Lunar Habitat and What's The Difference (WTD)

Moon Math Case Studies

Introduction: This unit of instruction will consist of three case studies. Each case study will address the concepts of lunar habitat design. All three case studies will utilize WTD application in order to offer the students a deeper understanding of different lunar habitat models.

> Depending on mathematical competency of the students, these units can be utilized in upper middle grades or with high school freshmen. It is not required for students to complete all three units. While it is suggested that all students complete the third unit, students familiar with the area concepts do not need to complete the first unit. Similarly, the students familiar with the volume concepts do not need to complete the second unit.

> The three cases all have three levels of difficulty: A, B, and C. Level A, the beginning level, will involve multiplying whole numbers (except for π). Level B, the intermediate level, will involve multiplying decimals. Level C, the advanced level, will involve multiplying fractions.

The first case study, Case Study I, will address the concept of area by having the students calculate areas of two different lunar habitat designs. The students will also calculate area of a one-bedroom apartment and compare it with the areas of both lunar habitat designs. The second case study, Case Study II, will address the concept of volume by having the students calculate volumes of two different lunar habitat designs. The students will also calculate volume of a one-bedroom apartment and compare it with the volumes of both lunar habitat designs.

The third case study, Case Study III, will address the concept of proportions by having the students construct scale models of a lunar habitat. Three levels of difficulty will be offered in this case study: A, B, and C. Level A, the beginning level, will ask the students to create a scale model of a simple singe-building lunar habitat. Level B, the intermediate level, will ask the students to create a scale model of a lunar habitat consisting of two structures. Level C, the advanced level, will ask the students to create a scale model of a lunar habitat consisting of three structures.

- **Guiding Question**: How can the area and volume of a lunar habitat be calculated easily and effectively?
- Main Concept:Paper-and-pencil calculations can be used to problem-solve simple
calculations of area and volume, but technology is required for
speed and accuracy in more complicated cases.

The students will also master the following concepts: multiplying decimals, multiplying fractions, and converting units of measure.

Prerequisite Skills: To successfully complete Case Study I, the students needs to be able to compute the areas of basic cylinders.

To successfully complete Case Study II, the students need to be able to compute volumes of basic cylinders. To successfully complete Case Study III, the students need to be able to construct proportionate scale models of three-dimensional shapes.

Objectives:By completing these case studies the students will gain an
understanding of the design requirements for a lunar habitat. The
students will also become proficient in calculating area and volume
of various shapes, and in creating scale models of various shapes.

NCTM Standards: Represent and Analyze (Algebra): explore relationships between symbolic expressions and graphs of lines; model and solve contextualized problems using various representations, such as graphs, tables, and equations.

> Analyze Characteristics (Geometry): precisely describe, classify, and understand relationships among types of two- and threedimensional objects using their defining properties; understand relationships among the angles, side lengths, perimeters, areas, and volumes of similar objects; create and critique inductive and deductive arguments concerning geometric ideas and relationships, such as congruence, similarity, and the Pythagorean relationship.

- Preparation:Before starting work on each unit, the teacher will discuss the
appropriate mathematical concepts with the students. Depending on
the case study they participate in, students will be exposed to the
areas and volumes of cylinders and to the construction of scale
models.
- Materials:Each student is expected to have a pencil, ruler, sheet of paper, and
an appropriate student worksheet. Calculators are optional. The

teacher should also secure access to the computer lab and WTD application.

Time for Activity:Each case study is expected to take between one and two academic
hours depending on the skills of the students. A teacher may assign
more than one case study per student.

Case Study II: Comparing the Volumes of Different Lunar Habitats

Engage: The lesson will begin with the teacher discussing the history of lunar exploration. The teacher will discuss the Apollo mission. The teacher will ask students to think of five things regarding what it would be like to travel to the moon. The teacher will continue by asking the students to imagine of what it would be like to live on the moon for an extended period of time and what kind of things will the lunar colonists need to have with them.

Explore: The teacher will ask the students to consider space requirements of research equipment and personal belongings of a group of lunar habitat's inhabitants. The students will be divided into groups of four and asked to compose the list of equipment needed and to think of its space requirements.

In fifteen-twenty minutes, the teacher will re-unite the class and the groups will report their findings to the whole class. The teacher will construct a KWL chart.

Explain:After concluding the class discussion mentioned above and
completing the KWL chart, the teacher will address the key issues of
the lunar habitat's space requirements design. The teacher will
remind the students of the two models of lunar habitat: model A
consisting of three wide cylinders (r > h) stacked on top of each
other and model B consisting of a single large horizontally aligned
cylinder (r < l).

The teacher will address the space requirements of each model as well. The teacher will mention that each model should include enough space for the following: living quarters, hygiene area, galley, central eating / recreation area. There should also be enough space left to add laboratories, workshops, and crew health and exercise stations in the future (see <u>http://www.astrobio.net/news/modules.php?op=modload&name=Ne</u> <u>ws&file=article&sid=1904&mode=thread&order=0&thold=0</u> for

reference).

Extend: To further students' understanding of various lunar habitat designs and to reinforce students' mastery with computing volumes, the students will be asked to complete a case study worksheet (of appropriate difficulty level) where they will compute volumes of two different lunar habitat designs and compare it with the volume of a typical one-bedroom apartment.

Once the case studies are completed, the students will work in the computer lab where they practice comparing different lunar habitat volumes using the WTD tool. The teacher will circulate and offer individual help as needed.

Evaluate: As students complete the case studies, their finding shall be presented to the class. The students will submit their Findings Sheets and they will be posted on the classroom walls. The teacher will proceed with re-teaching or enrichment as needed after analyzing students' work.

Case Study II: Level A Teacher Worksheet

Page 1 of 2

Case Study II: Level A Teacher Worksheet

Figure C:

Part C: Consider figure C above. You are seeing a typical floor plan of a one-bedroom apartment. For comparison purposes, compute the volume of this apartment assuming that the ceilings are nine feet high. Make sure to convert all units of measure to the metric system.
V = L * W * H

V = L * W * H V = [(.3 * 43) * (.3*22) * (.3 * 9)] + [(.3 * 4)] * (.3*4) * (.3*9)] = $= 233.77 \text{ (m}^{3})$ Remember to convert feet to meters and to add the foyer volume.

Case Study II: Level B Teacher Worksheet

Page 1 of 2

Case Study II: Level B Teacher Worksheet

Figure C:

Part C: Consider figure C above. You are seeing a typical floor plan of a one-bedroom apartment. For comparison purposes, compute the volume of this apartment assuming that the ceilings are nine feet high. Present your answer in both cubic feet and cubic meters units of measure.

$$\begin{split} &V = L * W * H \\ &V = [43 * 22 * 9] + [4 * 4 * 9] = 8,658 \ (ft^3) \\ &V = [(.3 * 43) * (.3 * 22) * (.3*9)] + [(.3 * 4) * (.3*4) * (.3*9)] = \\ &= 233.77 \ (m^3) \end{split}$$

Case Study II: Level C Teacher Worksheet

Page 1 of 2

Case Study II: Level C Teacher Worksheet

Figure C:

Part C: Consider figure C above. You are seeing a typical floor plan of a one-bedroom apartment. For comparison purposes, compute the volume of this apartment assuming that the ceilings are nine feet high. Present your answer in both cubic feet and cubic meters units of measure.

V = L * W * H V = [43 * 22 * 9] + [4 * 4 * 9] = 8,658 (ft³)V = [(.3 * 43) * (.3 * 22) * (.3*9)] + [(.3 * 4) * (.3*4) * (.3*9)] = 233.77 (m³)
