Subject: River Operable Unit Remedial Investigation Data Summary Report
Bradford Island
Bonneville Dam Forebay, Cascade Locks, Oregon
Contract No W9128F-04-D-0001, Task Order No. DT06

Dear Mr. Gross:

Please find the analytical results for the post-removal action samples collected in February and March 2008. A summary of the sample collection was provided in the May 12, 2008 *Memorandum: Post-Removal Sample Collection*. The forebay and reference area sediment, clam, crayfish and water samples were analyzed in general accordance with the *Quality Assurance Project Plan, River Operable Unit Remedial Investigation*.

This summary report consists of the following:

- Sample location maps
- Tabulated data for each sample analyzed
- Quality control summary reports for analytical chemistry for sediment, tissue and water matrices, discussing the laboratory data quality and usability

The original laboratory data deliverables both the .pdf and electronic versions are available upon request.

This information will be utilized in the remedial investigation and risk assessment as provided in the *RI/FS Management Plan*.

Sincerely,
URS CORPORATION

Jeff Wallace, R.G.
Project Manager

ODEQ Sediment Bioaccumulation SLVs (2007)¹ (µg/kg dry)						Birds (Individual)	NE	NE	1.8										
						Mammals (Individual)	NE	NE	NE	NE	NE	44							
						Fish (Freshwater)	NE	NE	NE	NE	NE	22							
						Humans (Subsistence)	NE	NE	NE	NE	NE	0.046							

Notes:

µg/kg = microgram per kilogram

D = Dry Weight

EPA = U.S. Environmental Protection Agency

MRL = Method reporting limit

MDL = Method detection limit

NE = Not Established

ODEQ = Oregon Department of Environmental Quality

CAS = Columbia Analytical Services

SLVs = screening level values

J = The reported value is an estimate.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

 = The reported concentration exceeded one or more screening criteria listed.

1 = Table A-1 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, ODEQ, Final January 31, 2007.

2 = PCB Aroclors summed using all non-detect values as zero. If all values were non-detect the highest non-detect value was reported.

						Humans (Subsistence)	NE	NE	7.00	NE	NE	1.00	NE	NE	NE	17	0.070	NE	NE	NE	NE	NE	NE	NE

Notes:

mg/kg = milligram per kilogram

D = Dry Weight

EPA = U.S. Environmental Protection Agency

MRL = Method reporting limit

MDL = Method detection limit

NE = Not Established

ODEQ = Oregon Department of Environmental Quality

CAS = Columbia Analytical Services

SLVs = screening level values

J = The reported value is an estimate.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

 = The reported concentration exceeded one or more screening criteria listed.

1 = Table A-1 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, ODEQ, Final January 31, 2007.

Notes:

µg/kg = microgram per kilogram

D = Dry Weight

EPA = U.S. Environmental Protection Agency

MRL = Method reporting limit

MDL = Method detection limit

NE = Not Established

ODEQ = Oregon Department of Environmental Quality

CAS = Columbia Analytical Services

SIM = select ion monitoring

SLVs = screening level values

J = The reported value is an estimate.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

 = The reported concentration exceeded one or more screening criteria listed.

¹ = Table A-1 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, ODEQ, Final January 31, 2007.

Notes:

mg/kg = milligram per kilogram

D = Dry Weight

MRL = Method reporting limit

MDL = Method detection limit

CAS = Columbia Analytical Services

PSEP = Puget Sound Estuary Program Protocol

NWTPH = Northwest Total Petroleum Hydrocarbons Method

TPH-Dx = Total Petroleum Hydrocarbons-Diesel Range

J = The reported value is an estimate.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

ODEQ ATLs for Fish/Shellfish (2007)¹ (µg/kg wet)							Birds (Individual)	NE	NE	NE	35							
							Mammals (Individual)	NE	NE	NE	880							
							Humans³	NE	NE	NE	0.57							
ODEQ CTLs for Fish/Shellfish (2007)² (µg/kg wet)							Freshwater	NE	NE	NE	430							

Notes:

µg/kg = microgram per kilogram

ATL = Acceptable Tissue Levels

CTL = Critical Tissue Level

NE = Not Established

- = Not Analyzed

CAS = Columbia Analytical Services

D = Dry Weight

W = Wet Weight

ODEQ = Oregon Department of Environmental Quality

EPA = U.S. Environmental Protection Agency

MDL = Method detection limit

MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

4 = PCB Aroclors summed using all non-detect values as zero.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

JJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

Yellow background = The reported concentration exceeded one or more screening criteria listed.

Notes:

mg/kg = milligram per kilogram

ATL = Acceptable Tissue Levels

CTL = Critical Tissue Level

NE = Not Established

- = Not Analyzed

CAS = Columbia Analytical Services

D = Dry Weight

W = Wet Weight

ODEQ = Oregon Department of Environmental Quality

EPA = U.S. Environmental Protection Agency

MDL = Method detection limit

MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

JJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

Yellow background = The reported concentration exceeded one or more screening criteria listed.

ODEQ CTLs for Fish/Shellfish (2007)² (mg/kg wet)				Freshwater			NE	NE	6.60	NE	NE	0.15	NE	NE	NE	0.120	0.088 (inorganic)	NE	NE	NE	NE	NE

Notes:

mg/kg = milligram per kilogram
 ATL = Acceptable Tissue Levels
 CTL = Critical Tissue Level
 NE = Not Established
 - = Not Analyzed
 CAS = Columbia Analytical Services
 D = Dry Weight
 W = Wet Weight
 ODEQ = Oregon Department of Environmental Quality
 EPA = U.S. Environmental Protection Agency

MDL = Method detection limit

MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'U'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

Yellow background = The reported concentration exceeded one or more screening criteria listed.

ODEQ ATLs for Fish/Shellfish (2007) ¹ (µg/kg wet)							Birds (Individual)	NE	NE	NE	35								
							Mammals (Individual)	NE	NE	NE	NE	880							
							Humans ³	NE	NE	NE	NE	0.57							
ODEQ CTLs for Fish/Shellfish (2007) ² (µg/kg wet)							Freshwater	NE	430										

Notes:

µg/kg = microgram per kilogram
 ATL = Acceptable Tissue Levels
 CTL = Critical Tish Level
 NE = Not Established
 - = Not Analyzed
 CAS = Columbia Analytical Services
 D = Dry Weight
 W = Wet Weight
 ODEQ = Oregon Department of Environmental Quality
 EPA = U.S. Environmental Protection Agency
 MDL = Method detection limit

MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

4 = PCB Aroclors summed using all non-detect values as zero.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

[Redacted] = The reported concentration exceeded one or more screening criteria listed.

ODEQ ATLs for Fish/Shellfish (2007)¹ (µg/kg wet)							Birds (Individual)	NE	NE	NE	NE	35												
							Mammals (Individual)	NE	NE	NE	NE	NE	880											
							Humans³	NE	NE	NE	NE	NE	0.57											
ODEQ CTLs for Fish/Shellfish (2007)² (µg/kg wet)							Freshwater	NE	NE	NE	NE	430												

Notes:

µg/kg = microgram per kilogram
ATL = Acceptable Tissue Levels
CTL = Critical Tish Level
NE = Not Established
- = Not Analyzed
CAS = Columbia Analytical Services
D = Dry Weight
W = Wet Weight
ODEQ = Oregon Department of Environmental Quality
EPA = U.S. Environmental Protection Agency
MDL = Method detection limit

MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

4 = PCB Aroclors summed using all non-detect values as zero.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UU = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

☐ = The reported concentration exceeded one or more screening criteria listed.

Table 24
Crayfish Tissue Metal Analytical Results and Screening Criteria
Bradford Island - Remedial Investigation
Post-Removal Action Samples - Forebay
February/March 2008 Sampling Event

Sample Station	URS ID	Lab ID	Sample Date	Parameter			Metals (EPA SW-846) (units = mg/kg or ppm)

Notes:

mg/kg = milligram per kilogram
ATL = Acceptable Tissue Levels
CTL = Critical Tish Level
NE = Not Established
- = Not Analyzed
CAS = Columbia Analytical Services
D = Dry Weight
W = Wet Weight
ODEQ = Oregon Department of Environmental Quality
EPA = U.S. Environmental Protection Agency

MDL = Method detection limit
MRL = Method reporting limit

1 = Table A-3a in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

2 = Table A-4 in Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Oregon Department of Environmental Quality (ODEQ), Final January 31, 2007.

3 = Lowest values of either carcinogen or non-carcinogen criteria.

U = The analyte was not detected at or above the CAS MDL. The non-detect values reported in this table are CAS MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J = The reported value is an estimate.

Yellow background = The reported concentration exceeded one or more screening criteria listed.

Notes:

ng/L = nanogram per Liter

ppt = parts per trillion

MDL = Method detection limit

MRL = Method reporting limit

NE = Not Established

Axys = Axys Analytical Services

EPA = Environmental Protection Agency

SLVs = screening level values

1 = EPA National Recommended Water Quality Criteria, 2006. These SLVs are for the total phase of the analyte in the water column, which is calculated by adding respective column and filter fractions results for each sample.

2 = SLV is for Benzo(k)fluoranthene.

U = The analyte was not detected at or above the Axys MDL. The non-detect values reported in this table are Axys MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

J = The reported value is an estimate.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

 = The reported concentration exceeded one or more screening criteria listed.

EPA NRWQC (2006) for total PCBs (pg/L)¹			Chronic	14,000
			Human Health (Water+Organism)	64

Notes:

High volume water samples were collected using Infiltrax 300 sampling system supplied by Axys Environmental Systems. Water is pumped through a glass-wound filter and XAD resin column, each phase representing particulate and dissolved fractions, respectively.

Reported concentrations are calculated using total volume of water filtered.

Total PCBs are calculated by summing all 209 congeners, excluding results flagged as U, UJ, or J-EMPC.

Full list of congeners reported in tables 33 through 36.

