

Final Preliminary Assessment/Site Inspection Report

**Additional and Uncharacterized Sites Operable Unit
Crab Orchard National Wildlife Refuge NPL Site
Marion, Illinois (Williamson County)**

June 2003

This Final PA/SI Report is identical to the "Draft-Final" Report issued in September 2001.

VOLUME X

Sections 22 through 29

18124-11-J

TABLE OF CONTENTS

VOLUME X

SECTION 22	AUS-0062 - COC AREA	22-1
22.1	Historic Search Information	22-2
22.1.1	Site Description	22-2
22.1.2	Operational History and Waste Characteristics.....	22-2
22.1.3	AUS-0062 Previous Sampling Results.....	22-3
22.1.4	Observations During Site Visit.....	22-4
22.1.5	Recommendations Based on Preliminary Assessment.....	22-4
22.2	Site Investigation Information.....	22-4
22.2.1	Field Investigation.....	22-4
22.2.2	Field Results.....	22-5
22.2.2.1	Site Conditions	22-5
22.2.2.1.1	Geologic Conditions	22-5
22.2.2.1.2	Hydrogeologic Conditions	22-5
22.2.2.1.3	Hydrologic Conditions.....	22-5
22.2.2.2	Chemical Results.....	22-5
22.3	Screening Risk Assessment.....	22-6
22.3.1	Human Health Risk	22-7
22.3.1.1	Soil/Sediment	22-7
22.3.1.2	Surface Water	22-7
22.3.2	Ecological Risk	22-7
22.3.2.1	Soil	22-7
22.3.2.2	Sediment.....	22-8
22.3.2.3	Surface Water.....	22-9
22.4	Scientific Management Decision Point	22-10
SECTION 23	AUS-0063 - COC AREA.....	23-1
23.1	Historic Search Information	23-1
23.1.1	Site Description	23-1
23.1.2	Operational History and Waste Characteristics.....	23-1
23.1.3	AUS-0063 Previous Sampling Results.....	23-2
23.1.4	Observations During Site Visit.....	23-2
23.1.5	Recommendations Based on Preliminary Assessment.....	23-2
23.2	Site Investigation Information.....	23-2
23.2.1	Field Investigation.....	23-3
23.2.2	Field Results.....	23-3
23.2.2.1	Site Conditions	23-3
23.2.2.1.1	Geologic Conditions	23-3
23.2.2.1.2	Hydrogeologic Conditions	23-3
23.2.2.1.3	Hydrologic Conditions.....	23-3
23.2.2.2	Chemical Results.....	23-3
23.3	Screening Risk Assessment.....	23-4
23.4	Summary and Recommendations	23-4
SECTION 24	AUS-0064 - COC AREA.....	24-1
24.1	Historic Search Information	24-1
24.1.1	Site Description	24-1
24.1.2	Operational History and Waste Characteristics.....	24-1

TABLE OF CONTENTS

24.1.3	AUS-0064 Previous Sampling Results.....	24-1
24.1.4	Observations During Site Visit.....	24-2
24.1.5	Recommendations Based on Preliminary Assessment.....	24-2
24.2	Site Investigation Information.....	24-2
24.2.1	Field Investigation.....	24-2
24.2.2	Field Results.....	24-2
24.2.2.1	Chemical Results.....	24-3
24.3	Screening Risk Assessment.....	24-3
24.3.1	Human Health Risk	24-4
24.3.1.1	Soil	24-4
24.3.2	Ecological Risk	24-4
24.3.2.1	Soil	24-4
24.4	Scientific Management Decision Point	24-5
24.4.1	Human Health Risk Evaluation.....	24-5
24.4.2	Ecological Risk Evaluation	24-6
24.4.3	Summary of Recommendations	24-8
SECTION 25	AUS-0065 - COC AREA.....	25-1
25.1	Historic Search Information	25-1
25.1.1	Site Description	25-1
25.1.2	Operational History and Waste Characteristics.....	25-1
25.1.3	AUS-0065 Previous Sampling Results.....	25-1
25.1.4	Observations During Site Visit.....	25-1
25.1.5	Recommendations Based on Preliminary Assessment.....	25-2
25.2	Site Investigation Information.....	25-2
25.2.1	Field Investigation.....	25-2
25.2.2	Field Results.....	25-2
25.2.2.1	Site Conditions	25-2
25.2.2.1.1	Geologic Conditions	25-2
25.2.2.1.2	Hydrogeologic Conditions	25-3
25.2.2.1.3	Hydrologic Conditions	25-3
25.2.2.2	Chemical Results.....	25-3
25.3	Screening Risk Assessment.....	25-3
25.3.1	Human Health Risk	25-4
25.3.1.1	Soil	25-4
25.3.2	Ecological Risk	25-4
25.3.2.1	Soil	25-4
25.4	Scientific Management Decision Point	25-5
SECTION 26	AUS-0066 - COC AREA.....	26-1
26.1	Historic Search Information	26-1
26.1.1	Site Description	26-1
26.1.2	Operational History and Waste Characteristics.....	26-1
26.1.3	AUS-0066 Previous Sampling Results.....	26-1
26.1.4	Observations During Site Visit.....	26-2
26.1.5	Recommendations Based on Preliminary Assessment.....	26-2
26.2	Site Investigation Information.....	26-2
26.2.1	Field Investigation.....	26-2
26.2.2	Field Results.....	26-3
26.2.2.1	Site Conditions	26-3
26.2.2.1.1	Geologic Conditions	26-3

TABLE OF CONTENTS

26.2.2.1.2	Hydrogeologic Conditions	26-3
26.2.2.1.3	Hydrologic Conditions	26-3
26.2.2.2	Chemical Results	26-3
26.3	Screening Risk Assessment.....	26-4
26.3.1	Human Health Risk	26-4
26.3.1.1	Soil/Sediment	26-4
26.3.1.2	Surface Water	26-5
26.3.2	Ecological Risk	26-5
26.3.2.1	Soil	26-5
26.3.2.2	Sediment.....	26-6
26.3.2.3	Surface Water	26-7
26.4	Scientific Management Decision Point	26-8
SECTION 27	AUS-0067 - COC AREA.....	27-1
27.1	Historic Search Information	27-1
27.1.1	Site Description	27-1
27.1.2	Operational History and Waste Characteristics.....	27-1
27.1.3	AUS-0067 Previous Sampling Results.....	27-1
27.1.4	Observations During Site Visit.....	27-1
27.1.5	Recommendations Based on Preliminary Assessment.....	27-1
27.2	Site Investigation Information.....	27-2
27.2.1	Field Investigation.....	27-2
27.2.2	Field Results.....	27-2
27.2.2.1	Site Conditions	27-2
27.2.2.1.1	Geologic Conditions	27-2
27.2.2.1.2	Hydrogeologic Conditions	27-2
27.2.2.1.3	Hydrologic Conditions	27-2
27.2.2.2	Chemical Results	27-2
27.3	Screening Risk Assessment.....	27-3
27.3.1	Human Health Risk	27-4
27.3.1.1	Soil	27-4
27.3.1.2	Cistern Water.....	27-4
27.3.2	Ecological Risk	27-4
27.3.2.1	Soil	27-4
27.4	Scientific Management Decision Point	27-5
SECTION 28	AUS-0069 - COC AREA.....	28-1
28.1	Historic Search Information	28-1
28.1.1	Site Description	28-1
28.1.2	Operational History and Waste Characteristics.....	28-1
28.1.3	AUS-0069 Previous Sampling Results.....	28-2
28.1.4	Observations During Site Visit.....	28-2
28.1.5	Recommendations Based on Preliminary Assessment.....	28-2
28.2	Site Investigation Information.....	28-2
28.2.1	Field Investigation.....	28-2
28.2.2	Field Results.....	28-4
28.2.2.1	Site Conditions	28-4
28.2.2.1.1	Geologic Conditions	28-4
28.2.2.1.2	Hydrogeologic Conditions	28-4
28.2.2.1.3	Hydrologic Conditions	28-4
28.2.2.2	Chemical Results.....	28-4

TABLE OF CONTENTS

28.3	Screening Risk Assessment.....	28-4
28.3.1	Human Health Risk	28-5
28.3.1.1	Soil/Sediment	28-5
28.3.1.2	Trench Water.....	28-6
28.3.2	Ecological Risk	28-6
28.3.1.1	Soil	28-6
28.3.1.2	Sediment.....	28-7
28.4	Scientific Management Decision Point	28-8
SECTION 29	AUS-0109 - COC AREA.....	29-1
29.1	Historic Search Information	29-1
29.1.1	Site Description	29-1
29.1.2	Operational History and Waste Characteristics.....	29-1
29.1.3	AUS-0109 Previous Sampling Results.....	29-2
29.1.4	Observations During Site Visit.....	29-2
29.1.5	Recommendations Based on Preliminary Assessment.....	29-2
29.2	Site Investigation Information.....	29-2
29.2.1	Field Investigation.....	29-2
29.2.2	Field Results.....	29-3
29.2.2.1	Site Conditions	29-3
29.2.2.1.1	Geologic Conditions	29-3
29.2.2.1.2	Hydrogeologic Conditions	29-3
29.2.2.1.3	Hydrologic Conditions	29-3
29.2.2.2	Chemical Results	29-3
29.3	Screening Risk Assessment.....	29-3
29.3.1	Human Health Risk	29-4
29.3.1.1	Soil	29-4
29.3.2	Ecological Risk	29-4
29.3.2.1	Soil	29-4
29.4	Scientific Management Decision Point	29-5
29.9.1	Human Health Risk Evaluation.....	29-5
29.9.2	Ecological Risk Evaluation	29-6
29.9.3	Summary of Recommendations	29-7

ACRONYM LIST
Crab Orchard AUS OU PA/SI Report

ACRONYM	DEFINITION
3S _b	Mean plus three standard deviations
A.N.	Ammonium Nitrate
ARAR	Applicable, Relevant and Appropriate Requirements
AOC	Area of Concern
AST	Aboveground Storage Tank
ASTER	Assessment Tools for the Management of Risk (USEPA database)
AUS OU	Additional Uncharacterized Sites Operable Unit
BGS	Below Ground Surface
BNA	Base-Neutral Acids
BOD	Biological Oxygen Demand
BOR	U.S. Bureau of Reclamation
BRA	Baseline Risk Assessment
BTAG	Biological Technical Assistance Group
BTOC	Below Top of Casing
BWT	Below Water Table
CCME	Canadian Council of Ministers of the Environment
CERCLA	Comprehensive Environmental Response Compensation and Liability Act of 1980 (a.k.a. Superfund)
CIA	Central Intelligence Agency
CIPS	Central Illinois Public Service
CLP	Contract Laboratory Program
CM/SEC	Centimeters per Second
COC	Chain-of-Custody
COC	Chemical of Concern
COC	Crab Orchard Cemetery
COI	Chemical of Interest
COL	Crab Orchard Lake
CONWR	Crab Orchard National Wildlife Refuge
COP	Crab Orchard Pond
COPC	Chemical of Potential Concern
COPEC	Chemical of Potential Ecological Concern
CSC	Commercial Solvents Corporation
CSEQGs	Canadian Sediment Quality Guidelines
CSOQGs	Canadian Soil Quality Guidelines
CTI	Central Technologies Incorporated
CVOC	Chlorinated Volatile Organic Compounds
CWQG	Canadian Water Quality Guidelines
DAF	Dilution Attenuation Factor
DEHP	bis(2-ethylhexyl)phthalate
DERP	Defense Environmental Restoration Program
DGOLs	New Dutchlist Groundwater Optimum Levels
DNT	Dinitrotoluene
DOD	Department of Defense
DOI	U.S. Department of the Interior

ACRONYM LIST
Crab Orchard AUS OU PA/SI Report

ACRONYM	DEFINITION
DQCR	Daily Quality Control Reports
DQO	Data Quality Objective
DRO	Diesel Range Organics
DSOLs	New Dutchlist Soil Optimum Levels
DTW	Depth to water
DU	Depleted Uranium
EMMA OU	Explosives and Munitions Manufacturing Area Operable Unit
EPA	U.S. Environmental Protection Agency
EqP	Equilibrium Partitioning
ERL	Effects-Range Low
ERM	Effects-Range Medium
ESV	Ecological Screening Value
FDAP	Field Director of Ammunition Plants
FFA	Federal Facility Agreement
FID	Flame Ionization Detector
FOIA	Freedom of Information Act
FNH	Flashless Non-hydroscopic Powder
FS	Feasibility Study
FSP	Field Sampling Plan
FT	feet or foot
FWS	U.S. Fish and Wildlife Service
GPS	Global Positioning System
GRO	Gasoline Range Organics
GSA	General Services Administration
GW	Ground Water
HBX	High Blast Explosives
HE	High Explosives
HEDP	High Explosive Detonation Product
HEI	High Explosives Igniter
HMX	Her Majesty's Explosive (Cyclotetramethylenetrinitramine)
HQ	Hazard Quotient
HSA	Hollow Stem Auger
HSP	Health and Safety Plan
IAC	Illinois Administrative Code
IDW	Investigation Derived Waste
IEPA	Illinois Environmental Protection Agency
IPCB	Illinois Pollution Control Board
IOP	Illinois Ordnance Plant
K _{ow}	Octanol-to-Water Partitioning Coefficient
LAW	Light Antitank Weapon
LOEC	Lowest Observed Effects Concentration
MAOU	Metals Area Operable Unit
MATC	Maximum Acceptable Toxicant Concentration

ACRONYM LIST
Crab Orchard AUS OU PA/SI Report

ACRONYM	DEFINITION
TSS	Total Suspended Solids
UET	Upper Effect Threshold
UG/KG	micrograms per kilogram
UG/L	micrograms per liter
UMC	Universal Match Corporation
USACE	U.S. Army Corp of Engineers
USCS	Unified Soil Classification System
USEPA	United States Environmental Protection Agency
ECOTOX	Ecological Toxicity Database
USFWS	United States Fish & Wildlife Service
USGS	United States Geological Survey
UST	Underground Storage Tank
UXO	Unexploded Ordnance
VJ Day	Victory over Japan day (August 15, 1945)
VOCs	Volatile Organic Compounds
WAA	War Assets Administration
WSA	West Shop Area
WWII	World War II
WWTP	Wastewater Treatment Plant

ACRONYM LIST
Crab Orchard AUS OU PA/SI Report

ACRONYM	DEFINITION
MCL	Maximum Contaminant Level
MDL	Method Detection Limit
MG/KG	milligrams per kilogram
MG/L	milligrams per liter
MHSPE	Ministry of Housing, Spatial Planning, and the Environment
MISCA OU	Miscellaneous Areas Operable Unit
MM	millimeter
MOCA	4,4' - Methylenebis (2-chloroaniline)
MSDS	Material Safety Data Sheets
MSL	Mean Sea Level
MW	Monitoring Well
NA	Not analyzed
NA	Not applicable
NAPL	Non-aqueous Phase Liquid
NEC	No Effect Concentration
NCP	National Contingency Plan
ND	Not detected
NG	Nitroglycerin
NG/KG	Nanograms per kilogram
NOAA	National Oceanic and Atmospheric Administration
NaOH	Caustic Soda
NOEC	No-observed-effect concentration
NPL	National Priorities List
OD	Outside Diameter
OE	Ordnance and Explosives
OEW	Ordnance and Explosive Waste
OFDAP	Ordnance Field Director of Ammunition Plants
OU	Operable Unit
PA	Preliminary Assessment
PAH	Polynuclear Aromatic Hydrocarbons
PA/SI	Preliminary Assessment/Site Investigation
PBX	Plastic Bonded Explosives
PCB	Poly-chlorinated Biphenyl
PCB OU	PCB Operable Unit
PCE	Tetrachloroethylene
PEC	Probable Effect Concentration
PEL	Probable Effect Level
PETN	Pentaerythritol Tetranitrate
PID	Photo Ionization Detector
PLC	Preliminary Levels of Concern
PM	Project Manager
PPB	Parts Per Billion
PPE	Personnel Protection Equipment

ACRONYM LIST
Crab Orchard AUS OU PA/SI Report

ACRONYM	DEFINITION
PPM	Parts Per Million
PRG	Preliminary Remediation Goals
PRP	Potentially Responsible Party
PVC	Polyvinyl Chloride
QA/QC	Quality Assurance/Quality Control
QAPP	Quality Assurance Project Plan
QCSR	Quality Control Summary Report
R&D	Research & Development
RAGS	Risk Assessment Guidance for Superfund (USEPA document)
RCRA	Resource Conservation and Recovery Act
RDX	Royal Demolition Explosive (Cyclonite)
RI	Remedial Investigation
RI/FS	Remedial Investigation / Feasibility Study
RL	Reporting Limit
ROD	Record of Decision
RR	Railroad
RRTC	Railroad Tank Car
SAP	Sampling and Analysis Plan
SARA	Superfund Amendments and Reauthorization Act (1986)
SI	Site Investigation
SIU	Southern Illinois University
SMCL	Secondary Maximum Contaminant Level
SMDP	Scientific Management Decision Point
SOP	Standard Operating Procedure
SPO	Solid Propellant Operations
SSLs	Soil Screening Levels (USEPA)
SVOC	Semi-volatile Organic Compound
SWDC	Sherwin Williams Defense Corporation
TACO	Tiered Approach to Corrective Action Objectives
TAL	Target Analyte List
TBD	To Be Determined
TCDD	Tetrachlorodibenzo-p-Dioxin
TCE	Trichloroethylene
TCL	Target Compound List
TDS	Total Dissolved Solids
TEC	Threshold Effect Concentration
TEL	Threshold Effect Level
TEQ	Toxicity Equivalent for Dioxins/Furans
TNT	Trinitrotoluene
TOC	Total Organic Carbon
TPH	Total Petroleum Hydrocarbons
TRPH	Total Recoverable Petroleum Hydrocarbons
TRV	Toxicity Reference Value

COC AREA SITES

This volume of the report includes the eight Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in the Crab Orchard Cemetery (COC) area that were investigated in the Site Investigation (SI). The sites are on the south side of Crab Orchard Lake (Figure 22-1), in the vicinity of Wolf Creek Road and an abandoned roadway that has been designated for this report as the COC Area Road. The COC Area, which is remote from industrial and public areas, was used by the Army for detonation of surplus munitions after the end of World War II. Army records indicate that in 1943 “burning pits were constructed...near Hampton Cemetery and put into operation”.¹ The Army also reportedly fenced off several ½ acre to 2 acre areas around Hampton Cemetery in 1946 for the disposal of ordnance components, specifically landmine parts.² Two former employees at the IOP stated that there were pits at the where landmines, primers, and detonators were destroyed by detonation. The locations of these pits could not be determined but one of them was described as being deep and lined with red brick.³

As discussed below, a number of sites in this area were investigated, and some were remediated, as part of the Explosives and Munitions Manufacturing Area Operable Unit (EMMA OU). Except for Site AUS-0063, as discussed below, EMMA OU sites that were determined to require no further action, based on the results of a chemical investigation, were excluded from the AUS OU investigation.

