Proposal:

Hades terrace is a steep, mainly ice-covered bluff along the east side of Campbell Glacier, situated just west of Vulcan Hills in the Southern Cross Mountains of Victoria Land..

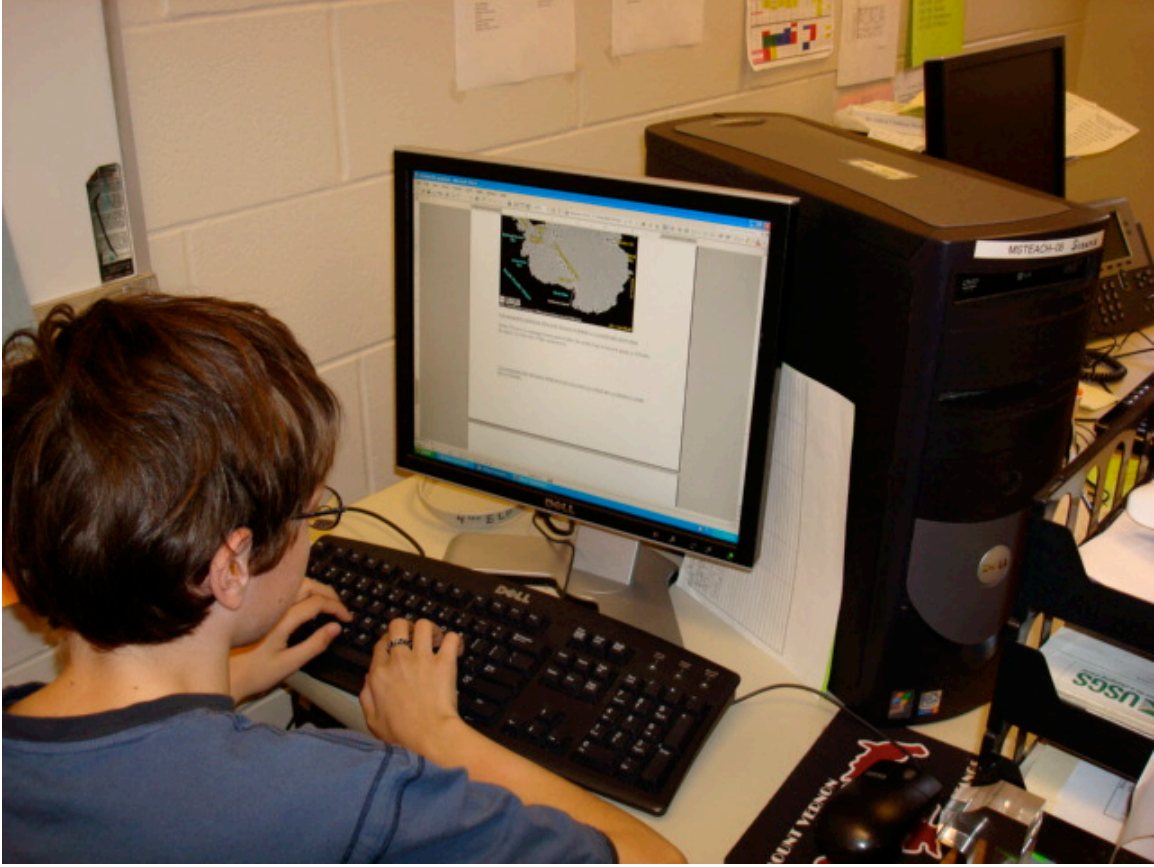

Hades Terrace is located at -73.6833333 latitude and 163.5 longitude.

Hades Terrace is a strange area named after the mythological ancient Greek god Hades, thought to be the ruler of the underworld. I think Hades Terrace is interesting because, it is a very rough and rocky terrain also close to many crevasses which are deep open cracks in a glacier.

I believe the crevasses are formed from slow moving ice coming down the mountain.

I think my team should be funded to investigate this part of Antarctica because it is a strange area of Antarctica filled with many crevasses. According to Wikipedia “ a **crevasse** is a fracture in a glacier due to tensile stress at or near the glacier's surface.” Acceleration in glacier speed can lead to more stress and make a crevasse. I think if we measure the speed of glaciers over time this will help us understand the properties of global warming. The area of Hades Terrace and the crevasses in the glaciers surrounding it would be a great area to study this.

Thank you for considering my project.
