KANSAS PERFORMANCE TESTS WITH

WINTER WHEAT VARIETIES

REPORT OF PROGRESS 967

**Kansas State University
Agricultural Experiment Station
and Cooperative Extension Service**

K-STATE AGRONOMY

Agronomy Centennial Celebration
SEPTEMBER 27-30, 2006

KANSAS CERTIFIED SEED DIRECTORY

of producers of field crops
including wheat, spring
oats, triticale, canola,
and winter barley

**Kansas Crop
Improvement
Association**

HD DRILLS

TAKING GRAIN DRILLS TO THE NEXT LEVEL.

- Excels at conventional, conservation and direct seeding.
- New Generation "00HD" opener with 15" opener blades, heat treated blade separators and planter seed tubes.
- Available in 26', 30' and 40' working widths
- Heavy down pressure springs
- Several seed and dry fertilizer combinations available
- Additional weight package available
- Hydraulic down pressure standard equipment

2006 WHEAT CROP REVIEW

Crop Development

Progress of the 2006 wheat crop followed an unusual pattern. Planting and emergence were close to the pace of recent years, but pulled ahead in the last two weeks of October. Jointing began at the average time in late March, but soon began to pull ahead of the average pace, much like last year. Most of the wheat crop was jointed by late April, significantly earlier than the 5-year average. Heading was particularly early, after a warm spell in April. Nearly three quarters of the wheat crop had headed by the first week in May, 40% more than in previous years. The early development of the crop continued through maturation and harvest. Harvest was essentially complete by the July 4 holiday.

The condition of the 2006 wheat crop reflected constantly changing soil moisture availability and temperatures. The first reports in late October indicated that roughly 70% of the crop was rated as either good or excellent. Steadily decreasing soil moisture over the winter months was reflected in a similar decline in crop condition until late March, when only about a quarter of the crop was rated as good or excellent. Late-March precipitation led to a short-term improvement in crop condition, but hot, dry weather followed by freezing temperatures in mid to late April caused further deterioration in crop condition. Crop condition continued to decline until early June, when only 16% of the wheat acres were rated as good or excellent, and 53% were rated as poor to very poor, leaving 31% in the fair category. Crop condition rebounded somewhat with June precipitation, but the effect of these late-season rains on final yield varied greatly. (*Crop-Weather* reports, Kansas Ag. Statistics)

Weather

The 2005-06 wheat season was characterized by uneven conditions, both in temperature and precipitation. While some locations saw a wet start to the season, with precipitation more than three inches above normal, other locations saw an extremely dry start to the winter. Overall, the winter was mild and dry, with many locations having the driest December-to-February period on record. March saw a brief respite for the hardest hit regions, with a timely snowfall in southwestern Kansas. The moisture did not continue, and the western third of the state averaged less than 40% of normal April rainfall. Injury from the moisture deficit was compounded by a freeze on April 26 and 27, when low temperatures dropped as low as 26 °F, and stayed below freezing for several hours.

The uneven rainfall pattern continued through May and June. Some locations received sufficient quantities, while locations only a few miles away were much below normal. This contributed to the uneven yields within counties and across the state. Major hail storms on March 12, March 30, April 15, April 23, and May 7 also contributed to yield reductions in a few locations.

The continued warmer-than-normal conditions and generally dry weather allowed harvest to progress much more rapidly than normal. More than 90% of the harvest was completed by the 1st of July. (Mary Knapp, K-State Weather Data Library).

Diseases

“Dry” would be the best way to sum up the 2006 Kansas wheat crop. How did the dryness affect the wheat disease situation? Two of our traditional disease problems, leaf rust and stripe rust, were well below long-term averages. Stripe rust barely showed up at all, and leaf rust developed only late in the season on susceptible varieties, much too late for significant yield loss. The lack of rust is attributable primarily to the extreme drought in southern Texas, which serves as the annual breeding ground for rust spores.

Incidence of most other common foliar diseases, including tan spot and speckled leaf blotch, was below normal as well, once again due to the dry weather early in the spring. One exception was powdery mildew, which reached moderate levels in some fields planted to susceptible varieties in the eastern half of the state. Some fields were sprayed with fungicides to control this disease.

