**ABSTRACT**

**Los Alamos National Laboratory is subject to annual emissions-reporting requirements for regulated air contaminants under Title 20 of the New Mexico Administrative Code, Chapter 2, Part 73 (20.2.73 NMAC), *Notice of Intent and Emissions Inventory Requirements*. The applicability of the requirements is based on the Laboratory's potential to emit 100 tons per year of suspended particulate matter, nitrogen oxides, carbon monoxide, sulfur oxides, or volatile organic compounds. For calendar year 2002, the Technical Area 3 steam plant and the air curtain destructors were the primary sources of criteria air pollutants from the Laboratory, while the air curtain destructors and research and development activities were the primary sources of volatile organic compounds. Emissions of beryllium and aluminum were reported for activities permitted under 20.2.72 NMAC. Hazardous air pollutant emissions were reported from chemical usage from research and development as well as from all combustion sources. In addition, estimates of PM<sub>2.5</sub> and ammonia were provided as requested by the New Mexico Environment Department, Air Quality Bureau.**

## 1.0 INTRODUCTION

Los Alamos National Laboratory (LANL or the Laboratory) has reported on air pollutants generated from its operations since the 1970s when Air Quality Control Regulation 703, *Registration of Air Contaminant Sources*, was promulgated. According to the regulation, the Laboratory was required to register air pollutant sources that emitted more than 2000 lb per year of any air contaminant. This regulatory requirement later evolved into Title 20 of the New Mexico Administrative Code, Chapter 2, Part 73 (20.2.73 NMAC), *Notice of Intent and Emissions Inventory Requirements*. The objective of the reporting requirement is to provide emissions data to the New Mexico Environment Department (NMED) so its staff can determine whether LANL meets state and federal air pollutant standards.

LANL reports the following sources in the annual emissions inventory under 20.2.73 NMAC:

- Units with a 20.2.72 NMAC construction permit
- Units included in the 2002 Operating Permit Application
- Volatile organic compound (VOC) and hazardous air pollutants (HAP) emissions from research and development (R&D) activities (based on chemical procurements)

Additionally, for the first time, the 2002 report includes HAP emissions from all combustion sources. Also, the report includes estimates of suspended particulate matter in the size range of 2.5 microns or less (PM<sub>2.5</sub>) and ammonia as requested by NMED. NMED also requested LANL to voluntarily report New Mexico toxic air pollutants. However, this information was not provided in the 2002 report due to time and resource constraints.

## 2.0 CONTENT OF THE EMISSIONS INVENTORY REPORT

NMED requested that LANL submit emissions data for 2002 via electronic format for entry into Aerometric Information Retrieval System (AIRS). The information required for submittal includes the following:

- company name, address, and physical location for the facility;
- facility contact information;
- signed certification statement by a responsible facility official; and
- specific information for each emission unit such as the type and efficiency of control equipment, schedule of operation, annual process or fuel combustion rates, and estimated actual emissions for calendar year (CY) 2002.

This annual emissions inventory report includes air contaminant data for total particulate matter (PM), suspended particulate matter in the size range of 10 microns or less (PM<sub>10</sub>), carbon monoxide (CO), nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>x</sub>), VOCs, beryllium, and aluminum. Additionally, at the request of NMED, the 2002 report provides data on HAP emissions, emissions of PM<sub>2.5</sub>, and ammonia emissions for CY 2002.

The new requirement to provide PM<sub>2.5</sub> and ammonia emissions data stems from the recent development by the US Environmental Protection Agency (EPA) of a National Ambient Air Quality Standard for PM<sub>2.5</sub>. States are now in the process of developing a baseline for PM<sub>2.5</sub>. As such, for the 2002 Emission Inventory submittal, NMED requested emissions information on PM<sub>2.5</sub>. Further, ammonia (NH<sub>3</sub>) is a precursor to PM<sub>2.5</sub> formation. It contributes to the secondary aerosol formation of PM<sub>2.5</sub> by combining with NO<sub>x</sub> and SO<sub>x</sub> to form ammonium nitrate and fine sulfate particles. Therefore, NMED also requested emissions information on ammonia.

In the 2002 Emission Inventory submittal, LANL provided PM<sub>2.5</sub> emissions data for all combustion sources, and other emission sources where PM<sub>2.5</sub> emission factors were readily available. In the absence of PM<sub>2.5</sub> emission factors, PM or PM<sub>10</sub> emissions were assumed to be equivalent to PM<sub>2.5</sub>. LANL does not operate any major sources of ammonia emissions. Ammonia was included in the emission estimates for R&D chemical use.

### **3.0 REPORTED EMISSION SOURCES**

The Laboratory's *2002 Emissions Inventory Report* includes estimates of actual air emissions for regulated pollutants from the following sources:

- steam plants,
- miscellaneous small boilers,
- asphalt plant,
- paper shredder,
- rock crusher,
- degreasers,
- air curtain destructors (ACDs),
- carpenter shop,
- oil storage tanks,
- permitted beryllium sources, and
- facility-wide chemical use.

The following sub-sections describe the emission sources included in the 2002 emission inventory and emission calculation methodology for each source type. A summary table of actual reported emissions by source is included at the end of this section (Section 3.13). Attachment A includes worksheets showing detailed emission calculations for individual emissions sources. The *2002 Emissions Inventory Report* as submitted to NMED is presented in Attachment B.

#### **3.1 Steam Plants**

The Laboratory operates two steam plants, one located at Technical Area (TA) 3 and the other at TA-21. The TA-3 steam plant produces steam for heating and electricity when sufficient power from outside sources is not available. The steam plant at TA-21 provides

steam for heating. The heat produced from both steam plants is used for comfort and hot water and to support facility processes. Each steam plant has three boilers that are fueled primarily with natural gas and with diesel fuel as a backup. Actual emissions are estimated on the basis of metered fuel consumption and emission factors. The primary source of emission factors is AP-42, the EPA's *Compilation of Air Pollutant Emission Factors* (Volume 1, *Stationary Point and Area Sources*, Sections 1 and 3, Fifth Edition). However, emission factors from stack tests conducted at the TA-3 steam plant when it was burning natural gas were also used as appropriate.

The TA-3 steam plant has been the largest source of NO<sub>x</sub> emissions at the Laboratory. In 2002 a voluntary project to install pollution control equipment on the three boilers at the TA-3 steam plant was completed. The three boilers were fitted with flue gas recirculation (FGR) equipment to reduce NO<sub>x</sub> emissions. The equipment became operational in October 2002. The installation of this emission control equipment resulted in a reduction in NO<sub>x</sub> emissions of approximately 70 percent. Figure 3.1 is a picture of the TA-3 steam plant building and stacks.

**Figure 3.1. TA-3 steam plant.**

### **3.2 Nonexempt Boilers**

The Laboratory operates approximately 200 boilers. Most of the boilers are exempt from permitting requirements because of their size and use as comfort boilers and do not need to be included in the emissions inventory. The exemption analysis applied to the boilers is discussed in Section 4.1 of this report.

The nonexempt boilers reported in the 2002 emissions inventory include the following:

- four boilers at TA-16,
- three boilers at TA-48,
- two boilers at TA-53,
- two boilers at TA-55, and
- two boilers at TA-59.

All of the reported boilers burn natural gas. The TA-16 boilers are equipped with meters to track the fuel consumption. For all other boilers, the fuel consumption was estimated on the basis of the total natural gas used by the Laboratory minus the amount supplied to the metered sources. Some emission factors were available from stack tests (TA-55), some were provided by the boiler manufacturer (Sellers Engineering Company), and the rest were taken from AP-42.

### ***3.3 Asphalt Plant***

The asphalt plant produces small amounts of asphalt for road repairs in and around the Laboratory. Emissions from the asphalt plant are based on the amount of asphalt produced for the year. The PM emissions from the asphalt plant were calculated with an emission factor obtained from a source test. Otherwise, emission factors from AP-42 were used.

### ***3.4 Water Pump***

The water pump was transferred to Los Alamos County in November 2001. It is no longer owned or operated by LANL and therefore no emissions were reported from this source.

### ***3.5 Paper Shredder***

The shredding operations of the paper shredder at TA-52-11 are a source of PM emissions. Estimates of actual emissions are based on an averaged monthly shredding rate and engineering estimates for controlled emissions. These PM emissions are controlled with a cyclone and a baghouse.

### ***3.6 Rock Crusher***

In June 1999, the Laboratory was issued a 20.2.72 NMAC construction permit (Permit No. 2195) to operate an impact rock crusher to crush potentially radioactive contaminated concrete removed from buildings as part of the Laboratory's decontamination and decommissioning efforts. The rock crusher was not operated in 2002. Therefore, there were no PM emissions from crushing activities and no combustion products from the crusher's diesel-fired engine for CY 2002.

### **3.7 Degreaser**

The halogenated solvent cleaning machine at TA-55 Building PF-4 has a capacity of 18 liters and is registered with NMED's Air Quality Bureau (AQB) as required under the National Emissions Standards for Hazardous Air Pollutants, 40 CFR 63 Subpart T, "Halogenated Solvent Cleaning." The solvent used in the machine, trichloroethylene (Chemical Abstracts Service [CAS] No. 79-01-6), is a VOC and a HAP. Measured losses were reported. LANL has two additional halogenated solvent cleaning machines registered with NMED; however, these two machines did not operate in 2002.

### **3.8 Air Curtain Destructors**

Three ACDs were extensively used during 2002 for controlled open burning of wood and wood scrap generated from tree thinning activities at LANL. The ACDs work by blowing a curtain of air over materials as they burn within a semi-enclosed environment. The fan-driven curtain of air introduces a steady oxygen supply into the combustion chamber and helps ensure that nearly all fuel and gasses are consumed. Each unit can burn up to 10 tons of wood per hour. In 2002 a total of 11,856.8 tons of wood and straw generated from forest thinning activities were burned in the ACDs. A picture of an ACD operating at LANL is included as Figure 3.2.

**Figure 3.2. Air curtain destructors.**

Both wood burning and engine operation emissions were estimated. Wood burning emissions were estimated based on the total tons of wood burned in 2002 and using

emission factors presented in the Title V operating permit application submitted to NMED in November 2002. Engine emissions were estimated based on the total diesel fuel consumed and the total horsepower hours operated. The calculated emissions are based on emission factors presented in the Title V application submitted to NMED. The units were operated under an open burn permit issued by NMED's AQB on June 20, 2001.

### **3.9 Carpenter Shop**

LANL operates a carpenter shop at TA-3-38. This carpenter shop was built before 1960, and therefore is not subject to 20.2.72 NMAC construction permitting. However, LANL included this source in its updated Title V Operating Permit application submitted to NMED on November 27, 2002. Therefore, this carpenter shop is included in the 2002 emission inventory for the first time.

PM emissions from the carpenter shop are estimated based on the number of hours the exhaust system operated and an estimated control efficiency of the cyclone. Emission factors from AP-42, Section 10.4, Woodworking Waste Collection Operations, February 1980, were used to estimate PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions.

### **3.10 Oil Storage Tanks**

The Laboratory included 15 storage tanks in the recently updated Title V permit application because they are subject to New Source Performance Standards 40 CFR 60, Subpart Kb. Fourteen of the 15 tanks store mineral oil, scintillation oil, or dielectric oil, which all have vapor pressures of <0.01 mmHg. Emissions from these oil storage tanks were included for the first time in the 2002 emissions inventory. The fifteenth tank (a diesel storage tank) at the TA-3-779 Power Plant is already included on the Emission Inventory under AIRS ID 036. With the agreement of the NMED, the emissions of the 14 tanks were summed and listed under one stack entry in the emissions inventory report due to the small quantity of emissions. Based on the most conservative tank parameters and the actual throughput from chemical inventory records a unit emission rate was calculated using TANKS 4.0 for both vertical and fixed roof tanks. These unit emission rates in lb/yr were multiplied by the number of horizontal and vertical tanks to provide an estimate of the total annual emissions from all of the tanks.

### **3.11 Permitted Beryllium-Machining Operations**

The Laboratory operates under five 20.2.72 NMAC AQB construction permits\*\* for beryllium-machining operations that are subject to 40 CFR 61, Subpart C, "National Emission Standards for Beryllium." Emissions from these sources were reported at permitted emission levels; however, actual emissions monitored during initial compliance stack tests were below permitted levels.

---

\*\* Permit No. 632, issued December 26, 1985.  
Permit No. 634-M2, issued October 30, 1998.  
Permit No. 635, issued March 19, 1986  
Permit No. 636, issued March 19, 1986.  
Permit No. 1080-M1-R3, issued February 11, 2000.

### **3.12 Emissions from Research and Development Activities**

The majority of the Laboratory's work is devoted to R&D activities. Varying operating parameters, as well as amounts and types of chemicals, are used in these activities. R&D activities occur at virtually all technical areas within the Laboratory. R&D activities were evaluated for VOC and HAP emissions and are discussed below.

#### **3.12.1 VOC Emissions**

With the exception of specific listed chemicals, VOCs are any compounds of carbon that participate in atmospheric photochemical reactions. VOCs include commonly used chemicals such as ethanol, methanol, trichloroethylene, and isopropanol. The Laboratory's Chemlog inventory system CY 2002 data set (chemical containers added to LANL's inventory between January 1, 2002, and December 31, 2002) was reviewed to identify all VOCs purchased and received at LANL in 2002. The general assumption used in estimating VOC emissions from chemical use is as follows:

$$\text{Purchasing} = \text{Use} = \text{Emissions}$$

From the dataset of chemicals purchased in 2002, certain categories of chemicals were separated and eliminated from the analysis. The classifications assigned and the corresponding reasons (noted in parentheses) for the exclusion of chemicals from inventory records are noted below.

- Solid materials (Solids are not a significant source of air emissions based on their low vapor pressure.)
- Non-VOC materials as defined by 40 CFR 51.100 (Specific chemicals that are listed in 40 CFR 51.100 have been determined to have negligible photochemical reactivity and are therefore exempt.)
- Paints (Paints were evaluated separately—See Section 4.4.)
- Inorganic chemicals (Inorganics are not compounds of carbon.)
- Oils (Oils are not a significant source of air emissions based on their low vapor pressure and are used primarily for maintenance.)
- Fuels used for combustion purposes (Emissions from fuel combustion are already reported for each combustion unit).

Furthermore, the following categories of chemicals were eliminated based on guidance from NMED (see exemptions listed in Table 4.1 for further explanation).

- Container sizes of 1 lb or less,
- Chemicals with vapor pressures less than 10-mm Hg,
- Chemicals used to calibrate equipment,
- Maintenance chemicals,
- Use of office equipment and products,
- Chemicals used for boiler water treatment operations,
- Chemicals used for oxygen scavenging (deaeration) of water, and
- Chemicals used in bench-scale chemical analysis.\*

---

\* This exemption was applied only to biological research solutions. Otherwise, this exemption was not applied. See Table 5.1.

After the elimination of the chemicals and categories of chemicals listed above, the remaining chemical inventory records were matched with a list of known VOCs by CAS number. Mixtures were evaluated in the same manner as HAP mixtures. As a conservative estimate, VOCs identified in the Laboratory's chemical-tracking records were assumed to be 100 percent emitted to the air. As a result, the estimated emissions of VOCs at LANL from chemical use totals 14.9 tons. Use of NMED AQB's Operating Permit Program exemptions from the "List of Insignificant Activities" (September 29, 1995) and "List of Trivial Activities" (January 10, 1996) is discussed in Section 4.2 of this report.

### **3.12.2 HAP Emissions**

Section 112(b) of the 1990 Clean Air Act Amendments listed 189 unique HAPs that were identified for potential regulation by EPA. In 1995, caprolactam was delisted as a HAP. Of the remaining 188 listed HAPs, 17 are classes of compounds (e.g., nickel compounds). The use of the 188 listed chemicals in R&D activities at the Laboratory was evaluated and quantified for the annual emission inventory submittal to NMED.

The Chemlog inventory system CY 2002 data set was analyzed to identify HAPs used in R&D activities. The identification process was similar to that used for the VOCs, described in Section 3.12.1. Pure chemicals (i.e., chemicals with CAS numbers), classes of compounds, and mixtures were evaluated to determine if the chemicals themselves were HAPs or if they had HAP constituents. For mixtures, material safety data sheets were reviewed to determine if any HAPs were present and, if so, to determine the associated HAP percentages. Listed below are certain chemical types or categories that were classified and removed from this analysis (refer to Section 3.12.1 and Table 4.1 for explanations on the removal of these chemicals).

- Paints,
- Oils,
- Maintenance chemicals,
- Chemicals used to calibrate equipment,
- Container sizes of 1 lb or less,
- Chemicals used in bench-scale chemical analysis,
- Use of office equipment and products,
- Chemicals used for boiler water treatment operations, and
- Chemicals used for oxygen scavenging (deaeration) of water.

Total HAP emissions were estimated by summing (1) pure HAP chemicals, (2) classes of compounds that are HAPs, and (3) the HAP constituents from mixtures. The resulting total amount of HAPs from chemical use reported for 2002 was 7.7 tons.

The HAP emissions reported generally reflect the quantities procured in the CY. In a few cases, however, procurement values and operational processes were further evaluated so that actual air emissions could be reported instead of the procurement quantities.

Additional analyses for mercury and hydrochloric acid (HCl) were performed and are described below.

### Mercury

All purchases of mercury through the Chemlog chemical tracking system were evaluated to determine usage and potential air emissions. Some purchases of mercury were identified as exempt from the emission inventory requirements because of their use as standards for calibrating laboratory equipment. Other purchasers of mercury that were contacted confirmed that the mercury was still in use, or in storage and had not resulted in air emissions.

### Hydrochloric Acid

Facility and Waste Operations (TA-50-1) purchased multiple 14-gallon carboys of HCl totaling approximately 4,463 lbs. This HCl was used for heat exchanger scale cleaning and for the cleaning of electro dialysis reversal membranes. Emissions from these particular activities were estimated to be 0.24 lb based on specific process information and engineering calculations. The remaining procurements were approximately 3,077 lb, resulting in a reported total for HCl of 1.54 tons.

### 3.13 Emissions Summary by Source

Table 3.1 provides a summary of LANL's 2002 actual emissions, as submitted for the annual emissions inventory. The table presents the emissions by pollutant and by source, with a facility total at the bottom of the table. Attachment A provides detailed information on how the emissions were calculated for each emission unit.

**Table 3.1. Summary of LANL's 2002 Actual Emissions**

	NO <sub>x</sub> (tons/yr)	SO <sub>x</sub> (tons/yr)	PM <sub>10</sub> (tons/yr)	PM <sub>2.5</sub> (tons/yr)	CO (tons/yr)	VOC (tons/yr)	HAPs (tons/yr)
TA-3 Power Plant Boilers	40.3	0.27	2.34	2.33	12.31	1.69	0.56

## 4.0 REPORTING EXEMPTIONS

Under NMED's AQB Operating Permit Program, specific insignificant or trivial activities are exempt from reporting. NMED has designated exempt sources, activities, or thresholds in the following lists:

- "List of Insignificant Activities," September 29, 1995;
- "List of Trivial Activities," January 10, 1996.

Laboratory sources and activities that qualify as insignificant or trivial as specified in these lists are not included in the *2002 Emissions Inventory Report*. The following subsections of this report provide information and examples of the Laboratory's exempt activities, as well as the analyses that were performed to determine the exempt status.

### 4.1 Boilers

The Laboratory's boiler inventory was evaluated against the "List of Insignificant Activities." Specifically, a boiler was considered exempt from the emissions inventory reporting requirements if it met one of the following requirements:

- Any emissions unit . . . that has the potential to emit no more than **one (1) ton per year** of any regulated pollutant; or
- Fuel burning equipment which uses gaseous fuel, has a design rate less than or equal to five (5) million BTU per hour, and is used solely for heating buildings for personal comfort or for producing hot water for personal use.

Any boiler that was not used exclusively for comfort heating or hot water was evaluated for the **one (1) ton per year** exemption. For purposes of determining the exemption, the boiler design ratings were used to estimate the potential to emit. Any boiler not qualifying for one of these two exemptions was included in the report.

### 4.2 VOC Emissions

A number of insignificant and trivial activities were applicable for exempting materials from the VOC R&D total in the report. The basis of the exemptions and the corresponding insignificant or trivial activities are explained in Table 4.1.

Fuels such as propane, kerosene, and acetylene were analyzed separately and are not listed in Table 4.1. When fuels are burned in an open flame, almost all of these fuels are consumed and the emissions are minimal. Furthermore, under normal conditions, fuels burned with oxygen are reduced to carbon dioxide and water, which are not regulated air pollutants.

**Table 4.1. Exemptions Applied for R&D Activities**

Basis of Exemption	Activity Type	Activity
Container sizes of 1 lb or less	Trivial	Paint or nonpaint materials dispensed from prepackaged aerosol cans of 16-oz. capacity or less.
Chemicals with vapor pressures <10-mm Hg	Insignificant	Any emissions unit, operation, or activity that handles or stores a liquid with a vapor pressure of less than 10–mm Hg or in quantities of less than 500 gal.
Calibration chemicals	Trivial	Routine calibration and maintenance of laboratory equipment or other analytical instruments, including gases used as part of those processes.
Maintenance chemicals and oils	Trivial	<p>Activities that occur strictly for maintenance of grounds or buildings, including the following: lawn care; pest control; grinding; cutting; welding; painting; woodworking; sweeping; general repairs; janitorial activities; plumbing; re-tarring roofs; installing insulation; steam-cleaning and water-washing activities; and paving of roads, parking lots, and other areas.</p> <p>Activities for maintenance and repair of equipment, pollution-control equipment, or motor vehicles either inside or outside of a building.</p>
Use of office equipment and products	Trivial	Use of office equipment and products, not including printers or businesses primarily involved in photographic reproduction.
Chemicals used for boiler water treatment	Trivial	Boiler water treatment operations, not including cooling towers.
Chemicals used for oxygen scavenging	Trivial	Oxygen scavenging (deaeration of water).
Chemicals used in bench-scale chemical analysis	Trivial	<p>Bench-scale laboratory equipment used for physical or chemical analysis but not lab fume hoods or vents.</p> <p><i>Note: This exemption was applied only to biological research solutions. Otherwise, this exemption was not applied.</i></p>

### **4.3 HAP Emissions**

A HAP R&D activity exemption analysis, similar to the VOC R&D activity exemption analysis, resulted in application of several of the same exemptions from NMED's AQB "List of Trivial Activities" and "List of Insignificant Activities" (refer to Table 4.1).

### **4.4 Paints**

An exemption analysis was performed for VOC and HAP emissions resulting from painting activities conducted at the Laboratory. Paint information for 2002 was gathered from the work control databases and the Laboratory's procurement and inventory systems. These records were evaluated for applicability of exemptions for trivial and insignificant activities.

The following exemptions from NMED's AQB Operating Permit Program "List of Trivial Activities" were used in the paint analysis:

- Activities that occur strictly for maintenance of grounds or buildings, including the following: lawn care; pest control; grinding; cutting; welding; painting; woodworking; sweeping; general repairs; janitorial activities; plumbing; re-tarring roofs; installing insulation; steam-cleaning and water-washing activities; and paving of roads, parking lots, and other areas.
- Activities for maintenance and repair of equipment, pollution control equipment, or motor vehicles either inside or outside of a building.
- Paint or nonpaint materials dispensed from prepackaged aerosol cans of 16 oz. or less capacity.

The corresponding amounts of paint were totaled for painting activities that did not qualify for one of the exemptions listed above. This paint total for CY 2002 was determined to be 2,650 lbs (1.32 tons), which further qualified for the following insignificant activity:

Surface coating of equipment, including spray painting and roll coating, for sources with facility-wide total cleanup solvent and coating actual emissions of less than two (2) tons per year.

All emissions from paints and painting activities were exempt as insignificant or trivial activities and therefore were not included in the *2002 Emissions Inventory Report*.

### **4.5 Generators**

The Laboratory has an inventory of approximately 125 portable generators. Portable generators are used at the Laboratory for temporary operations requiring remote power or to provide emergency backup power during power outages at various sites. The portable generators are fueled by gasoline and/or diesel fuel.

In addition to the portable generators, the Laboratory maintains and operates approximately 45 stationary generators. Stationary generators are used on standby (emergency) status to provide power to critical systems at the Laboratory during power outages. The stationary generators are fueled by natural gas, gasoline, or diesel.

The insignificant activity exemptions applicable to the Laboratory's generators are the following:

- Portable engines and portable turbines that have a design capacity...less than or equal to
  - 200-HP engine if fueled by diesel or natural gas, and
  - 500-HP engine if fueled by gasoline.
- Emergency generators that comply with the definition of standby equipment.

Standby equipment is defined in NMED's AQB "List of Insignificant Activities" as "an emissions unit which on a temporary basis replaces equipment used in normal operation, and which either has an allowable emission rate or potential to emit for each fee pollutant that is equal to or less than the equipment replaced, or which does not operate for a period exceeding 500 hours per calendar year."

On the basis of their size, the portable generators used for temporary power at remote locations are exempt from emissions inventory reporting requirements. Since all of the stationary generators are designated as standby equipment under the Operating Permit Program and are used solely to provide emergency backup power for less than 500 hours per year, they are insignificant sources and, therefore, are exempt from emissions inventory reporting requirements.

## 5.0 EMISSIONS SUMMARY

Table 5.1 presents facility-wide actual emissions of criteria pollutants for 2002, as reported in the emission inventory. Table 5.2 presents facility-wide actual emissions for HAPs. Graphical representations of emissions are also provided. Figures 5.1 and 5.2 show emissions by source and by year respectively. Figure 5.3 represents VOC and HAP emissions from R&D activities.

Emission unit information and emissions estimates are included in Attachment A. The *2002 Emissions Inventory Report* as submitted to NMED is presented in Attachment B. As mentioned, it is formatted to be compatible with AIRS.

**Table 5.1. LANL Facility-Wide Criteria Pollutant Emissions for 2002**

Pollutant	Actual Emissions (tons/yr)
NO <sub>x</sub>	64.7
SO <sub>x</sub>	1.2
CO	28.1
PM <sub>10</sub>	12.5
VOC	39.9

**Table 5.2. LANL HAPs Emissions from Facility-Wide Chemical Use for 2002**

Pollutant	Actual Emissions (tons/yr)
Total HAPs	7.7
<b>Top Five HAPs</b>	
Hydrochloric Acid	1.54
Methylene Chloride	1.44
Acetonitrile	0.95
Methanol	0.85
Manganese Compounds	0.76

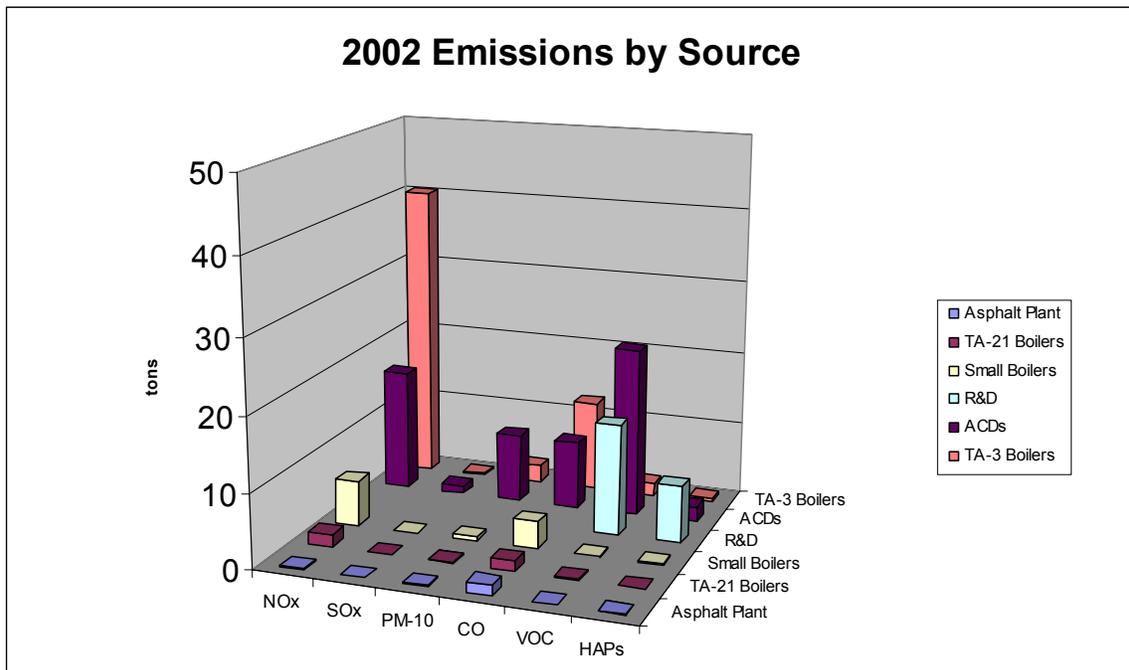

Attachment B is a copy of the data in spreadsheet form that was submitted to NMED for reportable emission sources. Several notable changes occurred to the emission inventory sources for 2002. First, the water pump (AIRS #014) was transferred to Los Alamos County in November 2001. It is no longer owned or operated by LANL and therefore no emissions from this source were reported. Some existing sources (degreasers at TA-46-24 and the rock crusher) did not operate in 2002.

Second, two emission units are reported for the first time this year: a carpenter shop at TA-3-38 and a “composite” storage tank representing 14 various storage tanks at LANL used for storing mineral oil and scintillation oil. Therefore, two new Stack ID Nos. were added to the inventory (not yet assigned 042 and 043).

Finally, as requested by NMED, HAP emissions from all combustion sources, PM<sub>2.5</sub> emission estimates, and ammonia were reported. As discussed with Jim Shively and Mary Uhl of NMED, on February 21, 2002, the voluntary reporting of New Mexico toxic air pollutants was not included due to time and resource constraints.

Figure 5.1 shows the air pollutant emissions by source, excluding beryllium, aluminum, and HAPs. As the figure shows, the TA-3 steam plant is the primary source of NO<sub>x</sub> and CO emissions and the ACDs are the primary source of PM<sub>10</sub> and VOC emissions.

The Laboratory’s FGR equipment on the TA-3 steam plant boilers became operational in October 2002. This project resulted in a reduction in NO<sub>x</sub> emissions by approximately 70 percent. Historically, the TA-3 steam plant boilers are the largest source of air emissions (NO<sub>x</sub>) at LANL. The stack test demonstrated a reduction of approximately 70 percent for NO<sub>x</sub> emissions.

**Figure 5.1. Emissions of air pollutants by source in 2002.**

Figure 5.2 compares the past five years’ emissions for criteria air pollutants and VOCs reported to NMED. There are some differences in the emissions from 2001 to 2002. Emissions of NO<sub>x</sub> have decreased from 2001 levels due to the implementation of the FGR system on the TA-3 steam plant boilers. PM, VOC, and SO<sub>x</sub> emissions have increased since 2001 due to the use of the ACDs at the Laboratory for forest thinning and fire mitigation efforts.

Figure 5.3 represents VOC and HAP emissions from R&D activities. As shown, the HAP emissions from R&D activities are slightly greater in 2002 than in 2001, and the VOC emissions from R&D activities are slightly less in 2002 than in 2001. The continued fluctuation in both VOC and HAP emissions is largely related to the variation in chemical purchases.

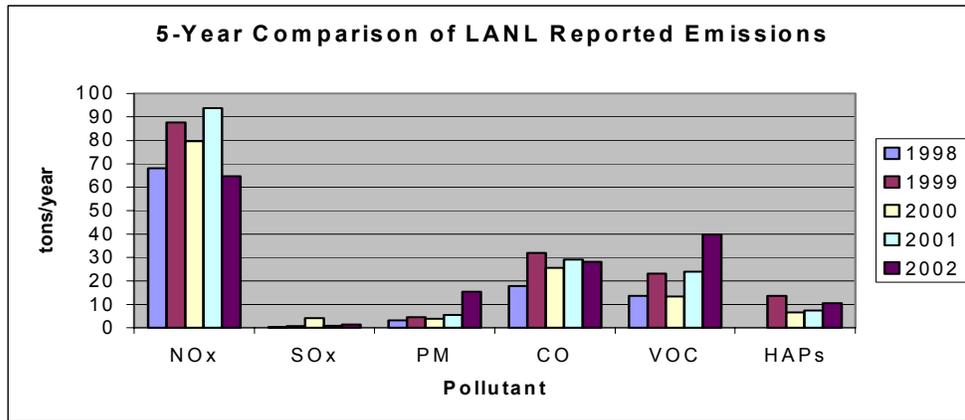

Figure 5.2. Emissions generated in 1998, 1999, 2000, 2001, and 2002.

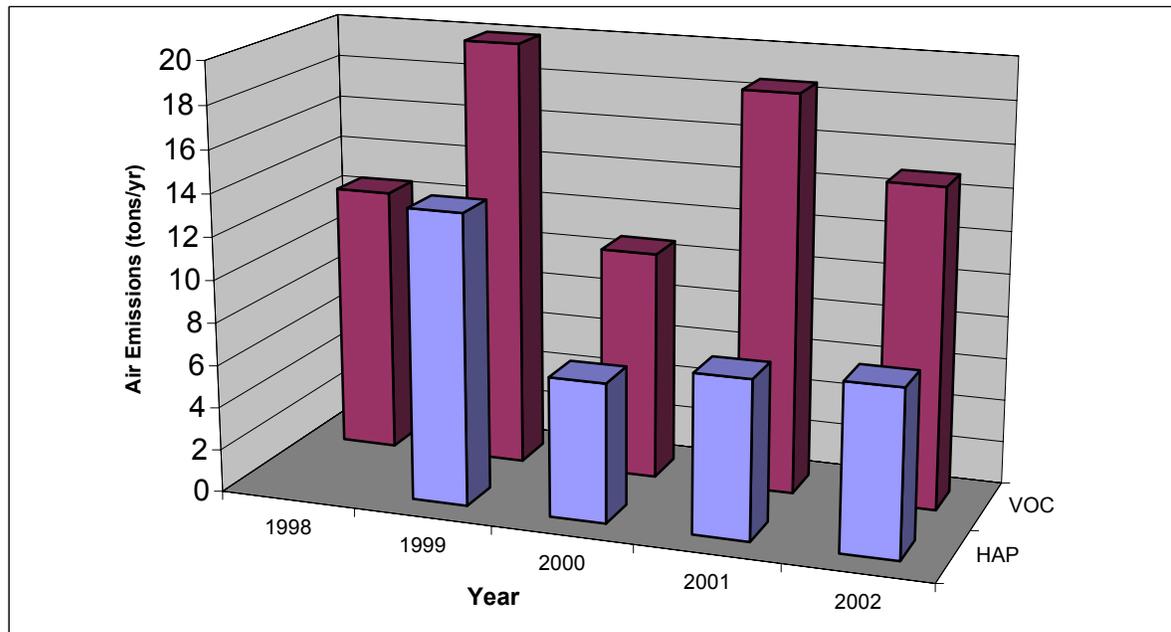

Figure 5.3. VOC and HAP emissions from R&D activities.
