2	ELOXATIN TM
3	(oxaliplatin for injection)
4	

WARNING

ELOXATIN (oxaliplatin for injection) should be administered under the supervision of a qualified physician experienced in the use of cancer chemotherapeutic agents. Appropriate management of therapy and complications is possible only when adequate diagnostic and treatment facilities are readily available.

Anaphylactic-like reactions to ELOXATIN have been reported, and may occur within minutes of ELOXATIN administration. Epinephrine, corticosteroids, and antihistamines have been employed to alleviate symptoms. (See WARNINGS and ADVERSE REACTIONS).

5

6 **DESCRIPTION**

7

8 ELOXATINTM (oxaliplatin for injection) is an antineoplastic agent with the molecular formula 9 $C_8H_{14}N_2O_4Pt$ and the chemical name of *cis*-[(1*R*,2*R*)-1,2-cyclohexanediamine-*N*,*N'*] 10 [oxalato(2-)-*O*,*O'*] platinum. Oxaliplatin is an organoplatinum complex in which the 11 platinum atom is complexed with 1,2- diaminocyclohexane (DACH) and with an oxalate 12 ligand as a leaving group.

13 14

15 The molecular weight is 397.3. Oxaliplatin is slightly soluble in water at 6 mg/mL, very 16 slightly soluble in methanol, and practically insoluble in ethanol and acetone.

17

ELOXATIN is supplied in vials containing 50 mg or 100 mg of oxaliplatin as a sterile, preservative-free lyophilized powder for reconstitution. Lactose monohydrate is present as an inactive ingredient at 450 mg and 900 mg in the 50 mg and 100 mg dosage strengths, respectively.

23 CLINICAL PHARMACOLOGY

24

25 Mechanism of Action

Oxaliplatin undergoes nonenzymatic conversion in physiologic solutions to active derivatives via displacement of the labile oxalate ligand. Several transient reactive species are formed, including monoaquo and diaquo DACH platinum, which covalently bind with macromolecules. Both inter- and intra-strand Pt-DNA cross-links are formed. Crosslinks are formed between the *N7* positions of two adjacent guanines (GG), adjacent adenine-guanines (AG), and guanines separated by an intervening nucleotide (GNG). These crosslinks inhibit DNA replication and transcription. Cytotoxicity is cell-cycle nonspecific.

33

34 Pharmacology

35 In vivo studies have shown antitumor activity of oxaliplatin against colon carcinoma. In

36 combination with 5-fluorouracil (5-FU), oxaliplatin exhibits *in vitro* and *in vivo*

antiproliferative activity greater than either compound alone in several tumor models [HT29

38 (colon), GR (mammary), and L1210 (leukemia)].

39

40 Human Pharmacokinetics

The reactive oxaliplatin derivatives are present as a fraction of the unbound platinum in plasma ultrafiltrate. The decline of ultrafilterable platinum levels following oxaliplatin administration is triphasic, characterized by two relatively short distribution phases ($t_{1/2\alpha}$; 0.43 hours and $t_{1/2\beta}$; 16.8 hours) and a long terminal elimination phase ($t_{1/2\gamma}$; 391 hours). Pharmacokinetic parameters obtained after a single 2-hour IV infusion of ELOXATIN at a dose of 85 mg/m² expressed as ultrafilterable platinum were C_{max} of 0.814 µg/mL and volume of distribution of 440 L.

48

Interpatient and intrapatient variability in ultrafilterable platinum exposure (AUC₀₋₄₈) assessed over 3 cycles was moderate to low (23% and 6%, respectively). A pharmacodynamic relationship between platinum ultrafiltrate levels and clinical safety and effectiveness has not been established

- 52 been established.
- 53

54 **Distribution**

At the end of a 2-hour infusion of ELOXATIN, approximately 15% of the administered platinum is present in the systemic circulation. The remaining 85% is rapidly distributed into tissues or eliminated in the urine. In patients, plasma protein binding of platinum is irreversible and is greater than 90%. The main binding proteins are albumin and gammaglobulins. Platinum also binds irreversibly and accumulates (approximately 2-fold) in erythrocytes, where it appears to have no relevant activity. No platinum accumulation was observed in plasma ultrafiltrate following 85 mg/m² every two weeks.

