Introduction and Problem

Pricklypear cacti belong to the Cactaceae Family and the Genus *Opuntia*. In the United States, it is a large genus of cacti with approximately 93 species.

Pricklypear cacti are being threatened by the accidental introduction of the cactus moth (*Cactoblastis cactorum*) into Florida and its recent range expansion to Pensacola on the Gulf Coast and Charleston on the Atlantic Coast. This moth, native to Argentina, is expected to reach Alabama and Mississippi within the next year.

The caterpillars of this moth are capable of complete destruction of entire plants and stands of cacti. This exotic pest is expected to have a catastrophic effect on the landscape of the western states and Mexico, if its range expands beyond Louisiana.

Pricklypear in Mississippi

There are four common species of pricklypear (*Opuntia* spp.) native to Mississippi. Devil's-tongue (*Opuntia humifusa*), cockspur pricklypear (*O. pusilla*), and erect pricklypear (*O. stricta*) are native to Mississippi, while cow-tongue (*O. engelmannii*) is not. The fruit of the cow-tongue cactus, a southwest native, is sold in grocery stores throughout Mississippi. It is used in commercial and private landscapes as an ornamental. Cow-tongue cacti may persist at old home sites, but do not tend to be invasive. A key to these four common species can be found in the brochure.

Native species of pricklypear tend to be more frequent on dry sites, due to sandy or gravelly soils, or shallow soils over bedrock. Pricklypear are found throughout the state, from the old dunes of the barrier islands and adjacent mainland in the south to the chalk outcrops of the Blackland Prairies in the northeast to the sandy bluffs of central and southwestern Mississippi.

Web Database

An effort is being conducted to locate pricklypear populations in Mississippi. This information is in a web database at www.gri.msstate.edu/cactus_moth for public and government agency access. This information is being used by agencies to locate pricklypear populations for cactus moth monitoring.

Ways You Can Help

Assistance is needed from individuals who can volunteer to monitor stands of native cacti and ornamental cacti for presence of the cactus moth. In addition, reports of suspected infestations are needed. Individuals or groups willing to collaborate on this project should contact:

Richard L. Brown, PhD
Department of Entomology & Plant Pathology
Box 9775
Mississippi State, MS 39762-9775
Ph. 662-325-2085
Fax: 662-325-8837
E-mail: moth@ra.msstate.edu

Ways You Can Help

Information is urgently needed on locations where native and ornamental cacti are growing in Mississippi. Please send this information to:

Victor Maddox, PhD
GeoResources Institute
Box 9555
Mississippi State, MS 39762-9555
Ph. 662-325-2313
