

Proposal for Research at Mt. Discovery
Submitted by Rachel, Sarah, Sabrina, Katrina

Image:

Location: Lat: 78.2S 165.2E

We chose this location because the last eruption is unknown so we would like to send scientists to explore and estimate when the last eruption was. We also want to take cores to see if there are any living microorganisms.

Mt. Discovery contains many glaciers and glacial ice, maybe hidden crevasses. It is a central stratovolcano cone in the center of a three-armed mass of which Brown Peninsula is part of.

We think we should be funded because we believe there might be unknown creatures living there, and we also believe there are geological features that are unknown. We could find out a lot about its 5.3 million year old history.