63 Metabolism

64 Oxaliplatin undergoes rapid and extensive nonenzymatic biotransformation. There is no 65 evidence of cytochrome P450-mediated metabolism *in vitro*.

66

Up to 17 platinum-containing derivatives have been observed in plasma ultrafiltrate samples
from patients, including several cytotoxic species (monochloro DACH platinum, dichloro
DACH platinum, and monoaquo and diaquo DACH platinum) and a number of noncytotoxic,
aoniugated species

- 70 conjugated species.
- 71

72 Elimination

The major route of platinum elimination is renal excretion. At five days after a single 2-hour infusion of ELOXATIN, urinary elimination accounted for about 54% of the platinum eliminated, with fecal excretion accounting for only about 2%. Platinum was cleared from plasma at a rate (10 - 17 L/h) that was similar to or exceeded the average human glomerular filtration rate (GFR; 7.5 L/h). There was no significant effect of gender on the clearance of ultrafilterable platinum. The renal clearance of ultrafilterable platinum is significantly correlated with GFR. (See ADVERSE REACTIONS)

80

81 Pharmacokinetics in Special Populations

82 Renal Impairment

83

The AUC_{0-48hr} of platinum in the plasma ultrafiltrate increases as renal function decreases. The AUC_{0-48hr} of platinum in patients with mild (creatinine clearance, CL_{cr} 50 to 80 mL/min), moderate (CL_{cr} 30 to <50 mL/min) and severe renal (CL_{cr} <30 mL/min) impairment is increased by about 60, 140 and 190%, respectively, compared to patients with normal renal function (CL_{cr} >80 mL/min)]. (See PRECAUTIONS and ADVERSE REACTIONS)

89

90 Drug - Drug Interactions

No pharmacokinetic interaction between 85 mg/m² of ELOXATIN and 5-FU has been observed in patients treated every 2 weeks, but increases of 5-FU plasma concentrations by approximately 20% have been observed with doses of 130 mg/m² of ELOXATIN administered every 3 weeks. *In vitro*, platinum was not displaced from plasma proteins by the following medications: erythromycin, salicylate, sodium valproate, granisetron, and paclitaxel. *In vitro*, oxaliplatin is not metabolized by, nor does it inhibit, human cytochrome P450 isoenzymes. No P450-mediated drug-drug interactions are therefore anticipated in patients.

98

99 Since platinum containing species are eliminated primarily through the kidney, clearance of

- 100 these products may be decreased by co-administration of potentially nephrotoxic compounds,
- 101 although this has not been specifically studied.
- 102

103 CLINICAL STUDIES

104

105Combination Therapy with ELOXATIN and 5-FU/LV in Patients Previously106Untreated for Advanced Colorectal Cancer

107 A North American, multicenter, open-label, randomized controlled study was sponsored by 108 the National Cancer Institute (NCI) as an intergroup study led by the North Central Cancer 109 Treatment Group (NCCTG). The study had 7 arms at different times during its conduct, four 110 of which were closed due to either changes in the standard of care, toxicity, or simplification. 111 During the study, the control arm was changed to irinotecan plus 5-FU/LV. The results 112 reported below compared the efficacy and safety of two experimental regimens, ELOXATIN in 113 combination with infusional 5-FU/LV and a combination of ELOXATIN plus irinotecan, to an 114 approved control regimen of irinotecan plus 5-FU/LV in 795 concurrently randomized 115 patients previously untreated for locally advanced or metastatic colorectal cancer. After 116 completion of enrollment, the dose of irinotecan plus 5-FU/LV was decreased due to toxicity. 117 Patients had to be at least 18 years of age, have known locally advanced, locally recurrent, or metastatic colorectal adenocarcinoma not curable by surgery or amenable to radiation therapy 118 119 with curative intent, histologically proven colorectal adenocarcinoma, measurable or evaluable disease, with an ECOG performance status 0,1, or 2. Patients had to have 120 granulocyte count $\ge 1.5 \ge 10^{9}/L$, platelets $\ge 100 \ge 10^{9}/L$, hemoglobin $\ge 9.0 \text{ gm/dL}$, creatinine 121 122 \leq 1.5 x ULN, total bilirubin \leq 1.5 mg/dL, AST \leq 5 x ULN, and alkaline phosphatase \leq 5 x 123 ULN. Patients may have received adjuvant therapy for resected Stage II or III disease 124 without recurrence within 12 months. The patients were stratified for ECOG performance status (0, 1 vs. 2), prior adjuvant chemotherapy (yes vs. no), prior immunotherapy (yes vs. 125 no), and age (<65 vs. \geq 65 years). Although no post study treatment was specified in the 126 127 protocol, 65 to 72% of patients received additional post study chemotherapy after study 128 treatment discontinuation on all arms. Fifty eight percent of patients on the ELOXATIN plus 129 5-FU/LV arm received an irinotecan-containing regimen and 23% of patients on the 130 irinotecan plus 5-FU/LV arm received oxaliplatin-containing regimens. Oxaliplatin was not 131 commercially available during the trial.

- 132 The following table presents the dosing regimens of the three arms of the study.
- 133

142

143 The length of a treatment cycle was 2 weeks for the ELOXATIN and 5-FU/LV regimen; 6

144 weeks for the irinotecan plus 5-FU/LV regimen; and 3 weeks for the ELOXATIN plus

145 irinotecan regimen. The median number of cycles administered per patient was 10 (23.9

146 weeks) for the ELOXATIN and 5-FU/LV regimen, 4 (23.6 weeks) for the irinotecan plus 5-

147 FU/LV regimen, and 7 (21.0 weeks) for the ELOXATIN plus irinotecan regimen.

- 149 Patients treated with the ELOXATIN and 5-FU/LV combination had a significantly longer time
- 150 to tumor progression based on investigator assessment, longer overall survival, and a
- 151 significantly higher confirmed response rate based on investigator assessment compared to

152 patients given irinotecan plus 5-FU/LV. The following table summarizes the efficacy results.

153

Table 3 – Summary	of Efficacy

154 *Compared to irinotecan plus 5-FU/LV (IFL) arm

155 **Based on all patients with measurable disease at baseline

156

157 The numbers in the response rate and TTP analysis are based on unblinded investigator 158 assessment.

159

160

161 Figure 1 illustrates the Kaplan-Meier survival curves for the comparison of ELOXATIN and 5-

162 FU/LV combination and ELOXATIN plus irinotecan to irinotecan plus 5-FU/LV.

*Log rank test comparing Eloxatin plus 5-FU/LV to irinotecan plus 5-FU/LV.

163

164 A descriptive subgroup analysis demonstrated that the improvement in survival for

165 ELOXATIN plus 5-FU/LV compared to irinotecan plus 5-FU/LV appeared to be maintained

across age groups, prior adjuvant therapy, and number of organs involved. An estimated

167 survival advantage in ELOXATIN plus 5-FU/LV versus irinotecan plus 5-FU/LV was seen in

168 both genders; however it was greater among women than men. Insufficient subgroup sizes

169 prevented analysis by race.

171 Combination Therapy with ELOXATIN and 5-FU/LV in Previously Treated 172 Patients with Advanced Colorectal Cancer

173 A multicenter, open-label, randomized, three arm controlled study was conducted in the US 174 and Canada comparing the efficacy and safety of ELOXATIN in combination with an infusional schedule of 5-FU/LV to the same dose and schedule of 5-FU/LV alone and to single agent 175 oxaliplatin in patients with advanced colorectal cancer who had relapsed/progressed during or 176 177 within 6 months of first line therapy with bolus 5-FU/LV and irinotecan. The study was 178 intended to be analyzed for response rate after 450 patients were enrolled. Survival will be 179 subsequently assessed in all patients enrolled in the completed study. Accrual to this study is complete, with 821 patients enrolled. Patients in the study had to be at least 18 years of age, 180 181 have unresectable, measurable, histologically proven colorectal adenocarcinoma, with a 182 Karnofsky performance status >50%. Patients had to have SGOT(AST) and SGPT(ALT) $\leq 2x$ the institution's upper limit of normal (ULN), unless liver metastases were present and 183 documented at baseline by CT or MRI scan, in which case $\leq 5x$ ULN was permitted. Patients 184 had to have alkaline phosphatase $\leq 2x$ the institution's ULN, unless liver metastases were 185 present and documented at baseline by CT or MRI scan, in which cases $\leq 5x$ ULN was 186 permitted. Prior radiotherapy was permitted if it had been completed at least 3 weeks before 187 188 randomization.