Each of the eight AUS OU sites in the COC area was included in the SI for one or more of the following reasons:

- The site was reportedly used as a landfill (Site AUS-0062).
- Suspect debris, signage and/or fencing were found at the site (Sites AUS-0063, -0064, -0065, -0066, -0067, and -0069).
- The site is an EMMA OU COC site, but chemical data were not collected as part of the EMMA OU; only ordnance searches were done (Sites AUS-0062, 0063⁴, -0064, -0066, and -0069).
- Historic aerial photography interpretation indicated that the site may have been used for detonations (Site AUS-0109).

COC AREA—EMMA OU

There were 10 COC sites included in the EMMA OU Remedial Investigation (RI), COC-1 through COC-10.⁵ These sites were investigated for chemical contamination. Five more sites

⁴ Site AUS-0063 was intended to be at the location of COC-12. The locations that were sampled were actually part of COC-9. See discussion in Section 23.

⁵ Environmental Science and Engineering, Draft Final RI Report for the Explosives/Munitions Manufacturing Operable Unit, Crab Orchard National Wildlife Refuge, September 15, 1994.

were added (COC-11 through COC-15) in a later investigation that addressed only unexploded ordnance (UXO) and ordnance scrap.⁶ The COC sites are shown in Figure 22-2⁷.

Figures 22-3 through 22-10 present the previous sampling results for Sites COC-1, COC-2, COC-4, COC-5, COC-6, COC-7, COC-8, and COC-9, respectively. Results for Site COC-3 are not included because that site was remediated as part of the EMMA OU. The remaining sites for which chemical analytical results are available, shown in Figures 22-3 through 22-10, were determined to require no further action.^{8,9,10}

AUS-0062

According to the United States Fish & Wildlife Service (USFWS), AUS-0062 is a former landfill that was closed by the Refuge in 1974. This site was identified by the USFWS and corresponds to COC-11 of the EMMA OU. It is located on the south side of the COC Area Road, about 1.1 miles west of Wolf Creek Road (Figure 22-1).

AUS Original Site Designations

AUS-0062 is one of the original AUS OU sites designated in 1997-1999 by USFWS.

22.1 HISTORIC SEARCH INFORMATION

22.1.1 Site Description

This site was originally described as an area of mounds and pits approximately 100 yards west of former COC-1. The site measures approximately 600 feet (ft) (in an east-west direction) by 200 ft (in a north-south direction).¹¹

22.1.2 Operational History and Waste Characteristics

The aerial photograph interpretation indicated that this site appeared to be a roadside clearing and fill operation in 1971, the year of the first photograph that showed any signs of activity in

⁶ Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois

⁷ COC-10 is not shown and is outside the area shown in the figure. COC-10 is discussed in Section 41 of this report and the location is shown in Figure 41-1. Sampling results from the EMMA OU investigation are shown in Figure 41-2 of this report.

this area.¹² No waste materials could be discerned from the 1971 photograph. Some mounds of unidentifiable materials were noted near the western edge of the assumed fill material.¹³ By 1980, the site appeared to be inactive (which agrees with information obtained from the USFWS, that this landfill was closed in 1974) and the aerial extent of the fill area appeared to extend farther west than in the 1971 photo.¹⁴ It appears that the site activity progressed from east to west, based on visual observation of the vegetation in the aerial photos. In the 1993 aerial photograph, there appeared to be a large linear scar located at the geographic center of the fill.¹⁵ This suggests recent activity, however the nature of the activity could not be determined from the aerial photographs.¹⁶

There have been no known industrial lessees of this property.

22.1.3 AUS-0062 Previous Sampling Results

No samples for chemical analysis were taken at this site as part of the EMMA OU.

Parsons Engineering, 1997

As part of the EMMA OU, the Department of the Army conducted an Ordnance and Explosive Waste (OEW) investigation at this site (formerly COC-11) in 1997¹⁷. Two 100-ft square grids were investigated at this site and a total of 133 magnetic anomalies were identified.¹⁸ Forty-two of these were investigated and all were non-ordnance scrap except for one, which was a munitions fragment (not classified as UXO).¹⁹

USEPA Sampling, 1998

The United States Environmental Protection Agency (USEPA) collected two samples (62-01C and 62-02C) from AUS-0062. USEPA sample locations are shown in Figures 22-11 and 22-12. The results for all detected constituents are listed in Table 22-1A. No polynuclear aromatic hydrocarbons (PAHs), mercury, or volatile organic compounds (VOCs) were detected. Nickel (210 milligrams per kilogram (mg/kg)) exceeded USEPA Soil Screening Levels (SSLs) and Refuge background²⁰ in both samples.

22.1.4 Observations During Site Visit

This site is located in a valley just south of the COC Area Road (Figure 22-1). An east-west drainageway traverses the site (Figure 22-11). Several mounded areas and pits were observed. Some of these mounds and pits are likely the result of previous UXO investigations (such as those found in a grassy area with hand dug pits and flag markers) and others are more likely the result of other activities such as dumping or landfilling.

22.1.5 Recommendations Based on Preliminary Assessment

AUS-0062 was included in the SI because the 1998 USEPA sample results exceeded the preliminary screening levels, and because of the reported history of usage as a landfill.

22.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0062 on May 3, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)²¹ for the AUS OU PA/SI. AUS OU SI sample locations are shown on Figures 22-11 and 22-12. Survey coordinates for all sample locations in AUS-0062 are listed in Table 22-1. Table 22-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples unless otherwise noted.

22.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted.

Soil Mounds and Pits

Soil samples 0062-001 and 0062-008 were collected from mounded areas identified during the site reconnaissance. Sediment Sample 0062-005 was collected from a pit that was observed during the site reconnaissance. The origin of the mounds and pits is unknown.

²⁰ See Table 1-11 of this report for Refuge background soil values used for the PA.

²¹ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

Drainage Ditch

Sediment and surface water locations 0062-004 and 0062-007 were in the east-west drainageway. Location 0062-004 was in an area of the drainageway that appears to receive runoff from the northern part of the site. Location 0062-007 was in a ponded area of this drainageway, near the exit of the COC Area Road culvert, close to a partial 55-gallon drum (Figure 22-11). The previous contents and origin of the drum are not known.

Other Locations

Soil samples 0062-002 and 0062-003 were collected from the grassy area with hand dug pits and flag markers. It is likely that this is the area of the previous UXO investigation. This area may also be the location of the former landfill.

Soil sample 0062-006 was collected next to the partial 55-gallon drum.

22.2.2 Field Results

22.2.2.1 Site Conditions

22.2.2.1.1 *Geologic Conditions*

There were no test pits or monitoring wells installed at AUS-0062. The upper two ft of material from the hand auger borings was described as silty clay fill. The fill at sample location AUS-0062-006 included debris.

22.2.2.1.2 *Hydrogeologic Conditions*

No hydrogeological information is available for this site.

22.2.2.1.3 *Hydrologic Conditions*

There was some water in the east-west drainageway at the time of the field investigation, including a small amount of ponded water at the east end of the site, near the discharge of the COC Area Road culvert.

22.2.2.2 Chemical Results

The sample analytical results are summarized in the following tables:

- Table 22-3 – soil samples results,
- Table 22-4 – sediment results, and
- Table 22-5 – surface water samples results.

These tables list all the chemicals detected in AUS-0062 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report (QCSR).

Sample results are presented on the following figures:

- Figure 22-11 – results for soil and sediment samples, and
- Figure 22-12 – results for surface water samples at this site.

22.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 22-6 through 22-11 as follows:

- Table 22-6--human health risk screening for soils,
- Table 22-7--human health risk screening for sediment,
- Table 22-8--human health risk screening for surface water,
- Table 22-9--ecological risk screening for soils,
- Table 22-10--ecological risk screening for sediment, and
- Table 22-11--ecological risk screening for surface water.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0062. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criteria is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed for but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs, but rather as uncertainties.

In Figures 22-11 and 22-12, the shading convention used is the same as for the tables, discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 22-12 (human health risk) and 22-13 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 22-12) and COPECs (Table 22-13) are shaded in the tables.

22.3.1 Human Health Risk

22.3.1.1 Soil/Sediment

Human health screening results for soil and sediment samples are presented in Tables 22-6 and 22-7, respectively. Soil screening values were used to screen the sediment samples, since sediment-specific data are not available for human health risk.

For carcinogens, a cancer risk was calculated using the USEPA Region 9 Industrial Soil Preliminary Remediation Goals (PRGs) as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

22.3.1.2 Surface Water

Human health risk screening results for chemicals in surface water at AUS-0062 are presented in Table 22-8. The maximum concentrations from AUS-0062 were screened against the State of Illinois General Use Surface Water Quality Criteria – Human Health.

22.3.2 Ecological Risk

22.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 22-9. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)²²
- Environment Canada (1995)²³
- Talmage *et al.* (1999)²⁴
- Efroymson *et al.* (1997a, 1997b)²⁵

²⁵ Efroymson, R.A., M.E. Will, G.W. Suter II, and A.C. Wooten. 1997a. *Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Terrestrial Plants: 1997 Revision*. Oak Ridge National Laboratory, Oak Ridge, Tennessee. ES/ER/TM-85/R3.

- CCME (1999)²⁶
- MHSPE (1994)²⁷
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)²⁸ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

22.3.2.2 Sediment

Ecological screening results for sediment samples are presented in Table 22-10. Sources of TRVs for evaluating direct exposures to aquatic organisms in sediments included:

- Consensus-based freshwater sediment criteria (MacDonald et al. 1999)²⁹
- USEPA (1996 – summarized by Ingersoll et al. 1996)³⁰
- Ontario Ministry of the Environment and Energy (1995)³¹
- NOAA (1999)³²
- Ecotox (USEPA 1996)³³

- Long *et al.* (1995)³⁴
- Equilibrium partitioning
- USEPA Region V Environmental Data Quality Levels (EDQLs)
- Other sources

With respect to effects levels, there are a number of potential sources and endpoints. There are also multiple endpoints from some sources. For example, threshold effects levels (TELs) as reported by Ingersoll *et al.* (1996) are the geometric mean of the 15th percentile in the effects data set and the 50th percentile in the no-effects data set. The effects-range low (ERL) and effects-range medium (ERM) are the 15th percentile and 50th percentile values in the effects datasets, respectively. The Probable Effects Level (PEL) is the geometric mean of the 50th percentile in the effects data set and the 85th percentile in the no-effects data set, and the effects range medium is the 50th percentile value of the effects dataset. A TEL or ERL is assumed to represent a concentration below which toxic effects are rarely observed. The range between the TEL and PEL is assumed to represent the range in which effects are occasionally observed. MacDonald *et al.* (2000) developed “consensus-based” freshwater sediment screening concentrations. Threshold effect concentrations (TECs) were developed as concentrations below which adverse effects are not expected to occur. Probable effect concentrations (PECs) were levels above which effects are frequently expected to occur. Among other potential screening values, no effect concentrations (NECs – Ingersoll *et al.* 1996) and upper effect thresholds (UETs – NOAA 1999) are also levels above which effects are frequently or always observed.

In deriving an ecological screening value (ESV), preference was given to the TEC, TEL and ERL values since these are the most conservative (i.e., levels below which effects are rarely observed). Preference was also given to freshwater-derived values (MacDonald *et al.* [1999], Ingersoll *et al.* [1996], Ontario [1995] and NOAA [1999]) as opposed to estuarine or saltwater (Long *et al.* 1995). If screening values were unavailable from the sources noted above, the “equilibrium-partitioning” (EqP) approach was used. This used the surface water ecological screening value and the expected partitioning between sediment and sediment pore water as described in USEPA (1993). A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was the same as for soils as presented in Section 22.3.2.1.

22.3.2.3 Surface Water

Ecological screening results for surface water samples are presented in Table 22-11. TRVs for direct exposure by aquatic organisms in surface water were obtained from:

- Illinois water quality standards
- National Recommended Ambient Water Quality Criteria (USEPA 1999a)³⁵

³⁴ Long, E.R., D.D. MacDonald, S.L. Smith, and F.D. Calder. 1995. Incidence of adverse biological effects within ranges of chemical concentrations in marine and estuarine sediments. Environ. Management. 19(1): 81-97.

³⁵ USEPA. 1999a. National Recommended Water Quality Criteria--Correction. Office of Water. EPA 822-Z-99-001. April.

- EcoTox (USEPA 1996)³⁶
- USEPA Region IV Freshwater Screening Values (1999b)³⁷
- Maximum Acceptable Toxicant Concentrations (MATCs) or lowest observed effect concentrations (LOECs) obtained from the USEPA Assessment Tools for the Evaluation of Risk database (ASTER 2000)³⁸
- Other sources

The Illinois water quality standards are believed to be the most relevant, followed by national recommended ambient water quality criteria. EcoTox reports values based on ambient water quality criteria, and Tier II water quality criteria have been developed in the absence of sufficient information to support a national recommended water quality criterion using guidelines outlined in the Great Lakes Water Quality Initiative. Remaining sources were prioritized based on relevance to the area and professional judgment. The detailed discussion of the approach for selecting a single ESV from among the multiple sources is presented in Appendix G.

The screening approach for ingestion pathway exposures was the same as for soils as presented in Section 22.3.2.1.

22.4 SCIENTIFIC MANAGEMENT DECISION POINT

An RI is recommended for Site AUS-0062, based on exceedances of the SI screening criteria.

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not necessarily be retained as COPCs/COPECs for further evaluation. These are the constituents coded with “D” on the COPC list, Table 22-12, and include antimony and cadmium in sediment; and antimony, arsenic, barium, and selenium in soil. On the COPEC list, Table 22-13 the constituents coded with “D” includes beryllium in surface water; cadmium and mercury in sediment; and boron, manganese, mercury, and selenium in soil. These chemicals may later be included in the RI for other reasons, but the detections at the locations noted are not considered to be of concern since they are below Refuge background levels. All other COPCs/COPECs on Tables 22-12 and 22-13 should be investigated in the RI. In addition, all analytes listed as uncertainties on these tables should be considered for further evaluation in the RI Work Plan.

Chemicals that exceeded screening criteria and Refuge background (if applicable) are listed in Table 22-14.

Note that a number of the human health COPCs exceed migration to groundwater screening criteria. Groundwater has not been investigated at this site, and based on these data, should be considered in the RI. Other areas of the site and media and contaminants in addition to those

Metals		
Aluminum	7/7	11,100 mg/kg to 28,000 mg/kg
Antimony	4/7	0.25 mg/kg to 0.52 mg/kg
Arsenic	7/7	3.5 mg/kg to 8.6 mg/kg
Barium	7/7	58.1 mg/kg to 131 mg/kg
Beryllium	7/7	0.42 mg/kg to 0.74 mg/kg
Boron	2/7	1.6 mg/kg
Cadmium	2/7	0.63 mg/kg to 0.78 mg/kg
Calcium	7/7	1,080 mg/kg to 2,390 mg/kg
Chromium, Total	7/7	18.6 mg/kg to 29.8 mg/kg
Cobalt	7/7	3.6 mg/kg to 11.4 mg/kg
Copper	7/7	8.4 mg/kg to 15.6 mg/kg
Iron	7/7	13,100 mg/kg to 26,100 mg/kg
Lead	7/7	9.2 mg/kg to 37.5 mg/kg
Magnesium	7/7	1,760 mg/kg to 3,230 mg/kg
Manganese	7/7	168 mg/kg to 652 mg/kg
Mercury	7/7	0.017 mg/kg to 0.051 mg/kg
Nickel	7/7	13.6 mg/kg to 24.1 mg/kg
Potassium	7/7	578 mg/kg to 1,300 mg/kg
Selenium	3/7	0.38 mg/kg to 1.1 mg/kg
Sodium	7/7	40.8 mg/kg to 545 mg/kg
Thallium	1/7	0.66 mg/kg
Vanadium	7/7	31.1 mg/kg to 43 mg/kg
Zinc	7/7	27.9 mg/kg to 56 mg/kg

Sheet 1 of 1

mg/kg = milligrams per kilogram

ug/kg = micrograms per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

TABLE 22-4
SEDIMENT SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Metals		
Aluminum	3/3	8,900 mg/kg to 13,900 mg/kg
Antimony	1/3	0.41 mg/kg
Arsenic	3/3	3.3 mg/kg to 15.8 mg/kg
Barium	3/3	108 mg/kg to 200 mg/kg
Beryllium	3/3	0.65 mg/kg to 1.7 mg/kg
Boron	3/3	1 mg/kg to 4.6 mg/kg
Cadmium	2/3	0.92 mg/kg to 1.5 mg/kg
Calcium	3/3	1,220 mg/kg to 2,930 mg/kg
Chromium, Total	3/3	10.2 mg/kg to 34.4 mg/kg
Cobalt	3/3	3.7 mg/kg to 14.7 mg/kg
Copper	3/3	10.3 mg/kg to 32.7 mg/kg
Iron	3/3	10,600 mg/kg to 39,700 mg/kg
Lead	3/3	10 mg/kg to 28.8 mg/kg
Magnesium	3/3	1,740 mg/kg to 2,510 mg/kg
Manganese	3/3	92.3 mg/kg to 472 mg/kg
Mercury	3/3	0.03 mg/kg to 0.035 mg/kg
Nickel	3/3	13.2 mg/kg to 47.7 mg/kg
Potassium	3/3	838 mg/kg to 3,360 mg/kg
Selenium	1/3	1.6 mg/kg
Silver	1/3	0.31 mg/kg
Sodium	3/3	53.1 mg/kg to 224 mg/kg
Thallium	1/3	0.55 mg/kg
Vanadium	3/3	8.6 mg/kg to 60 mg/kg
Zinc	3/3	29.5 mg/kg to 133 mg/kg

AUS-0062-FORMER LANDFILL (COC-11)

PA/SI REPORT-AUS OU CRAB ORCHARD NWR MARION, ILLINOIS	PROJECT NO. 2320000026.00
URS	
DRN. BY:djd 12/16/00 DSGN. BY:mam CHKD. BY:mch/cmw	AUS-0062 Sample Locations and Detections in Surface Water FIG. NO. 22-12

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC Area. AUS-0063, shown in Figure 22-1, is located approximately 1.3 miles west of the intersection of Wolf Creek Road and the COC Area Road, on the south side of the COC Area Road.