EPA = Environmental Protection Agency

¹ = EPA National Recommended Water Quality Criteria, 2006. These SLVs are for total constituents in the water column.

 = The reported concentration exceeded one or more screening criteria listed.

Total PCBs ² (pg/L)		14.5	97.5	55.5	153	60.9	95.5
Total PCBs - Filter+Column (pg/L)			112	209		156	

Notes:

All congener results are in units of pg/L (picograms/Liter)

PCBs = Polychlorinated Biphenyls

MDL = Method detection limit

MRL = Method reporting limit

Axys = Axys Analytical Services

C = concentration represents coeluting congeners

U = The analyte was not detected at or above the Axys MDL. The non-detect values reported in this table are Axys MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

J = The reported value is an estimate.

UU = The analyte was not detected. The reported sample quantification limit is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

2=Total PCBs are calculated by summing all 209 congeners, excluding results flagged as U, UU, or J-EMPC.

Total PCBs² (pg/L)		22.4	154	26.3	138	24.0	153
Total PCBs - Filter+Column (pg/L)		177		164		177	

Notes:

All congener results are in units of pg/L (picograms/Liter)

PCBs = Polychlorinated Biphenyls

MDL = Method detection limit

MRL = Method reporting limit

Axys = Axys Analytical Services

C = concentration represents coeluting congeners

U = The analyte was not detected at or above the Axys MDL. The non-detect values reported in this table are Axys MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

J = The reported value is an estimate.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

2=Total PCBs are calculated by summing all 209 congeners, excluding results flagged as U, UJ, or J-EMPC.

Total PCBs² (pg/L)		21.0	109	22.5	149
Total PCBs - Filter+Column (pg/L)		130		172	

Notes:
All congener results are in units of pg/L (picograms/Liter)
PCBs = Polychlorinated Biphenyls
MDL = Method detection limit MRL = Method reporting limit
Axsy = Axsy Analytical Services
C = concentration represents coeluting congeners
U = The analyte was not detected at or above the Axsy MDL. The non-detect values reported in this table are Axsy MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.
J = The reported value is an estimate.
UJ = The analyte was not detected. The reported sample quantification limit is an estimate.
J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.
1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.
2=Total PCBs are calculated by summing all 209 congeners, excluding results flagged as U, UJ, or J-EMPC.

Total PCBs² (pg/L)		26.5	145	25.4	123
Total PCBs - Filter+Column (pg/L)		172		148	

Notes:

All congener results are in units of pg/L (picograms/Liter)

PCBs = Polychlorinated Biphenyls

MDL = Method detection limit

MRL = Method reporting limit

Axys = Axys Analytical Services

C = concentration represents coeluting congeners

U = The analyte was not detected at or above the Axys MDL. The non-detect values reported in this table are Axys MRLs. If an analyte was detected above the MDL, but below the MRL, that analyte was qualified and flagged 'J'.

J = The reported value is an estimate.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

2=Total PCBs are calculated by summing all 209 congeners, excluding results flagged as U, UJ, or J-EMPC.

RIVER OPERABLE UNIT REMEDIAL INVESTIGATION REPORT

QUALITY CONTROL SUMMARY REPORT FOR ANALYTICAL CHEMISTRY

SEDIMENT – FEBRUARY/MARCH 2008 SAMPLING EVENT

JULY 2008

TABLES

Table 1 Sediment Sample ID and Analysis Summary Following Report
Table 2 Sediment Qualifier Summary Following Report

1.0 Executive Summary

The overall assessment of the sediment sample results shows the quality of the data is acceptable to support project objectives. The contracted laboratory provided results for all requested analyses and laboratory data reports were complete. Some data were qualified as estimated and flagged 'J' or 'UJ'. Some data were qualified as not detected and flagged 'U'. All data qualifiers resulting from this review have been added to both the project database and the data tables within the main body of the River Operable Unit Remedial Investigation Report.

2.0 Project Description

URS collected and authorized analysis of 45 sediment samples during the remedial investigation near Bradford Island at Bonneville Dam between February 11 and March 20, 2008. Table 1 summarizes the sample locations, media, URS and analytical laboratory identification numbers and the requested analyses.

3.0 Sampling and Analytical Procedures

Samples were collected according to the Quality Assurance Project Plan (QAPP) *River Operable Unit Remedial Investigation* (URS 2007). Deviations from the QAPP (i.e. number and volume per each pre-determined sample location) are addressed in the Post-Removal Sample Collection Memorandum (URS 2008). Deviations in sample locations and sample size do not affect data usability. All sediment samples were submitted to Columbia Analytical Services (CAS) located in Kelso, WA and were assigned to one of three CAS sample delivery group identification numbers (K0801328, K0801769, or K0802371). Not all samples logged in under these sample delivery groups were authorized for analysis (i.e. only samples meeting project criteria were selected for analysis). Sediment was submitted in laboratory-provided 8oz glass containers, and each sample consisted of two to ten sample containers depending on availability of sample media at each location. CAS composited and homogenized all sample containers from each location using a mechanical mixer prior to subaliquoting for individual analyses. The remaining sediment is archived (frozen to -20°C) at CAS for potential future analyses.

The following table lists the parameters analyzed on one or more of the samples. Table 1 summarizes the specific requested analyses for each sample by URS and laboratory identification numbers.

Method	Analytical Parameter
EPA 8082M	Polychlorinated Biphenyls (PCBs) as Aroclors
EPA 6000/7000 series	Metals
EPA 8270C	Semi-Volatile Organic Compounds (SVOCs)
NWTPH-Dx (Ecology 1997)	Northwest Total Petroleum Hydrocarbons – Diesel and Residual Range (NWTPH-Dx)

Method	Analytical Parameter
Plumb (Plumb 1981)	Total Organic Carbon (TOC)
Gravimetric (EPA 1983)	Percent Solids
PSEP (PSEP 1996)	Grain Size

4.0 Data Validation

Analyses were performed in general accordance with the above-referenced methods. The analytical results for all samples were subjected to a quality assurance/quality control (QA/QC) review. This QA/QC review includes evaluation of representativeness (sample collection/handling), accuracy (spike and/or standard recoveries), analytical precision (duplicate relative percent difference), comparability (use of standard methods) and completeness (percent of usable data). Specifically, the following items were reviewed when appropriate: compliance with the QAPP, chain of custody (COC), laboratory case narrative, proper sample preservation and handling procedures, holding times, initial and continuing calibrations, quantitation limits, field/method/trip blank analyses, matrix/matrix spike duplicate recoveries, laboratory duplicate results, field duplicate results, blank spike recoveries (laboratory control samples), data completeness and format, data qualifiers assigned by the laboratory, and analyte identification. The following items were reviewed for 15% or greater of the data: primary and secondary column verification, instrument calibration and a verification of the reported electronic data with the hard copy deliverable. The data were reviewed in accordance with the QAPP (URS 2007). The data results were reviewed in accordance with the criteria specified in the DoD QSM (DoD 2006), the above-listed methods, and the following EPA guidance documents in that order; EPA's *Contract Laboratory Program National Functional Guidelines (EPA NFGs) for Organic Data Review* (USEPA 1999) and EPA's *NFGs for Inorganic Data Review* (USEPA 2004). Project-specific QC criteria are listed in the QAPP (URS 2007).

A summary of qualifiers assigned to results in this investigation is included in Table 2. Samples are represented by their URS sample identification assigned in the field as well as the laboratory identification. The laboratory was requested to report analytical results above the method detection limit (MDL) but below the method reporting limit (MRL). These results were flagged 'J' by CAS and are not included in Table 2 for simplicity. These 'J' qualifiers are included in the database and are included in the data tables included in the main body of this report. Qualifiers that may be assigned to the results of this investigation include the following:

- U - The analyte was analyzed for but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
- DNR - Do Not Report. Another value is available that is more reliable or appropriate.

Final sample results and qualifiers are presented in the analytical tables provided in the sampling report.

4.1 Chain-of-Custody, Sample Preservation and Holding Time

URS frequently submitted sediment samples to CAS throughout the six-week collection period. CAS archived all sample sediment by freezing to -20°C until authorization was given by URS to begin homogenization and analysis. The chain-of-custody (COC) forms indicate that samples were maintained under proper chain-of-custody and forms were signed upon release and receipt. All samples were sent via CAS courier in wet ice and were received and logged in by the laboratory on the same day. All coolers were submitted at temperatures within the EPA-recommended temperature of 6°C or below. Due to the length of the sampling event (six weeks) and the multitude of COC forms for sediment, CAS has included COC forms for the entire sampling event but not in every deliverable, therefore the COC forms must be evaluated concurrently for the three sediment sample delivery groups. Additionally, one of the COC forms associated with sample delivery group K0802371 was inadvertently left out, URS received this COC form from CAS as part of the sample confirmation and it is acceptable. It has been included as an addendum to the original K0802371 data deliverable.

The sample dates for the following three samples were misreported within the data reports, listed below and in Table 1 are the correct sample collection dates.

- K0801328-003 – February 11, 2008
- K0802371-015 – March 11, 2008
- K0802371-016 – March 11, 2008

Holding times listed in the QAPP were not explicit in specifying times for samples archived frozen with the exception of PCBs. Holding times listed in the Washington State Department of Ecology's document *The Development of Sediment Sampling and Analysis Plans* (Ecology 2008) were used for comparison (as shown below).

Quality Control Summary Report

Analytical Parameter	Hold Time (Table 10, Ecology 2008)
Polychlorinated Biphenyls (PCBs)	1 year (Frozen, -18°C) (as reported in QAPP)
Metals	1 year (Frozen, -18°C)
Mercury	28 days (Frozen, -18°C)
Semi-Volatile Organic Compounds (SVOCs)	1 year (Frozen, -18°C)
Northwest Total Petroleum Hydrocarbons – Diesel Range (NWTPH-Dx)	6 months (Frozen, -18°C)
Total Organic Carbon (TOC)	6 months (Frozen, -18°C)
Percent Solids	6 months (Frozen, -18°C)
Grain Size	6 months (4°C) (as reported in QAPP)

All sediment samples were analyzed within the above-listed holding times with the following exception:

- The 28-day hold time for mercury was exceeded for sample K0801328-003 by one day and sample K0802371-009 by three days. These sample results were flagged 'J' due to hold time exceedance.

