

# Radiative Forcing of LONG-LIVED Non-CO<sub>2</sub> Greenhouse Gases

\*CH<sub>4</sub> (discussed by Ed D.)

\*N<sub>2</sub>O

\*Ozone-depleting gases  
and their substitutes:

Chlorofluorocarbons

Other chlorinated and brominated chemicals

Hydrochlorofluorocarbons

Hydrofluorocarbons

\*SF<sub>6</sub>

\*Perfluorinated carbon compounds

Direct and Indirect Influences...

Anthropogenic use is addressed by  
the Montreal Protocol or  
the Kyoto Protocol

Air sampling  
at the South Pole

# **Current and Past Activities in NOAA/ESRL Related to *Radiative Forcing of Non-CO<sub>2</sub> Greenhouse Gases***

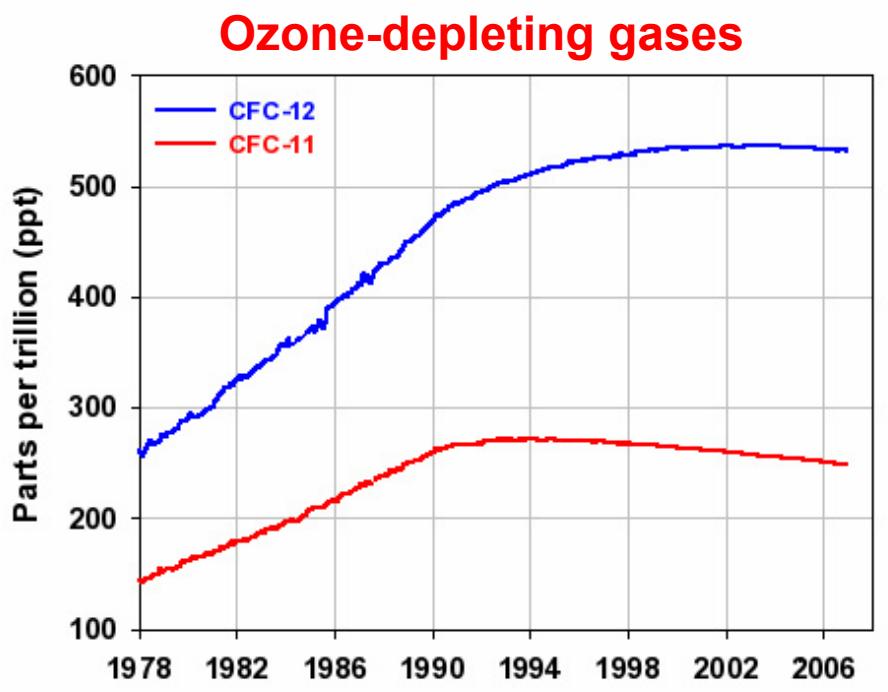

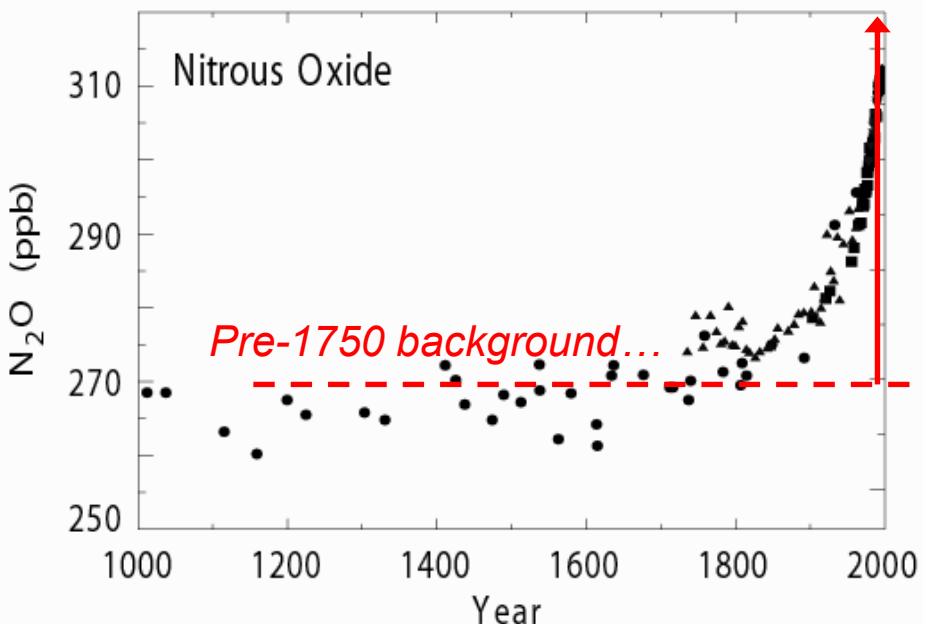

## **\*\* Observing global changes for non-CO<sub>2</sub> greenhouse gases:**

Global sampling networks, custom instrumentation, high-accuracy standardization  
air trapped in glacial snow...