By far the most significant disease problems were caused by viruses, including barley yellow dwarf virus, wheat streak mosaic virus, and high plains virus. The severity of these diseases is attributed to increased volunteer left growing last fall as farmers tried to reduce fuel costs, and an extended period of warm weather that lasted well into November in parts of the state. This warm weather allowed the vectors of the virus diseases, aphids for barley yellow dwarf and curl mites for wheat streak mosaic and high plains, to feed and transmit the virus well beyond the Hessian fly free date, which normally is used as a planting guide to limit damage from the virus diseases. (K-State Extension Plant Pathologist, Doug Jardine).

Insects

The 2006 wheat crop statewide had relatively few insect problems. In late fall and early winter, there was considerable concern relative to greenbugs and bird cherry oat aphids migrating into Kansas from Oklahoma. Some damage and spraying did occur, primarily in the southern third of the state, but aphid effects overall were relatively minor. There was, however, considerable barley yellow dwarf, which is vectored by greenbugs and bird cherry oat aphids, and some wheat streak mosaic, which is vectored by wheat curl mites, throughout the state. Scattered problems with Hessian flies were noted, especially in south-central Kansas. Timely destruction of volunteer wheat will help reduce the incidence of these diseases by reducing the over-summering habitat of the aphids, wheat curl mites, and Hessian flies.

Scattered reports of wheat head army worms also were received in south central Kansas. Worms were noticed only during harvest, and some damaged kernels were noted by grain inspectors. This insect is generally confined to border

rows and, thus, the worms and damage usually affect only the first loads, as fields are “opened up”. (K-State Extension Entomologist, Jeff Whitworth).

Harvest Statistics

The Kansas Agricultural Statistics’ July 12 estimate of the 2006 crop was 300.8 million bushels from 9.4 million acres, with a 32 bushels/acre yield average. These are significant decreases from last year’s crop and, except for harvested acres, are well below the averages for the past 10 years.

(July 12, 2006, *CROPS* report, Kansas Ag. Statistics, Topeka).

Figure 1. Historical Kansas wheat production

Acreage Distribution

Jagalene replaced Jagger as the variety planted on the most acres in Kansas in 2006. Jagger fell to the second spot, and 2137 fell to fourth place, with only 3.1 of the statewide acreage. Overlay jumped from 8th place in 2005 to 3rd in 2006, with a 13.1% increase in acres. For the first time since 1998, more than two varieties were planted on greater than 10% of the Kansas wheat acres. Hard white varieties occupied 1.7% of the 2006 wheat acreage, down from 4.9% in 2004. The acreage of blends decreased in 2006 to 10% from a high of 15.2% in 2004.

(February 1, 2006, *Wheat Variety*, Kansas Ag. Statistics, Topeka).

2006 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution.

Originators or marketers enter privately developed varieties on a voluntary basis. Entrants choose both the entries and test sites and pay a fee to help defray test expenses. The 2006 private entrants are listed in Table 1. Eleven entrants provided a total of 37 varieties for testing.

Table 13 describes the characteristics of seed submitted for testing. Seed quality, including such factors as size, purity, and germination, can be important in determining the performance of a variety. Wheat seed used for entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Performance of a given variety comparable to that obtained in these tests is best assured under similar environmental and cultural conditions and with the use of certified or professionally prepared seed.

Environmental Factors

Winter and spring drought, a late-April freeze, or hail influenced most of the performance tests to some extent. Five locations had to be abandoned in 2006. The continuous-wheat test at Caldwell had poor stands because of a combination of dry fall weather and low pH. The new irrigated test at Dodge City suffered from herbicide carry-over and rabbit feeding. Drought conditions caused extreme variation in the dryland test there, making it unusable. Both tests at Colby were hit by a hard freeze in late April and by a severe hail storm just before harvest. Freeze and hail damage influenced yields more than variety performance did in those tests.