189

190 The dosing regimens of the three arms of the study are presented in the table below.

- 191
- 192 193

Treatment Arm	Dose	Regime n
ELOXATIN + 5-FU/LV (N =152)	Day 1: ELOXATIN: 85 mg/m ² (2-hour infusion) + LV 200 mg/m ² (2-hour infusion), followed by 5- FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	q2w
	Day 2: LV 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	
5-FU/LV (N=151)	Day 1: LV 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion) Day 2: LV 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	q2w
ELOXATIN (N=156)	Day 1: ELOXATIN 85 mg/m ² (2-hour infusion)	q2w

 Table 4 – Dosing Regimens in Refractory and Relapsed

 Colorectal Cancer Clinical Trial

195 Patients entered into the study for evaluation of response must have had at least one

- unidimensional lesion measuring \geq 20mm using conventional CT or MRI scans, or \geq 10mm
- using a spiral CT scan. Tumor response and progression were assessed every 3 cycles (6
- 198 weeks) using the Response Evaluation Criteria in Solid Tumors (RECIST) until radiological
- 199 documentation of progression or for 13 months following the first dose of study drug(s),
- 200 whichever came first. Confirmed responses were based on two tumor assessments separated
- 201 by at least 4 weeks.
- 202

The demographics of the patient population entered into this study are shown in the table below.

205

206

207

Table 5 – Patient Demographics in Refractory and Relapsed Colorectal Cancer Clinical Trial

208

The median number of cycles administered per patient was 6 for the ELOXATIN and 5-FU/LV combination and 3 each for 5-FU/LV alone and ELOXATIN alone.

211

Patients treated with the combination of ELOXATIN and 5-FU/LV had an increased response rate compared to patients given 5-FU/LV or oxaliplatin alone. The efficacy results are

summarized in the tables below.

 Table 6 - Response Rates (ITT Analysis)

Best Response	5-FU/LV (N=151)	ELOXATIN (N=156)	ELOXATIN + 5-FU/LV (N=152)
CR	0	0	0
PR	0	2 (1%)	13 (9%)
p-value	0.0002 for 5-1	FU/LV vs. ELO	XATIN + 5-FU/LV
95%CI	0-2.4%	0.2-4.6%	4.6-14.2%

218

219

Table 7 - Summary of Radiographic Time to Progression*

Arm	5-FU/LV (N=151)	ELOXATIN (N=156)	ELOXATIN + 5-FU/LV (N=152)
No. of Progressors	74	101	50
No. of patients with no radiological	22	16	17
evaluation beyond baseline	(15%)	(10%)	(11%)
Median TTP (months)	2.7	1.6	4.6
95% CI	1.8-3.0	1.4-2.7	4.2-6.1

*This is not an ITT analysis. Events were limited to radiographic disease progression documented by
 independent review of radiographs. Clinical progression was not included in this analysis, and 18%
 of patients were excluded from the analysis based on unavailability of the radiographs for
 independent review.

224

225 At the time of the interim analysis 49% of the radiographic progression events had occurred.

226 In this interim analysis an estimated 2-month increase in median time to radiographic

227 progression was observed compared to 5-FU/LV alone.

228

Of the 13 patients who had tumor response to the combination of ELOXATIN and 5-FU/LV, 5 were female and 8 were male, and responders included patients <65 years old and ≥ 65 years old. The small number of non-Caucasian participants made efficacy analyses in these populations uninterpretable.

233

234 INDICATIONS AND USAGE

235

ELOXATIN, used in combination with infusional 5-FU/LV, is indicated for the treatment of advanced carcinoma of the colon or rectum.