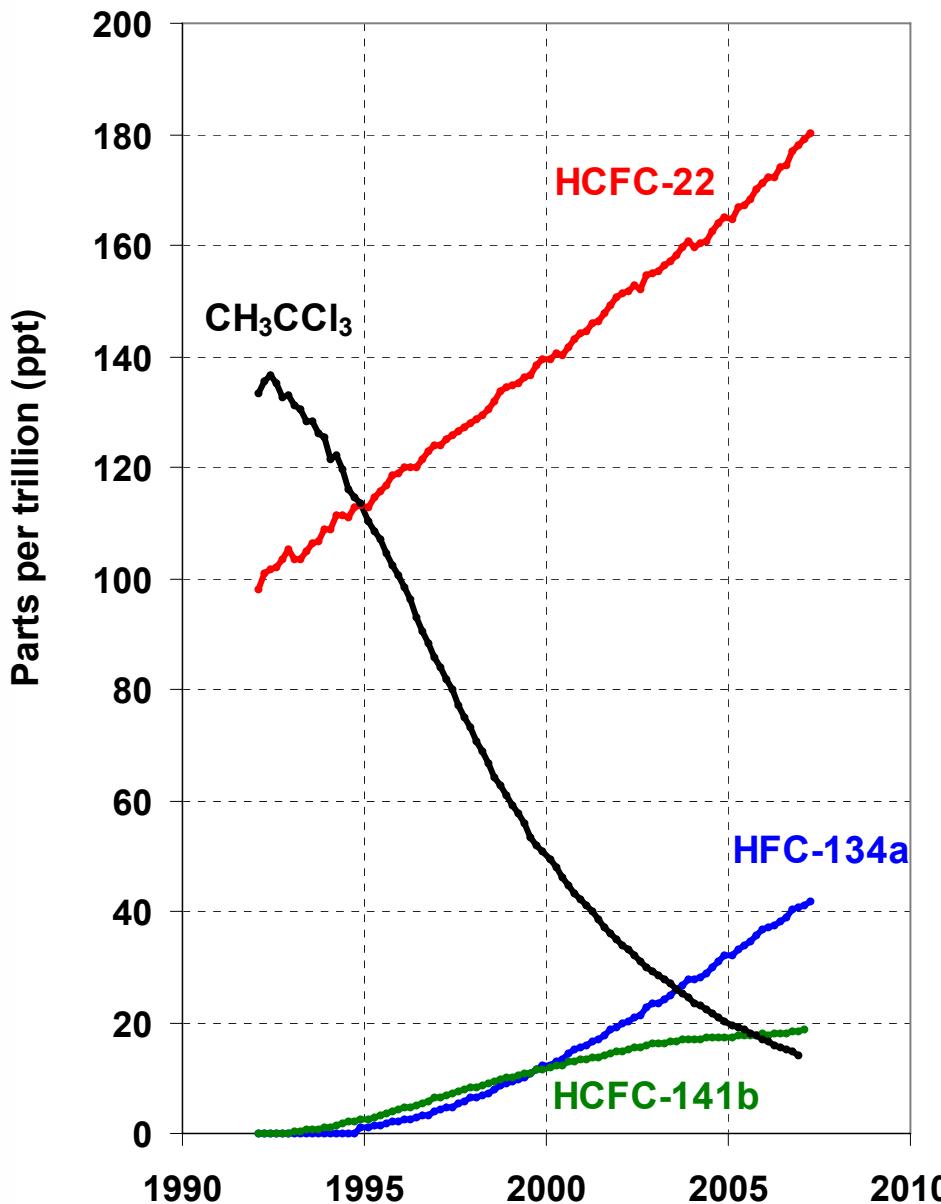

## **\*\* Assessing the significance of observed global changes:**

## **\*\* Understanding the underlying causes of observed global changes:**

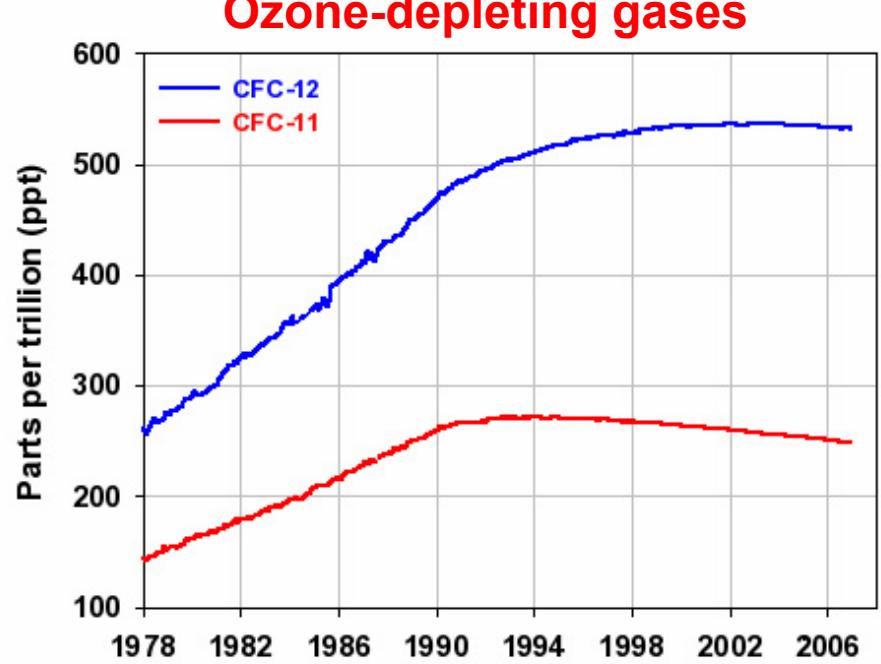

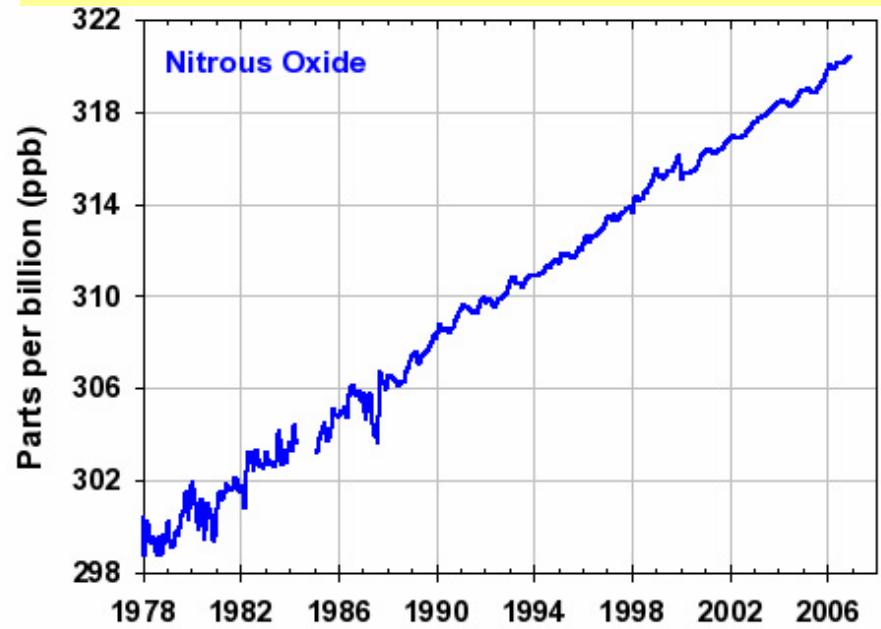

# Observing global changes in atmospheric abundance:

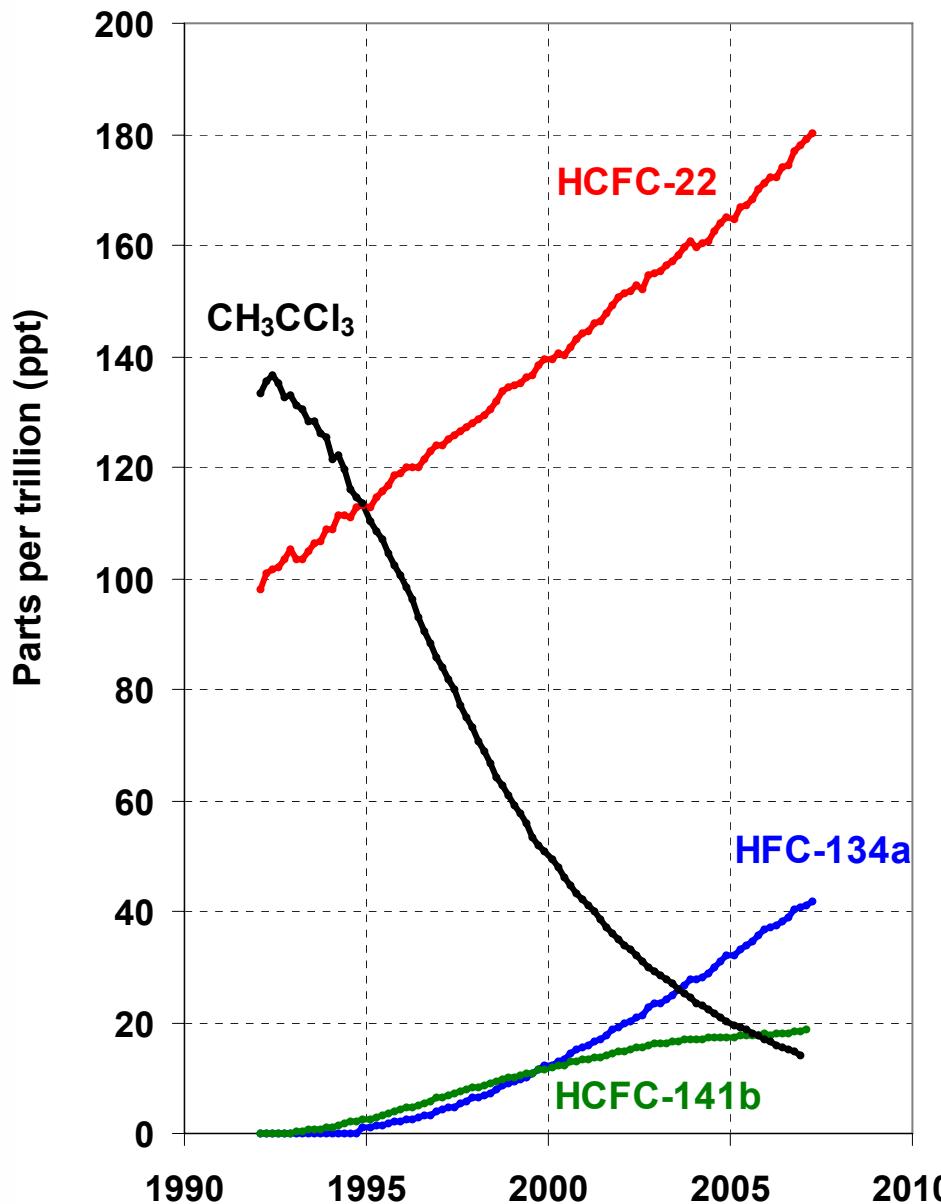

## Other ozone-depleting gases and substitute chemicals

# Observing global changes in atmospheric abundance:

## Other ozone-depleting gases and substitute chemicals

# **Current and Past Activities in NOAA/ESRL Related to Radiative Forcing of Non-CO<sub>2</sub> Greenhouse Gases**

## **\*\* Observing global changes for non-CO<sub>2</sub> greenhouse gases:**

Global sampling networks, custom instrumentation, high-accuracy standardization  
air trapped in glacial snow