The surviving tests suffered from some of the same conditions. Tests in central and northeast Kansas performed better than expected in light of the dry season. The tests in southeastern Kansas had severe barley yellow dwarf virus. Most plants in those tests lost primary tillers during the dry winter and spring, stimulating late secondary tillers that delayed harvest and introduced additional variability. Site descriptions and management practices for each site are summarized in Table 4. Be sure to keep extenuating environmental conditions in mind when examining test results.

Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 12. Yields are reported as bushels per acre (60 pounds per bushel) adjusted to a moisture content of 13%, where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of highest yielding entries. Multi-year averages are presented for those varieties entered more than one year. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions.

Additional information, such as test weight, heading date, and plant height, is helpful for fine-tuning variety comparisons. For example, a relatively tall variety may yield well in the tests, but may not be appropriate for some situations. Conversely, some producers may want a tall variety for straw production. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) LSD (least significant difference) for each column of replicated data. One can think of the LSD as a "margin of error" that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

Performance Summaries

Figures 3 through 10 summarize the performance of each variety standardized to the average of two widely grown, check varieties: Jagger and 2137. The number at the base of each bar indicates the number of direct comparisons with the check varieties. In general, as the number of comparisons increases, the reliability of a value increases. Values that differ significantly from the average of the two check varieties are indicated by a + or – at the end of the bar.

Electronic Access

For those interested in accessing crop performance testing information electronically, visit our World Wide Web site. Most of the information contained in this publication is available for viewing or downloading at <http://kscroptests.agron.ksu.edu>.

Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the

University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 967 '2006 Kansas Performance Tests with Winter Wheat Varieties', or the Kansas Crop Performance Test website, <http://kscroptests.agron.ksu.edu>, for details. Endorsement or recommendation by Kansas State University is not implied."

¹ Varieties and percentage seeded acreage from the Feb. 1, 2006, Wheat Variety survey, Kansas Agricultural Statistics, Topeka, KS.
² Most ratings are estimates based on information and observations from many sources over several years. Agronomic information by Joe Martin - Hays, and Allan Fritz, Jim Shroyer, and Kraig Roozeboom - K-State Agronomy.
³ Summary of crop performance test results from recent years.
⁴ Ratings from Jane Lingeneiser - K-State Grain Science and Industry, using inputs from the U.S. Grain Marketing and Production Research Center, and industry. See also "Milling & Bread-baking Qualities of Hard Winter Wheat Varieties."
 EX = Exceptional; large kernels; high protein content; very good milling, mixing, and commercial bread-baking.
 AC = Acceptable; milling and baking attributes acceptable, but not outstanding, for all properties; may have minor defects.
⁵ Ratings by Allan Fritz - Manhattan, Joe Martin - Hays; W.W. Bockus and Doug Jardine - K-State Plant Pathology. Final ratings and descriptions of disease and insect pests are available in "Wheat Variety Disease and Insect Ratings 2006."