4.2 Instrument Calibration

The laboratory performed initial multipoint calibrations for all target and surrogate compounds as required by the analytical methods. Initial calibrations (ICALs) and continuing calibrations (CCALs) were analyzed at the proper frequency and at the appropriate concentrations required by the methods.

Instrument calibrations were acceptable for all sample analyses performed with the following exception:

- One of the five CCALs for Aroclor 1016 measured on the confirmation column exceeded the DoD QSM percent difference (%D) limits of $\pm 20\%$ in the ICAL value at 21%. The CCAL for the primary column and the remaining four CCALs (primary and confirmation columns) were acceptable. Aroclor 1016 was not detected in any associated project samples in this sequence. No qualifiers were assigned to the data based on this ICAL.

4.3 Review of Blanks

Method blanks were used to check for laboratory contamination and instrument bias. The laboratory analyzed at least one method blank for each analysis and for each batch, per QAPP requirements. Field blanks were not collected as part of this analytical program. Qualification of samples due to method blank contamination followed guidelines set forth in the EPA NFGs.

Organic sample results less than five times (5x) and inorganic sample results (or common laboratory organic contaminants such as phthalates) less than ten times (10x) the method blank concentration and between the method detection limit (MDL) and the method reporting limit (MRL) were qualified as non-detect and flagged with a 'U' at the MRL. When sample results were less than 5x (or 10x for phthalates) the blank concentration but above the MRL, the reported result was qualified as non-detect and flagged 'U'. Target compounds detected in the method blank but reported as not detected in the associated samples were not qualified. Target compounds reported with concentrations greater than 5x (or 10x) the blank concentration were not qualified. For solid matrices reported in both wet and dry weight concentrations, the above-noted guidelines were applied using the wet weight results and any qualifiers assigned were also assigned to the dry weight results. All analytes were reported as not detected in the associated method blanks with the following exceptions:

- Residual range organics (RRO) were detected in the method blank associated with sample delivery group K0802371. All associated sample results were detected at concentrations less than 5x the method blank concentration and between the MRL and MDL and were flagged 'U' at the MRL.
- Di-n-butyl phthalate, butyl benzyl phthalate and bis(2-ethylhexyl) phthalate were detected in the method blanks associated with sample delivery groups K0802371 and K0801328. All samples had at least one of these phthalates detected at concentrations less than 10x the method blank concentrations. The associated results were flagged 'U' according to the criteria outlined above (see Table 2 for specific analytes in each sample).
- Metals (aluminum, cadmium, cobalt, copper, lead, thallium) were detected at concentrations between the MDL and the MRL in the method blank associated with sample delivery group K0802371. All sample results were greater than 10x the method blank concentrations with the exceptions of cadmium in samples K0802371-005, K0802371-007, K0802371-008 and K0802371-010 and thallium in samples K0802371-002, K0802371-005, K0802371-006, K0802371-007 and K0802371-008, K0802371-010 and K0802371-013. These results were flagged 'U' according to the criteria outlined above (see Table 2).
- Copper was detected in the method blank associated with sample delivery group K0801328 at a concentration between the MDL and the MRL. All sample results were more than 10x the method blank concentration; therefore, data were not qualified based on this method blank detection.
- Aluminum and thallium were detected in the method blank associated with sample delivery group K0801769. Thallium was detected at a concentration between the MDL and the MRL and aluminum was detected at a concentration above the MRL. All sample concentrations were more than 10x the method blank concentration; therefore, data were not qualified based on this method blank detection.

- TPH results associated with sample delivery group K0801769 were analyzed in two extraction batches. Method blanks associated with both extraction batches had detections between the MDLs and the MRLs. Extraction batch KWG0803324 had a detection of diesel range organics (DRO). All associated DRO results were more than 5x the method blank concentration; therefore, data were not qualified based on this method blank detection. Extraction batch KWG0803155 had a detection of residual range organics (RRO). Samples K0801769-009, K0801769-011, K0801769-023, K0801769-029, and K0801769-030 had RRO concentrations less than 5x the method blank concentration and were flagged 'U' at the respective MRLs.

4.4 Surrogate Recovery Review

Each sample analyzed for organic compounds was spiked with surrogates (system monitoring compounds). Surrogate recoveries are a measure of accuracy for the overall analysis of each individual sample. When more than one surrogate per fraction (acid or base/neutral) was spiked in the sample, PAHs and/or SVOCs were qualified if two or more surrogate recoveries for a given fraction exceeded DoD QSM sample criteria. When only one surrogate per fraction was spiked, all sample results associated with that fraction were qualified when the surrogate recovery exceeded DoD QSM sample criteria. Surrogate recoveries were acceptable for all analyses with the following exceptions:

- The SVOC surrogate recovery for 2-fluorobiphenyl in sample K0801769-018 was below the lower DoD QSM limit of 45% at 39%. While above the lower control limits, surrogate recoveries for phenol-d6 and nitrobenzene-d5 were comparatively low with recoveries of 43% and 41% respectively, in this sample. All detected SVOC results in sample K0801769-018 were previously flagged 'J' by the laboratory due to detections between the MDL and the MRL. All SVOCs reported as not detected in this sample were qualified as estimated and flagged 'UJ' based on low recoveries for three of the four surrogate compounds. These low recoveries appear to be isolated within this single sample.

4.5 Laboratory Control Samples and Matrix Spike/Matrix Spike Duplicate Review

Laboratory control/laboratory control duplicate (LCS/LCSD) samples are used to monitor the laboratory's day-to-day performance of routine analytical methods independent of matrix effects and to assess accuracy for the target compounds. Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to assess the ability of the laboratory to recover the target compounds from the sample matrix. At least one LCS and one MS/MSD were performed for each analysis and for each batch per method requirements.

LCS/LCSD and MS/MSD recoveries were acceptable for all analytical tests with the following exceptions:

- The percent recoveries for antimony in all three of the of the MS/MSD pairs associated with the three sample delivery groups were below lower DoD QSM control limit of 80%.
 - K0802371-001: MS/MSD = 44% and 30%, respectively.
 - K0801328-004: MS/MSD = 36.5% and 40.7%, respectively.
 - K0801769-021: MS/MSD = 41.5% and 43.3%, respectively.

All associated LCS and post-digestion spike recoveries indicate analytical batches were in control. All associated antimony results were reported at concentrations between the MDL and the MRL and are flagged 'J.' Further qualification is not required; however, the antimony concentrations represented in these samples are potentially biased low.

- The percent recovery for aluminum in the MS performed on sample K0801769-21 exceeded DoD QSM criteria; however, the aluminum concentration in this sample was greater than 4x the spike concentration, thereby preventing accurate evaluation of the spike recovery. The data were not qualified based on MS recoveries for aluminum.
- The percent recoveries for mercury and vanadium in the MSD performed on sample K0801769-21 exceeded DoD QSM criteria. The percent recoveries in the MS and post-digestion spike and the relative percent differences (RPDs) for the MS/MSD pair were within acceptance criteria. The samples were not qualified based on these MSD recoveries.
- The percent recoveries for many SVOCs in the MS performed on sample K0802371-013 were low. The percent recoveries in the MSD were all within control limits; however, due to the low MS recoveries, the RPDs for the MS/MSD pair are above the DoD QSM control limit. The MS recovery losses appear to be isolated to this single MS and appear to be an error in the MS sampling and not a matrix interference because the MSD recoveries are acceptable for sample K0802371-013. Data was not qualified based on the MS or RPD recoveries.
- The percent recoveries for acenaphthene, fluorene, anthracene, and fluoranthene were below the DoD QSM lower limits in the MS performed on sample K0801769-021. The percent recoveries in the MSD and RPDs for MS/MSD pair were within the control limits. Fluorene and fluoranthene also had low recoveries in the associated LCS (as stated below). Only fluorene and fluoranthene were qualified and flagged 'UJ' in sample K0801769-021 based on the low MS recoveries and low LCS recoveries for this QC batch. Acenaphthene and anthracene were not qualified solely on MS recoveries.
- The LCS associated with K0801769 had percent recoveries below the DoD QSM lower limits for fluorene, di-n-butyl phthalate and fluoranthene. The results for these analytes were qualified as estimated and flagged 'J' or 'UJ' for all samples in sample delivery group K0801769 unless previously qualified as estimated based on reported concentrations between the associated MDLs and MRLs.

4.6 Duplicate Review

Field duplicates were not collected during this sampling event due to the statistical nature of the sampling event (as discussed in detail in the QAPP). To evaluate laboratory precision, CAS performed duplicate analyses (i.e. LCS/LCSD and MS/MSD) as discussed above. All values were acceptable with the following exceptions:

- The RPD for bis(2-ethylhexyl) phthalate for the MS/MSD pair performed on sample K0801769-021 was outside the 30% control limit at 62%. This analyte was previously qualified as estimated and flagged with a 'J' due to the concentration between the MDL and the MRL. Further qualification is not required based on the RPD.
- The RPDs for pyrene and indeno(1,2,3-cd)pyrene for the LCS/LCSD pair associated with sample delivery group K0801769 were above the 30% DoD QSM control limit at 36% and 32%, respectively. All associated detections for pyrene in this sample delivery group with the exception of K0801769-029 were previously flagged 'J' due to detections between the MDL and the MRL. Further qualification of these results was unnecessary. The result for pyrene in sample K0801769 -029 was qualified as estimated and flagged 'J'. All reported concentrations for indeno(1,2,3-cd)pyrene were likewise previously qualified as estimated and flagged with a 'J' due to detections between the MDL and the MRL. Results reported as not detected were qualified as estimated and flagged 'UJ'.

