Department of Energy

Washington, DC 20585

March 1, 1996

Mr. John T. Conway
Chairman
Defense Nuclear Facilities Safety Board
625 Indiana Avenue, N.W.
Suite 700
Washington, D.C. 20004

Dear Mr. Conway:

Your letter of January 31, 1996, to Assistant Secretary Grumbly expressed concern regarding the potential delay in meeting certain milestones for stabilization of solid residues at the Rocky Flats Environmental Technology Site. The detailed recovery plan addressing your concerns is enclosed as requested. The baseline schedule presented to your staff during their January 25, 1996, visit to Rocky Flats, shows a six-month slip in the stabilization of 10,000 kg of pyrochemical salt and a twelve-month slip in the stabilization of 4,000 kilograms of sand, slag, and crucible and graphite fines. The recovery plan outlines a set of initiatives that may reduce these schedule slips; however, the schedules presented are credible and given the present situation, represent an aggressive approach to stabilizing the salts and sand, slag and crucibles.

In addition to pursuing the initiatives discussed in the plan, the Rocky Flats Field Office is negotiating performance measures with Kaiser-Hill for Fiscal Year (FY) 1996 to provide incentives for completion of current year milestones that will ensure continued progress toward meeting outyear Recommendation 94-1 commitments. Similar measures will also be developed for FY 1997.

We remain committed to addressing the urgent risks identified in Recommendation 94-1, as expeditiously as possible, and will continue to pursue all potential options for schedule recovery.

Sincerely,

Richard J. Guimond
Assistant Surgeon General, USPHS
Principal Deputy Assistant Secretary
for Environmental Management

Enclosure

Rocky Flats Solid Residue

Stabilization Recovery Plan

for DNFSB Recommendation 94-1

Material Recovery Plans

Material Category:
Residue Pyro-chemical Salts

Plan

- The plan is to stabilize pyro-chemical salts using ten (10) pyro-chemical oxidation furnaces to be installed in Module "A" of Building 707.

- The current baseline schedule shows completion of the 10,000 kgs of high-hazard salts by 06/98. This represents a six month slip from the commitment made in the February 1995 submittal of the Implementation Plan

- Salts will be stabilized in Building 707 instead of Building 779. The basis for this decision is discussed in the summary section (page 8).

Schedule
See Attachment (1) for schedule of activities.

Assumptions. This schedule is based on the following set of assumptions:

- During construction and operations, building availability is assumed to be 70%.
- During construction, work load is assumed to be 2 shifts/day, 5 days/week, 12 hour shifts.
- During stabilization, equipment availability is assumed to be 90%, combined with an assumed building availability of 70%, would mean an integrated availability (building + equipment) of 60%.
- During stabilization operations work load is assumed to be 3 shifts/day, 5 days/week.
- These assumptions are consistent with data gathered in 1995 for processing material in Building 707 (viz: oxide stabilization).

Schedule Improvement Opportunities

Initiative:

Perform salt processing at other DOE sites, such as Los Alamos National Laboratory (LANL), in addition to processing salts at Rocky Flats.

Discussion:

Using other facilities in the DOE complex allows for an earlier start of stabilization at a site that has performed this type of operation as well as decreases the time required to process the salt backlog. LANL has the capability to process approximately 3,000 kg salt per year. Operations could commence at LANL in early 1997. There are a number of issues, such as the availability of shipping containers, shipper receiver agreements, etc. that still need to be resolved. This is being worked through the Nuclear Material Stabilization Task Group.

Affect on critical path:

Using another DOE facility to process material could provide for an early start on stabilization of the salt backlog by up to two months as well as reduce the baseline schedule slip by up to three months.

In addition, this would reduce programmatic risk as LANL represents additional capacity and capability in the event that Rocky Flats was unable to process materials for an extended period of time.

Key decision date:

May 1996

Initiative:

Develop and implement an activity-specific Basis for Operations (BFO) for Building 707 residue processing.

Discussion:

A major contributor to Building 707 being unavailable to conduct Pu operations is due to the termination of operations when systems or equipment do not meet the requirements specified in the Limiting Conditions of Operation (LCOs). The LCOs in the current Operational Safety Requirements (OSRs) require that specific hardware configurations to be operable. These requirements may be overly conservative given the changes in the Building 707 mission. Analysis underway has the potential for supporting revisions to the LCOs and OSRs. This could increase the time available that Building 707 would be able to conduct Pu processing operations.