238

239 CONTRAINDICATIONS

240

ELOXATIN should not be administered to patients with a history of known allergy to ELOXATINor other platinum compounds.

243

244WARNINGS

245

As in the case for other platinum compounds, hypersensitivity and anaphylactic/anaphylactoid reactions to ELOXATIN have been reported (see ADVERSE REACTIONS). These allergic reactions were similar in nature and severity to those reported with other platinum-containing compounds, i.e., rash, urticaria, erythema, pruritis, and, rarely, bronchospasm and hypotension. These reactions occur within minutes of administration and should be managed with appropriate supportive therapy. Drug-related deaths associated with platinum compounds from this reaction have been reported.

253

254 **Pregnancy Category D**

255 ELOXATIN may cause fetal harm when administered to a pregnant woman. Pregnant rats were 256 administered 1 mg/kg/day oxaliplatin (less than one-tenth the recommended human dose 257 based on body surface area) during gestation days 1-5 (pre-implantation), 6-10, or 11-16 258 (during organogenesis). Oxaliplatin caused developmental mortality (increased early 259 resorptions) when administered on days 6-10 and 11-16 and adversely affected fetal growth (decreased fetal weight, delayed ossification) when administered on days 6-10. If this drug is 260 261 used during pregnancy or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to the fetus. Women of childbearing potential 262 263 should be advised to avoid becoming pregnant while receiving treatment with ELOXATIN.

264

265 (PRECAUTIONS)

266

267 General

ELOXATIN should be administered under the supervision of a qualified physician experienced in the use of cancer chemotherapeutic agents. Appropriate management of therapy and complications is possible only when adequate diagnostic and treatment facilities are readily available.

272 (Neuropathy) 273

Neuropathy was graded using a study-specific neurotoxicity scale, which was different than
the National Cancer Institute Common Toxicity Criteria, Version 2.0 (NCI CTC) (See below).

In the previously treated study, neuropathy information was collected to establish that
 ELOXATIN is associated with two types of neuropathy:

279

280 An acute, reversible, primarily peripheral, sensory neuropathy that is of early onset, • occurring within hours or one to two days of dosing, that resolves within 14 days, 281 and that frequently recurs with further dosing. The symptoms may be precipitated or 282 283 exacerbated by exposure to cold temperature or cold objects and they usually present as transient paresthesia, dysesthesia and hypoesthesia in the hands, feet, perioral area, or 284 285 throat. Jaw spasm, abnormal tongue sensation, dysarthria, eye pain, and a feeling of chest 286 pressure have also been observed. The acute, reversible pattern of sensory neuropathy was 287 observed in about 56% of study patients who received ELOXATIN with 5-FU/LV. In any 288 individual cycle acute neurotoxicity was observed in approximately 30% of patients. Ice 289 (mucositis prophylaxis) should be avoided during the infusion of ELOXATIN because cold 290 temperature can exacerbate acute neurological symptoms. (See DOSAGE AND 291 ADMINISTRATION: Dose Modifications).

292

An acute syndrome of pharyngolaryngeal dysesthesia seen in 1-2% (grade 3/4) of patients previously untreated for advanced colorectal cancer, and the previously treated patients is characterized by subjective sensations of dysphagia or dyspnea, without any laryngospasm or bronchospasm (no stridor or wheezing).

297

298 • A persistent (>14 days), primarily peripheral, sensory neuropathy that is usually 299 characterized by paresthesias, dysethesias, hypoesthesias, but may also include deficits in proprioception that can interfere with daily activities (e.g. writing, 300 301 buttoning, swallowing, and difficulty walking from impaired proprioception). These forms of neuropathy occurred in 48% of the study patients receiving ELOXATIN with 5-302 303 FU/LV. Persistent neuropathy can occur without any prior acute neuropathy event. The majority of the patients (80%) who developed grade 3 persistent neuropathy progressed 304 305 from prior Grade 1 or 2 events. These symptoms may improve in some patients upon 306 discontinuation of ELOXATIN.

