

Research Proposal for Scott Mountains
Submitted by Sam and Brandon
Location: Lat 67°30S 50°30 E

The Scott Mountains were discovered in 1930 by New Zealand researchers. The BANZARE project was last there between 1929- 1931 and it was mainly exploratory. We want to study the geology and oceanography there.

The area is close to the sea next to the Amundsen Bay. We want to learn about the organisms there and we want to learn about the geology and maybe volcanic activity. It is an area that has not been studied very much.

How will research be done? We will need a small ship, mountain climbers and equipment and a few snowmobiles. And we will need tools for studying the geology.