Hutchinson (HUF)	Wheat, 2004	--	--	--	Spring	60 lb/a	
Max Kolarik Farm	Sandy loam	50	--	--	Fall	Abandoned	Extremely low pH caused uneven stands and growth; too variable for good results.
Caldwell (CA)	Wheat, 2005	--	--	--	Spring	60 lb/a	
North West Dryland							
Agric Res Ctr - Hays	Harney clay loam	60	--	--	Fall	9/29/2005-6/10/2006	Dry most of season, little disease.
Hays (HA)	Wheat, 2004	--	--	--	Spring	50 lb/a	
NW Res-Ext Ctr	Keith silt loam	60	--	--	Fall	Abandoned	Dry until spring, freeze in late April, severe shattering from June 15 hail.
Colby (CO)	Wheat, 2004	--	--	--	Spring	60 lb/a	
SW Res-Ext Ctr	Richfield silt loam	5	25	--	Fall	9/29/2005-6/20/2006	Good establishment, dry winter and spring.
Tribune (TR)	Sorghum, 2004	80	--	--	Spring	55 lb/a	
South West Dryland							
Farmer's Field	Harney clay loam	--	--	--	Fall	9/25/2005-6/15/2006	Dry all season, planted no-till into sorghum stubble, severe damage from wheat streak mosaic virus.
Larned (LA)	Sorghum, 2004	30	--	--	Spring	50 lb/a	
Farmer's Field	Harney clay loam	50	--	--	Fall	Abandoned	Drought caused extreme variation.
Dodge City (DC)	Sorghum, 2004	--	--	--	Spring	45 lb/a	
SW Res-Ext Ctr	Keith silt loam	50	--	--	Fall	10/25/2005-6/20/2006	Good planting moisture, dry rest of season, hard freezes in late April.
Garden City (GC)	Wheat, 2004	--	--	--	Spring	65 lb/a	
Irrigated							
NW Res-Ext Ctr	Keith silt loam	90	--	--	Fall	Abandoned	Freeze in late April, severe shattering from June 15 hail.
Colby (CO)	Wheat, 2004	--	--	--	Spring	90 lb/a	
Farmer's Field	--	--	--	--	Fall	Abandoned	Poor stands due to herbicide carry-over and rabbit feeding, abandoned in early spring.
Dodge City (DC)	Corn, 2004	120	--	--	Spring	80 lb/a	
SW Res-Ext Ctr	Keith silt loam	50	--	--	Fall	10/27/2006-6/27/2006	Good planting moisture, dry rest of season, hard freezes in late April.
Garden City (GC)	Sorghum, 2004	--	--	--	Spring	75 lb/a

About this directory

The seed producers listed in this directory have applied to the Kansas Crop Improvement Association (KCIA) for inspection of seed production fields. KCIA checks all seed sources to confirm seed eligibility.

Seed produced on these fields is not Certified or Quality Assured until the field has passed inspection and the harvested seed has been properly conditioned, sampled and tested.

Seed meeting certification standards is issued a Certificate of Inspection and may be sold as Certified Seed. Quality Assured seed must meet similar standards.

Kansas Seed Law requires all seed to be properly labeled. The label is your warranty. Each bag of Kansas Certified Seed must be labeled with an official KCIA certification tag.

A completed KCIA Bulk Retail Sale Certificate or Bulk Invoice Label must accompany each bulk sale. Contact KCIA regarding the specific rules for reselling bulk Certified Seed.

KCIA does not produce, process, buy or sell seed; therefore, assumes no financial responsibility regarding any seed listed herein.

Growers guarantee that Foundation, Registered,

Certified or Quality Assured seed sold by them conforms to the standards of the Association in origin, varietal purity and quality. KCIA should be advised of any complaints made to the producer or vendor of seed.

Listing of a producer does not imply that all requirements have been met at time of publishing. Contact KCIA if you have concerns or questions about seed offered as Certified or KCIA Quality Assured.

Plant Variety Protection

The Plant Variety Protection Act (PVPA) makes it possible to protect plant varieties by law. Therefore, it is unlawful to sell, offer for sale or expose for sale, uncertified seed by variety name when it is a variety for which a Certificate of Plant Protection has been issued, specifying sale only as a class of certified seed.

It is the responsibility of the grower to inform the purchaser that a variety is protected and at what level. This may be accomplished on the label by the appropriate statements. The status of varieties listed in this directory is as follows:

Barley		Canola		Triticale	
Tambar 501 (6)		Summer (0) Wichita (0)		336 (6) TAMscale 5019 (6) NE422T (6)	
Wheat

PVP Level (Legend)

0. Not a Protected Variety.
1. Unauthorized Propagation Prohibited - U.S. Variety Protection Applied For.
2. Unauthorized Propagation Prohibited - U.S. Variety Protection Applied For Specifying That Seed Of This Variety Is To Be Sold By Variety Name Only As A Class Of Certified Seed.
3. Unauthorized Propagation Prohibited - U.S. Protected Variety.
4. Unauthorized Propagation Prohibited - To Be Sold By Variety Name Only As A Class Of Certified Seed. - U.S. Protected Variety.
5. Unauthorized Propagation Prohibited - U.S. Protected Variety - 1994 PVPA.
6. Unauthorized Propagation Prohibited - To be Sold by Variety Name Only As A Class of Certified Seed - U.S. Protected Variety - 1994 PVPA

Limited Generation

For varieties released after 1970, the certified class of seed is not eligible to produce another crop of certified seed. A certified seed producer, to stay in business, should purchase foundation or registered seed.