4.7 Compound Quantification

All second column confirmation performed by CAS on Method 8082 were acceptable.

4.8 Reporting Limits

If sample concentrations were detected below the MRL but above the MDL, they were qualified as estimated by the laboratory and flagged with a 'J'. All laboratory J-flagged results are considered estimates. As stated above, these flags are recorded within the database and are reported in the data tables included in the main body of this report.

5.0 Completeness

The laboratory reported all requested analytes and the deliverable data reports were complete. Some data were qualified as estimated and flagged with a 'J' or a 'UJ.' Some laboratory data was qualified as not detected and flagged with a 'U'. A summary of qualifiers can be found in Table 2.

The electronic and portable delivery format (.pdf) versions of the deliverables were cross-checked for accuracy at a frequency of 20% or greater. Any minor discrepancies found between

the deliverables were reported to CAS and corrected by updating the database to reflect the .pdf deliverable.

- *Technical Completeness* = (number of useable results/total reported results) x100
= (2,315 compliant / 2,315 total results) = 100%

All samples results are considered useable.

- *Analytical Completeness* = (number of unqualified results/total reported results) x100
= (2162 compliant / 2,315 total results) = 93%

Data were qualified non-detect 'U' and some as estimated 'UJ' or 'J'. Data qualified 'J' due to detections between the MRL and the MRL were not included in this calculation.

- *Contract Completeness* = (number of contract compliant results/total reported results) x100
= (2,313 compliant / 2,315 total results) = 99%

All samples analyzed met laboratory contract requirements with the exception of two samples analyzed outside of the 28 day hold time for mercury. Due to the staged sampling event, sample authorization was not given to CAS until a few days prior to the hold time expiration for these samples.

- *Field Sampling Completeness* = (number samples collected/total reported results) x100
= (45 compliant / 45 total results) = 100%

All samples collected and submitted to CAS for analysis had a complete set of results. All samples had sufficient sample volume to analyze the full analyte list as detailed in the QAPP.

Table 1 Clam and Crayfish Sample ID and Analysis Summary Following Report
Table 2 Clam and Crayfish Qualifier Summary Following Report

1.0 Executive Summary

The overall assessment of the tissue sample results shows the quality of the data is acceptable to support project objectives. The contracted laboratories provided all requested analyses and delivered data reports were complete. Some data were qualified as estimated and flagged with a 'J' or 'UJ'. Some data were qualified as not detected and flagged with a 'U'. All data qualifiers resulting from this review have been added to both the project database and the data tables within the main body of the River Operable Unit Remedial Investigation Report.

2.0 Project Description

URS collected and authorized analysis of 36 crayfish and 37 clam samples (for a total of 73 tissue samples) during the remedial investigation near Bradford Island at Bonneville Dam between February 11 and March 19, 2008. Table 1 summarizes the sample locations, media, URS and analytical laboratory identification numbers, and the requested analyses.

3.0 Sampling and Analytical Procedures

Samples were collected according to the Quality Assurance Project Plan (QAPP) *River Operable Unit Remedial Investigation* (URS 2007). Deviations from the sampling collection (i.e. number and volume per each pre-determined sample location) are addressed in the Post-Removal Sample Collection Memorandum (URS 2008). Deviations in sample locations and sample size do not affect data usability. Three crayfish samples (08021902CF, 08022003CF and 080314105CF) had insufficient sample volume to complete SVOC and PAH analyses as indicated in Table 1. The remaining 70 tissue samples had sufficient volume to analyze those analytes listed in the QAPP.

All samples were submitted to Columbia Analytical Services (CAS) located in Kelso, WA and logged in by the laboratory under five CAS sample delivery groups (K0801325, K0801458, K0801772, K0802375 and K0802503). Not all samples logged in under these sample delivery groups were authorized for analysis (i.e only tissue samples meeting project criteria were selected for analysis). The following table lists the parameters analyzed on one or more of the samples. Table 1 summarizes the specific analyses requested for each sample by URS and the corresponding laboratory identification numbers. (Note: SVOCs and PAHs were analyzed separately for tissue matrices and are discussed separately in this report).

Method	Analytical Parameter
EPA 8082M	Polychlorinated Biphenyls (PCBs) as Aroclors
EPA 6000/7000 series	Metals

Method	Analytical Parameter
EPA 1631-Modified	Methyl Mercury
EPA 8270C-SIM	Semi-Volatile Organic Compounds (SVOCs)
EPA 8270C-SIM	Polynuclear Aromatic Hydrocarbons (PAHs)
Puget Sound Estuary Program (PSEP 1996)	Percent Lipids
Freeze Dry	Percent Solids

4.0 Data Validation

Analyses were performed in general accordance with the above-referenced methods. The analytical results for all samples were subjected to a quality assurance/quality control (QA/QC) review. This QA/QC review includes evaluation of representativeness (sample collection/handling), accuracy (spike and/or standard recoveries), analytical precision (duplicate relative percent difference), comparability (use of standard methods) and completeness (percent of usable data). Specifically, the following items were reviewed when appropriate: compliance with the QAPP, chain-of-custody (COC), laboratory case narrative, proper sample preservation and handling procedures, holding times, initial and continuing calibrations, quantitation limits, field/method/trip blank analyses, matrix/matrix spike duplicate recoveries, laboratory duplicate results, field duplicate results, blank spike recoveries (laboratory control samples), data completeness and format, data qualifiers assigned by the laboratory, and analyte identification. The following items were reviewed on 15% or greater of the data: primary and secondary column verification, instrument calibration and a verification of the reported electronic data with the hard copy deliverable. The data were reviewed in accordance with the QAPP (URS 2007). The data results were reviewed in accordance with the criteria contained in the DoD QSM (DoD 2006) and the above-listed methods and the following EPA guidance documents in that order; EPA's *Contract Laboratory Program National Functional Guidelines (EPA NFGs) for Organic Data Review* (USEPA 1999) and EPA's *NFGs for Inorganic Data Review* (USEPA 2004). Project-specific QC criteria are listed in the above-mentioned QAPP.

A summary of qualifiers assigned to results in this investigation is included in Table 2. Samples are represented by their URS sample identification assigned in the field as well as the laboratory identification. The laboratory was requested to report analytical results above the method detection limit (MDL) but below the method reporting limit (MRL). These results were flagged 'J' by CAS and are not included in Table 2 for simplicity. These 'J' qualifiers are included in the database and are included in the data tables included in the main body of the remedial investigation report. Qualifiers that may be assigned to the results of this investigation include the following:

- U - The analyte was analyzed for but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
- DNR - Do Not Report. Another result is available that is more reliable or appropriate.

Final sample results and qualifiers are presented in the analytical tables provided in the sampling report.

4.1 Chain-of-Custody, Sample Preservation and Holding Time

Clam samples were stored on ice prior to shucking by URS and then archived by freezing to -20°C in laboratory-provided 16oz glass containers prior submission to CAS. Crayfish were euthanized by freezing, and then they were weighed and measured prior to submission to CAS in laboratory-provided 16oz glass containers. URS frequently submitted both clam and crayfish samples to CAS throughout the six-week collection period. CAS archived all sample tissue frozen (-20°C) until authorization was given by URS to begin homogenization and analysis.

The chain-of-custody (COC) forms indicate that samples were maintained under chain-of-custody protocols and forms were signed upon release and receipt. All samples were sent via CAS courier in wet ice and were received and logged in by the laboratory on the same day. All coolers were submitted at temperatures within the EPA-recommended temperature of 6°C or below.

All samples were analyzed within the technical and contracted holding time with the following exceptions:

- The QAPP specified hold time is 28 days (frozen) for both mercury and methyl mercury. The short hold time of 28 days for inorganic mercury is due to the loss of analyte from evaporation. The DoD QSM does not stipulate hold times for methyl mercury; therefore, 28 days was selected as a conservative value for the QAPP. CAS lyophilizes (freeze dries) a portion of all tissue samples for mercury, methyl mercury and percent solid

analyses. All tissue samples were freeze-dried prior to the typical 28 day hold time. The DoD QSM does not stipulate hold times for samples preserved by freeze drying. However, EPA Method 1631 (*Total Mercury in Tissue, Sludge, Sediment and Soil by Acid Digestion*) states freeze dried tissue can be stored unrefrigerated in a low-mercury atmosphere for a maximum of 1 year. There is no specific hold time guidance for methyl mercury analysis on freeze dried samples; however, the 1 year hold time stated above was deemed appropriate for methyl mercury as well. Tissue samples were not flagged based on hold time due to the samples being freeze dried prior to analysis.

4.2 Instrument Calibration

The laboratory performed initial multipoint calibrations for all target and surrogate compounds as required by the analytical methods. Initial calibrations (ICALs) and continuing calibrations (CCALs) were analyzed at the proper frequency and at the appropriate concentrations required by the methods.

Instrument calibrations were acceptable for all tissue sample analyses performed with the following exception:

- The ICAL for di-n-octyl phthalate exceeded the individual DoD QSM relative standard deviation (RSD) limit of $\leq 15\%$ at 17.5%. The alternate criteria presented both in the DoD QSM (p.139) and EPA guidance was met. Additionally, the CCALs for this analyte were within the control limits. No qualification was assigned to the data based on this ICAL.

4.3 Review of Blanks

Method blanks were used to check for laboratory contamination and instrument bias. The laboratory analyzed at least one method blank for each analysis and for each analytical batch, per QAPP requirements. Field blanks were not collected as part of this analytical program. Qualification of samples due to method blank contamination followed guidelines set forth in the EPA NFGs.