AUS-0063 was included in the original AUS OU list because of the presence of a suspect fenced area, and the fact that it was thought to be part of COC-12, an Explosives and Munitions Manufacturing Area Operable Unit (EMMA OU) site which was investigated for unexploded ordnance (UXO) but not chemical contamination.

AUS Original Site Designations

AUS-0063 is one of the original sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS) as part of the AUS OU.

23.1 HISTORIC SEARCH INFORMATION

23.1.1 Site Description

AUS-0063 was originally described as “fenced areas west of COC-11”. The fenced areas were first suspected of being explosive detonation areas, but were identified during the SI by USFWS personnel as deer exclosures. The aerial photo interpretation did not identify any historic activities in the vicinity of these fenced areas.

During the SI field investigation, three additional samples were collected from the same ditch (near the fenced area) that United States Environmental Protection Agency (USEPA) sampled in 1998. After the sampling was done, it was determined that the ditch was actually part of the EMMA OU Site COC-9, and not COC-12, as intended. USFWS evaluated the USEPA 1998 results and the SI results in the context of the findings of the EMMA baseline risk assessment (BRA) and verified that the BRA determination of no further action for COC-9 was still applicable.

This site will not be included in further investigations because it was determined previously to be a No-Action site.¹ Results from this current investigation are presented for informational purposes only.

23.1.2 Operational History and Waste Characteristics

There have been no known industrial lessees of this property. The site was identified as a former homestead during the aerial photo interpretation.

¹ U.S. Environmental Protection Agency, Region V, 1997. Record of Decision for Crab Orchard National Wildlife Refuge Explosives/Munitions Operable Unit.

23.1.3 AUS-0063 Previous Sampling Results**EMMA OU RI, 1994**

Analytical results from the EMMA OU Remedial Investigation (RI) for Site COC-9 are presented in Figure 22-10.

USEPA Sampling, 1998

In 1998, USEPA collected one soil sample (63-01) from “a small creek west of fenced in area.” The sample location is shown in Figure 23-1. The results for all detected constituents are listed in Table 23-1A. There were no PAHs, mercury, or VOCs detected in this sample. Cadmium (3.4 milligrams per kilogram (mg/kg)), and nickel (32 mg/kg) exceeded USEPA Soil Screening Levels (SSLs) and Refuge background values.² Zinc (140 mg/kg) exceeded New Dutchlist Soil Optimum Levels (DSOLs) and Refuge background.

23.1.4 Observations During Site Visit

During the October 17, 2000 site visit, the drainage for the site was described as a maze of ditches that converged and flowed north. The main north-flowing ditch was dry during the site visit. The site is wooded. At the time of the site visit, there was a plowed field to the east and south, and a field with tall grass to the west.

23.1.5 Recommendations Based on Preliminary Assessment

This site was included in the SI because it was on the original AUS OU list (fenced area and EMMA COC site) and because of exceedances of screening criteria in the 1998 USEPA sampling.

23.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0063 on May 8, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)³ for the AUS OU PA/SI. AUS OU SI sample locations are shown on Figure 23-1. Survey coordinates for all sample locations in AUS-0063 are listed in Table 23-1. Table 23-2 lists the sample locations and the matrix sampled at that location.

² See Table 2-6 of this report for Refuge background soil values used for the PA.

³ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

23.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted. Three sample locations (0063-001, 0063-002 and 0063-003) were in the drainageway that flows northward through the site. Sediment was collected at each of these, and surface water was collected at Location 0063-002.

All samples were collected in accordance with the Field Sampling Plan with the following exceptions:

- AUS-0063-001-SW-00 The sample was not collected due to lack of surface water at this location.
- AUS-0063-002-SW-00 A surface water sample was added at this location to replace the surface water sample that was not collected at AUS-0063-001-SW-00.

23.2.2 Field Results

23.2.2.1 Site Conditions

23.2.2.1.1 *Geologic Conditions*

There were no test pits or monitoring wells installed at AUS-0063 as part of the AUS OU SI. The soil from the hand auger borings, which extended to depths of two feet (ft), was described as silty clay fill. At sample location 0062-0006 the soil was described as including debris, and at sample location 0063-002 the soil was described as including some sand and gravel.

Additional geologic information is available in the EMMA OU RI.

23.2.2.1.2 *Hydrogeologic Conditions*

No hydrogeological data were collected during the SI. A discussion of hydrogeologic conditions is contained in the EMMA OU RI.

23.2.2.1.3 *Hydrologic Conditions*

There are multiple small drainageways that converge to flow north via the main drainageway shown in Figure 23-1.

23.2.2.2 Chemical Results

The sample analytical results are summarized in the following tables:

- Table 23-3 – sediment samples results, and
- Table 23-4 – surface water sample results.

These tables list all the chemicals detected in AUS-0063 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report. All results are shown in Figure 23-1.

23.3 SCREENING RISK ASSESSMENT

The screening risk assessment is not applicable to this site because it was previously evaluated in a baseline risk assessment. See discussion in Section 23.1.1 above.

23.4 SUMMARY AND RECOMMENDATIONS

The results of the investigation are presented for informational purposes only. The samples were mistakenly taken at COC-9, an EMMA OU site which had previously been determined to require no further action, based on analytical results and a baseline risk assessment.

Lead	3/3	24.6 mg/kg to 34.4 mg/kg
Magnesium	3/3	1,720 mg/kg to 2,040 mg/kg
Manganese	3/3	340 mg/kg to 8,520 mg/kg
Mercury	3/3	0.034 mg/kg to 0.078 mg/kg
Nickel	3/3	33 mg/kg to 63 mg/kg
Potassium	3/3	1,040 mg/kg to 1,290 mg/kg
Selenium	3/3	1.4 mg/kg to 3 mg/kg
Sodium	3/3	79.9 mg/kg to 105 mg/kg
Vanadium	3/3	44.4 mg/kg to 70 mg/kg
Zinc	3/3	110 mg/kg to 259 mg/kg

Sheet 1 of 1

mg/kg = milligrams per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

Checked by: MMF 7/23/01

TABLE 23-4
SURFACE WATER SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Metals		
Aluminum	1/1	4,570 ug/L
Barium	1/1	36.4 ug/L
Beryllium	1/1	2.1 ug/L
Boron	1/1	47.5 ug/L
Cadmium	1/1	3.3 ug/L
Calcium	1/1	141,000 ug/L
Chromium, Total	1/1	3.2 ug/L
Cobalt	1/1	44 ug/L

Sodium	1/1	21,400 ug/L
Vanadium	1/1	7.6 ug/L
Zinc	1/1	510 ug/L

Sheet 1 of 1

ug/L = micrograms per Liter

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are included only when the duplicate results are greater than original sample results, or when an analyte was detected in a duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are lower than the low end of the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

AUS-0063 Sample Locations and
Detections in Sediments and
Surface Water
FIG. NO.
23-1

PROJECT NO.
2320000026.00

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC Area. AUS-0064 is located south of the COC Area Road, about 1.4 miles west of the intersection of Wolf Creek Road and the COC Area Road.

AUS-0064 is Explosives and Munitions Manufacturing Area Operable Unit (EMMA OU) Site COC-13, one of the COC sites for which no chemical data were collected during EMMA OU investigations.

AUS Original Site Designations

AUS-0064 is one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS).

24.1 HISTORIC SEARCH INFORMATION

24.1.1 Site Description

AUS-0064 was originally described as “mounds and a brick pit near Site 63 (AUS-0063)” and it was identified as COC-13 of the EMMA OU. COC-13 is a small site, with dimensions of approximately 35 feet (ft) by 35 ft.¹ The site is a very small wooded area.

24.1.2 Operational History and Waste Characteristics

AUS-0064 may have been the location of a former farmstead according to the 1943 aerial photographs.² No other evidence of activity was observed in the historical aerial photographs.

There have been no known industrial lessees of this property.

24.1.3 AUS-0064 Previous Sampling Results

Parsons Engineering, 1997

Under contract to the Department of the Army, Parsons Engineering conducted an ordnance and explosive waste (OEW) investigation at this site (COC-13) in 1997. The entire site was investigated for OEW and a total of 35 magnetic anomalies were identified.³ Eleven of these anomalies were investigated and two of them were identified as ordnance scrap (munitions

¹ Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Page 2-27.

² Entech, Inc., 1999, Historical Aerial Photographic Analysis – Inventory of Potential Disposal Sites: Additional and Uncharacterized Sites (AUS) Operable Unit, Crab Orchard National Wildlife Refuge, Marion, Illinois, Volume II (Maps) Page R. The Entech reports analyze historic aerial overflight photographs of industrial areas at the Refuge, from 1943 to 1993. The photos were obtained from the National Archives and Records Administration (NARA) and the U.S. Department of Agriculture Agricultural Stabilization and Conservation Service (ASCS).

³ Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Page 2-27.

fragments) and the rest were non-ordnance scrap.⁴ No unexploded ordnance (UXO) items were recovered.

USEPA Sampling, 1998

In 1998, the United States Environmental Agency (USEPA) collected one soil sample (64-01)⁵ from this site, “near intersection in road, downstream of tipped barrel,” according to USEPA field notes. Survey coordinates were not available for this sample; therefore, the location does not appear on any figures. The results for all detected constituents are listed in Table 24-1A. No target semi-volatile organic compounds (SVOCs) were detected. Beryllium (1.1 milligrams per kilogram (mg/kg)) exceeded USEPA Soil Screening Levels (SSLs) and Refuge background levels.⁶

24.1.4 Observations During Site Visit

The site was not visited during the Preliminary Assessment (PA).

24.1.5 Recommendations Based on Preliminary Assessment

AUS-0064 was not originally included in the Site Investigation (SI) since USFWS was unable to locate the site during the site reconnaissance. During the SI field investigation, the USFWS located the site and it was added to the SI field investigation since previous USEPA sample results revealed exceedances of PA screening levels. AUS-0064 was also included in the SI because of suspect debris on site and because it was a COC site investigated for UXO only (no chemical analyses).

24.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0064 on May 12, 2000. The rationale for sample locations, media, and analytes was not included in the FSP for the AUS OU PA/SI, since sample locations at this site were added after the FSP had been completed. AUS OU SI sample locations are shown on Figure 24-1. Survey coordinates for all sample locations in AUS-0064 are listed in Table 24-1. Table 24-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples.

24.2.1 Field Investigation

Two soil samples (0064-001 and 0064-002) were collected from this site. No other samples were taken.

24.2.2 Field Results

There were no test pits or monitoring wells installed at AUS-0064. The soil from the hand auger samples, which extended to depths of two ft, was described as silty clay fill.

⁴ Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Page 2-27.

⁵ The sample was also labeled AUS-102.

⁶ See Table 1-11 of this report for Refuge background soil values used for the PA.

24.2.2.1 Chemical Results

Table 24-3 lists the chemicals detected at AUS-0064 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report (QCSR). Sample results are shown in Figure 24-1.

24.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 24-4 and 24-5 as follows:

- Table 24-4--human health risk screening for soils, and
- Table 24-5--ecological risk screening for soils.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0064. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as contaminants of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs, but rather as uncertainties.

In Figure 24-1, the shading convention used is the same as for the tables, discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 24-6 (human health risk) and 24-7 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 24-6) and COPECs (Table 24-7) are shaded in the tables.

24.3.1 Human Health Risk

24.3.1.1 Soil

Human health screening results for soil samples are presented in Table 24-4. For carcinogens, a cancer risk was calculated using the USEPA Region 9 Industrial Soil Preliminary Remediation Goals (PRGs) as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

24.3.2 Ecological Risk

24.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 24-5. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)⁷
- Environment Canada (1995)⁸
- Talmage *et al.* (1999)⁹
- Efroymson *et al.* (1997a, 1997b)¹⁰
- CCME (1999)¹¹
- MHSPE (1994)¹²
- Other Sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)¹³ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

24.4 SCIENTIFIC MANAGEMENT DECISION POINT

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not be retained as COPCs/COPECs for further evaluation. These are the constituents coded with “D” on the COPC list, Table 24-6; and on the COPEC list, Table 24-7. On the COPC list constituents in this category include arsenic, chromium, nickel and selenium in soil. COPECs coded with a “D” on Table 24-7 include boron, chromium, manganese, and selenium in soil. Soil was the only media sampled.

24.4.1 Human Health Risk Evaluation

Constituents that exceeded both the screening criteria and Refuge background are discussed below, with recommendations.

Barium. The maximum barium concentration detected, 197 mg/kg, exceeded the calculated background value of 195 mg/kg for barium by one percent¹⁴. The Region 9 migration to groundwater criteria for a DAF 1 for barium is 80 mg/kg. The screening value for the soil component of the groundwater ingestion route for State of Illinois Class I groundwater was not exceeded. The Region 9 DAF 1 factor assumes that groundwater is at the surface, an unnecessarily conservative assumption for this site, which is located on the side of a hill. At the Refuge, groundwater can be expected to occasionally rise to the surface in flat low-lying areas, but not on hillsides. The Region 9 screening value for DAF 20 (assuming a dilution/attenuation factor of 20) is 1,600 mg/kg, almost an order of magnitude greater than the maximum detected concentration.

In addition, the maximum concentration detected is well below the mean plus three standard deviations, which was calculated as 361 mg/kg for barium¹⁵. USEPA guidance states that the

¹³ USEPA 1991. Assessment and Control of Bioconcentratable Contaminants in Surface Waters (Draft). US Environmental Protection Agency Office of Research and Development, Washington, D.C.

¹⁴ This is the 95 percent upper tolerance limit (UTL), based on the 95 percent confidence level. See Section 2 for the development of background values.

¹⁵ See discussion and results in Section 2 and Table 2-7.

mean plus three standard deviations ($3S_b$) comprises a reasonable maximum allowable or upper limit.¹⁶

For the reasons presented above, it is recommended that barium not be retained as a COPC for further evaluation.

Cadmium. The maximum cadmium concentration detected, 0.88 mg/kg, exceeded the calculated background value of 0.2 mg/kg for cadmium¹⁷. The Region 9 DAF 1 value for cadmium is 0.4 mg/kg. The screening value for the Illinois TACO soil component of the groundwater ingestion route for Class I groundwater was not exceeded. The Region 9 screening value for DAF 20 (assuming a dilution/attenuation factor of 20) is 8 mg/kg, almost an order of magnitude greater than the maximum detected concentration. Based on these data and the magnitude of the detection, it is recommended that cadmium not be retained as a COPC based on potential groundwater impacts.

Several chemicals represent uncertainties for AUS-0064 because, while they were not detected, the reporting limit was equal to or exceeded the screening criteria. These are indicated as uncertainties on Table 24-6, and coded with a "B." The uncertainty associated with these chemicals is not considered to be significant.

Note that concentrations of beryllium (1.1 mg/kg) and nickel (19 mg/kg) from the USEPA 1998 sampling exceeded the screening criteria used for the PA. The beryllium concentration of 1.1 mg/kg does not exceed any of the SI human health screening criteria, and the nickel concentration is essentially at background, based on current data (18.9 mg/kg for nickel).

In summary, results of the soil analyses at AUS-0064 indicate there are no chemicals present at levels of potential human health concern warranting further evaluation. It is recommended that none of the chemicals be retained as COPCs for this site.

24.4.2 Ecological Risk Evaluation

Chemicals identified as COPECs for Site AUS-0064 include boron, chromium, iron, manganese, mercury, selenium and zinc. As discussed above, the maximum detected concentrations of boron, chromium, manganese and selenium were below Refuge background levels. It is recommended that these chemicals not be retained as COPECs. Iron, mercury, and zinc are discussed below.

