National Bureau of Standards Certificate of Analysis

Standard Reference Material 357

Gasometric Standard for Unalloyed Zirconium

Analytical Program Performed at the Albany Research Center, U.S. Bureau of Mines, Albany, Oregon, by A. J. Mackie

This standard is in the form of wire, 0.85 mm (0.034 in) in diameter. It is intended for calibration of apparatus used in the determination of gases in metals.

CAUTION: Prior to use, the wire should be washed in acetone or trichloroethylene, and thoroughly dried.

SRM No.		357	
Designation	Unalloyed Zirconium		
	Certified Value ^a	Estimated Uncertainty ^b	
Element	Parts per Million by Weight, $\mu g/g$		
Hydrogen	19	3	
Nitrogen	49	5	

^a The certified value listed is the *present best estimate* of the "true" value based on the cooperative program for certification.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. E. Michaelis.

Washington, D.C. 20234 June 16, 1980

George A. Uriano, Chief Office of Standard Reference Materials

The estimated uncertainty listed is based on judgment and represents an evaluation of the combined effects of method imprecision, possible systematic errors among methods, and material variability for samples of 0.2 g (or more) for hydrogen, and samples of 0.7 g (or more) for nitrogen.

PLANNING, PREPARATION, TESTING, ANALYSIS:

The wire material for this SRM was obtained from Teledyne Wah Chang, Albany, Oregon.

At the Albany Research Center, U.S. Bureau of Mines, Albany, Oregon, eight wire positions were sampled representing the entire coil of wire. Hydrogen, nitrogen, and oxygen determinations were made in at least quadruplicate at each position. Prior to each determination, samples were washed in acetone and dried.

<u>Hydrogen.</u> Determinations were performed by vacuum hot extraction on samples weighing 0.2 to 0.3 g. (Note: The wire was bent to a compact shape for use in the apparatus.) The average of all results (n = 32) was 19.3 ± 1.6 ppm (1 sigma). Previously issued SRM 352, certified at 32 ± 2 ppm (1 sigma), was also run (n = 4) and yielded 32.7 ± 0.7 (1 sigma).

Nitrogen. Determinations were performed by a semi-micro Kjeldahl method on samples weighing 0.7 to 1.0 g. The average of all results (n = 32) was 49.0 ± 2.4 ppm (1 sigma). SRM 360a, certified at 43 ppm, was also run (n = 4) and yielded 44.3 ± 2.2 ppm (1 sigma).

Oxygen. Determinations were performed by inert gas fusion with a chromatographic readout on samples weighing 0.12 to 0.16 g. Samples were wrapped in metal foil and determinations were made both in a nickel bath and in a platinum bath. The apparatus was calibrated each day with potassium acid phthalate standards containing 200, 300, and 400 micrograms of oxygen. The average of the nickel bath results (n = 32) was 1182 ± 48.5 ppm (1 sigma). SRM 356, certified at 1332 ± 77 (1 sigma), was also run (n = 15) and yielded 1376 ± 148 (1 sigma). The average of the platinum bath results (n = 32) was 1203 ± 76 ppm (1 sigma). SRM 356 yielded 1400 ± 90 using the platinum bath procedure (n = 8).

The analytical work for homogeneity testing and certification was performed at the Albany Research Center by A. J. Mackie and D. H. Bollman.

Cooperative analyses on samples from one selected wire position were performed at the Oregon Metallurgical Corporation, Albany, Oregon, by A. D. Fryer; and at Teledyne Wah Chang, Albany, Oregon, by J. H. Schlewitz.

For hydrogen, the two cooperating laboratories confirmed the results from the Albany Research Center within the estimated uncertainty reported. For nitrogen, one cooperating laboratory confirmed the results from the Albany Research Center.

Oxygen is *not* being certified at this time because of apparent systematic errors among methods (lack of agreement relative to the different reference materials used).

Additional studies are under way for oxygen in this SRM.

For information only, the following is given:
