## **EXECUTIVE SUMMARY**

### **PURPOSE**

The provisions of Food and Agricultural Code (FAC) section 13144(b) require the Department of Pesticide Regulation (DPR) to annually report to the Legislature, the Office of Environmental Health Hazard Assessment, and the State Water Resources Control Board information regarding the status of the ground water protection data gaps of pesticidal active ingredients registered for agricultural use, the pesticide active ingredients with data exceeding specific numerical values (SNVs), and sales and use information. The ground water protection data for each active ingredient include information on certain physical and chemical properties and environmental fate. Active ingredients with properties that exceed the SNVs established by DPR are considered to have the potential to contaminate ground water. These active ingredients are listed in this report and include tables with information on the reported sale and use in California.

### **BACKGROUND**

The Pesticide Contamination Prevention Act (PCPA) of 1985 established a set of data requirements for identifying and tracking potential and actual ground water contaminants. The PCPA directed DPR to establish SNVs and compare the data as a basis to estimate their relative risk to ground water and to undertake a process to determine whether they have contaminated ground water. The PCPA establishes procedures for reviewing chemicals found in ground water or in soil as a result of legal agricultural use and for modifying or canceling use of such chemicals.

Under the provisions of the PCPA, California registrants of agricultural use pesticides must provide DPR with data on physical and chemical properties and environmental fate of the active ingredients in their products. Based on this information, DPR identified active ingredients with data that meet or exceed the SNVs for water solubility, soil adsorption, hydrolysis half-life, aerobic soil metabolism half-life, and anaerobic soil metabolism half-life. Since the enactment

of the PCPA, the ability to establish an SNV for field dissipation could not be scientifically determined.

Active ingredients that meet or exceed criteria for SNVs and are labeled for agricultural use are placed on the Ground Water Protection List (GWPL) found in Title 3 of the California Code of Regulations. The GWPL consists of two sublists. One sublist consists of chemicals that meet the conditions specified in FAC section 13145(d). These chemicals must also have pesticide product labels that allow application by chemigation or by application to or injection into the soil or that the application be followed by flood or furrow irrigation within 72 hours. The second sublist consists of chemicals that have been detected in ground water or soil in California pursuant to FAC section 13149. Under the PCPA, DPR has set regulatory use restrictions for these chemicals.

## **REPORT SUMMARY**

### Section I

DPR must provide information about active ingredients whose pesticides are registered for agricultural use. The information includes identifying active ingredients with ground water protection data gaps, providing a list of active ingredients that exceed the SNVs and providing use information about these active ingredients.

### Section II

This section lists the one remaining active ingredient that still contains data gaps.

### Section III

This section identifies the registered and unregistered active ingredients that exceed the SNVs established by DPR. For the 130 active ingredients registered for agricultural use, there are additional data detailing the annual sales, type of use and total use reported in California.

## **CONCLUSION**

Sixteen years since the passage of the Pesticide Contamination Prevention Act, DPR has one remaining active ingredient that still has data gaps. The registrant has committed to filling this gap. DPR continually updates the pesticide chemistry database to report the active ingredients that exceed the SNVs and to quantify their annual sales and use in California.

## **I. REPORT REQUIREMENTS PURSUANT TO THE PESTICIDE CONTAMINATION PREVENTION ACT**

The Pesticide Contamination Prevention Act of 1985 requires that the Department of Pesticide Regulation (DPR) provide the following information for each pesticide registered for agricultural use. The information is provided to the Legislature, the Office of Environmental Health Hazard Assessment, and the State Water Resources Control Board.

1. A list of each active ingredient, other specified ingredient, or degradation product of an active ingredient of a pesticide for which there is a ground water protection gap.
2. A list of each pesticide that contains an active ingredient, other specified ingredient, or degradation product of an active ingredient that is greater than one or more of the numerical values established pursuant to the Act or is less than the numerical value in the case of the soil adsorption coefficient in both of the following categories:
  - (a) Water solubility or soil adsorption coefficient ( $K_{oc}$ ); and
  - (b) Hydrolysis, aerobic soil metabolism, anaerobic soil metabolism, or field dissipation.
3. Provide for each pesticide listed pursuant to number 2 (if information is available), the amount sold in California during the most recent year (for which sales information is available), where and for what purpose the pesticide was used, and when this information is available in the Pesticide Use Report.

The information is presented in the following two sections. The section titled “Active Ingredients with Ground Water Protection Data Gaps” identifies the remaining active ingredients that contain data gaps from the ground water protection data call-in list established in 1986. The section titled “Active Ingredients Exceeding the Specific Numerical Values” identifies the active ingredients with leaching potential. For the 130 active ingredients registered for agricultural use, there are additional data detailing the annual sales, type of use and total use reported in California.