Iron - The maximum concentration of iron (20,300 mg/kg) was slightly (about 5 percent) above the background concentration (19,306 mg/kg -- Table 24-5). Though the maximum detection exceeded the screening value, iron is not considered a significant ecological concern since it is generally considered to have low toxicity, it is an essential nutrient, and is similar to the background concentration.

¹⁶ USEPA, 1995. Determination of Background Concentrations of Inorganics in Soils and Sediments at Hazardous Waste Sites. OSWER Engineering Forum Issue. EPA/540/5-96/500.

¹⁷ This is the 95 percent upper tolerance limit (UTL), based on the 95 percent confidence level. See Section 2 for the development of background values.

Mercury - The screening hazard quotient for mercury was less than one, indicating that mercury does not pose a risk associated with direct exposures in soils, but is discussed because it was detected and is a potential bioaccumulative constituent. The maximum concentration of mercury (0.11 mg/kg) was higher than background (0.06 mg/kg). However, the background mean plus three standard deviations is 0.11 mg/kg. As discussed in Section 2, this approach (in addition to the 95% UTL) also represents a reasonable maximum value for reference area data sets as based on guidance in *Determination of Background Concentrations of Inorganics in Soils and Sediments at Hazardous Waste Sites*.¹⁸ In addition, though mercury is a potentially bioaccumulative constituent, its bioaccumulation potential is less pronounced in terrestrial as compared to aquatic systems.¹⁹ Therefore, mercury at AUS-0064 is not believed to be sufficiently elevated to warrant further evaluation.

Zinc - The maximum concentration of zinc (144 mg/kg) resulted in a screening HQ of 1.2 (Table 24-5). This suggests there may be a potential for direct exposure risks associated with zinc in soils. However, the maximum zinc concentration is below all other Level A toxicity reference values presented in Appendix G. In addition, the mean concentration of zinc was 93.6 mg/kg, which is below all the Level A toxicity reference values in Appendix G. Because the screening HQ based on the maximum concentration only slightly exceeds unity, and a screening quotient based on the mean concentration would be less than 1, zinc is not believed to present a significant ecological concern.

One organic chemical and several inorganic chemicals represent uncertainties at AUS-0064 (Tables 24-5 and 24-7). The single organic, 2,6-dinitrotoluene, was not detected, but the reporting limit exceeded the screening value. In fact, none of the explosives were detected. Therefore, the uncertainty associated with 2,6-dinitrotoluene is considered low. Similarly, thallium was not detected but represents an uncertainty because the reporting limit exceeded the ecological screening value (HQ = 1.4). Because it was not detected, and the associated HQ only slightly exceeds unity, thallium is not considered a significant ecological concern. Other inorganics were identified as uncertainties because they were detected but no screening values were identified. These include calcium, magnesium, potassium, and sodium. Both calcium and sodium were below background concentrations. Though the maximum concentrations of magnesium and potassium were above background levels, these are essential nutrients (as are calcium and sodium) and uptake is physiologically controlled. Therefore, the uncertainty associated with these chemicals is not considered significant. Aluminum was also characterized as an uncertainty. The screening criterion for aluminum is based on soil pH, and there are no site-specific pH data available for AUS-0064. However, the maximum concentration is below background, and thus aluminum is not considered a significant ecological concern.

In summary, results of the soil analyses at AUS-0064 indicate there are no chemicals present at levels of potential ecological concern warranting further evaluation. It is recommended that none of the chemicals be retained as COPECs for this site.

24.4.3 Summary of Recommendations

Based on the above discussions, it is recommended that none of the constituents detected at AUS-0064 be retained for further evaluation. Site AUS-0064 is judged to require no further action.

Zinc	2/2	43.2 mg/kg to 144 mg/kg

Sheet 1 of 1

mg/kg = milligrams per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

A - Chemical was not detected and the reporting limit does not exceed the screening concentration.

B - Chemical was not detected, but reporting limit was equal to or exceeded screening concentration.

C - Chemical was not detected and there is no screening concentration.

D - Chemical was detected and was equal to or exceeded screening concentration, but did not exceed background.

E - Chemical was detected and was equal to or exceeded screening concentration and background, if applicable.

F - Chemical was detected and did not exceed screening concentration.

G - Chemical was detected, but no screening value was available.

H - Chemical was detected, but it is an essential nutrient.

J - Chemical was classified as a COPC based on USEPA 1998 data but was not a COPC based on SI data.

NA - Not Analyzed or not applicable.

A - Chemical was not detected and the reporting limit does not exceed the screening concentration.

B - Chemical was not detected, but reporting limit was equal to or exceeded screening concentration.

C - Chemical was not detected and there is no screening concentration.

D - Chemical was detected and was equal to or exceeded screening concentration, but did not exceed background.

E - Chemical was detected and was equal to or exceeded screening concentration and background, if applicable.

F - Chemical was detected and did not exceed screening concentration.

G - Chemical was detected, but no screening value was available.

H - Chemical was detected, but it is an essential nutrient.

I - If pH<5.5, Aluminum is a COPEC, otherwise it is not.

J - Chemical was classified as a COPEC based on USEPA 1998 data but was not a COPEC based on SI data.

NA - Not Analyzed or not applicable.

PA/SI REPORT-AUS OU CRAB ORCHARD NWR MARION, ILLINOIS		PROJECT NO. 23200000026.00
URS		
DRN. BY: djd 12/2/00 DSGN. BY: are CHKD. BY:mch/cmw	AUS-0064 Sample Locations and Detections in Soils	
SCALE	FEET	FIG. NO. 24-1

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC Area. AUS-0065 is located at the northeast corner of the intersection of the COC Area Road and another unnamed roadway that leads northward towards Crab Orchard Lake (Figure 22-1).

AUS-0065 is made up of foundations that are located to the northeast of former COC-1 and it has suspect debris at the site.

AUS Original Site Designations

AUS-0065 is one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS).

25.1 HISTORIC SEARCH INFORMATION

25.1.1 Site Description

AUS-0065 was originally described as “foundations northeast of COC-1.” Figure 25-1 is a site map of AUS-0065.

25.1.2 Operational History and Waste Characteristics

There have been no known industrial lessees of this property.

25.1.3 AUS-0065 Previous Sampling Results

USEPA Sampling, 1998

In 1998, the United States Environmental Protection Agency (USEPA) collected two samples (65-01 and 65-02) and one duplicate sample (65-02 DUP) at AUS-0065. Sample locations are shown in Figures 25-1 and 25-2. The results for all detected constituents are listed in Table 25-1A. The following SVOC compounds were detected above USEPA (Soil Screening Levels) SSLs: carbazole (0.23 mg/kg), benzo[a]anthracene (0.75 mg/kg), benzo[b]fluoranthene (1.1 mg/kg), benzo[a]pyrene (0.62 mg/kg), and dibenz[a,h]anthracene (0.11 mg/kg). Mercury (0.23 mg/kg) exceeded USEPA SSL and Refuge background level.¹ Zinc (150 mg/kg) exceeded New Dutchlist Soil Optimum Levels (DSOL) and the Refuge background level.

25.1.4 Observations During Site Visit

The site was observed to have two visible concrete foundations falling into depressions that partially surround the foundations. One of the depressions contained water. Numerous soil mounds were observed. A brick structure resembling a well was observed on the eastern side of the site. The site was well vegetated with trees and grasses. A fence to the south separates the COC Area Road from the site.

¹ See Table 1-11 of this report for Refuge background soil values used for the PA.

25.1.5 Recommendations Based on Preliminary Assessment

Site AUS-0065 was retained in the Site Investigation (SI) primarily because of suspect debris on site, and because the 1998 USEPA analytical results exceeded Preliminary Assessment (PA) screening criteria.

25.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0065 on May 8, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)² for the AUS OU PA/SI. AUS OU SI sample locations are shown on Figures 25-1 and 25-2. Survey coordinates for all sample locations in AUS-0065 are listed in Table 25-1. Table 25-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples.

25.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted.

Depressions

Six soil samples were collected from the three major depressions that were identified in this area during the site reconnaissance (Figure 25-1). Samples 0065-001 and 0065-005 were collected from within the depression located east of the foundation on the west side of the site. Samples 0065-003 and 0065-007 were collected from the depression located south of the east foundation. Two samples were collected from the third depression located to the northeast of the west foundation (0065-002 and 0065-006). The third depression also contained water during the site reconnaissance.

Mounded Areas

There were numerous mounded areas present on site (Figure 25-1). Three samples were collected from mounded areas: 0065-004, 0065-008 and 0065-009.

25.2.2 Field Results

25.2.2.1 Site Conditions

The majority of the site is wooded. It is bounded to the north and east by a grassy field, and to the south by a fence line.

25.2.2.1.1 *Geologic Conditions*

There were no test pits or monitoring wells installed at AUS-0065. The soil from hand auger borings, which extended to a maximum depth of 4 feet (ft), was described as silty clay fill. The soil at locations 0065-008 and 0065-009 (mounded areas) included 2-inch gravel.

² U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

25.2.2.1.2 Hydrogeologic Conditions

No hydrogeological information is available for this site.

25.2.2.1.3 Hydrologic Conditions

As shown on Figure 25-1, there are three depressions in the middle of the site. Only one of the depressions contained water at the time of the SI.

25.2.2.2 Chemical Results

Table 25-3 lists the chemicals detected in AUS-0065 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report.

Sample results are presented on the following figures:

- Figure 25-1 – organic results for soil samples, and
- Figure 25-2 – inorganic results for soil samples at this site.

25.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 25-4 and 25-5 as follows:

- Table 25-4--human health risk screening for soils, and
- Table 25-5--ecological risk screening for soils.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0065. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs/COPECs, but rather as uncertainties.

In Figures 25-1 and 25-2, the shading convention used is the same as for the tables discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are

qualified as estimated (coded with "J") are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 25-6 (human health risk) and 25-7 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 25-6) and COPECs (Table 25-7) are shaded in the tables.

25.3.1 Human Health Risk

25.3.1.1 Soil

Human health screening results for soil samples are presented in Table 25-4. For carcinogens, a cancer risk was calculated using the USEPA Region 9 Industrial Soil Preliminary Remediation Goals (PRGs) as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

25.3.2 Ecological Risk

25.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 25-5. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)³
- Environment Canada (1995)⁴
- Talmage *et al.* (1999)⁵
- Efroymson *et al.* (1997a, 1997b)⁶

- CCME (1999)⁷
- MHSPE (1994)⁸
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)⁹ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

25.4 SCIENTIFIC MANAGEMENT DECISION POINT

A Remedial Investigation (RI) is recommended for Site AUS-0065, based on exceedances of the SI screening criteria.

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not necessarily be retained as COPCs/COPECs for further evaluation. These are the constituents coded with “D” on the COPC list, Table 25-6; and on the COPEC list, Table 25-7. The COPCs in this category include antimony, arsenic, barium, chromium, nickel and selenium in soil. COPECs that were detected below Refuge background levels include arsenic, chromium, iron, manganese and selenium in soil. Soil was the only media investigated. These chemicals may later be included in the RI for other reasons, but the detections at the locations noted are not considered to be of concern since they are below Refuge background levels. All other COPCs/COPECs on Tables 25-6 and 25-7 should be investigated in the RI. In addition, all analytes listed as uncertainties on these tables should be considered for further evaluation in the RI Work Plan.

Chemicals that exceeded screening criteria and Refuge background (if applicable) are listed in Table 25-8.

Note that a number of the human health COPCs exceed migration to groundwater screening criteria. Groundwater has not been investigated at this site, and based on these data, should be considered in the RI. Other areas of the site, media, and contaminants in addition to those

TABLE 25-3
SOIL SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Semivolatile Organic Compounds		
2,4-Dimethylphenol	1/12	1,100 ug/kg
2-Methylnaphthalene	9/12	45 ug/kg to 3,500 ug/kg
2-Methylphenol (o-Cresol)	1/12	760 ug/kg
4-Methylphenol (p-Cresol)	3/12	71 ug/kg to 2,600 ug/kg
Acenaphthene	1/12	850 ug/kg
Acenaphthylene	4/12	78 ug/kg to 7,200 ug/kg
Anthracene	4/12	49 ug/kg to 5,900 ug/kg
Benzo(a)Anthracene	6/12	47 ug/kg to 11,000 ug/kg
Benzo(a)Pyrene	6/12	56 ug/kg to 12,000 ug/kg
Benzo(b)Fluoranthene	7/12	52 ug/kg to 11,000 ug/kg
Benzo(g,h,i)Perylene	6/12	67 ug/kg to 12,000 ug/kg
Benzo(k)Fluoranthene	6/12	51 ug/kg to 9,200 ug/kg
Bis(2-ethylhexyl) Phthalate	1/12	1,400 ug/kg
Carbazole	3/12	65 ug/kg of 5,600 ug/kg
Chrysene	10/12	57 ug/kg to 14,000 ug/kg
Dibenz(a,h)Anthracene	3/12	120 ug/kg to 4,700 ug/kg
Dibenzofuran	8/12	42 ug/kg to 3,100 ug/kg
Fluoranthene	11/12	42 ug/kg to 21,000 ug/kg
Fluorene	2/12	180 ug/kg to 5,100 ug/kg
Indeno(1,2,3-c,d)Pyrene	5/12	88 ug/kg to 9,900 ug/kg
Naphthalene	5/12	120 ug/kg to 4,700 ug/kg
Phenanthrene	11/12	93 ug/kg to 27,000 ug/kg
Phenol	1/12	940 ug/kg
Pyrene	11/12	44 ug/kg to 17,000 ug/kg
Explosives		
4-Nitrotoluene (PNT)	1/7	1700 ug/kg
Other Inorganics		
Total Organic Carbon	1/1	27,900 mg/kg
Metals		
Aluminum	12/12	6,480 mg/kg to 12,700 mg/kg
Antimony	8/12	0.22 mg/kg to 0.76 mg/kg
Arsenic	12/12	4.6 mg/kg to 9.7 mg/kg
Barium	12/12	46 mg/kg to 164 mg/kg
Beryllium	12/12	0.32 mg/kg to 0.86 mg/kg
Boron	12/12	1.6 mg/kg to 11.7 mg/kg
Cadmium	4/12	0.69 mg/kg to 1.1 mg/kg
Calcium	12/12	2,320 mg/kg to 106,000 mg/kg
Chromium	12/12	9.2 mg/kg to 20.6 mg/kg
Cobalt	12/12	3.9 mg/kg to 11.6 mg/kg
Copper	12/12	6.8 mg/kg to 33.4 mg/kg
Iron	12/12	11,200 mg/kg to 19,300 mg/kg
Lead	12/12	13.5 mg/kg to 212 mg/kg

Sheet 1 of 2

TABLE 25-3
SOIL SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Magnesium	12/12	1,170 mg/kg to 11,100 mg/kg
Manganese	12/12	295 mg/kg to 1,140 mg/kg
Mercury	12/12	0.023 mg/kg to 0.47 mg/kg
Nickel	12/12	9.5 mg/kg to 14.1 mg/kg
Potassium	12/12	690 mg/kg to 1,340 mg/kg
Selenium	9/12	0.47 mg/kg to 1.4 mg/kg
Sodium	12/12	49.4 mg/kg to 143 mg/kg
Vanadium	12/12	17 mg/kg to 37.9 mg/kg
Zinc	12/12	42.5 mg/kg to 351 mg/kg

Sheet 2 of 2

mg/kg = milligrams per kilogram

ug/kg = micrograms per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

Checked by: MMF 7/23/01

AUS-0065 Sample Locations and
Detections of Inorganic Compounds
in Soils

FIG. NO.
25-2

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC area. AUS-0066 is located approximately 1.4 miles west of the intersection of Wolf Creek Road and the COC Area Road, on the north side of the COC Area Road (Figure 22-1).

AUS-0066 was included in the AUS OU because of suspect debris and signage on site and because it is also COC-14, one of the COC sites investigated only for unexploded ordnance (UXO)¹.

AUS Original Site Designations

AUS-0066 is one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS).

26.1 HISTORIC SEARCH INFORMATION

26.1.1 Site Description

AUS-0066 was originally described as “berm with red brick rubble” with a “Danger Contaminated Area” sign to the west, and it was identified by USFWS as COC-14 of the Explosives and Munitions Manufacturing Area Operable Unit (EMMA OU). COC-14 measures approximately 50 feet (ft) (in an east-west direction) by 50 ft (in a north-south direction).² Figure 26-1 is a site map of AUS-0066.

26.1.2 Operational History and Waste Characteristics

There have been no known industrial lessees of this property.

The location in the COC Area, the danger sign, and the presence of the red brick rubble suggest that this may have been a site used by the Army for detonation of ordnance during and/or after World War II (see introductory text in Section 22).

26.1.3 AUS-0066 Previous Sampling Results

Parsons Engineering, 1997

Under contract to the Department of Army, Parsons Engineering conducted an ordnance and explosive waste (OEW) investigation at this site (COC-14) in 1997. There was no chemical investigation done in this area at that time. The entire site was investigated for OEW and a total of 20 magnetic anomalies were identified.³ All twenty of these anomalies were investigated and

¹ Note that according to Leanne Moore of the USFWS, we should assume that the Parsons Engineering report incorrectly identified the location of COC-14 to the south of the COC Area Road, instead of to the north where it was located during the site reconnaissance (See Figure 22-2 for COC area sites).

² Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Page 2-27.

³ Parsons Engineering Science, Inc., 1997, Engineering Evaluation and Cost Analysis – Final Report, Former Illinois Ordnance Plant - Marion, Illinois, Page 2-27.

all twenty were identified as ordnance scrap.⁴ No unexploded ordnance (UXO) items were recovered.