Organic sample results less than five times (5x) and inorganic sample results (or common laboratory organic contaminants such as phthalates) less than ten times (x10) the method blank concentration and between the method detection limit (MDL) and the method reporting limit (MRL) were qualified as non-detect and flagged with a 'U' at the MRL. When sample results were less than 5x (or 10x) the blank concentration but above the MRL, the reported result was qualified as non-detect and flagged with a 'U'. Target compounds detected in the method blank but reported as not detected in the associated samples were not qualified. Target compounds reported with concentrations greater than 5x (or 10x) the blank concentration were not qualified. For solid matrices reported in both wet and dry weight concentrations, these guidelines were applied using wet weight results and any flags applied were also applied to the dry weight

results. All analytical tests indicate non-detects for method blanks with the following exceptions:

Clams

- Di-n-butyl phthalate was detected in the method blanks associated with sample delivery groups K0801325 and K0801772 at a concentration above the MRL (K0801325) and at a concentration below the MRL (K0801772). Samples K0801325-002, K0801325-006, K0801772-015, and K0801772-016 had results for di-n-butyl phthalate less than 10x the method blank concentration and were between the MDL and the MRL. These results were qualified as not detected and flagged 'U' at the MRL.
- PAHs in sample delivery group K0802503 were reextracted due to low surrogate recoveries (discussed below). The method blank associated with the reextraction (laboratory batch KWG0803570) had low-level detections for anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3,-cd)pyrene, dibenzo(a,h)anthracene and benzo(g,h,i)perylene. The concentrations for the above-noted PAHs in the samples associated with this method blank (all samples in sample delivery group K0802503 and samples K0801772-010 and K0801772-020 (reextracts)) were greater than 5x the method blank concentrations, with the exception a few analytes in samples K0802503-002 and K0802503-005 (see Table 2). The results for PAHs with concentrations less than 5x the method blank concentrations in samples K0802503-002 and K0802503-005 are qualified as not detected and flagged with a 'U'.

Crayfish

- Mercury was detected in the method blank associated with sample delivery group K0802375 at a concentration above the MDL, but below the MRL. All sample results were greater than 10x this concentration; therefore, data were not qualified based on this method blank detection.
- Di-n-butyl phthalate was detected in the method blank associated with sample delivery group K0801458 at a concentration above the MRL. Samples K0801458-003, K0801458-004, K0801458-008, K0801458-010, K0801458-012, K0801458-015 and K0801458-016 had concentrations for di-n-butyl phthalate less than 10x the method blank concentration and were qualified as not detected and flagged 'U' as described above and as indicated in Table 2.
- Di-n-butyl phthalate was detected in the method blank associated with sample delivery group K0802375 at a concentration below the MRL. Samples K0802375-003, K0802375-007, K0802375-008, K0802375-010, K0802375-012 through K0802375-018, K0802375-024 and K0802375-025 had concentrations for di-n-butyl phthalate less than

10x the method blank concentration and were qualified as not detected and flagged 'U' as described above and as indicated in Table 2.

- Fluoranthene, pyrene and benzo(g,h,i)perylene were detected in the method blank associated with sample delivery group K0802375 at concentrations between the MDL and the MRL. All associated sample results for these analytes were reported at concentrations between the MDL and the MRL; therefore, results less than 5x the method blank concentration were qualified as not detected and flagged 'U' at the MRL (see Table 2 for specifics).

4.4 Surrogate Recovery Review

Each sample analyzed for organic compounds was spiked with surrogates (system monitoring compounds). Surrogate recoveries are a measure of accuracy for the overall analysis of each individual sample. As noted above, PAHs and SVOCs were analyzed separately for all tissue matrices and both analyses utilized three surrogates. When more than one surrogate per fraction (acid or base/neutral) was spiked in the sample, PAHs and/or SVOCs were qualified if two or more surrogate recoveries for a given fraction exceeded DoD QSM sample criteria. When only one surrogate per fraction was spiked, all sample results associated with that fraction were qualified when the surrogate recovery exceeded DoD QSM sample criteria. Surrogate recoveries were acceptable for all analyses with the following exceptions:

Clams

- The percent recoveries for PAH surrogates fluorene-d10 and fluoranthene-d10 were below the lower DoD QSM control limit of 60% for some samples in extraction batch KWG0803121 associated with sample delivery group K0801772 (as shown below).

	<u>fluorene-d10</u>	<u>fluoranthene-d10</u>
K0801772-004	52	56
K0801772-010	34	32
K0801772-019	48	53
K0801772-020	36	44

PAHs in this sample delivery group were reported from a combination of an undiluted analysis and a 5x dilution and the surrogates fluorene-d10 and fluoranthene-d10 for those above-listed samples were outside control limits for both runs (those shown above are from the full-strength run). All PAHs for these samples were qualified and flagged 'J/UJ' based on surrogate recoveries.

- The PAH surrogate recoveries associated with sample delivery group K0802503 were below the DoD QSM control limits (extraction batch KWG0803122). The entire analytical batch was reextracted for PAHs under extraction batch KWG0803570. All results were reported from the secondary analysis; therefore, the original results were flagged 'DNR'. All surrogate recoveries in the secondary analysis were acceptable with

the exception of fluorene-d10 and fluoranthene-d10 in sample K0802503-004 which had recoveries below the lower DoD QSM control limit of 60%. Results for sample K0802503-004 were reported from a combination of an undiluted analysis and a 5x dilution. The surrogate fluorene-d10 was below the lower control limit in both runs and fluoranthene-d10 was below the limit in the 5x dilution (most PAHs are reported from the 5x dilution). All PAH sample results were flagged 'UJ/J' for sample K0802503-004 based on surrogate recoveries.

- The percent recovery for the PAH surrogates fluoranthene-d10 and terphenyl-d14 in sample K0801325-012 were below the lower DoD QSM limits of 60% and 30% with recoveries of 59% and 24%, respectively. All PAHs in sample K0801325-012 were flagged 'J/UJ' to indicate potential low bias.

4.5 Laboratory Control Samples and Matrix Spike/Matrix Spike Duplicate Review

Laboratory control/laboratory control duplicate (LCS/LCSD) samples are used to monitor the laboratory's day-to-day performance of routine analytical methods independent of matrix effects and to assess accuracy for the target compounds. Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to assess the ability of the laboratory to recover the target compounds from the sample matrix. At least one LCS and one MS/MSD for each analysis and for each batch were analyzed per method requirements.

LCS/LCSD and MS/MSD recoveries were acceptable for all analytical tests with the following exceptions:

Clams

- The MS/MSD performed on sample K0802503-005 had percent recoveries above DoD QSM limits for di-n-octyl phthalate and di-n-butyl phthalate. Both analytes were non-detect in the parent sample. The associated LCS and calibration standards indicate that the analytical batch was in control. Therefore, results for di-n-octyl phthalate and di-n-butyl phthalate were not qualified based on MS/MSD recoveries.
- The MSD percent recovery for sample K0802503-005 was below the DoD QSM control limit of 45% for bis(2-ethylhexyl) phthalate at 43%. Additionally, the RPD for the MS/MSD pair was above the 30% control limit at 33%. The associated MS, LCS and calibration standards indicate that the analytical batch was in control. The sample result for bis(2-ethylhexyl) phthalate was qualified as estimated and flagged 'J' in sample K0802503-005 due to the MSD and RPD results.
- MS/MSD percent recoveries were above the upper control limits for di-n-butyl phthalate and di-n-octyl phthalate in the MS/MSD performed on sample K0801772-007. The associated phthalates were non-detect in the parent sample. The associated MS, LCS and

calibration standards indicate that the analytical batch was in control. Analytical results for K0801772-007 were not qualified based on potential bias high MS recoveries.

- MS/MSD percent recoveries were above the upper control limit for di-n-butyl phthalate, butyl benzyl phthalate, bis(2-ethylhexyl) phthalate, and di-n-octyl phthalate in the MS/MSD performed on sample K0801325-005. The associated phthalates were non-detect in the parent sample with the exception of bis(2-ethylhexyl)phthalate which was previously qualified 'J' by the laboratory due to sample results being between the MRL and the MDL. No further qualification was necessary.
- LCS/LCSD percent recoveries associated with sample delivery group K0801325 were above the upper control limit for di-n-butyl phthalate, butyl benzyl phthalate, and di-n-octyl phthalate. The associated phthalates were not detected above the MRL in the associated samples. There were detections reported between the MDL and the MRL for di-n-butyl phthalate in samples K0801325-002 and K0801325-006; however, these detections were previously flagged 'J' by the laboratory. Further estimation of the data due to the potential high bias based on the LCS/LCSD recoveries was not necessary.

Crayfish

- MS/MSDs for copper were analyzed on four crayfish samples (two each from sample delivery groups K0802375 and K0801458). Either one or both of the MS/MSD recoveries in each of the four pairs were below the DoD QSM lower control limit of 80%, with values ranging from 58.5% to 77.4%. Associated QA/QC including LCS, SRM, post-spike and calibration standards indicate that the analytical batch was in control. All copper results in the crayfish samples were flagged 'J' to indicate the potential low bias in this matrix.
- An MS/MSD for aluminum was analyzed in sample K0802375-005 and had recoveries below the DoD limit of 80% at 67.8% and 62.2%, respectively. An MS/MSD analyzed for mercury in sample K0802375-007 had recoveries below the DoD QSM limit of 80% at 66.4% and 73.8%, respectively. Associated QA/QC including LCS, SRM, post-digestion spike and calibration standards indicate that the analytical batches were in control. MS/MSDs analyzed in similar crayfish matrixes were within control limits; therefore, only the parent samples were flagged 'J' to indicate potential low bias for aluminum and mercury in these samples.
- An MS/MSD analyzed for lead in sample K0801458-020 had percent recoveries below the DoD QSM limit of 80% at 73.2% and 75.2%, respectively. Associated QA/QC including LCS, SRM, post-digestion spike and calibration standards indicate that the analytical batch was in control. MS/MSDs analyzed in similar crayfish matrixes were within control limits, therefore only the parent sample was flagged 'J' to indicate potential low bias for lead in this sample.