The seed is designed to work with the herbicide.
The System is designed to work for you.

New varieties, new herbicide.

 **BASF**

The Chemical Company

You can get even better returns with the **CLEARFIELD**[®] Production System for wheat this year. New varieties, boasting better yield potential and agronomics, let you select the ideal genetics for your fields. Then choose either **Beyond**[®] herbicide, for proven weed control, or new **Clearmax**[™] herbicide, for broader-spectrum control, to shutdown tough grasses and broadleaf weeds, including downy brome, jointed goatgrass and volunteer cereals. You'll get cleaner grain with less profit-robbing dockage. Now is the time to get the **CLEARFIELD** system working for you. Start by visiting your **CLEARFIELD** seed retailer today.

Clearmax is not yet registered in some states.
Always read and follow label directions.

Beyond and CLEARFIELD are registered trademarks and Clearmax is a trademark of BASF. ©2006 BASF Corporation. All Rights Reserved. APN 06-10-269-0005

Improving Nature's Grains

Santa Fe

New!

Keota

The new red wheat everyone's talking about! Excellent yield record and Jagger pedigree. Stripe rust and leaf rust resistance.

Tough new red wheat for western High Plains with stripe rust resistance. Outstanding test results in 2005 - this will be one to watch for '06!

Watch for these additional exciting new releases in '06:

Shocker (WestBred 558exp)

QUALITY SEED
If you are not willing to commit to quality, what are you willing to commit to?™
Star Seed's commitment to quality seed is the foundation of Star Seed's reputation. Quality seed begins in selecting quality growers to grow Star Seed's Certified wheat. All wheat seed is conditioned over screen cleaner and gravity table to assure only top quality wheat seed is available.

PRODUCT DIVERSITY
Star Seed offers bags, bulk bags and bulk Certified Wheat seed. In addition to Star Seed's quality wheat seed, Star Seed offers other quality seed for fall planting, including GroGreen™ Tritacale for the ultimate in fall pasture, Star Seed's famous A-100 Brand Alfalfa Seed inoculated and treated with Apron, for maximum performance.

STAR SEED'S SUDDEN SERVICE™
This simply means that most of the products are usually available on a rush order basis if conditions require quick delivery. Customers everywhere can attest to our reputation and integrity in providing high standards of quality in the product lines we've produced and distributed for decades.

Flexibility, promptness and quality seed products to our customers are daily goals we take personally at Star Seed. Give us a call ... we look forward to doing business with you.

Call Star Seed today for a dealer near you.

Bindweed?

Don't let bindweed interfere with your wheat production. Get Hi-Dep®!

Hi-Dep® is a registered trademark of PBI/Gordon Corporation.

Hi-Dep's patented formula penetrates and translocates throughout the plant and into the root system where it can snuff out the last spark

of life in tough weeds like bindweed, spotted spurge and thistles. For the money, you can't get cleaner results. Considering how well it controls these tough weeds, **what do you have that Hi-Dep won't control?**

Attention Elevators, Seed Cleaners and Farmers

If you sell, trade, or even clean seed for sale of a protected variety without the express permission or authorization of the owner, you are liable to be penalized. Recently, a grain elevator in Kansas was detected selling seed of protected wheat varieties without authorization from the owners. This cost them \$50,000 to settle the claims.

The Plant Variety Protection Act (PVPA) allows for the recovery of all legal costs plus triple damages from those found guilty.

Don't expose yourself to the risk of a trial in Federal Court!

To report violations anonymously and for a reward for information leading to the successful prosecution of seed theft, i.e. the selling of PVP protected varieties by unauthorized entities, please contact us toll free at

1-877-482-5907