USEPA Sampling, 1998

In 1998, the United States Environmental Protection Agency (USEPA) collected a sample (66-01) from this site. According to USEPA field notes, this site was 0.5 miles west of the intersection (likely referring to the intersection that is just northeast of former COC-1) with red brick rubble. The sample location is shown in Figures 26-1, 26-2, and 26-3. The results for all detected constituents are listed in Table 26-1A. The sample was analyzed for semi-volatile organic compounds (SVOCs) and metals. No metals exceeded USEPA soil screening levels (SSLs) and Refuge background values.⁵

26.1.4 Observations During Site Visit

AUS-0066 is a wooded area along an abandoned road. The site is very close to Crab Orchard Lake. A creek runs through the site, to the northwest, and discharges to the Lake. The sediment in this creek was observed to have a reddish-orange color in places. A small bermed area created from brick rubble and a “Danger Contaminated Area” sign, approximately 100 feet to the west of the brick rubble, were observed. There is also some construction debris and some small soil mounds present on site.

26.1.5 Recommendations Based on Preliminary Assessment

AUS-0066 was included in the SI because observations made at the site during the site reconnaissance indicated that there was potential for contamination in this area (i.e., “Contaminated Area” sign, and discoloration in creek).

26.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0066 on May 9, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)⁶ for the AUS OU PA/SI. AUS OU SI sample locations are shown on Figures 26-1, 26-2, and 26-3. Survey coordinates for all sample locations in AUS-0066 are listed in Table 26-1. Table 26-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples unless otherwise noted.

26.2.1 Field Investigation

Eight locations were sampled. Sampling was done in accordance with the FSP, except as noted.

⁴ Parsons Engineering Science, Inc., 1997, Engineering Evaluation and Cost Analysis – Final Report. Former Illinois Ordnance Plant - Marion, Illinois, Page 2-31.

⁵ See Table 1-11 of this report for Refuge background soil values used for the PA.

⁶ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

Sample locations 0066-003 and 0066-004 (for both sediment and surface water) were in the creek.

Sample locations 0066-001, 0066-002 and 0066-008 (soil) are on a hillside northeast of the “Contaminated Area” sign. The surface runoff from this hillside drains into the creek.

Sample locations 0066-006 and 0066-007 (for both sediment and surface water) were in a ponded area inside the red-brick berm.

Sample location 0066-005 (soil) was southwest of the red-brick berm and north of the creek.

26.2.2 Field Results

26.2.2.1 Site Conditions

26.2.2.1.1 *Geologic Conditions*

There were no test pits or monitoring wells installed at AUS-0066. The soil from hand auger borings, which extended to depths of two feet, was described as silty clay fill.

26.2.2.1.2 *Hydrogeologic Conditions*

No hydrogeological information is available for this site.

26.2.2.1.3 *Hydrologic Conditions*

As shown on Figure 26-1, there is a creek that runs north through the middle southern portion of the site and then turns northwest toward Crab Orchard Lake. There is also a ponded area within a berm in the middle of the site.

26.2.2 Chemical Results

The sample analytical results are summarized in the following tables:

- Table 26-3 – soil samples results,
- Table 26-4 – sediment samples results, and
- Table 26-5 – surface water samples results.

These tables list all the chemicals detected in AUS-0066 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report.

Sample results are presented on the following figures:

- Figure 26-1 – organic results for soil and sediment samples,
- Figure 26-2 – inorganic results for soil and sediment samples, and
- Figure 26-3 – all results for surface water samples at this site.

26.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 26-6 through 26-11 as follows:

- Table 26-6 – human health risk screening for soils,
- Table 26-7 – human health risk screening for sediment,
- Table 26-8 – human health risk screening for surface water,
- Table 26-9 – ecological risk screening for soils,
- Table 26-10 – ecological risk screening for sediment, and
- Table 26-11 – ecological risk screening for surface water.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0066. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs for human health risk and COPECs for ecological risk). The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs/COPECs, but rather as uncertainties.

In Figures 26-1 through 26-3, the shading convention used is the same as for the tables discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 26-12 (human health risk) and 26-13 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 26-12) and COPECs (Table 26-13) are shaded in the tables.

26.3.1 Human Health Risk

26.3.1.1 Soil/Sediment

Human health screening results for soil and sediment samples are presented in Tables 26-6 and 26-7, respectively. Soil screening values were used to screen the sediment samples.

For carcinogens, a cancer risk was calculated using the USEPA Region 9 Industrial Soil PRGs as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (DAF=1), the Illinois TACO Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

26.3.1.2 Surface Water

Human health risk screening results for chemicals in surface water at AUS-0066 are presented in Table 26-8. The maximum concentrations from AUS-0066 were screened against the State of Illinois General Use Surface Water Quality Criteria – Human Health.

26.3.2 Ecological Risk

26.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 26-9. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)⁷
- Environment Canada (1995)⁸
- Talmage *et al.* (1999)⁹
- Efroymson *et al.* (1997a, 1997b)¹⁰
- CCME (1999)¹¹
- MHSPE (1994)¹²
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

¹² Ministry of Housing, Spatial Planning, and the Environment (MHSPE). 1994. *Intervention Values and Target Values – Soil Quality Standards*. Directorate General for Environmental Protection, Department of Soil Protection, The Hague, The Netherlands.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)¹³ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

26.3.2.2 Sediment

Ecological screening results for sediment samples are presented in Table 26-10. Sources of TRVs for evaluating direct exposures to aquatic organisms in sediments included:

- Consensus-based freshwater sediment criteria (MacDonald et al. 1999)¹⁴
- USEPA (1996 – summarized by Ingersoll et al. 1996)¹⁵
- Ontario Ministry of the Environment and Energy (1995)¹⁶
- NOAA (1999)¹⁷
- Ecotox (USEPA 1996)¹⁸
- Long et al. (1995)¹⁹
- Equilibrium partitioning
- USEPA Region V Environmental Data Quality Levels (EDQLs)
- Other sources

With respect to effects levels, there are a number of potential sources and endpoints. There are also multiple endpoints from some sources. For example, threshold effects levels (TELs) as reported by Ingersoll et al. (1996) are the geometric mean of the 15th percentile in the effects data set and the 50th percentile in the no-effects data set. The effects-range low (ERL) and effects-range medium (ERM) are the 15th percentile and 50th percentile values in the effects datasets, respectively. The Probable Effects Level (PEL) is the geometric mean of the 50th

¹⁹ Long, E.R., D.D. MacDonald, S.L. Smith, and F.D. Calder. 1995. Incidence of adverse biological effects within ranges of chemical concentrations in marine and estuarine sediments. Environ. Management. 19(1): 81-97.

percentile in the effects data set and the 85th percentile in the no-effects data set, and the effects range medium is the 50th percentile value of the effects dataset. A TEL or ERL is assumed to represent a concentration below which toxic effects are rarely observed. The range between the TEL and PEL is assumed to represent the range in which effects are occasionally observed. MacDonald et al. (2000) developed “consensus-based” freshwater sediment screening concentrations. Threshold effect concentrations (TECs) were developed as concentrations below which adverse effects are not expected to occur. Probable effect concentrations (PECs) were levels above which effects are frequently expected to occur. Among other potential screening values, no effect concentrations (NECs – Ingersoll et al. 1996) and upper effect thresholds (UETs – NOAA 1999) are also levels above which effects are frequently or always observed.

In deriving an ecological screening value (ESV), preference was given to the TEC, TEL and ERL values since these are the most conservative (i.e., levels below which effects are rarely observed). Preference was also given to freshwater-derived values (MacDonald et al. [1999], Ingersoll et al. [1996], Ontario [1995] and NOAA [1999]) as opposed to estuarine or saltwater (Long et al. 1995). If screening values were unavailable from the sources noted above, the “equilibrium-partitioning” (EqP) approach was used. This used the surface water ecological screening value and the expected partitioning between sediment and sediment pore water as described in USEPA (1993). A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was the same as for soils as presented in Section 26.3.2.1.

26.3.2.3 Surface Water

Ecological screening results for surface water samples are presented in Table 26-11. TRVs for direct exposure by aquatic organisms in surface water were obtained from:

- Illinois water quality standards
- National Recommended Ambient Water Quality Criteria (USEPA 1999a)²⁰
- EcoTox (USEPA 1996²¹)
- USEPA Region IV Freshwater Screening Values (1999b)²²
- Maximum Acceptable Toxicant Concentrations (MATCs) or lowest observed effect concentrations (LOECs) obtained from the USEPA Assessment Tools for the Evaluation of Risk database (ASTER 2000)²³
- Other sources

The Illinois water quality standards are believed to be the most relevant, followed by national recommended ambient water quality criteria. EcoTox reports values based on ambient water

²³ ASTER. 2000. Assessment Tools for Evaluation of Risk Database. United States Environmental Protection Agency, Office of Research and Development.

quality criteria, and Tier II water quality criteria have been developed in the absence of sufficient information to support a national recommended water quality criterion using guidelines outlined in the Great Lakes Water Quality Initiative. Remaining sources were prioritized based on relevance to the area and professional judgment. The detailed discussion of the approach for selecting a single ESV from among the multiple sources is presented in Appendix G.

The screening approach for ingestion pathway exposures was the same as for soils as presented in Section 26.3.2.1.

26.4 SCIENTIFIC MANAGEMENT DECISION POINT

A Remedial Investigation (RI) is recommended for Site AUS-0066, based on exceedances of the SI screening criteria.

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not necessarily be retained as COPCs/COPECs for further evaluation. These are the constituents coded with "D" on the COPC list, Table 26-12; and on the COPEC list, Table 26-13. COPCs in this category include mercury in surface water; arsenic and selenium in sediment; and arsenic, barium, chromium, nickel and selenium in soil. COPECs coded with "D" on Table 26-13 include mercury in surface water, sediment and soil; plus chromium, manganese, and selenium in soil. These chemicals may later be included in the RI for other reasons, but the detections at the locations noted are not considered to be of concern since they are below Refuge background levels. All other COPCs/COPECs listed on these tables should be investigated in the RI. In addition, all analytes listed as uncertainties on these tables should be considered for further evaluation in the RI Work Plan.

Chemicals that exceeded screening criteria and Refuge background (if applicable) are listed in Table 26-14.

Note that a number of the human health COPCs exceed migration to groundwater screening criteria. Groundwater has not been investigated at this site, and based on these data, should be considered in the RI. Other areas of the site, media, and contaminants in addition to those addressed in this study may warrant investigation in the RI. These issues will be addressed in the work plan for the RI.

Sheet 1 of 1

mg/kg = milligrams per kilogram

ug/kg = micrograms per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

TABLE 26-4
SEDIMENT SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Semivolatile Organic Compounds		
2-Methylnaphthalene	2/4	210 ug/kg to 370 ug/kg
Benzo(a)Anthracene	1/4	160 ug/kg
Benzo(a)Pyrene	1/4	140 ug/kg
Benzo(b)Fluoranthene	1/4	220 ug/kg
Benzo(g,h,i)Perylene	1/4	71 ug/kg
Benzo(k)Fluoranthene	1/4	73 ug/kg
Bis(2-ethylhexyl) Phthalate	3/4	55 ug/kg to 100 ug/kg
Chrysene	1/4	180 ug/kg
Dibenzofuran	2/4	58 ug/kg to 76 ug/kg
Fluoranthene	1/4	150 ug/kg
Indeno(1,2,3-c,d)Pyrene	1/4	76 ug/kg
Naphthalene	2/4	86 ug/kg to 170 ug/kg
Phenanthrene	2/4	110 ug/kg to 160 ug/kg
Pyrene	2/4	65 ug/kg to 190 ug/kg
Metals		
Aluminum	4/4	13,500 mg/kg to 20,500 mg/kg
Arsenic	4/4	2.5 mg/kg to 10.3 mg/kg
Barium	4/4	73.5 mg/kg to 241 mg/kg
Beryllium	4/4	0.57 mg/kg to 2.8 mg/kg
Boron	4/4	1.6 mg/kg to 2.5 mg/kg
Cadmium	2/4	3.8 mg/kg to 35.7 mg/kg
Calcium	4/4	940 mg/kg to 12,900 mg/kg
Chromium, Total	4/4	17.9 mg/kg to 32.8 mg/kg
Cobalt	4/4	4.2 mg/kg to 39 mg/kg
Copper	4/4	9.8 mg/kg to 19.4 mg/kg
Iron	4/4	9,590 mg/kg to 86,300 mg/kg
Lead	4/4	20.8 mg/kg to 28.7 mg/kg
Magnesium	4/4	1,380 mg/kg to 8,270 mg/kg
Manganese	4/4	115 mg/kg to 505 mg/kg
Mercury	4/4	0.025 mg/kg to 0.048 mg/kg
Nickel	4/4	17.9 mg/kg to 65.6 mg/kg
Potassium	4/4	505 mg/kg to 1,640 mg/kg
Selenium	2/4	0.45 mg/kg to 0.64 mg/kg
Sodium	4/4	77.5 mg/kg to 107 mg/kg
Thallium	1/4	0.77 mg/kg

Sheet 1 of 2

TABLE 26-4
SEDIMENT SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Vanadium	4/4	24.7 mg/kg to 41.1 mg/kg
Zinc	4/4	66.8 mg/kg to 447 mg/kg

Sheet 2 of 2

mg/kg = milligrams per kilogram

ug/kg = micrograms per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

TABLE 26-5
SURFACE WATER SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Other Inorganics		
Alkalinity, Total (As CaCO ₃)	2/2	23 mg/L to 44.1 mg/L
Nitrogen, Ammonia (As N)	1/2	0.28 mg/L
Nitrogen, Nitrate-Nitrite	1/2	0.2 mg/L
Metals		
Aluminum	4/4	1,490 ug/L to 55,500 ug/L
Arsenic	3/4	5.5 ug/L to 18.3 ug/L
Barium	4/4	51.4 ug/L to 261 ug/L
Beryllium	1/4	16.5 ug/L
Cadmium	2/4	7.1 ug/L to 33.9 ug/L
Calcium	4/4	19,200 ug/L to 76,700 ug/L
Chromium, Total	3/4	6 ug/L to 29.1 ug/L
Cobalt	4/4	19.6 ug/L to 278 ug/L
Copper	4/4	1.4 ug/L to 40.1 ug/L
Iron	4/4	4,060 ug/L to 346,000 ug/L
Lead	3/4	7.8 ug/L to 48.4 ug/L
Magnesium	4/4	18,800 ug/L to 64,300 ug/L
Manganese	4/4	2,480 ug/L to 6,850 ug/L
Mercury	2/4	0.069 ug/L to 0.073 ug/L
Nickel	4/4	77.3 ug/L to 425 ug/L
Potassium	4/4	1,990 ug/L to 5,070 ug/L
Selenium	1/4	7.6 ug/L
Sodium	4/4	8,130 ug/L to 27,500 ug/L
Vanadium	3/4	15 ug/L to 76.8 ug/L
Zinc	4/4	112 ug/L to 2,240 ug/L

Sheet 1 of 1

mg/L = milligrams per Liter

ug/L = micrograms per Liter

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

¹ Drums were not present at this site.