- The MSD performed on sample K0802375-007 had percent recoveries below the DoD QSM limit of 80% for aluminum at 64.3% and copper at 65.9%. The MS, RPD and other QA/QC criteria were in control for this sample. The sample results were not flagged based solely on the MSD percent recoveries for aluminum and copper.
- The MS performed on sample K0802375-008 had a percent recovery below the DoD QSM limit of 80% for lead at 77.6% and the MS performed on sample K0802375-013 had a percent recovery below the lower limit of 80% for zinc at 72.9%. The MSDs, RPDs, and other QA/QC criteria were in control for these samples. The sample results were not flagged based solely on the MS percent recoveries.
- The percent recovery for lead in one of the standard reference material (SRM) samples (N.R.C.C Dorm-2) was slightly above the CAS control limits of 0.091 mg/kg with a concentration of 0.095 mg/kg in sample delivery group K0801458. The associated QA/QC samples including SRM (N.R.C.C. Tort-2) and the LCS indicate the analysis was in control. Data were not qualified based on the SRM recovery.

4.6 Duplicate Review

Field duplicates were not collected during this sampling event due to the statistical nature of the sampling event (as discussed in detail in the QAPP). To evaluate laboratory precision, CAS performed duplicate analyses (i.e. LCS/LCSD and MS/MSD) as discussed above. No samples were qualified based exclusively on duplicate precision.

4.7 Compound Quantification

Clam and Crayfish

- During the second column confirmation performed by CAS on Method 8082, the sample results for K0802503-001, K0802503-006, and K0801325-010 exceeded the confirmation column agreement criterion of RPD < 40% for Aroclor 1254 and were flagged 'P' by the laboratory. The lower of the results from the analyses on the two columns was selected for reporting due to the apparent interferences observed in the chromatogram for the column with the higher concentration. The sample results for Aroclor 1254 were qualified as estimated and flagged 'J' in the above listed samples.
- Two SRM samples were used to evaluate copper. One SRM (N.R.C.C Dorm-2) associated with sample delivery group K0801772 was above the CAS control limit (i.e. 3.23 mg/kg versus the control of 3.00 mg/kg). The concentration of copper in this SRM is near the sensitivity limit of the instrument. The LCS, MS, calibrations and the second SRM (31.2 mg/kg) were within control limits. Samples were not qualified due to the SRM recovery.

4.8 Reporting Limits

If sample results were detected at concentrations below the MRL but above the MDL, they were identified by the laboratory and flagged with a 'J'. As stated above, these flags are recorded within the database and are reported in the data tables included in the main body of this report.

5.0 Completeness

The laboratory reported all requested analyses and the deliverable data reports were complete. Some data were qualified as estimated and flagged with a 'J' or a 'UJ'. Some data were qualified as not detected and flagged with a 'U.' A summary of qualifiers can be found in Table 2.

Samples K0801772-010 and K0801772-020 were reextracted and reanalyzed in extraction lot KWG0803570. The primary results were flagged 'DNR' and data were reported from the reextracted analyses.

The electronic and .pdf versions of the deliverables were cross-checked for accuracy at a frequency of 20% or greater. Any minor discrepancies found between the deliverables were reported to CAS and corrected by updating the database to reflect the .pdf deliverable.

- *Technical Completeness* = (number of useable results/total reported results) x100
= (3,371 compliant / 3,371 total results) = 100%

All samples results are considered usable. In the case of the few samples reextracted and reanalyzed, the original samples flagged 'DNR' were not included in these calculations.

- *Analytical Completeness* = (number of unqualified results/total reported results) x100
= (3,174 compliant / 3,371 total results) = 94%

Data were qualified non-detect and flagged 'U' and some as estimated and flagged 'J' or 'UJ.' Data qualified 'J' due to detections between the MRL and the MRL were not included in this calculation.

- *Contract Completeness* = (number of contract compliant results/total reported results) x100
= (3,371 compliant /3,371 total results) = 100%

All samples analyzed met laboratory contract requirements.

- *Field Sampling Completeness* =(number samples collected/total reported results) x100
= (70 compliant / 73 total results) = 96%

All samples collected and submitted to CAS for analysis had acceptable results with the exception of the 3 crayfish samples which had inadequate sample volume for the SVOC analyses.

1.0 Executive Summary

The overall assessment of the grab water and high volume water sample results shows the quality of the data is acceptable to support project objectives. The contracted laboratories provided all requested analyses and delivered data reports were complete. Some data were qualified as estimated 'J' or 'J-EMPC' and some as non-detect 'U'. All data qualifiers resulting from this review have been added to both the project database and the data tables within the main body of the River Operable Unit Remedial Investigation Report.

2.0 Project Description

URS collected and authorized analysis of 11 grab water samples (10 primary and one field duplicate) and 11 high volume water samples (10 primary and one field blank) during the remedial investigation near Bradford Island at Bonneville Dam between February 11 and March 20, 2008. Tables 1 summarizes the sample location, media, URS and laboratory identification numbers and the requested analyses.

3.0 Sampling and Analytical Procedures

Samples were collected according to the Quality Assurance Project Plan (QAPP) *River Operable Unit Remedial Investigation* (URS 2007). Deviations from the QAPP protocol were not necessary, specific details of the sample collection are addressed in the Post-Removal Sample Collection Memorandum (URS 2008). Briefly, high-volume water samples were collected using an Infiltrax 300 Organic Sampling System (Infiltrax) supplied by Axys Environmental Systems in Sidney, British Columbia, Canada. Water is pumped in series through a wound-glass filter to remove particulate-bound analytes, and through a column packed with macroporous resin (XAD resin) where dissolved-phase analytes are absorbed. During this field effort, approximately 600 liters of water were filtered for each sample. The filter and column at each sample location were analyzed separately to represent the particulate and dissolved phase of the water column. Flow rate was measured both on the Infiltrax's internal digital flow meter and verified periodically by hand using a graduated cylinder and a stopwatch. The reported concentrations are calculated using the total volume from the digital flow meter. Additionally, grab water samples were collected at each sample station using a peristaltic pump and dedicated tubing.

All Infiltrax samples were submitted to Axys Analytical Services, Ltd. Located in Sidney, British Columbia (Axys) for analysis. Grab water samples were sent to Columbia Analytical Services (CAS) located in Kelso, WA. Axys uses specialized methods to analyze PAHs and phthalate esters, these methods are modeled after EPA Method 1668A, in that target concentrations are determined by either isotope dilution or isotopically labeled internal standards using high resolution gas chromatography/low resolution mass spectroscopy (HRGC/LRMS). Sample-specific detection limits are also calculated similar to EPA 1668A.

Axys provides details about these methods in the case narratives within the data deliverables. The PAH and phthalate ester data qualifiers applied during this review are similar to those applied to the congener data.

The following table lists the parameters analyzed on one or more of the samples. Axys was not able to analyze for two analytes in the project-specific SVOC list (carbazole and p-cresol), the remaining four analytes in the project-specific SVOC list were phthalate esters and therefore, Axys refers to the SVOCs as phthalates esters in the reporting of the data. For clarity, the SVOCs are referred to as phthalate esters in this report. Table 1 summarizes the specific requested analyses for each media by URS and laboratory identification numbers.

Method	Analytical Parameter
EPA 1668A (Axys MLA-010) – HRGC/HRMS	Polychlorinated Biphenyls (PCBs) – Congeners
Axys MLA-021 – HRGC/LRMS	Polycyclic Aromatic Hydrocarbons (PAHs)
Axys MLA-027 – HRGC/LRMS	SVOCs (Phthalate Esters)
NWTPH-Dx (Ecology 1997)	Northwest Total Petroleum Hydrocarbons – Diesel Range (NWTPH-Dx)
415.1	Total Organic Carbon (TOC)
415.1	Dissolved Organic Carbon (DOC)
EPA 300.0	Chloride, Sulfate
EPA 353.2	Nitrate/Nitrite

HR – High Resolution
 LR – Low Resolution
 GC – Gas Chromatography
 MS – Mass Spectrometry

4.0 Data Validation

Analyses were performed in general accordance with the above reference methods. The analytical results for all samples were subjected to a quality assurance/quality control (QA/QC) review. This QA/QC review includes evaluation of representativeness (sample collection/handling), accuracy (spike and/or standard recoveries), analytical precision (duplicate relative percent difference), comparability (use of standard methods) and completeness (percent of usable data). Specifically, the following items were reviewed when appropriate: compliance with the QAPP, chain of custody (COC), laboratory case narrative, proper sample preservation and handling procedures, holding times, initial and continuing calibrations, quantitation limits, field/method/trip blank analyses, matrix/matrix spike duplicate recoveries, laboratory duplicate results, field duplicate results, blank spike recoveries (laboratory control samples), data completeness and format, data qualifiers assigned by the laboratory, and analyte identification. The following items will be reviewed on 15% or greater of the data: primary and secondary

column verification, instrument calibration and a verification of the reported electronic data with the hard copy deliverable.

The data were reviewed in accordance with the Quality Assurance Project Plan (QAPP) *River Operable Unit Remedial Investigation* (URS 2007). Additionally, because the QAPP-referenced *Department of Defense Quality Systems Manual* does not discuss PCB congeners, the data review process utilized guidance from EPA's *Contract Laboratory Program National Functional Guidelines (EPA NFGs) for Chlorinated Dibenzo-p-Dioxins (CDDs) and Chlorinated Dibenzofurans (CDFs) Data Review (September 2005)* and *EPA Region 10 Standard Operating Procedure (SOP) for the Validation of Method 1668 Toxic, Dioxin-like*. For the specialized PAH and phthalate ester method developed by Axys, laboratory derived quality criteria in conjunction with the above listed guidance were used in this review.