307

308 Overall, neuropathy was reported in patients previously untreated for advanced 309 colorectal cancer in 82% (all grades) and 19% (grade 3/4), and in the previously treated 310 patients in 74% (all grades) and 7% (grade 3/4) events. Information regarding 311 reversibility of neuropathy was not available from the trial for patients who had not 312 been previously treated for colorectal cancer.

- 314 Neurotoxicity scale:
- 315 The grading scale for paresthesias/dysesthesias was: Grade 1, resolved and did not interfere
- with functioning; Grade 2, interfered with function but not daily activities; Grade 3, pain or
- functional impairment that interfered with daily activities; Grade 4, persistent impairment that

318 is disabling or life-threatening.

319

320 Pulmonary Toxicity

321

322 ELOXATIN has been associated with pulmonary fibrosis (<1% of study patients), which may be 323 fatal. The combined incidence of cough, dyspnea and hypoxia was 43% (any grade) and 7% (grade 3 and 4) in the ELOXATIN plus 5-FU/LV arm compared to 32% (any grade) and 5% 324 (grade 3 and 4) in the irinotecan plus 5-FU/LV arm of unknown duration for patients with 325 previously untreated colorectal cancer. In case of unexplained respiratory symptoms such as 326 327 non-productive cough, dyspnea, crackles, or radiological pulmonary infiltrates, ELOXATIN 328 should be discontinued until further pulmonary investigation excludes interstitial lung disease 329 or pulmonary fibrosis.

330 331

332 Information for Patients

Patients and patients' caregivers should be informed of the expected side effects of ELOXATIN, particularly its neurologic effects, both the acute, reversible effects, and the persistent neurosensory toxicity. Patients should be informed that the acute neurosensory toxicity may be precipitated or exacerbated by exposure to cold or cold objects. Patients should be instructed to avoid cold drinks, use of ice, and should cover exposed skin prior to exposure to cold temperature or cold objects.

Patients must be adequately informed of the risk of low blood cell counts and instructed to contact their physician immediately should fever, particularly if associated with persistent diarrhea, or evidence of infection develop.

342

343 Patients should be instructed to contact their physician if persistent vomiting, diarrhea, signs

of dehydration, cough or breathing difficulties occur, or signs of allergic reaction appear.

345

346 Laboratory Tests

Standard monitoring of the white blood cell count with differential, hemoglobin, platelet
 count, and blood chemistries (including ALT, AST, bilirubin and creatinine) is recommended
 before each ELOXATIN cycle (See DOSAGE AND ADMINISTRATION).

350

351 Laboratory Test Interactions

- 352 None known.
- 353

354 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term animal studies have not been performed to evaluate the carcinogenic potential of oxaliplatin. Oxaliplatin was not mutagenic to bacteria (Ames test) but was mutagenic to mammalian cells *in vitro* (L5178Y mouse lymphoma assay). Oxaliplatin was clastogenic both *in vitro* (chromosome aberration in human lymphocytes) and *in vivo* (mouse bone marrow micronucleus assay).

360

361 In a fertility study, male rats were given oxaliplatin at 0, 0.5, 1, or 2 mg/kg/day for five days 362 every 21 days for a total of three cycles prior to mating with females that received two cycles of oxaliplatin on the same schedule. A dose of 2 mg/kg/day (less than one-seventh the 363 recommended human dose on a body surface area basis) did not affect pregnancy rate, but 364 caused developmental mortality (increased early resorptions, decreased live fetuses, decreased 365 live births) and delayed growth (decreased fetal weight). Testicular damage, characterized by 366 367 degeneration, hypoplasia, and atrophy, was observed in dogs administered oxaliplatin at 0.75 368 mg/kg/day x 5 days every 28 days for three cycles. A no effect level was not identified. This 369 daily dose is approximately one-sixth of the recommended human dose on a body surface area 370 basis.

371

372 **Pregnancy Category D - See WARNINGS**

Nursing Mothers - It is not known whether ELOXATIN or its derivatives are excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions in nursing infants from ELOXATIN, a decision should be made whether to discontinue nursing or delay the use of the drug, taking into account the importance of the drug to the mother.