Affect on critical path:

The impacts of this initiative are not yet fully understood. Currently Building 707 is assumed to be available for operations 70% of the time. If this could be improved by 10%, this would mean that ability to perform construction and processing could be increased by 10%. This could mean a potential 10% decrease in baseline schedule slip. This could potentially decrease the salt schedule slip by up to six weeks and the SSC/graphite fines schedule slip by up to two months.

Note: This could have a similar affect on the critical path for processing SSC/graphite fines in Building 707 as well as wet combustibles in Building 371.

Key decision date:

This process is already underway. A new OSR for residue processing has been incentivize through Performance Measures for implementation in Building 707 by September 1996. Additionally, a new OSR for residue processing in B371 has been incentivized as a Performance Measure for July 1996.

Initiative:

Develop alternate paths to acquire and install calorimetric measuring equipment in Building 707 that can reduce the dependance on long-lead procurement items.

Discussion:

Two paths are being pursued to provide for early calorimetry capability for residue processing. These paths are (1) lease equipment from the Mound Site for temporary usage during installation of permanent equipment, and (2) relocate some equipment from Building 771 to Building 707. Relocated calorimeters would require upgrades to the computer system and could require support system modification.

Affect on critical path:

This action is not expected to reduce the critical path duration/schedule slip. However this can reduce programmatic uncertainty as there are multiple paths being pursued to acquire necessary measuring capability which is a pre-requisite to performing stabilization operations.

Key decision date:

This path is being pursued. Rocky Flats will know the affects of this initiative by July 1996; at that point Rocky Flats should have the calorimetric equipment relocated and installed in Building 707 ready to test.

Initiative:

Accelerate the process for DOE evaluating work-place performance.

Discussion:

Readiness reviews required to start operations are planned to take up to 16 weeks and are on the critical path. A substantial reduction in duration in this activity may be possible without negatively impacting the scope or integrity of the process by performing an initial readiness assessment of a facility for a particular operation, continually assessing and monitoring the readiness of that facility, and then only reviewing the specific operation and changes to the facility caused by the additional operation that are to be started.

Affect on critical path:

As the readiness review is the final activity to be performed before actual processing, any decrease in the duration of this activity would mean a day-for-day reduction in the slip to the baseline schedule. If the readiness review duration was shortened by one-third, this could decrease the schedule slip by 5 weeks.

Note: This could have a similar affect on the critical path for processing SSC/graphite fines.

Key decision date:

This activity is under development based on improved and adequate processes in practice at other DOE sites. Rocky Flats will know the affects of this by December 1996.

Initiative:

Improve the Nuclear Criticality Safety (NCS) process for development of criticality evaluations.

Discussion:

There are three (3) areas being worked to decrease the time required to develop criticality evaluations and increase the resources available for development of criticality evaluations. These include: (a) improving the criticality evaluation process (e.g. planning, scheduling, and communications), (b) better utilizing existing NCS resources by working criticality engineers in teams with senior personnel being assigned as mentors, and (c) assigning criticality safety officers to facilities to provide qualified criticality engineers with better process information for developing criticality evaluations.

Affect on critical path:

Criticality evaluations are on the critical path. Any decrease in duration would either decrease the schedule slip or decrease the programmatic risk associated with completing the processing as the site has a history that indicates completing criticality evaluations has a high probability of impacting schedule.

Key decision date:

This process is already underway. An assessment on the effectiveness of this initiative will be available by August 1996.

Performance Measures

FY 96 Performance Measures under negotiation

Site preparation	
•Start site preparation	
•Complete removal of one (1) glove box from "A" module gloveline	06/96
•Complete removal of one (1) pump down table from "F" module	06/96
•Complete strip-out/site preparation of "A" module	09/96
•Complete Building 707 Basis for Operations for treating residue salts	09/96
Construction	
•Start construction in "A" module (the construction work order in place)	07/96

FY 97/98 Performance Measures that will be considered/negotiated

Construction	
•Salt construction phase complete	04/97
Processing	
•Start salt processing-first salt run complete in "A" module	08/97
•Complete treatment of 500 kg salt	09/97
•Complete treatment of 2,000 kg salt	10/97
•Complete treatment of 4,000 kg salt	12/97
•Complete treatment of 10,000 kg salt	06/98

Summary

- The February 1995 submittal of the Implementation Plan committed to stabilizing 6,000 kg of high-hazard salt by May 1997 and the remaining 4,000 kg of higher-hazard salt by December 1997 using newly installed pyrochemical oxidation furnaces in Building 779.