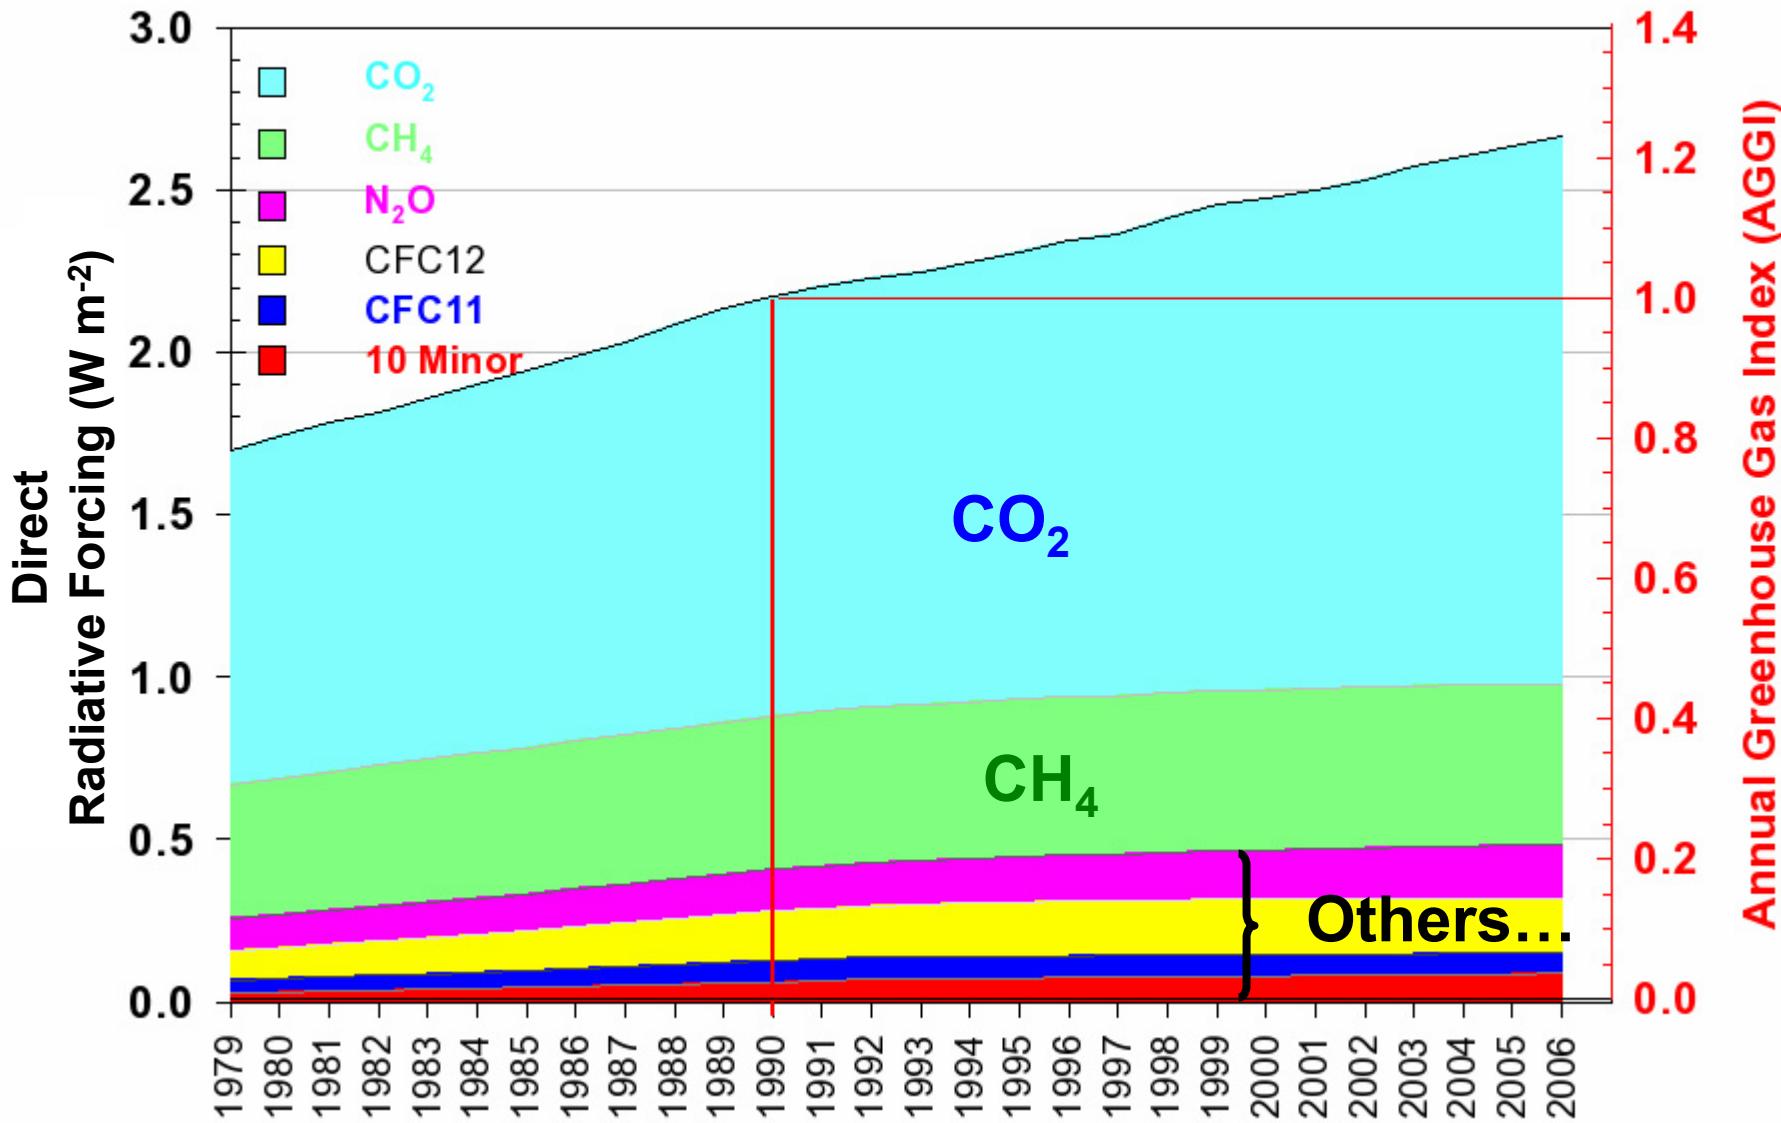

## **\*\* Assessing the significance of observed global changes:**

*Considering measured abundances and laboratory studies of chemical properties:*  
→ Quantifying radiative forcing changes over time (e.g., as the AGGI)