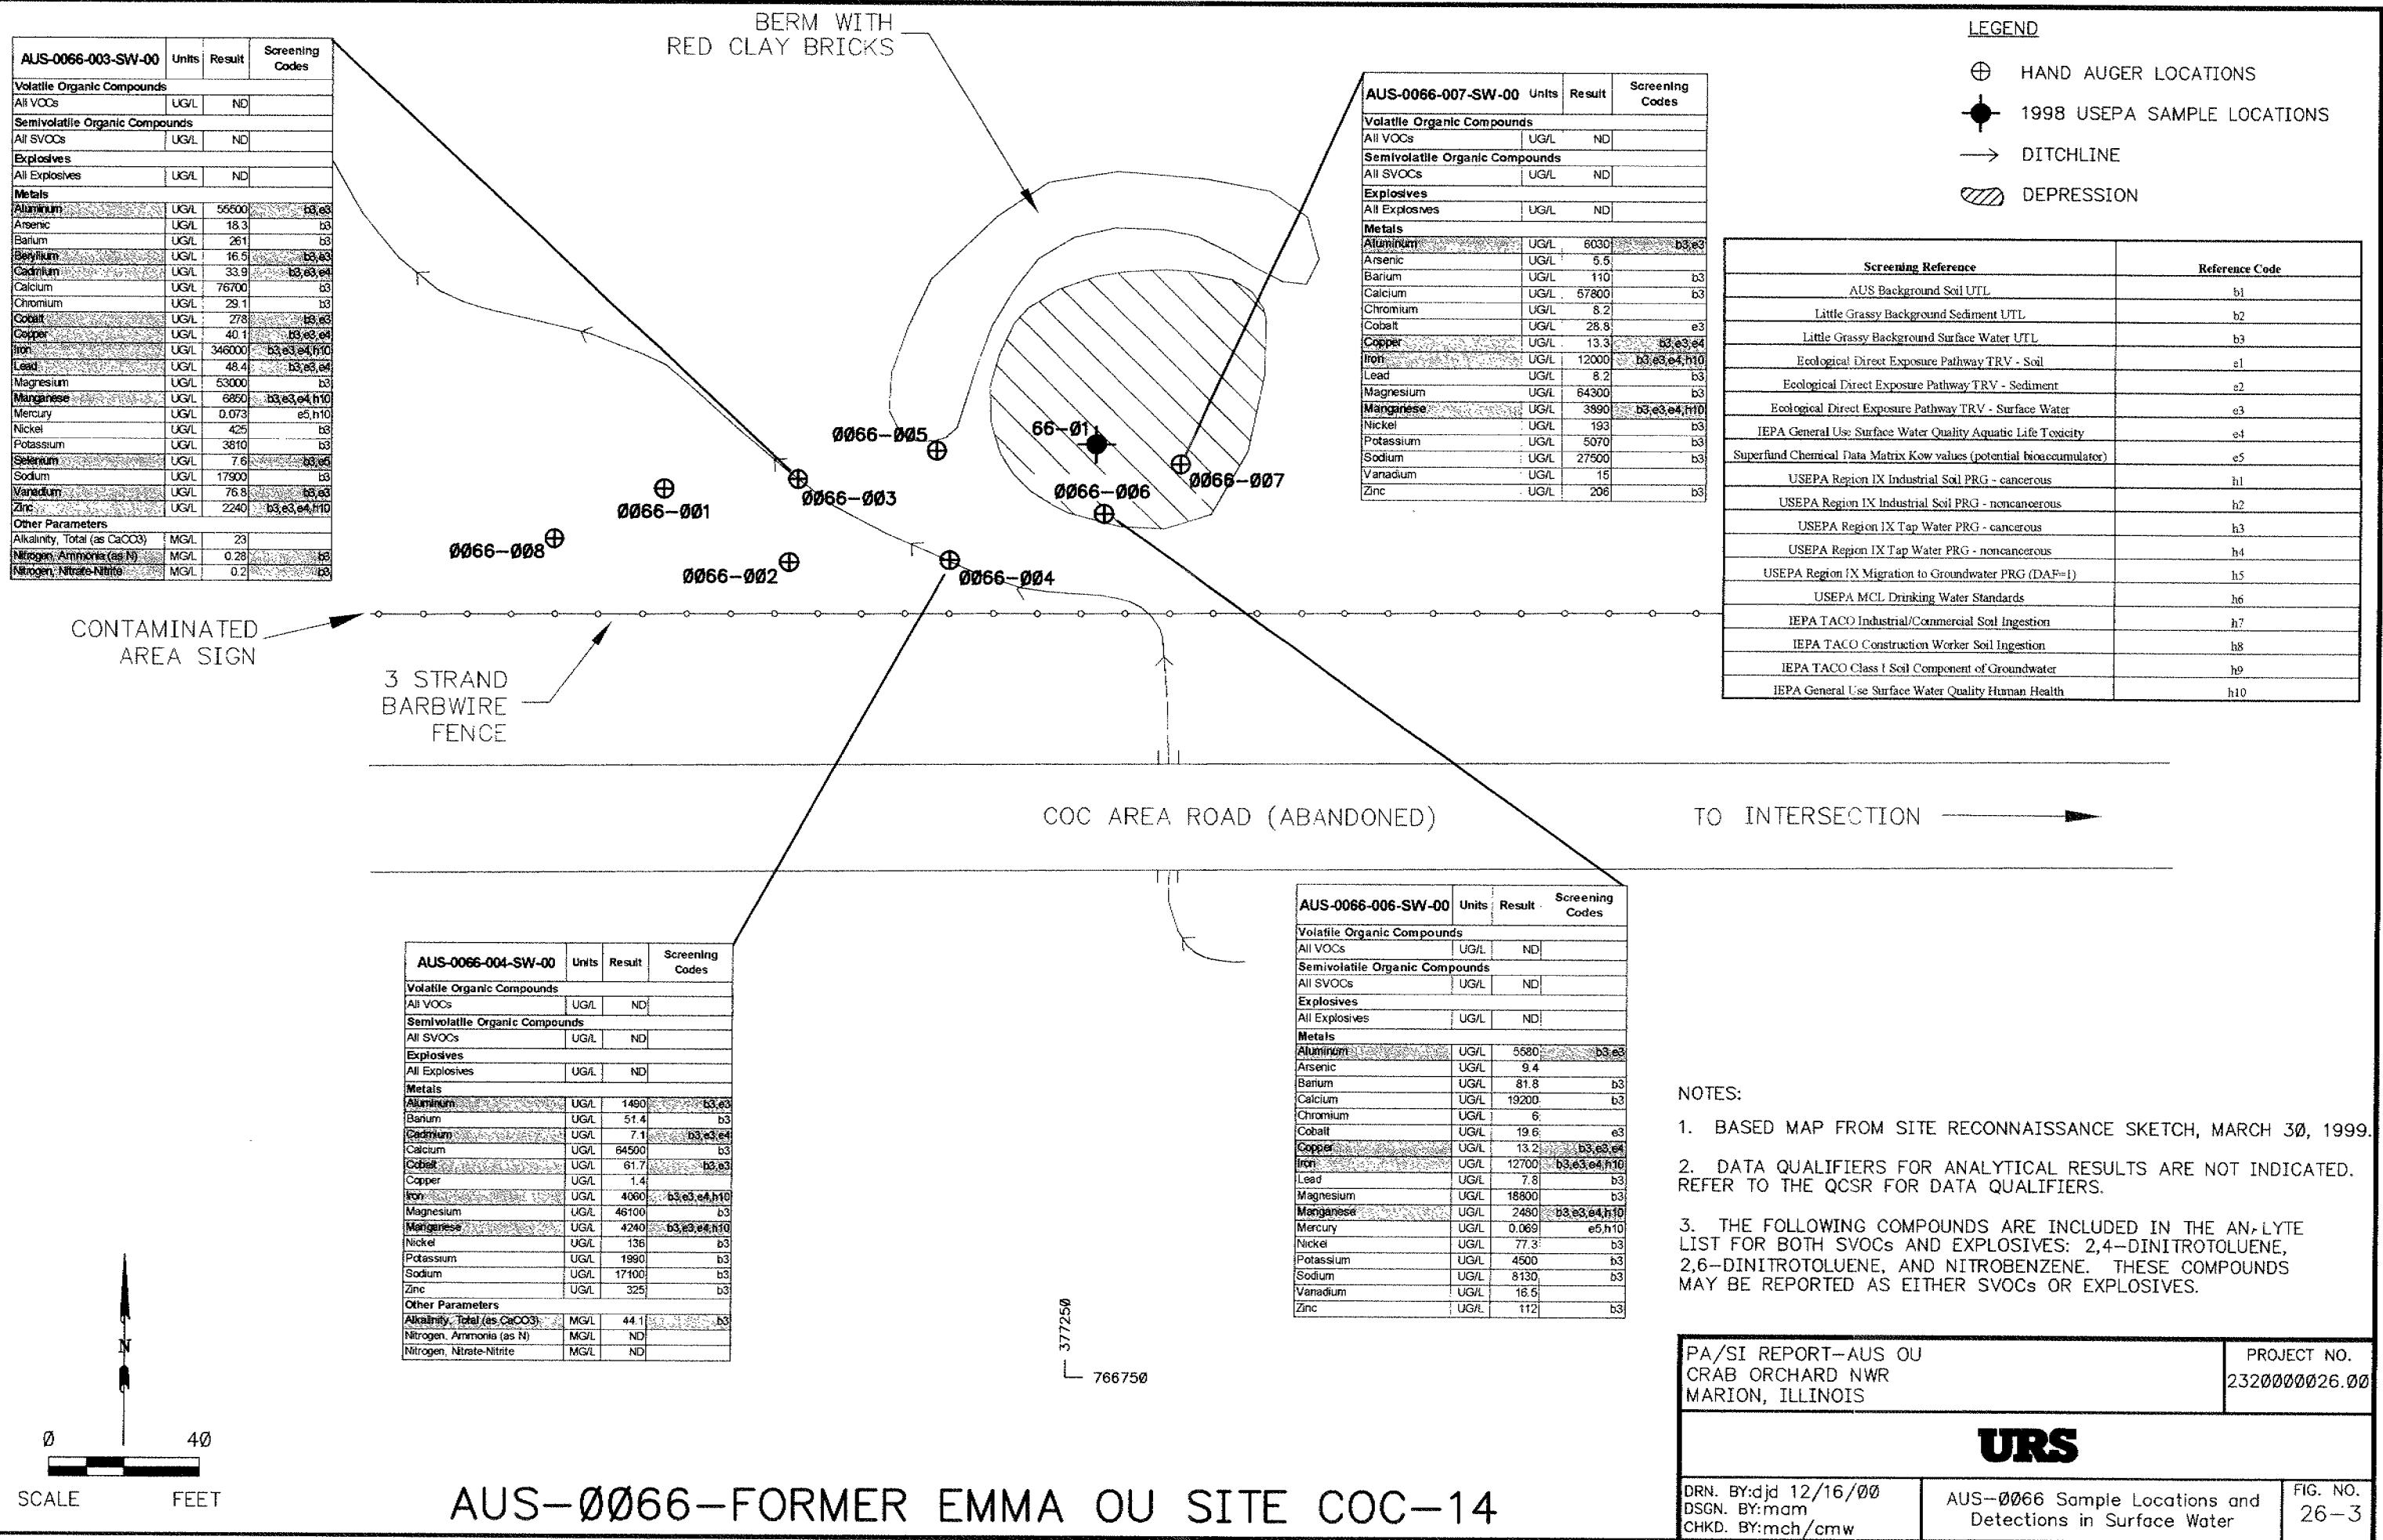

NA = not analyzed

H = human health screening criteria exceeded

E = ecological screening criteria exceeded

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC Area. AUS-0067 is located on an unnamed roadway that parallels Wolf Creek Road, and lies exactly one mile to the west of Wolf Creek Road. AUS-0067 is on the east side of the unnamed road, about 0.3 miles north of the COC Area Road. (Figure 22-1).

AUS-0067 was included in the AUS OU primarily because of suspect fencing and signage.

AUS Original Site Designations

AUS-0067 is one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS).

27.1 HISTORIC SEARCH INFORMATION

27.1.1 Site Description

AUS-0067 was originally described as “fence with contaminated area (sign) northwest of COC-6.”

27.1.2 Operational History and Waste Characteristics

There have been no known industrial lessees of this property.

The location in the COC Area, the signage, and the fencing suggest that this may have been a site used by the Army for detonation of ordnance during and/or after World War II (see introductory text in Section 22).

27.1.3 AUS-0067 Previous Sampling Results

There have been no previous investigations at this site.

27.1.4 Observations During Site Visit

The site slopes gently to the west and to the north and it is lightly wooded with some ground vegetation. A collapsed foundation, a cistern, some construction debris and some soil mounds were observed at the site (Figure 27-1).

27.1.5 Recommendations Based on Preliminary Assessment

AUS-0067 was included in the Site Investigation (SI) since this area was marked as a “Contaminated Area” and has not been previously investigated.

27.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0067 on May 8, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)¹ for the AUS OU Preliminary Assessment/Site Investigation (PA/SI). AUS OU SI sample locations are shown on Figure 27-1. Survey coordinates for all sample locations in AUS-0067 are listed in Table 27-1. Table 27-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples unless otherwise noted.

27.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted. Two soil samples and a cistern water sample were collected. Sample 0067-001 was from a soil mound. Sample 0067-003 (soil) was taken in a depressed area containing pieces of foundation and brick. Sample 0067-002 (cistern water) was collected from an abandoned cistern. It is possible that materials may have been dumped into the cistern, since there appears to be other debris in this area.

27.2.2 Field Results

27.2.2.1 Site Conditions

27.2.2.1 *Geologic Conditions*

There were no test pits or monitoring wells installed at AUS-0067. Soil collected from the hand auger borings, which extended to 2 feet (ft), was described as silty clay fill.

27.2.2.2 *Hydrogeologic Conditions*

No hydrogeological information is available for this site.

27.2.2.3 *Hydrologic Conditions*

The general slope of the site is to the west. There were no ponded areas or ditches observed at this site during the site reconnaissance in 1999.

27.2.2.2 Chemical Results

The sample analytical results are summarized in the following tables:

- Table 27-3 – soil samples results, and
- Table 27-4 – cistern water results.

These tables list all the chemicals detected in AUS-0067 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report. All results are shown in Figure 27-1.

¹ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

27.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 27-5 through 27-7 as follows:

- Table 27-5--human health risk screening for soils,
- Table 27-6--human health risk screening for cistern water, and
- Table 27-7--ecological risk screening for soils.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0067. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPCs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs/COPECs, but rather as uncertainties.

In Figure 27-1 the shading convention used is the same as for the tables discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 27-8 (human health risk) and 27-9 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 27-8) and COPECs (Table 27-9) are shaded in the tables.

27.3.1 Human Health Risk

27.3.1.1 Soil

Human health screening results for soil and sediment samples are presented in Tables 27-5. For carcinogens, a cancer risk was calculated using the United States Environmental Protection Agency (USEPA) Region 9 Industrial Soil Preliminary Remediation Goals (PRGs) as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

27.3.1.2 Cistern Water

Human health screening results for the cistern water sample are presented in Table 27-6. The maximum were screened against maximum contaminant levels (MCLs), Illinois Class I groundwater standards, and USEPA Region 9 tap water PRGs.

27.3.2 Ecological Risk

27.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 27-7. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)²
- Environment Canada (1995)³
- Talmage *et al.* (1999)⁴
- Efroymson *et al.* (1997a, 1997b)⁵
- CCME (1999)⁶

⁶ Canadian Council of Ministers of the Environment. 1999. Canadian Environmental Quality Guidelines.

- MHSPE (1994)⁷
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)⁸ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

27.4 SCIENTIFIC MANAGEMENT DECISION POINT

A Remedial Investigation (RI) is recommended for Site AUS-0067, based on exceedances of the SI screening criteria.

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not necessarily be retained as COPCs/COPECs for further evaluation. These are the constituents coded with “D” on the COPC list, Table 27-8; and on the COPEC list, Table 27-9. COPCs in this category include antimony, chromium, and selenium in soil. COPECs coded with “D” on Table 27-9 include chromium, manganese, and selenium in soil. These chemicals may later be included in the RI for other reasons, but the detections at the locations noted are not considered to be of concern since they are below Refuge background levels. All other COPCs/COPECs listed on these tables should be investigated in the RI. In addition, all analytes listed as uncertainties on these tables should be considered for further evaluation in the RI Work Plan.

Chemicals that exceeded screening criteria and Refuge background (if applicable) are listed in Table 27-10.

Note that 2,6-dinitrotoluene exceeded groundwater screening criteria in the cistern water sample taken at the site. Groundwater has not been investigated at this site, and based on these data, should be considered in the RI. Other areas of the site and media and contaminants in addition to those addressed in this study may warrant investigation in the RI. These issues will be addressed in the work plan for the RI.

Benzo(a)Anthracene	2/3	110 ug/kg to 200 ug/kg
Benzo(a)Pyrene	2/3	73 ug/kg to 130 ug/kg
Benzo(b)Fluoranthene	2/3	76 ug/kg to 180 ug/kg
Bis(2-Ethylhexyl) Phthalate	2/3	59 ug/kg to 200 ug/kg
Carbazole	1/3	57 ug/kg
Chrysene	2/3	98 ug/kg to 210 ug/kg
Dibenzofuran	2/3	260 ug/kg to 360 ug/kg
Fluoranthene	2/3	110 ug/kg to 240 ug/kg
Naphthalene	2/3	220 ug/kg to 360 ug/kg
Phenanthrene	2/3	510 ug/kg to 770 ug/kg
Pyrene	2/3	160 ug/kg to 310 ug/kg
Explosives		
Tetryl	1/3	3,100 ug/kg
Metals		
Aluminum	3/3	12,900 mg/kg to 17,100 mg/kg
Antimony	3/3	0.54 mg/kg to 0.76 mg/kg
Arsenic	3/3	10 mg/kg to 14.2 mg/kg
Barium	3/3	109 mg/kg to 274 mg/kg
Beryllium	3/3	0.57 mg/kg to 1 mg/kg
Boron	3/3	2.1 mg/kg to 7.2 mg/kg
Cadmium	2/3	0.77 mg/kg to 1.5 mg/kg
Calcium	3/3	1,230 mg/kg to 2,290 mg/kg
Chromium, Total	3/3	20 mg/kg to 22.2 mg/kg
Cobalt	3/3	9.6 mg/kg to 14 mg/kg
Copper	3/3	16.8 mg/kg to 36.1 mg/kg
Iron	3/3	24,000 mg/kg to 35,100 mg/kg
Lead	3/3	26.8 mg/kg 227 mg/kg
Magnesium	3/3	1,650 mg/kg to 2,930 mg/kg
Manganese	3/3	553 mg/kg to 1,880 mg/kg
Mercury	3/3	0.044 mg/kg to 0.12 mg/kg
Nickel	3/3	16.6 mg/kg to 22.9 mg/kg
Potassium	3/3	1,220 mg/kg to 1,630 mg/kg
Selenium	3/3	0.42 mg/kg to 0.89 mg/kg
Sodium	3/3	56.4 mg/kg to 76.2 mg/kg

Sheet 1 of 2

TABLE 27-3
SOIL SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Vanadium	3/3	37.5 mg/kg to 39.3 mg/kg
Zinc	3/3	75.3 mg/kg to 355 mg/kg

Sheet 2 of 2

mg/kg = milligrams per kilogram

ug/kg = micrograms per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

TABLE 27-4
CISTERN WATER SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Explosives		
2,6-Dinitrotoluene	1/1	6.5 ug/L
Metals		
Aluminum	1/1	356 ug/L
Barium	1/1	35 ug/L
Boron	1/1	64.5 ug/L
Calcium	1/1	28,500 ug/L
Copper	1/1	3.4 ug/L
Iron	1/1	648 ug/L
Lead	1/1	2.2 ug/L
Magnesium	1/1	1,790 ug/L
Manganese	1/1	132 ug/L
Nickel	1/1	2.6 ug/L
Potassium	1/1	6,570 ug/L
Sodium	1/1	1,310 ug/L
Zinc	1/1	30.1 ug/L

Sheet 1 of 1

ug/L = micrograms per Liter

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

and Cistern WaterFIG. NO.
27-1

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC Area. AUS-0069 is located approximately 700 feet (ft) east and 800 ft north of the intersection of Wolf Creek Road and the COC Area Road. The northern side of the site borders Crab Orchard Lake (Figure 22-1).