- The current path forward will install pyrochemical oxidation furnaces in "A" module of Building 707. The first 10,000 kg of this material will be stabilized by June 1998 (6 month slip).

- There are five (5) initiatives that Rocky Flats is pursuing to minimize schedule slip or to reduce the programmatic risk of completing salt stabilization activities. Relocating calorimetric equipment and improving the Nuclear Criticality Safety process are looked at minimizing schedule/programmatic risk, while potentially stabilizing salts at LANL, implementing activity-specific authorization basis, and improving the readiness review process may be able to decrease schedule slip. Although the affects of these initiatives are not fully known at this time, DOE is committed to improve the baseline schedule wherever and whenever possible.

- Building 707 was chosen over Building 779 for the following reasons:
  a. The known condition of the safety systems in Building 707.
  b. The well-established/well disciplined infrastructure of Building 707.
  c. The upgrades to Module "A" to resumption standards and the successful completion of two DOE operational readiness reviews.
  d. The operating history of Building 707 as this building, unlike Building 779, has a proven track record over the past year in conducting Pu operations.
  e. Stabilizing salts in Building 779 would not have decreased the schedule slip due to the extensive material and infrastructure upgrades that would have been required to start up pyrochemical stabilization activities.

- Rocky Flats will buy new furnaces rather than relocate furnaces from Building 779. Relocating furnaces that are installed in Building 779 would have not decreased the schedule slip nor have decreased the cost of the project. In addition, the relocation of older equipment would not have been as reliable as installing new furnaces.

- Rocky Flats will use performance measures, as described, in FY96 to incentivize completion of intermediate milestones as well as to try to pull back the baseline schedule discussed above. Performance measures for FY 97 and FY 98, also as discussed, will be developed and made part of the Performance Measure process.

Material Category:

Residue Ash: Sand, slag, & crucible and graphite fines.

Plan

- The plan for sand, slag & crucible (SSC) and graphite fines is to calcine these materials using eight (8) muffle furnaces to be installed in Module "E" of Building 707. Current schedules show completion of 4,000 kgs of this material by 05/98.

- This represents a twelve month (12) slip to the commitment made in the February 1995 submittal of the Implementation Plan as well as using newly installed furnaces in Building 707.

Schedule

See Attachment (1) for schedule of activities.

Assumptions This schedule is based on the following set of assumptions

- During construction and operations, building availability is assumed to be 70%.
- During construction, work load is assumed to be 2 shifts/day, 5 days/week, 12 hour shifts.
- During stabilization, equipment availability is assumed to be 90%, combined with an assumed building availability of 70%, would mean an integrated availability (building + equipment) of 60%.
- During stabilization operations work load is assumed to be 3 shifts/day, 5 days/week.
- Developing process parameters is being done concurrently with Title I design and will have no impact on Title II design.
- These assumptions are consistent with data gathered in 1995 for processing material in Building 707 (viz: oxide stabilization).

Schedule Improvement Opportunities

Initiative:

Process SSC/graphite fines in J-25 and/or J-60 in Building 707.

Discussion:

Processing SSC/graphite fines in J-25 and/or J-60 would provide for an accelerated start of processing high-risk materials. The through-put for these furnaces are assumed to be 1.5 kg/run and 1 run/shift and it is assumed that the required calcining temperatures for SSC/graphite fines are within the operating ranges of J-25 and J-60. These parameters will be confirmed and processing could be started after evaluating data obtained from the feasibility study (a FY 96 Performance Measure) scheduled to be completed 06/96. This activity would need to be coordinated with ongoing oxide stabilization activities, as these are the same furnaces used for those operations as well as coordinated with the installation of the 3013 metal and oxide bagless transfer system, that is also scheduled to be installed in "J" module.

Affect on critical path:

This initiative would allow for an early start by approximately six months (compared to baseline) for processing of SSC/graphite fines. If it is feasible to process materials in these furnaces, up to 400 kgs (10% of the SSC backlog) of material could be processed before the newly installed muffle furnaces become operational in "E" module which could mean a one month decrease in schedule slip.