## **\*\* Understanding the underlying causes of observed global changes:**

# Assessing the Significance of the Observed Changes:

NOAA Annual Greenhouse Gas Index  $\sim \sum(\text{Abundance} * \text{Radiative Efficiency})$

# **Current and Past Activities in NOAA/ESRL Related to Radiative Forcing of Non-CO<sub>2</sub> Greenhouse Gases**

## **\*\* Observing global changes for non-CO<sub>2</sub> greenhouse gases:**

Global sampling networks, custom instrumentation, high-accuracy standardization  
air trapped in glacial snow

## **\*\* Assessing the significance of observed global changes:**

*Considering measured abundances and laboratory studies of chemical properties:*

→ Quantifying radiative forcing changes over time (e.g., as the AGGI)

*Considering global emissions inferred from observations:*

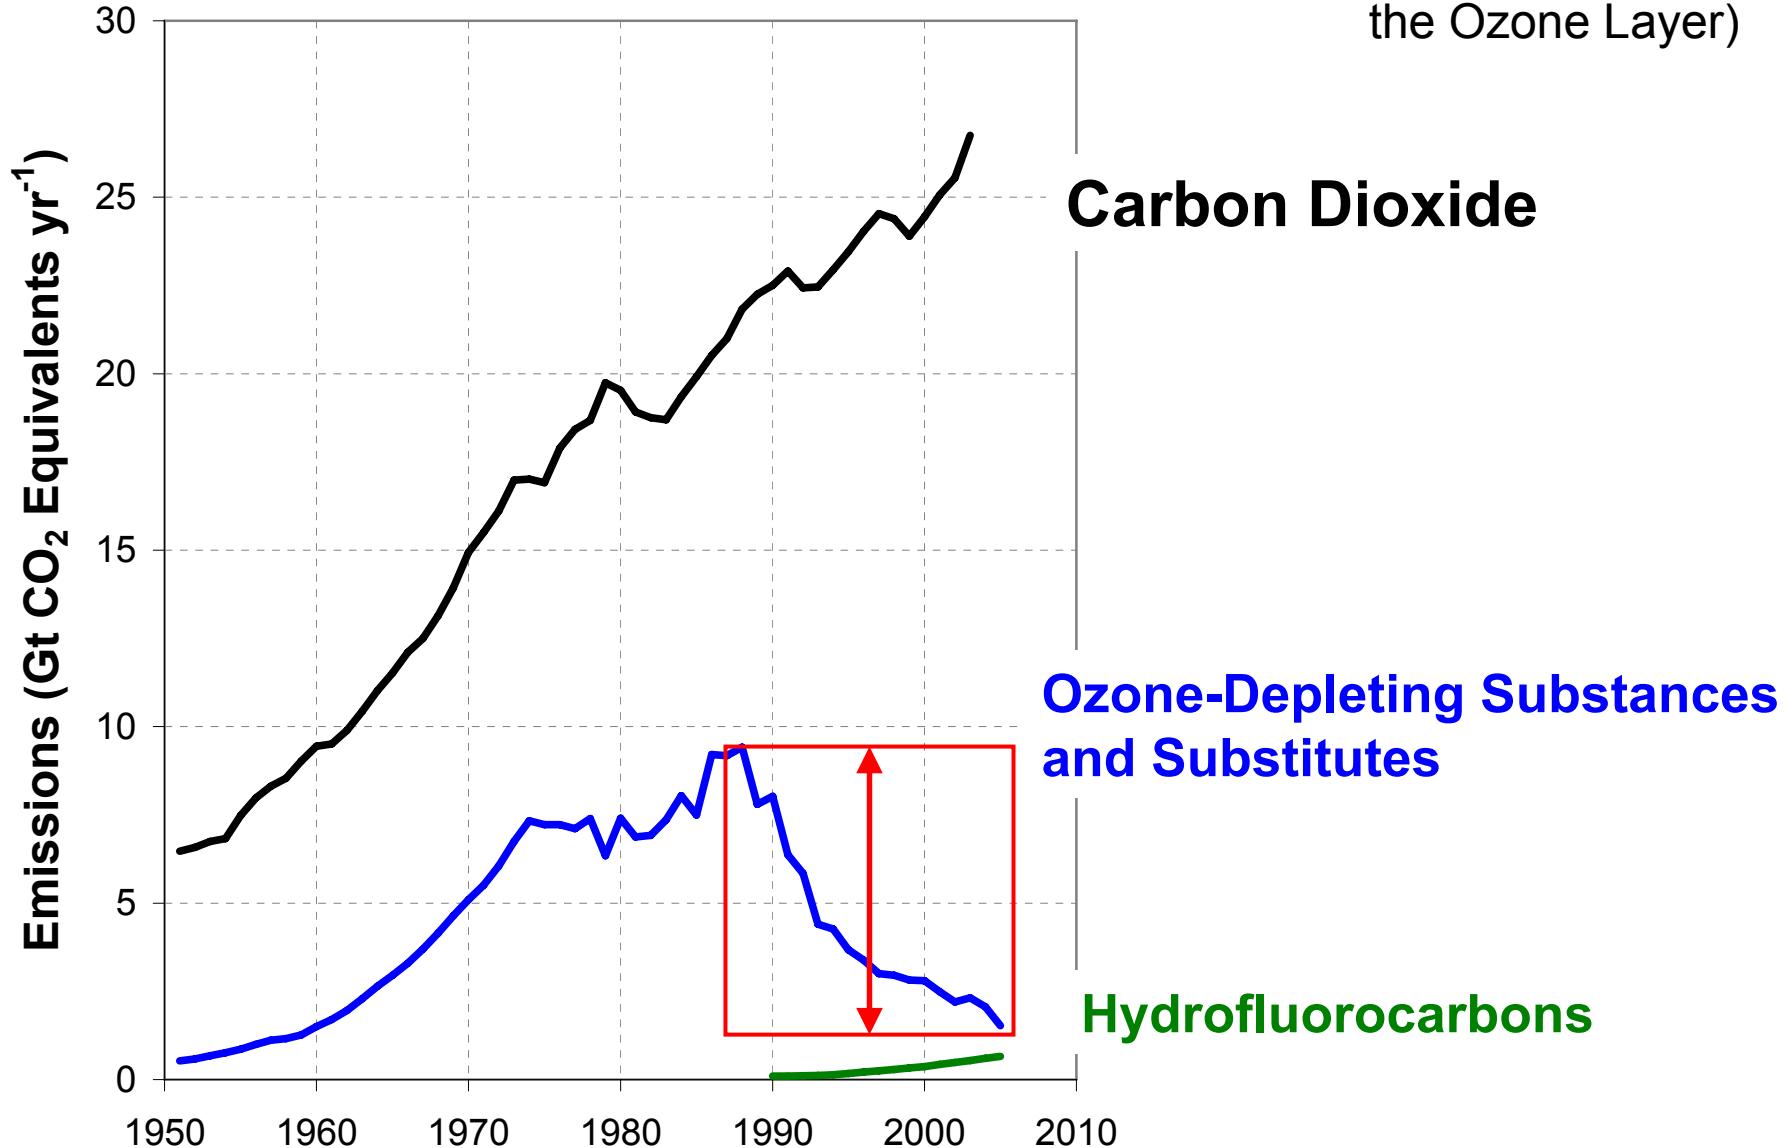

→ Inferring global-scale, CO<sub>2</sub>-equivalent emissions

## **\*\* Understanding the underlying causes of observed global changes:**

# Assessing the Significance of the Observations:

Deriving Global Emissions from observations (as CO<sub>2</sub>-equivalent emissions)

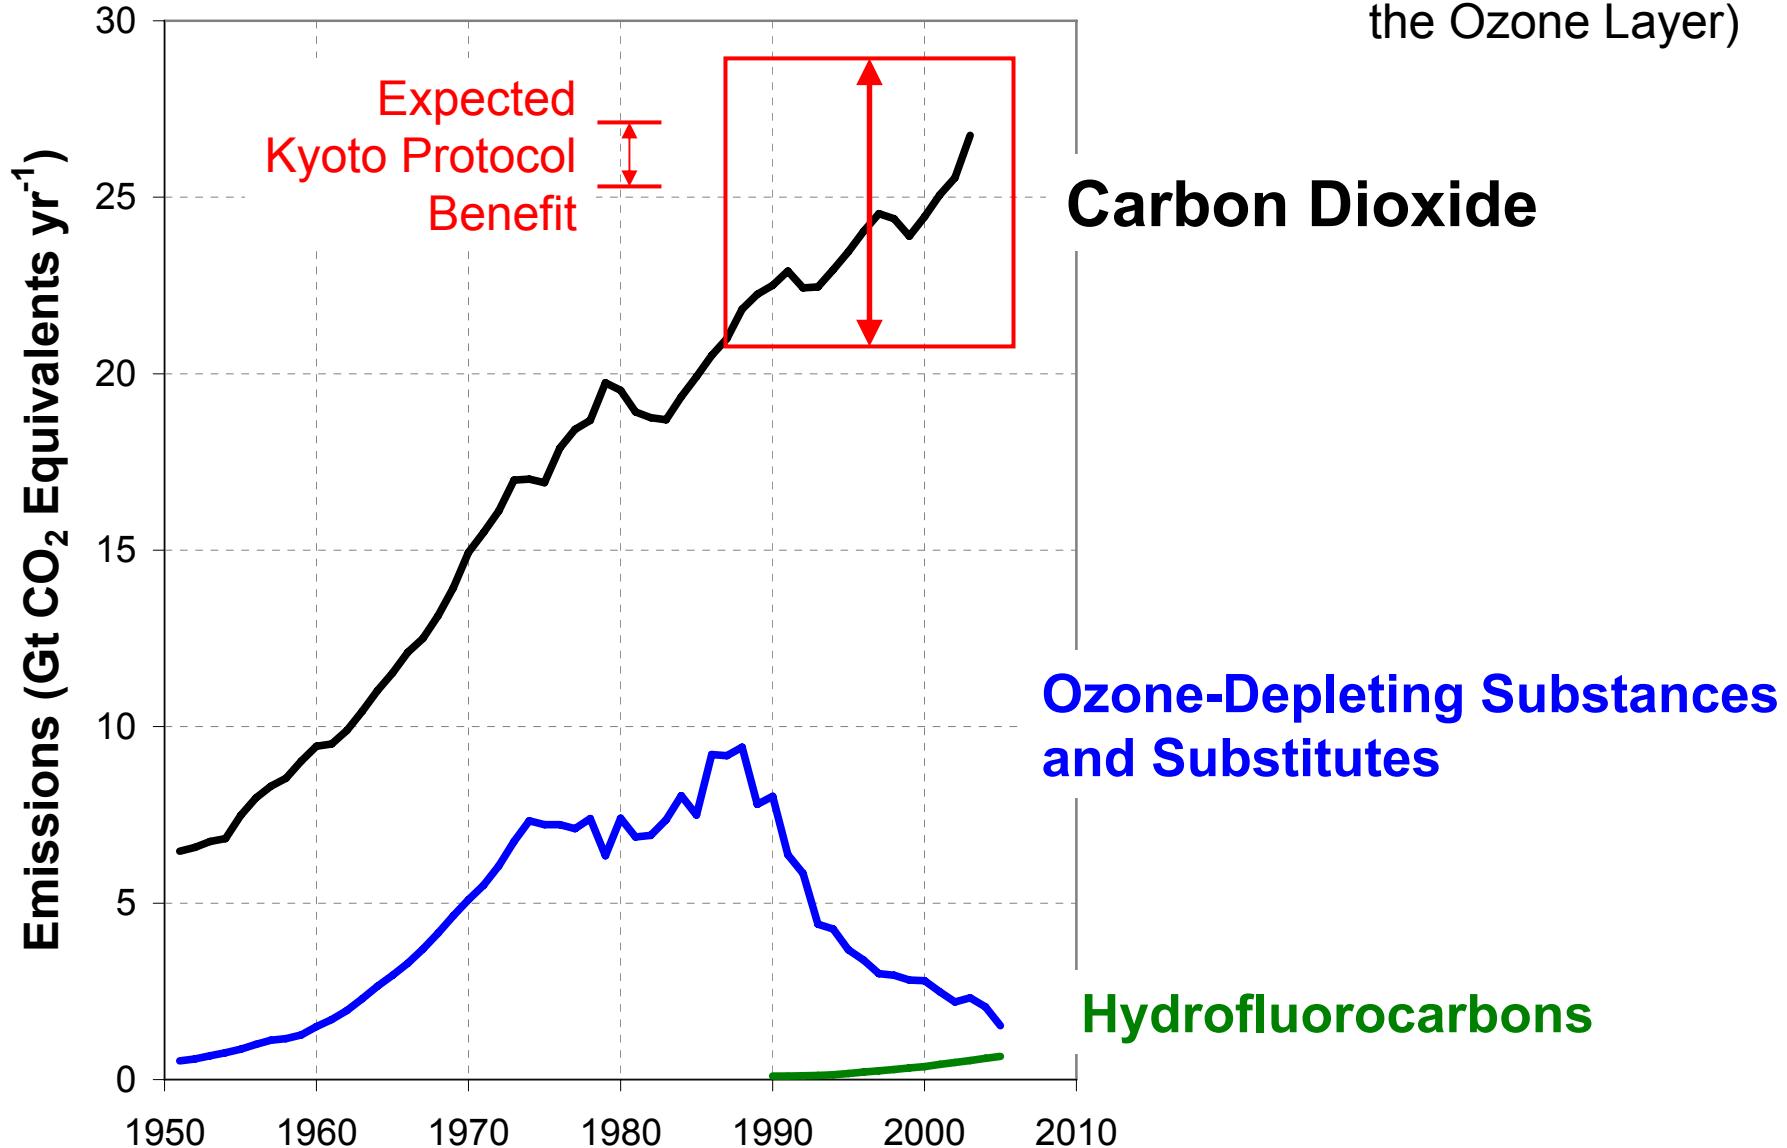

(On the climate benefits of the Montreal Protocol on Substances that Deplete the Ozone Layer)

# Assessing the Significance of the Observations:

Deriving Global Emissions from observations (as CO<sub>2</sub>-equivalent emissions)

(On the climate benefits of the Montreal Protocol on Substances that Deplete the Ozone Layer)