All remaining non-congener data results were reviewed in accordance with the criteria contained in the DoD QSM (DoD QSM, 2006) and the above listed methods and the following EPA guidance documents in that order; EPA's *NFGs for Organic Data Review (USEPA 1999)* and EPA's *NFGs for Inorganic Data Review (USEPA 2004)*. Project-specific QC criteria are listed in the above mentioned QAPP. A summary of qualifiers assigned to results in this investigation as part of this review is included in Table 2. Samples are referenced by both by their URS sample identification assigned in the field as well as the laboratory identification. CAS was requested to report analytical results above the method detection limit (MDL) but below the method reporting limit (MRL). These results were flagged 'J' by CAS Kelso and are not included in Table 2. Non-detect values for PCBs, PAHs and SVOCs (phthalate esters) as analyzed by Axys are reported at their respective sample-specific detection limits as discussed above. Qualifiers that may be assigned to the results of this investigation include the following:

- U - The analyte was analyzed for but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- J-EMPC – The analyte was not positively identified; the associated numerical value is the **Estimated Maximum Potential Concentration** of the analyte in the sample used only for PCB congener results.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

- DNR - Do Not Report

Final sample results and qualifiers are presented in the analytical tables provided in the sampling report.

4.1 Chain-of-Custody, Sample Preservation and Holding Time

Grab Water Samples

The chain-of-custody (COC) forms indicate that samples were maintained under chain of custody and forms were signed upon release and receipt, with the exception of one COC form associated with sample delivery group K0802104. This COC form was not signed by URS upon release to the sample courier, the sample courier did sign the COC and all samples arrived intact at the laboratory. Data within this sample delivery group were not qualified based on missing COC signature.

All samples were sent via CAS courier in wet ice and were received and logged in the same day. All coolers were submitted at temperatures within the EPA-recommended temperature of 6°C or below. Data were not qualified based COC or cooler temperature.

The QAPP stated unpreserved sample containers would be used for TPH samples, however HCl preserved containers were used to extend the holding time from 7 to 14 days per guidance from the NWTPH method. All water samples were analyzed within the technical and contracted holding times.

Infiltrax Samples

Infiltrax columns and filters were stored at or below 6°C by URS until the completion of the last Infiltrax sampling event. All Infiltrax samples were shipped with gel ice packs via FedEx to Axys on March 17, 2008. The chain-of-custody (COC) forms indicate that samples were maintained under chain of custody, and forms were signed upon release and receipt. All Infiltrax samples were analyzed within the technical holding times.

4.2 Instrument Calibration

The laboratory performed initial multipoint calibrations for all target and surrogate compounds as required by the analytical methods. Initial calibrations (ICAL) and continuing calibrations (CCAL) were analyzed at the proper frequency and at the appropriate concentrations required by the methods.

Grab Water

Instrument calibrations were acceptable for all samples analyses performed.

Infiltrax (congeners)

Initial calibrations (ICALs) and continuing calibration verifications (CCVs) were reviewed for PCB congener analyses. The laboratory performed initial multipoint calibrations for all target and surrogate compounds as required by the Method 1668A. ICALs, CCVs and OPR (ongoing precision recovery) standards were analyzed at the proper frequency and at the appropriate concentrations required by EPA Method 1668A. All calibration compounds analyzed associated with the Infiltrax samples meet the acceptance criteria as listed in Method 1668A.

Infiltrax (PAHs and phthalate esters)

ICAL and CCVs were reviewed for PAHs and phthalate esters. Similar to Method 1668A the ICAL is performed using a series of solutions including the suite of labeled surrogates and recovery standards that encompass the working concentration range of the instrument. CCVs are analyzed bracketing the samples as well as once every twelve hours. All calibration compounds analyzed associated with the Infiltrax samples meet Axys derived acceptance criteria.

Labeled Internal Standard Recovery Review (Infiltrax samples only)

PCB congeners

PCB congener samples were spiked with labeled internal standards prior to extraction or cleanup. These standards are used to quantitate target congeners and the calculations of target compound concentrations are designed to compensate for low extraction and/or cleanup efficiencies. In addition, their recovery is measured against labeled injection standards added after extraction and cleanup to evaluate extraction and/or cleanup efficiency which could affect sensitivity and could also affect accuracy for target compounds not quantitated against a chemically identical, isotopically labeled standard. The percent recovery of the labeled standards is compared with the limits set forth in EPA Method 1668A. All recoveries were acceptable.

Cleanup standards are added prior to cleanup and quantitated using injection standards added just prior to analysis to evaluate cleanup efficiency. The cleanup standards were within the 30-135% control limits set by EPA Method 1668A.

PAHs and phthalate esters

Similar to the above mentioned Method 1668A, labeled standards are spiked into the sample prior to the beginning of analysis. These labeled standards (called 'surrogates' within the Axys data packages) are deuterated versions of the PAH and phthalate ester parent analytes. All samples are recovery-corrected based on the concentration of these labeled standards. The percent recovery of these deuterated standards were within Axys derived control limits with the following exceptions:

- d4-dimethyl phthalate associated with sample L10998-4 was below the Axys control limit of 40% with 33.5%. As stated above all results are recovery corrected, therefore the results for dimethyl phthalate were not flagged based this labeled standard recovery.

Cleanup standards are not used for PAH and phthalate ester analysis.

4.3 Review of Blanks

Method blanks were used to check for laboratory contamination and instrument bias. The laboratory analyzed at least one method blank for each analysis and for each batch, per QAPP requirements. Qualification of samples due to method or field blank contamination followed guidelines set forth in the EPA NFGs .

Grab Water

For organic and inorganic analyses, sample results less than five times (5x) (or 10x for phthalates) the method blank or field blank concentration and between the method detection limit (MDL) and the method reporting limits (MRL) were flagged as non-detect 'U' at the MRL. When sample results were less than 5x (or 10x for phthalates) the blank concentration but above the MRL, the reported result was qualified as non-detect 'U'. Target compounds detected in the method but reported as not detected in the associated samples were not qualified. Target compounds reported with concentrations greater than 5x the blank concentration were not qualified. For inorganic analyses initial and continuing calibration blanks were examined in addition to the standard method blank samples. Field blanks were not collected for the grab water during this sampling event. All analytical tests indicate non-detects for method blanks with the following exceptions:

- Chloride was detected in the method blank below the MRL in sample delivery group K0801765. All sample results were above 5x the method blank concentration therefore, data were not qualified based on this method blank detection.
- Arsenic, beryllium, copper and thallium were detected in the continuing calibration blank (CCB) below the MRLs in sample delivery group K0801765. All associated detected results were greater than 10x the CCB concentrations with the exception of arsenic in samples K0801765-003 Diss and K0801765-005 Diss, cadmium in samples K0801765-003 and K0801765-005 and thallium in samples K0801765-001, K0801765-001 Diss, K0801765-003, K0801765-003 Diss, K0801765-005 and K0801765-005 Diss. Results for these samples were flagged 'U' following guidance described above.
- Aluminum, antimony, mercury and nickel were detected below the MRLs in the method blank and beryllium was detected below the MRL in the continuing calibration blank in sample delivery group K0801289. All associated detected results were greater than 10x the MB concentrations with the exception of aluminum in sample K0801289-001, K0801289-001 Diss, K0801289-002 and K0801289-002 Diss, results for aluminum were flagged 'U' at the MRL.
- Antimony and mercury were detected below the MRLs in the method blank in sample delivery group K0801530. All samples results were non-detect for mercury. All associated detected results for antimony were below the MRL and above the MDL. Detected results for antimony for samples K0801530-005, K0801530-005 Diss and K0801530-009 were flagged 'U' at the MRL.

- Residual Range Organics (RRO) were detected below the MRL in the method blank in sample delivery groups K0801289 and K0801530. Samples results detected below 5x the MB concentration and below the MRL and were flagged 'U' at the MRL.
- Arsenic, beryllium, cadmium, copper and thallium were detected in the continuing calibration blank (CCB) below the MRLs in sample delivery group K0802104. All associated detected results were greater than 10x the CCB concentrations with the exception of arsenic in samples K0802104-001 and K0802104-001 Diss, cadmium in sample K0802104-001 and thallium in sample K0802104-001. Results for these samples were flagged 'U' as described above.

Infiltrax

Sample results that were reported as detected at a concentration less than five times (5x) (or 10x for phthalates) the associated method blank concentration were flagged 'U' or non-detect at the reported concentration. Target compounds reported with concentrations greater than 5x (or 10x for phthalates) the laboratory or field blank concentration were not qualified. Target compounds detected in the method blank but reported as not detected in the associated samples were not qualified.

Method 1668A stipulates using a method blank as similar to the sample matrix as possible. Method blanks were prepared using clean filters and XAD resin. Method blank analytical results were non-detects with the exception of some PCB congeners and phthalate esters.

A field blank was collected on the Infiltrax to measure background levels of chemicals of potential concern in the atmosphere, instrument tubing and XAD column and filters. The field blank was collected by pumping laboratory provided deionized (6 liters) water through the Infiltrax system. Field blank analytical results were non-detects with the exception of some PCB congeners, PAHs and phthalate esters.

The sample concentrations in the data deliverables are reported as picograms per liter (pg/L) or absolute picograms measured divided by volume (in liters) pumped through the Infiltrax system. Since the volume of each sample varies and the method blank and field blank do not have comparable volumes to the samples, both the blank comparisons were performed using the absolute picograms concentrations. Picograms concentrations were calculated by multiplying the total volume (in liters) by the reported concentration in pg/L. Tables 4 and 5 indicate the results that were qualified non-detect 'U' based on method blank and field blank concentrations.

4.4 Surrogate Recovery Review

Each sample analyzed for organic compounds other than the HRGC/HRMS and HRGC/LRMS analyses was spiked with surrogates (system monitoring compounds) prior to extraction. Surrogate recoveries are a measure of accuracy for the overall analysis of each individual sample. Surrogate recoveries were acceptable for all analyses with the following exceptions:

- Surrogates o-terphenyl and n-triacontane in the LCS standard for NWTPH in sample delivery group K0802104 had recoveries above control limits of 150% with 152% and

155% respectively. All samples were non-detect, therefore data were not qualified based on the potential high bias indicated by the recoveries of the surrogates.