## II. ACTIVE INGREDIENTS WITH GROUND WATER PROTECTION DATA GAPS

In 1986, DPR established a list of 174 active ingredients that were subject to ground water protection data requirements pursuant to the PCPA. As of December 2001, one active ingredient from this list, chlorthal-dimethyl still contains data gaps. DPR has accepted one of two required field dissipation studies and has received a commitment from the registrant to submit additional information to upgrade the study status on the remaining field dissipation study.

### III. ACTIVE INGREDIENTS EXCEEDING THE SPECIFIC NUMERICAL VALUES

This report evaluates the potential of pesticide active ingredients to leach to ground water. Section 13144 (a) of the Pesticide Contamination Prevention Act of 1985 (PCPA, Stats. 1985, Ch. 1298, § 1) requires the Department of Pesticide Regulation (DPR) to establish thresholds known as specific numerical values (SNVs) for six physicochemical characteristics of environmental fate: water solubility, soil adsorption coefficient ( $K_{oc}$ ), hydrolysis half-life, aerobic and anaerobic soil metabolism half-lives, and field dissipation half-life. These parameters are presumed by the PCPA to correlate with the potential of a pesticide to leach to ground water. Water solubility and  $K_{oc}$  are considered indicators of the mobility of an active ingredient within the soil, while the half-lives for hydrolysis, aerobic and anaerobic soil metabolism and field dissipation are considered indicators of the persistence of the chemical in the soil.

Statistical comparison procedures were used to calculate the SNVs. Based on nationwide ground water studies, a list of pesticide active ingredients was created and separated into two groups: 1) chemicals that had been detected in ground water as a result of legal agricultural use (leachers), and 2) chemicals that had been sampled for and not found in ground water as a result of legal agricultural use (non-leachers). Estimates of the physicochemical parameter values for the chemicals in each group were determined from data available in the open literature and from DPR-approved studies submitted by pesticide registrants in fulfillment of the data call-in requirements in section 13143. The data for each of the parameter values were tested for their usefulness in discriminating between leachers and non-leachers by determining whether the means of the two groups were significantly different. The tests showed that the means of the data for water solubility, hydrolysis half-life,  $K_{oc}$ , and the anaerobic soil metabolism half-life for chemicals identified as leachers were significantly different from the means of chemicals identified as non-leachers. The SNVs for these properties were established as those values that would identify as leachers 90 percent of the chemicals found in ground water due to agricultural use (Wilkerson and Kim, 1986). The means of the two groups for aerobic soil metabolism, however, were not significantly different. Because the PCPA requires DPR to establish an SNV for each physicochemical property, the SNV for the aerobic soil metabolism half-life was set at a

value that minimized its importance in the discrimination procedure. The SNVs established by DPR are reevaluated periodically to incorporate new data into the calculations.

Details on revisions to the SNVs can be found in subsequent reports (Johnson, 1991; Johnson, 1989; Johnson, 1988). The SNVs currently in regulation (Titles 3 and 26, California Code of Regulations, § 6804) are:

(a)	Water solubility	3 ppm
(b)	Soil adsorption coefficient ( $K_{oc}$ )	1900 $\text{cm}^3/\text{g}$
(c)	Hydrolysis half-life	14 days
(d)	Aerobic soil metabolism half-life	610 days
(e)	Anaerobic soil metabolism half-life	9 days

The SNV for field dissipation half-life has not yet been established. The SNVs are required by section 13144 of the PCPA to be at least equal to those established by the U.S. Environmental Protection Agency (U.S. EPA). To date, the U.S. EPA has not established any SNVs.

Pursuant to section 13144(b) of the Act, pesticide active ingredients are tested against the SNVs and are placed on a list of candidates as potential leachers if both the mobility and persistence parameter values exceed (or are less than in the case of the  $K_{oc}$ ) the SNV for water solubility *or*  $K_{oc}$  *and* the SNV for the hydrolysis *or* aerobic soil metabolism *or* anaerobic soil metabolism *or* field dissipation half-life. If a potential leacher has a pesticide label which requires or recommends the application method to be by application to or injection into the soil or by chemigation or that application is to be followed by flood or furrow irrigation within 72 hours, then the chemical is placed on the Groundwater Protection List (Food & Agr. Code § 6800 [b]). Table 1 is a list of candidate potential leachers that are contained in currently registered pesticides and their respective mean physicochemical parameter values.

There are three new active ingredients on the 2001 list compared to the 2000 list:

fludioxonil  
glufosinate-ammonium

Fludioxonil is a fungicide. Glufosinate-ammonium is an herbicide. Prohexadione calcium is a growth regulator.

Section 13144(b) also requires DPR to provide, for each active ingredient in Table 1, a list of the amount sold in California, and a list of where and for what purpose the pesticide was used. The 2000 pesticide sales data are shown in Table 2. Information on the active ingredients and their modes of action can be found in Table 3.