AUS-0069 partially coincides with Explosives and Munitions Manufacturing Area Operable Unit (EMMA OU) Site COC-15 (Figure 22-2), one of the COC sites for which no chemical analyses were done as part of the EMMA OU. AUS-0069 is also a dump site.

AUS Original Site Designations

AUS-0069 is one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS).

28.1 HISTORIC SEARCH INFORMATION

28.1.1 Site Description

AUS-0069 was originally described as "dump near south shore of Crab Orchard Lake" and it was "close to where landmines were located in 1996 (COC-15)". According to a report done by Parsons Engineering¹, AUS-0069 is a part of COC-15. COC-15 measures approximately 600 ft by 1,000 ft.² Figure 28-1 is a site map.

28.1.2 Operational History and Waste Characteristics

AUS-0069 was identified in aerial photographs as a potential dump. The 1943 aerial photographs show deposits of probable debris and large numbers of crated materials in this area along with a looping access road.³ By 1951, there was still some ground scarring and mounded debris present on site, however it appears that activity in this area had been terminated.⁴ This would indicates that this site was used by the IOP.

There have been no known industrial lessees of this property.

¹ Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Figure 2.1.

² Parsons Engineering Science, Inc., October 1997, Engineering Evaluation and Cost Analysis, Final Report, Former Illinois Ordnance Plant, Marion, Illinois, Page 2-31.

³ Entech, Inc., 1999, Historical Aerial Photographic Analysis – Inventory of Potential Disposal Sites: Additional and Uncharacterized Sites (AUS) Operable Unit, Crab Orchard National Wildlife Refuge, Marion, Illinois, Volume I (Text) Page 3-23 and Volume II (Maps) Page L. The Entech reports analyze historic aerial overflight photographs of industrial areas at the Refuge, from 1943 to 1993. The photos were obtained from the National Archives and Records Administration (NARA) and the U.S. Department of Agriculture Agricultural Stabilization and Conservation Service (ASCS).

⁴ Entech, Inc., 1999, Historical Aerial Photographic Analysis – Inventory of Potential Disposal Sites: Additional and Uncharacterized Sites (AUS) Operable Unit, Crab Orchard National Wildlife Refuge, Marion, Illinois, Volume I (Text) Page 3-23 and Volume II (Maps) Page L.

28.1.3 AUS-0069 Previous Sampling Results

Parsons Engineering, 1997

Under contract with the Department of Army, Parsons Engineering conducted an Ordnance and Explosive Waste (OEW) investigation at this site (COC-15) in 1997. Six 100-ft by 200-ft grids were investigated at this site and a total of 2,702 magnetic anomalies were identified.⁵ Of these, 501 were investigated and 465 were non-ordnance scrap, 29 were ordnance scrap and seven were unexploded ordnance (UXO).⁶ The recovered ordnance scrap consisted of munitions fragments and mine spider wheels.⁷ The UXO recovered were all M-1 mine fuses which were later disposed of by demolition.⁸ The ordnance removal work was completed by the U.S. Army Corps of Engineers in 2000.

28.1.4 Observations During Site Visit

The site appeared to have been a dump. The following types of material were observed: construction debris (culverts, corrugated asbestos sheeting, concrete rubble, clay blocks, bricks, steel scrap), rusted drums, piping and soil mounds. Most of the debris is located in a stand of trees along the lakeshore and some of the debris is in Crab Orchard Lake.

28.1.5 Recommendations Based on Preliminary Assessment

AUS-0069 was included in the SI since there were numerous abandoned drums (empty) observed on site and some ordnance was also found on site during previous investigations.

28.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0069 on May 2, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)⁹ for the AUS OU PA/SI. AUS OU SI sample locations are shown on Figures 28-1, 28-2, and 28-3. Survey coordinates for all sample locations in AUS-0069 are listed in Table 28-1. Table 28-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples unless otherwise noted.

28.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted.

⁹ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

Abandoned Drums/Disposal Areas

Two test pits (0069-001 and 0069-013) and two hand auger samples (0069-006 and 0069-009) were located in the vicinity of abandoned drums (Figure 28-1). Test pit 0069-001 was located in an area with other dumped material in addition to the drums. Test pit 0069-013 was located on the northwest portion of the site, next to Crab Orchard Lake. A sample of water from the test pit (trench water) was also taken at location 0069-013.

Three hand augers (0069-004, 0069-007 and 0069-008) and one test pit (0069-012) were located in soil mounds at the site. A sample of water from the test pit (trench water) was also taken at location 0069-012.

Sample location 0069-005 is near the shore of Crab Orchard Lake, near some construction debris.

Sample locations 0069-014 thorough 0069-017 were planned for possible disposal areas that were identified in historical aerial photographs. These four samples were collected as planned, except that location 0069-014 was mistakenly labeled 0069-018.

All samples were collected in accordance with the tables in the Field Sampling Plan with the following exceptions:

- AUS-0069-001-GW-00 This sample was not collected because groundwater was not encountered during excavation activities.
- AUS-0069-014-SS-0X Due to a mistake in sample labeling during the field investigation, this sample was labeled AUS-0069-018-SS-0X in the field.
- AUS-0069-014-SS-02 Due to a mistake in sample labeling during the field investigation, this sample was labeled AUS-0069-018-SS-02 in the field.

Drainageways

Sample locations 0069-010 and 0069-011 (sediment) were in a drainageway that runs along the east side of the site and drains into Crab Orchard Lake.

Sample locations 0069-002 and 0069-003 were in a drainage swale that also flows into Crab Orchard Lake, near abandoned drums.

All samples were collected in accordance with the tables in the Field Sampling Plan with the following exceptions:

- AUS-0069-010-SW-00 This sample was not collected because there was no surface water present.
- AUS-0069-011-SW-00 This sample was not collected because there was no surface water present.

28.2.2 Field Results

28.2.2.1 Site Conditions

The northern boundary of the site is the south shore of Crab Orchard Lake, and the western, southern, and eastern sides of the site are bounded by woodlands.

28.2.2.1.1 *Geologic Conditions*

No monitoring wells were installed at AUS-0069. The test pits indicate that a 0.5 to 4.5 ft thick layer of fill material (topsoil, etc.) overlays the site at the test pit locations. In Test Pits 0069-012 and 0069-001 the fill contained burnt debris including metal, glass, and brick. The material encountered from below the fill to approximately 12 ft below ground surface (bgs), which was the bottom of pit depth for the deepest pits 0069-001 and 0069-013, was described as loess (low plastic silty clay, and silt). Hand auger samples collected at the site also described the first 5 ft of soil at the site as silty clay fill. The fill at sample locations 0069-001, 0069-006, and 0069-008 included debris.

28.2.2.1.2 *Hydrogeologic Conditions*

Groundwater was encountered in two of the three test pits during excavation, at depths of 4 ft bgs and 11 ft bgs (elevations of 404 and 396 ft mean sea level (msl)).

28.2.2.1.3 *Hydrologic Conditions*

The site drains north into Crab Orchard Lake. There is a drainageway at the east side of the site.

28.2.2.2 Chemical Results

The sample analytical results are summarized in the following tables:

- Table 28-3 – soil samples results,
- Table 28-4 – sediment samples results, and
- Table 28-5 – trench water samples results.

These tables list all the chemicals detected in AUS-0069 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report.

Sample results are presented on the following figures:

- Figure 28-1 – organic results for soil and sediment samples,
- Figure 28-2 – inorganic results for soil and sediment samples, and
- Figure 28-3 – all results for trench water samples at this site.

28.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 28-6 through 28-10 as follows:

- Table 28-6--human health risk screening for soils,

- Table 28-7--human health risk screening for sediment,
- Table 28-8--human health risk screening for trench water,
- Table 28-9--ecological risk screening for soils, and
- Table 28-10--ecological risk screening for sediment.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0069. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs/COPECs, but rather as uncertainties.

In Figures 28-1 through 28-3 the shading convention used is the same as for the tables discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 28-11 (human health risk) and 28-12 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 28-11) and COPECs (Table 28-12) are shaded in the tables.

28.3.1 Human Health Risk

28.3.1.1 Soil/Sediment

Human health screening results for soil and sediment samples are presented in Tables 28-6 and 28-7, respectively. Soil screening values were conservatively used to screen the sediment samples.

For carcinogens, a cancer risk was calculated using the United States Environmental Protection Agency (USEPA) Region 9 Industrial Soil (preliminary remediation goals) PRGs as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA

Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

28.3.1.2 Trench Water

Human health screening results for trench water are presented in Table 28-8. The maximum trench water concentrations from AUS-0069 were conservatively screened against maximum contaminant levels (MCLs) and Illinois Class I groundwater standards.

28.3.2 Ecological Risk

There were no complete exposure pathways to surface water for ecological receptors. Discussion of soil and sediment are presented below.

28.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 28-9. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)¹⁰
- Environment Canada (1995)¹¹
- Talmage *et al.* (1999)¹²
- Efroymson *et al.* (1997a, 1997b)¹³
- CCME (1999)¹⁴
- MHSPE (1994)¹⁵
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

¹⁵ Ministry of Housing, Spatial Planning, and the Environment (MHSPE). 1994. *Intervention Values and Target Values – Soil Quality Standards*. Directorate General for Environmental Protection, Department of Soil Protection, The Hague, The Netherlands.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)¹⁶ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

28.3.2.2 Sediment

Ecological screening results for sediment samples are presented in Table 28-10. Sources of TRVs for evaluating direct exposures to aquatic organisms in sediments included:

- Consensus-based freshwater sediment criteria (MacDonald et al. 1999)¹⁷
- USEPA (1996 – summarized by Ingersoll et al. 1996)¹⁸
- Ontario Ministry of the Environment and Energy (1995)¹⁹
- NOAA (1999)²⁰
- Ecotox (USEPA 1996)²¹
- Long et al. (1995)²²
- Equilibrium partitioning
- USEPA Region V Environmental Data Quality Levels (EDQLs)
- Other sources

With respect to effects levels, there are a number of potential sources and endpoints. There are also multiple endpoints from some sources. For example, threshold effects levels (TELs) as reported by Ingersoll et al. (1996) are the geometric mean of the 15th percentile in the effects data set and the 50th percentile in the no-effects data set. The effects-range low (ERL) and effects-range medium (ERM) are the 15th percentile and 50th percentile values in the effects datasets, respectively. The Probable Effects Level (PEL) is the geometric mean of the 50th

percentile in the effects data set and the 85th percentile in the no-effects data set, and the effects range medium is the 50th percentile value of the effects dataset. A TEL or ERL is assumed to represent a concentration below which toxic effects are rarely observed. The range between the TEL and PEL is assumed to represent the range in which effects are occasionally observed. MacDonald et al. (2000) developed “consensus-based” freshwater sediment screening concentrations. Threshold effect concentrations (TECs) were developed as concentrations below which adverse effects are not expected to occur. Probable effect concentrations (PECs) were levels above which effects are frequently expected to occur. Among other potential screening values, no effect concentrations (NECs – Ingersoll et al. 1996) and upper effect thresholds (UETs – NOAA 1999) are also levels above which effects are frequently or always observed.

In deriving an ecological screening value (ESV), preference was given to the TEC, TEL and ERL values since these are the most conservative (i.e., levels below which effects are rarely observed). Preference was also given to freshwater-derived values (MacDonald et al. [1999], Ingersoll et al. [1996], Ontario [1995] and NOAA [1999]) as opposed to estuarine or saltwater (Long et al. 1995). If screening values were unavailable from the sources noted above, the “equilibrium-partitioning” (EqP) approach was used. This used the surface water ecological screening value and the expected partitioning between sediment and sediment pore water as described in USEPA (1993). A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was the same as for soils as presented in Section 28.3.2.1.

28.4 SCIENTIFIC MANAGEMENT DECISION POINT

A Remedial Investigation (RI) is recommended for Site AUS-0069, based on exceedances of the SI screening criteria.

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not necessarily be retained as COPCs/COPECs for further evaluation. These are the constituents coded with “D” on the COPC list, Table 28-11; and on the COPEC list, Table 28-12. COPCs in this category include arsenic and silver in sediment. COPECs coded with “D” on Table 28-12 include silver in sediment and manganese in soil. These chemicals may later be included in the RI for other reasons, but the detections at the locations noted are not considered to be of concern since they are below Refuge background levels. All other COPCs/COPECs listed on these tables should be investigated in the RI. In addition, all analytes listed as uncertainties on these tables should be considered for further evaluation in the RI Work Plan.

Chemicals that exceeded screening criteria and Refuge background (if applicable) are listed in Table 28-13.

Note that a number of the human health COPCs exceed migration to groundwater screening criteria. Groundwater has not been investigated at this site, and based on these data, should be considered in the RI. Other areas of the site and media and contaminants in addition to those

addressed in this study may warrant investigation in the RI. These issues will be addressed in the work plan for the RI.

NOTES:

1. SAMPLE LOCATIONS ARE APPROXIMATE. SURVEY COORDINATES ARE FOUND IN TABLE 28-1.
2. THE BASE MAP FOR THIS FIGURE IS A HAND SKETCH PREPARED DURING FIELD RECONNAISSANCE. THE DRAWING IS NOT TO SCALE. THE DIMENSIONS OF THE SITE AS SHOWN ARE APPROXIMATELY 500 BY 800 FEET.
3. DATA QUALIFIERS FOR ANALYTICAL RESULTS ARE NOT INDICATED. REFER TO THE QCSR FOR DATA QUALIFIERS.
4. THE FOLLOWING COMPOUNDS ARE INCLUDED IN THE ANALYTE LIST FOR BOTH SVOCs AND EXPLOSIVES: 2,4-DINITROTOLUENE, 2,6-DINITROTOLUENE AND NITROBENZENE. THESE COMPOUNDS MAY BE REPORTED AS EITHER SVOCs OR EXPLOSIVES.

AUS-0069 Sample Locations and Detections in Trench Water				
Date: 12/20/00	Project Number: 232000026.00	Figure Number: 28-3		
Drawn by: CHS	Design by: MAM	Checked by: MCH/CMW		

See the beginning of Section 22 for a general discussion of the Crab Orchard Cemetery (COC) Area and the Additional and Uncharacterized Sites Operable Unit (AUS OU) sites in that area. Figure 22-1 shows all eight AUS OU sites in the COC area. AUS-0109 is located about 0.2 mile south of the COC Area Road and 1.2 miles west of Wolf Creek Road (Figure 22-1).

AUS-0109 was included in the AUS OU because it was identified from the historical aerial photograph interpretation done by Entech, Inc. as a potential detonation area.¹

AUS Original Site Designations

AUS-0109 is not one of the original AUS OU sites designated in 1997-1999 by the United States Fish & Wildlife Service (USFWS). It was added later based on aerial photography review.

29.1 HISTORIC SEARCH INFORMATION

29.1.1 Site Description

The 1951 aerial photograph interpretation identified several densely clustered craters in the location of AUS-0109.² The site was similar in appearance to COC 9, which was previously identified as an unexploded ordnance (UXO) detonation area. The craters appeared to be liquid-filled.³ By 1960, it appeared that detonation activity had ceased.⁴ By 1965, agricultural activity was encroaching on the cratered area.⁵ This site was observed in aerial photographs during the same time period as the rest of the COC Sites where explosives were detonated.

29.1.2 Operational History and Waste Characteristics

There were no known industrial lessees of this property.

¹ Entech, Inc., 1999, Historical Aerial Photographic Analysis – Inventory of Potential Disposal Sites: Additional and Uncharacterized Sites (AUS) Operable Unit, Crab Orchard National Wildlife Refuge, Marion, Illinois, Volume I (Text) Page 3-31 and Volume II (Maps) Page R. The Entech reports analyze historic aerial overflight photographs of industrial areas at the Refuge, from 1943 to 1993. The photos were obtained from the National Archives and Records Administration (NARA) and the U.S. Department of Agriculture Agricultural Stabilization and Conservation Service (ASCS).

29.1.3 AUS-0109 Previous Sampling Results

There were no previous investigations done at this site.

29.1.4 Observations During Site Visit

The site is located in the center of a plowed field. A fenced area was located to the southwest of the site.

29.1.5 Recommendations Based on Preliminary Assessment

AUS-0109 was included in the Site Investigation (SI) since this site appears to have been a former explosives detonation area and there has been no previous investigation of this area. Similar sites (such as COC-9) have shown evidence of contamination; therefore, it is expected that this site might also contain contamination.

29.2 SITE INVESTIGATION INFORMATION

URS conducted a Site Investigation at AUS-0109 on April 13, 2000. The rationale for sample locations, media, and analytes is presented in the Field Sampling Plan (FSP)⁶ for the AUS OU Preliminary Assessment/Site Investigation (PA/SI). AUS OU SI sample locations are shown on Figure 29-1. Survey coordinates for all sample locations in AUS-0109 are listed in Table 29-1. Table 29-2 lists the sample locations and the matrix sampled at that location. All samples are soil samples.

29.2.1 Field Investigation

Sampling was done in accordance with the FSP, except as noted. The intent of the field investigation was to sample the presumed crater areas that were identified on the aerial photos. Since there is no visible expression of the craters at the site, the coordinates of the craters had to be determined from the aerial photos.⁷

Test Pits 0109-001 and 0109-002 were located at two of the former potential crater areas. Soil samples were collected from the test pits to identify the potential for both explosives and metals residues in the area of the former craters. There is also the potential for organics contamination, if fuel oils or solvents were used to help ignite the explosives.