Key decision date:

Data from the feasibility study is expected to be ready by 06/96. Based on this data, a key decision on using J-25/J-60 will be made by 07/96.

Note:

As discussed in the salt material recovery section, improving the Nuclear Criticality Safety process, implementing activity-specific authorization basis, and improving the readiness review process may be able to decrease the schedule slip for processing these materials.

Performance Measures

FY 96 Performance Measures under negotiation

Treatability Study	
•Complete SSC/graphite fines treatability study	06/96
Site Preparation	
•Start site preparation	
Initiate ash site preparation-first piece of equipment in module "E" removed	07/96
•Complete ash site preparation to allow for start of construction	09/96

FY 97/98 Performance Measures that will be considered/negotiated:

Site Preparation	
•Ash site preparation complete	10/96
Construction	
•Ash construction complete	02/97
Processing	
•Start processing SSC/graphite fines in "E" module	09/97
•Complete treatment of 300 kg SSC/GF	09/97
•Complete treatment of 1,000 kg SSC/GF	12/97
•Complete treatment of 4,000 kg SSC/GF	05/98

Summary

- The February 1995 submittal of the Implementation Plan committed to stabilizing 4,000 kg of high hazard SSC and graphite fines by May 1997 using furnaces in Building 707.

- The current path forward will install muffle furnaces in "E" module of Building 707. The 4,000 kg of high-hazard material will be completed by May 1998 (12 month slip).

- There are four (4) initiatives that Rocky Flats is pursuing to minimize schedule slip or to reduce the programmatic risk of completing SSC/graphite fine stabilization activities. Improving the Nuclear Criticality Safety process is looked at minimizing schedule risks, while potentially stabilizing SSC and graphite fine in B707 "J" module, implementing activity-specific authorization basis, and improving the readiness review process may be able to decrease the schedule slip. Although the affects of these initiatives are not fully known at this time, DOE is committed to improve the baseline schedule where ever and whenever possible.

- Rocky Flats will use performance measures, as discussed, in FY96 to incentivize completion of intermediate milestones as well as to try to pull back the baseline schedule discussed above. Performance measures for FY97 and FY98, also as discussed, will be developed and made part of the Performance Measure process.

Material Category:

Combustibles

Plan

- The plan for combustibles is to stabilize the high-hazard (wet combustibles) in Buildings 774 and 371 by:
  - (a) cementing ion exchange resin beads using the bottle-box process in B774 (268 kg).
  - (b) microwave solidification of oily sludge (7 kg).
  - (c) washing and drying wet inorganic combustibles (approx. 11,000 kg).
  - (d) low temperature thermal desorption wet organic combustibles (approx. 2,100 kg).

- Current schedules show completion of all high-hazard material (11,500 kgs) of this material by 11/98, as committed to in the IP.

- Performance Measures for FY96 are being negotiated for expedited treatment of (a) ion exchange resins, (b) oily sludge, and (c) acid contaminated leaded-rubber gloves.

- This represents a decision on the technologies that will be used for the path-forward in treating these materials. A combustible trade study, now in progress and expected to be completed in June, may change the method of treatment. Ongoing research and development of these technologies will be continued on a complex-wide basis and coordinated through the Nuclear Material Stabilization Task Group:
  - (a) Pyrolysis
  - (b) Chemical and wet chemical oxidation

- Rocky Flats will repackage dry combustibles in vented containers without further treatment as these materials can meet interim safe storage criteria by repackaging.

Program Management Structure

The management structure within the Department of Energy at Rocky Flats has been established in that the Mission Advocacy Organization is the single point-of-contact for all matters relating to 94-1 to the Manager and is the primary interface and point of contact with DOE Headquarters, the Nuclear Material Stabilization Task Group, the Defense Nuclear Facilities Safety Board, etc..

Within the Rocky Flats Field Office, Mission Advocacy will continue to work with the Environmental Health & Safety Program Assessment (ESHPA) and the Strategy, Integration, & Guidance (SIG) organizations in all phases of work from setting Performance Measures to monitoring the contractor against its baseline to awarding incentive fee for completing milestones. This includes providing real-time recommendations to the RFFO manager concerning policy, direction, and guidance to the contractor that may be needed to ensure 94-1 commitments continue to be technically sound and that adequate progress is being made to meet stabilization objectives. A diagram of the organizational structure is included below:
