Vegetation Classification and Mapping Program  
List of California Vegetation Alliances  
October 22, 2007**

**Introduction:**

This document provides the Vegetation Classification and Mapping Program's currently accepted list of vegetation alliances. It is based on the classification put forth in the upcoming second edition of "A Manual of California Vegetation," (MCV) which is the California expression of the National Vegetation Classification (Grossman et al. 1998). This classification is hierarchical in nature: alliances are the generic vegetation unit and associations the specific unit. We hope to publish a list of accepted associations in the near future.

This list is structured differently than previous lists. It emphasizes the relationship of the California alliances with the current National Vegetation Classification System (NVC). NVC codes and names, if they have been identified, are shown in brackets. Those lacking NVC codes and titles indicate new alliances that have not been discovered in currently funded collaborative projects with NatureServe. Those listed in brackets have full descriptions viewable using the following link: <http://www.natureserve.org/explorer/servlet/NatureServe?init=Ecol>

California community codes follow the same format as in previous editions and are based on the Holland coding system (Holland 1986) with additional modifiers to accommodate for new types and the richer detail now currently understood in the California vegetation classification.

**Semi-natural Stands and Unique Stands:**

In addition to alliances, this list includes Semi-natural stands and unique stands. Semi-natural stands are strongly dominated by non-native plants that have become naturalized in the state; no alliances are defined by non-natives. Unique stands (which will be called "Special Stands" in the second edition of the MCV) are specific patches of vegetation in the landscape that are unique from other patches, which may appear structurally distinctive as well as rare. These are defined by the presence of specific rare or threatened CNPS list plants that typically define a type, and that usually establish in less redundancy (e.g., less than 10 stands) across the landscape than other vegetation types. Certain rare plants establish with a unique set of species within certain climatic and edaphic conditions, and they typically co-dominate with a rare assemblage of species.

**Rarity Ranking:**

One of the primary purposes of the classification is to assist in the location and determinations of significance and rarity of vegetation types for tracking purposes in the California Natural Diversity Database (CNDDDB). Thus, ranking of types by their rarity and threat is an important facet of the classification. In previous documents, asterisks (\*) denoted special vegetation types that were either known or believed to have been of high priority for inventory in the CNDDDB. Currently, this list refines the asterisks to actual "Global" or "State" rankings analogous to those provided with species reported in the CNDDDB. These are ranked either G1, G2, G3, G4, or G5 using NatureServe's standard heritage program methodology (<http://www.natureserve.org/explorer/ranking.htm#interpret>). If an alliance is marked with a G1 through a G3 code, this means that all of the associations within it will also be considered of high inventory priority. If marked as G4 or G5, these alliances are generally considered common enough to not be of concern. However, it does not mean that certain associations contained within them are not rare (G3 or lower). The forthcoming full association and alliance level ranking list will clarify these relationships.

Lead and trustee agencies may request that impacts to these communities be addressed in environmental documents. For example, impacts to wetland community types should be addressed under the state's no-net-loss of wetlands policy, or local agencies may have policies requiring avoidance of rare community types.

Vegetation classification is an active field in California and new types will continue to be defined and their relationships refined for some time. Currently, we define approximately 500 alliances.

We *relish* information on all vegetation types, whether it is a new record or re-assessment of existing information. Please contact us at VegCAMP at (916) 324-6857, and we can help you determine the most useful way to collect information on vegetation types.
