Our establishment itself has a sound monitoring system in operation to prevent and control the outbreak of poultry diseases like Avian Enfluenza and to ensure the wholesomeness and healthfulness of products precessed in the establishment. Based on past experience, the Chinese government has taken effective measures in response to the outbreaks; the establishments themselves have also taken actions against their own potential defects. In spite of outbreaks in some areas of China, the exports of Chinese poultry products to Japan and other coutries/regions have never been stopped, which showed that countries/regions like Japan still have confidence in our products and the effectivenesss of the actions we have taken.

We think it is not necessary for American citizens to panic the imports of Chinese poultry products. AI is neither a problem of an establishment, nor of a country/region, but a problem that can be controlled and solved by effective measures and actions in an establishment, or a country/region.