# **Current and Past Activities in NOAA/ESRL Related to Radiative Forcing of Non-CO<sub>2</sub> Greenhouse Gases**

## **\*\* Observing global changes for non-CO<sub>2</sub> greenhouse gases:**

*Considering global emissions inferred from observations:*

→ Inferring global-scale, CO<sub>2</sub>-equivalent emissions

## **\*\* Understanding the underlying causes of observed global changes:**

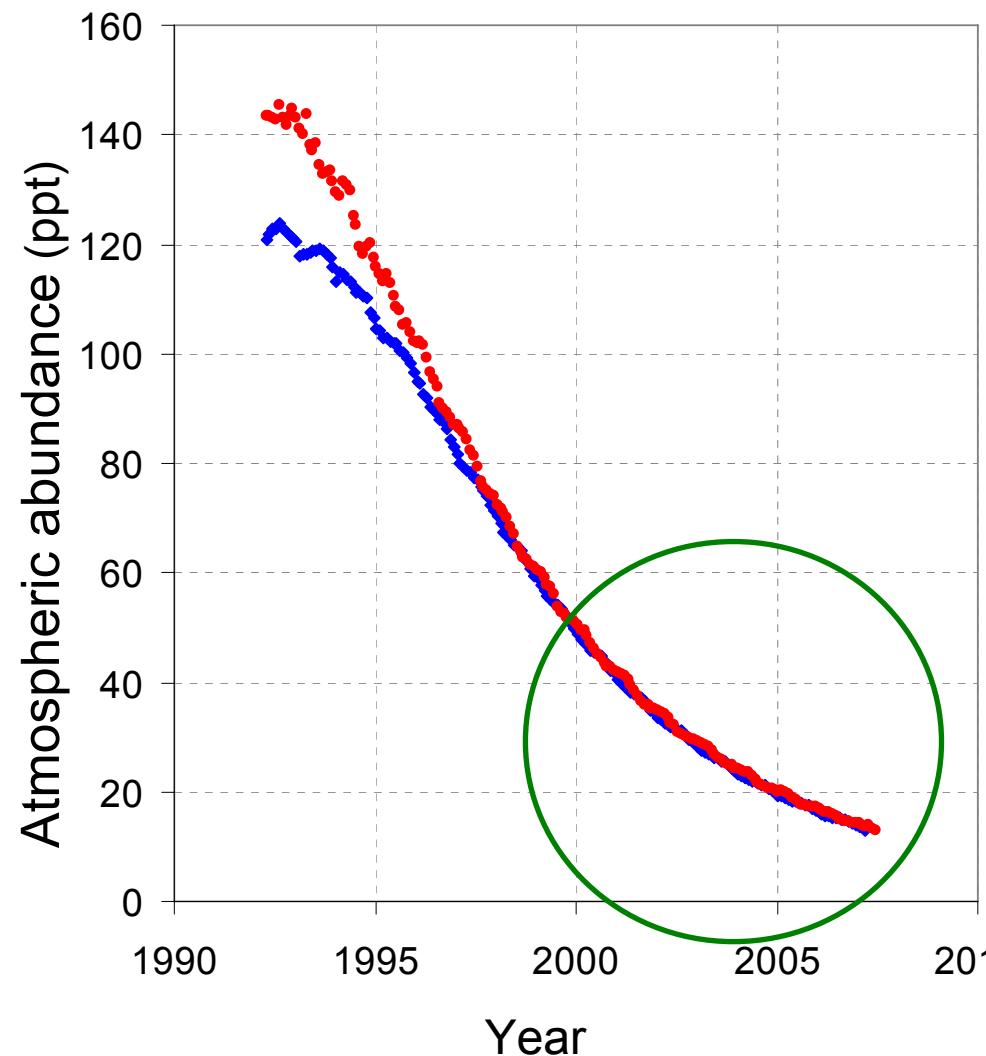

*Related to sinks:*

Abundance and variability in the atmospheric hydroxyl radical (OH)

(OH ties together many issues related to non-CO<sub>2</sub> GHGs)

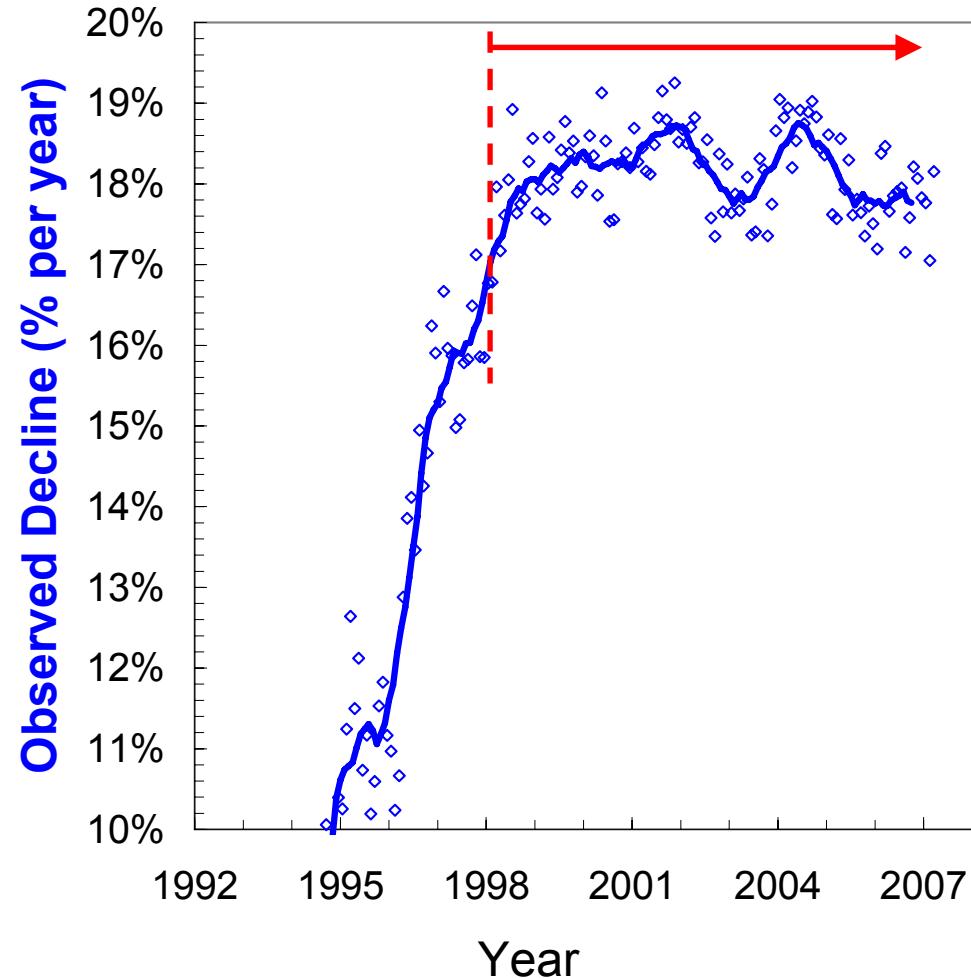

# Inferring OH abundance and variability from trace gas observations:

Rate of change = Emissions – Loss(OH, k)  
in methyl chloroform

# Inferring OH abundance and variability from trace gas observations:

$$\text{Rate of change in methyl chloroform} = \cancel{\text{Emissions}} - \text{Loss(OH, k)}$$

Rapid declines in MC emissions allow more direct insights into OH abundance and variability!

- \* Global OH abundance  
 $\sim 1.1 \times 10^6$  radicals/cm<sup>3</sup>
- \* Interannual OH variability of  $\pm 2\%$  (related to CO/burning?)  
→ Suggests OH is buffered against large changes

See poster later on...

# Current and Past Activities in NOAA/ESRL Related to *Radiative Forcing of Non-CO<sub>2</sub> Greenhouse Gases*

## **\*\* Observing global changes for non-CO<sub>2</sub> greenhouse gases:**

Global sampling networks, custom instrumentation, high-accuracy standardization  
air trapped in glacial snow

## **\*\* Assessing the significance of observed global changes:**

*Considering measured abundances and laboratory studies of chemical properties:*
