

Proposal for Research at Ronne Ice shelf- unnamed crevasses
Submitted by TIA (Tyler, Isaac, Alex)Research Group
Location: Lat 77 S Long 60W

We think this is a good area to study because this area connects to the ocean and we think there are living creatures under the ice, maybe at the bottom of the crevasses.

This area has many ice streams leading to it, and we are wondering why the ice is making crevasses here. If it's breaking off, we want to see what kinds of life are under it. It looks like the shelf is breaking from East and south ends.

We want to be funded to use a boat and a sub to explore. At the ice shelf edge we could drive the sub (remote controlled) under the crevasses to find out what's there.
