the dry spell, rain was adequate and harvest prospects were good. However, the rains ceased abruptly in mid-September, about three weeks earlier than normal, and reduced harvest prospects. As a result, forecast yields are less than the five-year average due to a combination of late plantings and early cessation of rains. *(For more information, please contact Curt Reynolds at 202-690-0143.)*

## **Pakistan Insect and Disease Infestation Threatens Cotton Crop**

Pakistan cotton production for 2007/08 is forecast at 9.75 million bales, down 1.25 million or 11 percent from last month and down 0.15 million from last year. Area is forecast at 3.25 million hectares, unchanged from last month and unchanged from last year. Area remains forecast at last year's record as a result of favorable prices for cotton. However, heavy rainfall during sowing resulted in poor germination in some of the growing areas. Other areas were sown later than the optimal planting window due to irrigation water shortages. Growing conditions have been mixed this season in part because of high temperatures in August and September which resulted in plants shedding bolls. More recently, damage from disease and pests have become more apparent. Relatively widespread attack by cotton leaf curl virus (CLCV) and mealy bugs have further reduced yield potential. On October 26, the Ministry of Agriculture reduced its production forecast to 10 million bales. Harvest is currently underway. It is estimated that less

than half of the crop has been harvested to date. A clearer picture of disease and insect pressure will be known as additional arrival data becomes available. *(For more information, please contact Jim Crutchfield at 202-690-0135.)*

## **Ukraine: Above-Average Corn Crop Despite Drought in Key Southern Region**

The USDA estimates Ukraine corn production for 2007/08 at 7.0 million tons, up 0.5 million from last month and up 0.6 million from last year. Harvested area is estimated at 1.9 million hectares, up 0.2 million from last year. Planted area increased by 15 percent from last year, to 2.2 million hectares, but a key question surrounding the 2007 harvest, and one unanswered by official progress reports, is how much of the area originally planted for grain was instead cut for silage due to unfavorable weather and low yield prospects in southern Ukraine. Above-normal temperatures, including frequently excessive heat at critical growth stages, prevailed throughout southern Ukraine from mid-May through early September. The Ministry of Agriculture reports that 6.2 million tons of corn had been harvested by October 25, with harvest 75 percent complete. Cumulative yield as of October 25 is reported to be above last year's level, with high yields in eastern and central Ukraine compensating for the low yields in the south. *(For more information, please contact Mark Lindeman at 202-690-0143.)*

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Branch, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-443), November 09, 2007.

World and Selected Countries and Regions

11/9/2007 8:49:02 AM

**TABLE 18**

The table below presents a 26-year record of the differences between the October projection and the final estimate. Using world wheat production as an example, changes between the October projection and the final estimate have averaged 7.6 million tons (1.4 percent) and ranged from -26.7 to 9.5 million tons. The October projection has been below the final 17 times and above the final 9 times.

**RELIABILITY OF PRODUCTION PROJECTIONS**

COMMODITY AND REGION	PROJECTION AND FINAL ESTIMATES, 1981/82 - 2006/07 1/

1/ The final estimate for 1981/82-2005/06 is defined as the first December estimate following the marketing year.

2/ May not total 25 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