- Surrogate recoveries for o-terphenyl and n-triacontane in the LCS associated with the NWTPH analysis for sample delivery group K0801289 were below the lower control limits of 50%. The duplicate LCS and all other surrogate recoveries within project samples were within the control limits, the bias low recoveries appears to be isolated to the single LCS sample, data were not qualified based on surrogate recoveries in the LCS.

4.5 Infiltrax Sampling Recovery Standards

Analytes can both adsorb and desorb from the XAD resin during the high volume sampling process. In order to understand analyte retention on the XAD resin during sampling, labeled standards are spiked onto the Infiltrax columns prior to sample collection. Axys spiked carbon-13 labeled PCBs (PCB 31, PCB 95 and PCB 153) as well as deuterated anthracene (d10-anthracene) onto the Infiltrax columns prior to shipment to URS. High recoveries of these labeled standards suggest little to no net loss of adsorbed analytes on the XAD column during this sampling event. The recoveries of these analytes shown in Table 6 and are presented in the Axys data deliverables as 'client standards'.

4.6 Laboratory Control Samples and Matrix Spike/Matrix Spike Duplicate Review

Laboratory control samples (LCS) are used to monitor the laboratory's day-to-day performance of routine analytical methods, independent of matrix effects and to assess accuracy of the analysis for the target compounds. Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to assess the ability of the laboratory to recover the target compounds from the sample matrix. At least one LCS and one MS/MSD for each analysis and for each batch per method requirements. MS/MSD samples are not required for PCB congener analysis and not used for PAHs and phthalate esters as analyzed per Axys method. Ongoing precision and recovery (OPR) samples are used in place of LCS to monitor laboratory performance.

LCS, OPR and MS/MSD recoveries were acceptable for all analytical tests with the following exceptions:

- The LCS associated with the NWTPH-Dx analysis in sample delivery group K0801269 had low surrogate recoveries as discussed above. LCS recoveries for this LCS sample were also low. The low recoveries appear to be isolated with the LCS, the duplicate LCS recoveries were within control limits and the associated surrogates in the samples were acceptable. NWTPH-Dx results were not considered to need qualification as estimated based on the LCS recoveries.
- OPR recovery of acenaphthene was over the Axys derived control limit of 130% with 152% in DPW25236, all associated sample results for acenaphthene in the XAD filters were non-detect. Therefore, data was not qualified based on the potential high bias indicated by the high OPR recovery.

4.7 Duplicate Review

A field duplicate was collected at one grab water sampling location by simultaneously filling duplicate sets of laboratory-provided sample containers to verify acceptable field sampling techniques and representativeness of sample aliquots to the medium sampled. Field duplicates were not collected for the Infiltrax samples. The RPD for field duplicates was calculated when both sample results were greater than 5x the reporting limit. Field duplicate precision was acceptable.

To evaluate laboratory precision, CAS performed duplicate analyses (i.e. LCS/LCSD and MS/MSD) as discussed above. All values were expectable with the following exceptions:

- As previously discussed the LCS for NWTPH-Dx in sample delivery group K0801289 had low recoveries, resulting in RPD values for the LCS/LCSD pair being outside the control limits. The data were not considered to need qualification as estimated due to the LCS recoveries and likewise the RPD values for the reasons described above under LCS evaluation.

4.8 Compound Quantification

As detailed in Table 2, some congener results were qualified as non-detect due to method blank contamination. Results were qualified as non-detect at the MRL; therefore, these non-detect results do not have elevated detection limits which should be considered by the data user as part of evaluating the data for end-use objectives.

The internal standard method is used to calculate concentrations of PCB congeners that do not have chemically identical labeled standards. The internal standard method is dependent upon consistent detector response over the calibration range. If the detector response varies, concentrations can be biased high or low based on variations in the detector sensitivity. During congener analysis, PFK (perfluorokerosene) is used as a lock mass reference standard to measure changes in detector sensitivity. Each lock mass must not vary more than 20% throughout its respective retention time window as required by Method 1668A. Variations of more than 20% indicate the presence of a co-eluting interference or decreased sensitivity. A slight deviation was seen in the lock mass spectra associated with the mono-chlorinated PCBs in the XAD filter samples (DPWG25357). This deviation in lock mass did not effect the quantification of the target PCBs. No congener results were qualified based on lock mass variations.

4.9 Compound Identification

Ion abundance ratios are used to identify PCB congeners, PAHs and phthalate esters. Results that met all other qualitative identification criteria but were more than 15% different from the theoretical ion abundance criterion for PCBs as set by EPA Method 1668A are flagged in the laboratory report with a 'K' flag. PAHs and phthalate esters with relative ion abundance ratios

greater than 20% different from the opening calibration values are flagged 'K'. Those results flagged 'K' with ion abundance ratios outside the identified quantitation criteria are considered estimated maximum possible concentrations (EMPC) and were re-flagged 'J-EMPC' during this review. If the analyte result was previously qualified 'U' by method blank detection, the result retained the 'U' qualifier and it was not qualified further because an ion ratio was out of limits (there is no ion ratio criterion for non-detects). J-EMPC qualifiers are shown in Tables 4 and 5, the database has been updated and the flags will appear in any future data tables that are created from the project database.

Ion ratios outside the control limits are generally a consequence of co-eluting interferences to either one or both quantitation peaks. In these cases, Axys chose to use the quantitation peak areas as recorded; no adjustments were made to force the peaks to match the theoretical ion abundance ratios. EMPC results should be considered by the data users as part of evaluating the data for end-use objectives.

4.9 Reporting Limits

If sample concentrations were detected below the MRL but above the MDL, they were identified by CAS and flagged estimated, 'J'. This laboratory flag was carried over to a "J" as the URS Review Qualifier and is recorded in the database and in the data tables included in the main body of this report.

5.0 Completeness

The laboratory reported all requested analyses and the deliverable data reports were complete. Some results were considered to be estimated and were qualified 'J', 'J-EMPC' and others were considered non-detects, 'U', based on blank contamination. A summary of qualifiers can be found in Tables 2 through 5.

The electronic and pdf versions of the deliverables were cross-checked for accuracy at a frequency of 20% or greater. Any minor discrepancies found between the deliverables were reported to the associated laboratory and corrected by updating the database to reflect the .pdf deliverable.

- *Technical Completeness* = (number of useable results/total reported results) x100
= (5,742 compliant / 5,742 total results) = 100%

All samples results are considered useable.

- *Analytical Completeness* = (number of unqualified results/total reported results) x100
= (4,732 compliant / 5,742 total results) = 82%

Data were qualified non-detect 'U' and some as estimated 'J' of 'J-EMPC'. Data qualified 'J' due to detections between the MRL and the MRL were not included in this calculation.

- *Contract Completeness* = (number of contract compliant results/total reported results) x100
= (5,742 compliant /5,742 total results) = 99%

All samples analyzed met laboratory contract requirements.

- *Field Sampling Completeness* =(number samples collected/total reported results) x100
11 grab water + 22 Infiltrax = 33 samples collected
=(33 compliant / 33 total results) =100%

All samples collected and submitted to CAS and Axys for analysis had a complete set of results. All samples had sufficient sample volume to analyze the full analyte list as detailed in the QAPP.

Notes:

J = The reported value is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

K = Peak detected but did not meet quantification criteria; the reported value may be interpreted as an 'estimated' maximum possible concentration.

NE = Not Established

ng/L = nanogram per Liter

ppt = parts per trillion

U = The analyte was not detected above the reported MRL.

UJ = The analyte was not detected. The reported sample quantification limit is an estimate.

Notes:

All results are in units of pg/L (picograms/Liter)

C = concentration represents coeluting congeners

U = The analyte was not detected above the reported sample quantification limit.

J = The reported value is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

K = A peak was detected that did not meet all criteria for identification as the target analyte; the reported value is the estimated maximum possible concentration of analyte present.

Non-detect values reported at the analytical reporting limit

PCBs = Polychlorinated Biphenyls

RL = method reporting limit

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

Notes:

All results are in units of pg/L (picograms/Liter)

C = concentration represents coeluting congeners

U = The analyte was not detected above the reported sample quantification limit.

J = The reported value is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

K = A peak was detected that did not meet all criteria for identification as the target analyte; the reported value is the estimated maximum possible concentration of analyte present.

Non-detect values reported at the analytical reporting limit

PCBs = Polychlorinated Biphenyls

RL = method reporting limit

¹ = When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

Notes:

All results are in units of pg/L (picograms/Liter)

C = concentration represents coeluting congeners

U = The analyte was not detected above the reported sample quantification limit.

J = The reported value is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

K = A peak was detected that did not meet all criteria for identification as the target analyte; the reported value is the estimated maximum possible concentration of analyte present.

Non-detect values reported at the analytical reporting limit

PCBs = Polychlorinated Biphenyls

RL = method reporting limit

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

Notes:

All results are in units of pg/L (picograms/Liter)

C = concentration represents coeluting congeners

U = The analyte was not detected above the reported sample quantification limit.

J = The reported value is an estimate.

J-EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.

K = A peak was detected that did not meet all criteria for identification as the target analyte; the reported value is the estimated maximum possible concentration of analyte present.

Non-detect values reported at the analytical reporting limit

PCBs = Polychlorinated Biphenyls

RL = method reporting limit

1= When two or more congeners can not be resolved in the chromatogram they are considered to be 'coeluting' and are reported as a single concentration. This concentration is reported once for all the coeluting congeners, to eliminate possible errors during congener summation.

Notes:

Alys spiked carbon-13 labeled PCBs and deuterated anthracene onto the Infiltrax columns prior to shipment to URS. High recoveries of these standards indicate little to no loss of adsorbed analytes during the sampling event.