While groundwater was encountered in the test pits, no groundwater samples were taken. All other samples were taken in accordance with the Field Sampling Plan (FSP).

⁶ U.S. Fish & Wildlife Service, Department of the Interior, March 2000, Draft Final Field Sampling Plan Site Inspection, Additional and Uncharacterized Sites Operable Unit, Crab Orchard National Wildlife Refuge Superfund Site, Marion, Illinois (Williamson County), prepared by URS Corporation.

⁷ At the beginning of the project, a test was conducted to estimate the accuracy of locating features from historic aerial photos. Using conventional methods, survey coordinates were obtained of a number of existing features at the Refuge that also appeared on a series of historic photos (for example, the corners of IOP buildings that are still existing). Entech independently obtained coordinates from the aerial photos. The coordinates obtained from the aerial photos were found to be in agreement with the coordinates obtained by conventional methods, within a few ft; acceptable for of locating site features such as craters.

29.2.2 Field Results

29.2.2.1 Site Conditions

29.2.2.1.1 *Geologic Conditions*

No monitoring wells were installed in AUS-0109. Soil material from the upper foot (ft) at both test pit locations was described as fill material and/or topsoil. Below this layer to approximately eight ft below ground surface (bgs) the soil was described as loess (low plastic, silty clay, and silt). The loess changes to till (low plastic silty clay with trace sand) and continues to the bottom of both test pits, 12 ft bgs at 0109-001 and 10 ft bgs at 0109-002.

29.2.2.1.2 *Hydrogeologic Conditions*

Groundwater was encountered in both test pits during excavation. The groundwater was detected at nine ft bgs at location 0109-001 and eight ft bgs at location 0109-002.

29.2.2.1.3 *Hydrologic Conditions*

There was no surface water observed at the site.

29.2.2 Chemical Results

Table 29-3 lists the chemicals detected at AUS-0109 during this investigation, along with the frequency and range of detections. Tabulated results of all analyses are included in the Quality Control Summary Report (QCSR). Figure 29-1 presents the results for soil samples at this site.

29.3 SCREENING RISK ASSESSMENT

Results of the screening are presented in Tables 29-4 and 29-5 as follows:

- Table 29-4--human health risk screening for soils, and
- Table 29-5--ecological risk screening for soils.

Each table lists the maximum detected concentration for each constituent analyzed at AUS-0109. The screening results are presented in the tables in terms of hazard quotients (HQs). The HQ for any chemical detected, for any particular screening criterion is simply the ratio of the maximum detected concentration to the screening concentration. For human health for carcinogens, a screening level “cancer risk” is calculated instead of an HQ.

Chemicals that are shaded in the tables are those that exceeded the screening criteria, and are identified as chemicals of potential concern (COPCs) for human health risk, and chemicals of potential ecological concern (COPECs) for ecological risk. The only COPCs/COPECs not shaded in the table are those inorganic constituents that exceeded the screening criteria but were detected at levels below Refuge background.

In cases where the chemical was analyzed but not detected, the HQ is the ratio between the maximum reporting limit and the screening concentration. Chemicals not detected are identified

with a “U” qualifier in the qualifier column. When these HQ values exceed one, they are not shaded. These constituents are not identified as COPCs/COPECs, but rather as uncertainties.

In Figure 29-1 the shading convention used is the same as for the tables discussed above. The particular screening criteria exceeded are indicated by the code in the analytical results labels. Duplicate results are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. Since in the screening process results which are qualified as estimated (coded with “J”) are treated the same as unqualified results, data qualifiers are not included in the results shown in the figures. Refer to the QCSR for data qualifiers.

Tables 29-6 (human health risk) and 29-7 (ecological risk) list all the analytes and corresponding media sampled and indicate whether each is a COPC (or COPEC), not a COPC (or COPEC), or an uncertainty. The codes in the tables indicate the rationale for each classification. All COPCs (Table 29-6) and COPECs (Table 29-7) are shaded in the tables.

29.3.1 Human Health Risk

29.3.1.1 Soil

Human health screening results for soil and samples are presented in Table 29-4. For carcinogens, a cancer risk was calculated using the USEPA Region 9 Industrial Soil Preliminary Remediation Goals (PRGs) as screening values. The cancer risk was derived by calculating a ratio of the maximum detected concentrations, or the maximum reporting limits, to their appropriate screening values. These ratios were then multiplied by 1×10^{-6} . In addition, ratios were calculated using the USEPA Region 9 Industrial Soil PRG for Toxins, the USEPA Region 9 Migration to Groundwater Criteria (Dilution Attenuation Factor (DAF)=1), the Illinois Tiered Approach to Corrective Action Objectives (TACO) Industrial/Commercial Soil Ingestion Criteria, the Illinois TACO Construction Worker Soil Ingestion Criteria, and the Illinois TACO Class I Soil Component of Groundwater Criteria.

29.3.2 Ecological Risk

29.3.2.1 Soil

Ecological screening results for soil samples are presented in Table 29-5. Soil screening concentrations for direct exposures were developed using toxicity reference values (TRVs) derived from several sources, including the following:

- USEPA (2000)⁸
- Environment Canada (1995)⁹
- Talmage *et al.* (1999)¹⁰

⁸ USEPA. 2000. Ecological Soil Screening Level Guidance (Draft). USEPA Office of Emergency and Remedial Response, Washington, DC.

⁹ Environment Canada. 1995. Toxicity Testing of NCSRP Priority Substances for Development of Soil Quality Guidelines for Contaminated Sites. Guidelines Division, Evaluation and interpretation Branch, Environmental Conservation Directorate, Environment Canada. Hull, Quebec.

- Efroymson *et al.* (1997a, 1997b)¹¹
- CCME (1999)¹²
- MHSPE (1994)¹³
- Other sources

A detailed discussion of the screening concentration selection is presented in Appendix G.

The screening approach for ingestion pathway exposures was based on the potential for a chemical to bioaccumulate. The potential for a chemical to bioaccumulate was based on the organic chemical-specific octanol-to-water partitioning coefficient (K_{ow}), which provides an indication of the lipophilicity of an organic chemical, and its potential for sequestration in biological tissue. The document *Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991)¹⁴ used a log K_{ow} of 3.5 as a target threshold value indicative of bioaccumulative chemicals to target organic chemicals of greatest concern. Using this as a guideline, organic chemicals with a log K_{ow} greater than 3.5 were considered potentially bioaccumulative chemicals. Among inorganics, mercury and selenium were considered as potentially bioaccumulative chemicals. Any potentially bioaccumulative chemical that is detected was retained as a COPEC.

29.4 SCIENTIFIC MANAGEMENT DECISION POINT

29.4.1 Human Health Risk Evaluation

This report recommends that inorganic constituents that exceeded project screening criteria but were within Refuge background levels not be retained as COPCs for further evaluation. These are the constituents coded with "D" on the COPC list, Table 29-6, and include arsenic, barium, chromium, nickel and selenium in soil. Soil was the only media sampled at this site.

Of the COPCs listed in Table 29-6, only mercury exceeded the background soil value (0.06 milligrams per kilogram (mg/kg). The maximum detected mercury concentration, 0.17 mg/kg, slightly exceeded the Illinois TACO Class I migration to groundwater screening value of 0.15 mg/kg. This site is very small, and any area of elevated mercury concentrations is expected to be very limited. No other screening values were exceeded. Based on this information, and the fact

¹⁴ USEPA 1991. Assessment and Control of Bioconcentratable Contaminants in Surface Waters (Draft). US Environmental Protection Agency Office of Research and Development, Washington, D.C.

that the screening criterion was only slightly exceeded, it is recommended that mercury not be retained for further evaluation for human health-based risk.

Several chemicals represent uncertainties for AUS-0109 because, while they were not detected, the reporting limit was equal to or exceeded the screening criteria. These are indicated as uncertainties on Table 29-6, and coded with a “B.” The uncertainty associated with these chemicals is not considered to be significant.

In summary, results of the soil analyses at AUS-0109 indicate there are no chemicals present at levels of potential human health concern warranting further evaluation. It is recommended that none of the chemicals be retained as COPCs for this site.

29.4.2 Ecological Risk Evaluation

There were no COPECs identified among the organic constituents analyzed at AUS-0109. However, several were identified as uncertainties because the reporting limit was higher than the screening concentration. In fact, there were no volatile organic compounds, semivolatile organic compounds or explosives detected, lending weight of evidence that organic chemicals are not of ecological concern at AUS-0109.

Among the inorganic compounds chromium, iron, manganese, mercury, and selenium were identified as COPECs. This report recommends that inorganic constituents which exceeded project screening criteria but were within Refuge background levels not be retained as COPECs for further evaluation. These are the constituents coded with “D” on Table 29-6, and include chromium, manganese, and selenium. Other COPECs are each discussed below.

Iron – The maximum concentration of iron (20,400 mg/kg) was slightly (about 5 percent) above the background concentration (19,306 mg/kg -- Table 29-5). Though the maximum detection exceeded the screening value, iron is not considered a significant ecological concern since it is generally considered to have low toxicity, it is an essential nutrient, and is similar to the background concentration.

Mercury - The screening hazard quotient for mercury was less than one, indicating that mercury does not pose a risk associated with direct exposures in soils, but is discussed because it was detected and is a potential bioaccumulative constituent. The maximum concentration of mercury (0.17 mg/kg) was above background (0.06 mg/kg). Though mercury is a potentially bioaccumulative constituent, this is much less pronounced in terrestrial as compared to aquatic systems.¹⁵ Based on the small size of AUS-0109, mercury concentration relative to background, and a lower bioaccumulation potential in terrestrial systems, mercury is not believed to be sufficiently elevated as to warrant further evaluation of AUS-0109.

Several inorganic constituents were also identified as uncertainties at AUS-0109 (Table 29-7). Though not detected, the screening value for boron was below the reporting limit. Because it was not detected, boron is not considered a significant concern. Other inorganics were identified as uncertainties because they were detected but no screening values were identified. These

¹⁵ Lodenius, M. 1994. Mercury in terrestrial Ecosystems: A Review. In Mercury Pollution Integration and Synthesis, Carl J. Watras and John W. Huckabee, editors. Lewis Publishers, Boca Raton, Florida.

include calcium, magnesium, potassium, and sodium. Each of these constituents was below background concentrations. In addition, these are essential nutrients. Therefore, the uncertainty associated with these constituents is not considered significant. Aluminum was also characterized as an uncertainty. The screening criterion for aluminum is based on soil pH, and there are no site-specific pH data available for AUS-0109. However, the maximum concentration of aluminum is below background, and thus aluminum is not considered a significant ecological concern.

In summary, results of the soil analyses at AUS-0109 indicate there are no chemicals present at levels of potential ecological concern that would warrant further evaluation of the site. It is recommended that none of the chemicals be retained as COPECs for AUS-0109.

29.4.3 Summary of Recommendations

Based on the above discussions, it is recommended that none of the constituents detected at Site AUS-0109 be retained for further evaluation. Site AUS-0109 is judged to require no further action.

TABLE 29-1

SOIL SAMPLE ANALYTICAL RESULTS SUMMARY

Constituent	Number of Detections	Range of Detections
Metals		
Aluminum	2/2	5,850 mg/kg to 6,860 mg/kg
Arsenic	2/2	4.8 mg/kg to 5.3 mg/kg
Barium	2/2	140 mg/kg to 145 mg/kg
Cadmium	2/2	0.12 mg/kg to 0.21 mg/kg
Calcium	2/2	1,480 mg/kg to 1,670 mg/kg
Chromium, Total	2/2	9 mg/kg
Cobalt	2/2	8.2 mg/kg to 12.3 mg/kg
Copper	2/2	4.5 mg/kg to 7.6 mg/kg
Iron	2/2	10,300 mg/kg to 20,400 mg/kg
Lead	2/2	13.2 mg/kg to 16.5 mg/kg
Magnesium	2/2	777 mg/kg to 891 mg/kg
Manganese	2/2	1,820 mg/kg to 2,170 mg/kg
Mercury	2/2	0.08 mg/kg to 0.17 mg/kg
Nickel	2/2	10.2 mg/kg to 11.9 mg/kg
Potassium	2/2	467 mg/kg to 479 mg/kg
Selenium	2/2	1.4 mg/kg to 1.5 mg/kg
Silver	1/2	0.65 mg/kg
Thallium	1/2	0.17 mg/kg
Vanadium	2/2	17.2 mg/kg to 17.4 mg/kg
Zinc	2/2	22.6 mg/kg to 29.9 mg/kg

Sheet 1 of 1

mg/kg = milligrams per kilogram

Notes: This table was derived from the figures that show the analytical results. As a result, duplicates are shown only if the duplicate result for an analyte exceeded the screening criteria and the result from the original sample did not; or, if the analyte was detected in the duplicate and not in the original sample. There may be some duplicate results, not shown in the table, that are outside the range shown. In addition, the frequency and range of detections is based on the number of sample locations, not the total number of samples (the total number of samples includes originals plus duplicates).

A - Chemical was not detected and the reporting limit does not exceed the screening concentration.

B - Chemical was not detected, but reporting limit was equal to or exceeded screening concentration.

C - Chemical was not detected and there is no screening concentration.

D - Chemical was detected and was equal to or exceeded screening concentration, but did not exceed background.

E - Chemical was detected and was equal to or exceeded screening concentration and background, if applicable.

F - Chemical was detected and did not exceed screening concentration.

G - Chemical was detected, but no screening value was available.

H - Chemical was detected, but it is an essential nutrient.

J - Chemical was classified as a COPC based on USEPA 1998 data but was not a COPC based on SI data.

NA - Not Analyzed or not applicable.

G - Chemical was detected, but no screening value was available.

H - Chemical was detected, but it is an essential nutrient.

I - If pH<5.5, Aluminum is a COPEC, otherwise it is not.

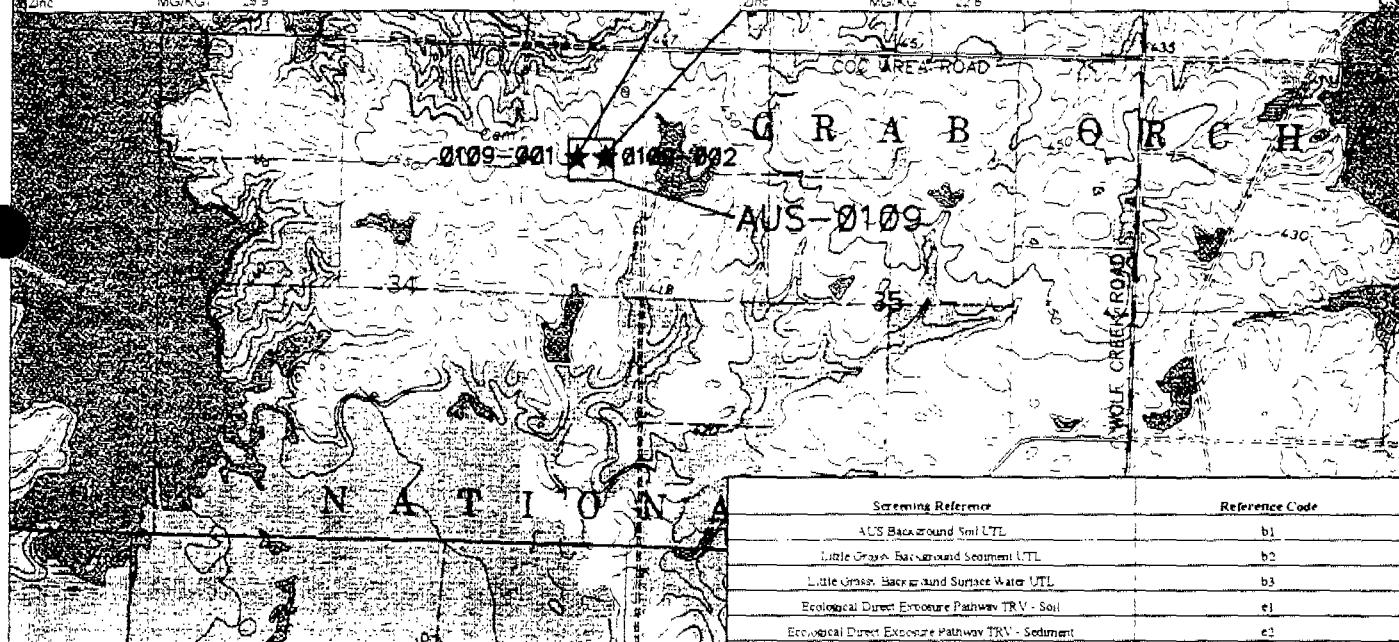

J - Chemical was classified as a COPEC based on USEPA 1998 data but was not a COPEC based on SI data.

NA - Not Analyzed or not applicable.

AUS-0109-POSSIBLE FORMER EXPLOSIVES DETONATION AREA

LEGEND

NOTES: TEST PIT LOCATION

1. SAMPLE LOCATIONS ARE APPROXIMATE. SURVEY COORDINATES CAN BE FOUND IN TABLE 29-1.
2. DATA QUALIFIERS FOR ANALYTICAL RESULTS ARE NOT INDICATED. REFER TO THE QCSR FOR DATA QUALIFIERS.
3. THE FOLLOWING COMPOUNDS ARE INCLUDED IN THE ANALYTE LIST FOR BOTH SVOCs AND EXPLOSIVES: 2,4-DINITROTOLUENE, 2,6-DINITROTOLUENE, AND NITROBENZENE. THESE COMPOUNDS MAY BE REPORTED AS EITHER SVOCs OR EXPLOSIVES.
