

HERBICIDE FORMULATIONS AND TOXICITIES

You should consider the potential health problems of a herbicide when you are choosing products. As you look through Table 1, you will see that products differ in their toxicity, and even various formulations of one active ingredient may differ in their oral or dermal toxicity or their irritability to the skin or eyes. The data correspond with the specific formulation listed under the trade name; for example, information for the two AAtrex products is given under AAtrex across from 4L and Nine-O. In a few instances, no information is available for the specific formulation. In these cases, data have been included for the active ingredient; this information has been listed across from the common name rather than the formulation.

The toxicity information given here is for acute (one-time) exposure. Acute exposure is what you would receive during one application or one day's work with a product. You should not extrapolate your risk of chronic disease (exposure over a lifetime or many years) from acute-toxicity data.

The label signal word (DANGER, Warning, or Caution) gives you a general idea of the hazard of the product. The signal word is always triggered by the category that most seriously threatens your health. For example, a chemical with a low oral and dermal toxicity, which would have "Caution" on the label, would instead have the signal word "DANGER" if it is corrosive to the eyes. In fact, several herbicides with low oral toxicity can be hazardous because of their risk to skin or eyes. The label signal word of "Warning" or "DANGER" is a clue to look closely at the precautionary statements on the label. For more information on toxicity and how toxicity tests are conducted, see Chapter 16, "Toxicity of Herbicides."

Material safety data sheets (MSDS), which are available from the product manufacturer or your pesticide dealer, contain information on other characteristics of a herbicide that might influence your handling of the product. In addition to these resources, you may contact the herbicide manufacturer if you have questions about the product.

Table 2 gives the common name of an active ingredient, with the corresponding trade names of products that contain that active ingredient. Some products contain only one active ingredient; others contain two or more.

As active ingredients go off patent, additional products containing the same active ingredients become available to the public as either private or generic brands. Private brands are manufactured by a producer of the active ingredient but distributed by another company. The quality and toxicity of a private brand should be identical to that of the original product of the same formulation. Therefore, the private brands are listed in Table 2 under the active ingredient but are not listed in Table 1. Refer to the toxicity of the original product, but be sure to look under the appropriate formulation.

Generic brands contain an active ingredient component found in a commonly known product, but the active ingredient for the formulation may be obtained from a different manufacturer. In addition, inert ingredients in the formulation (emulsifiers, for example) may be different. Generic brands are listed in Table 2 under the active ingredient, and their toxicity data may be found in Table 1.

Most products listed in these two tables are currently labeled and commonly used. New products

The information in this chapter is provided for educational purposes only. Product trade names have been used for clarity, but reference to trade names does not imply endorsement by the University of Illinois; discrimination is not intended against any product. The reader is urged to exercise caution in making purchases or evaluating product information.

Label registrations can change at any time. Thus the recommendations in this chapter may become invalid. The user must read carefully the entire, most recent label and follow all directions and restrictions. Purchase only enough pesticide for the current growing season.

that are scheduled for release in the following season are included in these lists, although they may not be available yet. Likewise, a product that has been suspended but is still available (supplies have yet to

be depleted) has been kept on these lists. If you have a question about the availability, consult the product manufacturer or the appropriate chapter in this handbook for pesticide use recommendations.

= information not available at this time.

^aEC, emulsifiable concentrate; G, granule; L, flowable; S, water-soluble liquid; WDG, water-dispersible granule; WP or W, wettable powder; WSP, water-soluble powder; DF, dry-flowable; P, pellet; ME, microencapsulated. Liquid formulations (EC, E, L, S, WDL, F, ME) are in pounds per gallon; dry formulations (G, WDG, WP, W, WSP, DF, P) are in percentages.

^bWeed Science Society of America-approved name or experimental number.

^cOral LD₅₀ means the milligrams of chemical per kilogram of body weight that are lethal to 50 percent of a population of test animals, usually white rats, when administered in a single oral dose.

^dDermal LD₅₀ means the milligrams of chemical per kilogram of body weight that are lethal to 50 percent of a population of test animals, usually rabbits, when administered in a single dermal dose.

^eDermal irritation is determined by applying an amount of pesticide onto the skin of shaved test animals.

^fEye irritation is determined by applying an amount of pesticide into the eye of test animals.

^gRestricted-use pesticide (RUP).

^hGroundwater advisory.

ⁱThe signal word "DANGER" is used primarily for corrosives. The few cases here involving a poison are so indicated.