378

379 Pediatric Use - The safety and effectiveness of ELOXATIN in pediatric patients have not been
 380 established.

381

382 **Patients with Renal Impairment** The safety and effectiveness of the combination of 383 ELOXATIN and 5-FU/LV in patients with renal impairment has not been evaluated. The combination of ELOXATIN and 5-FU/LV should be used with caution in patients with 384 385 preexisting renal impairment since the primary route of platinum elimination is renal. 386 Clearance of ultrafilterable platinum is decreased in patients with mild, moderate, and severe renal impairment. A pharmacodynamic relationship between platinum ultrafiltrate levels and 387 safety and effectiveness has not been 388 clinical established. (See CLINICAL 389 PHARMACOLOGY and ADVERSE REACTIONS)

391 Geriatric Use) - No significant effect of age on the clearance of ultrafilterable platinum has 392 been observed. In the previously untreated for advanced colorectal cancer randomized 393 clinical trial (see CLINICAL STUDIES) of ELOXATIN, 160 patients treated with ELOXATIN 394 and 5-FU/LV were < 65 years and 99 patients were \geq 65 years. The same efficacy 395 improvements in response rate, time to tumor progression, and overall survival were observed in the ≥ 65 year old patients as in the overall study population. In the previously treated 396 397 randomized clinical trial (see CLINICAL STUDIES) of ELOXATIN, 95 patients treated with 398 ELOXATIN and 5-FU/LV were < 65 years and 55 patients were \ge 65 years. The rates of overall 399 adverse events, including grade 3 and 4 events, were similar across and within arms in the 400 different age groups in both studies. The incidence of diarrhea, dehydration, hypokalemia, 401 leukopenia, fatigue and syncope were higher in patients ≥ 65 years old. No adjustment to starting dose was required in patients ≥ 65 years old. 402

403

404 **Drug Interactions** - No specific cytochrome P-450-based drug interaction studies have been 405 conducted. No pharmacokinetic interaction between 85 mg/m² ELOXATIN and 5-FU/LV has 406 been observed in patients treated every 2 weeks. Increases of 5-FU plasma concentrations by approximately 20% have been observed with doses of 130 mg/m² ELOXATIN dosed every 3 407 408 Since platinum containing species are eliminated primarily through the kidney, weeks. 409 clearance of these products may be decreased by coadministration of potentially nephrotoxic 410 compounds; although, this has not been specifically studied. (see CLINICAL PHARMACOLOGY) 411

413 (ADVERSE REACTIONS)

414

415 More than 4,000 patients with advanced colorectal cancer have been treated in clinical studies 416 with ELOXATIN either as a single agent or in combination with other medications. The most 417 common adverse reactions were peripheral sensory neuropathies, fatigue, neutropenia, 418 nausea, emesis, and diarrhea (See PRECAUTIONS).

419

420 (Patients Previously Untreated for Advanced Colorectal Cancer) 421

Two-hundred and fifty nine patients were treated in the ELOXATIN and 5-FU/LV combination arm of the randomized trial in patients previously untreated for advanced colorectal cancer (See CLINICAL STUDIES). The adverse event profile in this study was similar to that seen in other studies and the adverse reactions in this trial are shown in the tables below.

- 426
- 427 Both 5-FU and ELOXATIN are associated with gastrointestinal and hematologic adverse events.

428 When ELOXATIN is administered in combination with 5-FU, the incidence of these events is 429 increased.

430

The incidence of death within 30 days of treatment in the previously untreated for advanced colorectal cancer study, regardless of causality, was 3% with the ELOXATIN and 5-FU/LV combination, 5% with irinotecan plus 5-FU/LV, and 3% with ELOXATIN plus irinotecan. Deaths within 60 days from initiation of therapy were 2.3% with the ELOXATIN and 5-FU/LV combination, 5.1% with irinotecan plus 5-FU/LV, and 3.1% with ELOXATIN plus irinotecan.

436

437 The following table provides adverse events reported in the previously untreated for advanced 438 colorectal cancer study (see CLINICAL STUDIES) by body system and decreasing order of 439 frequency in the ELOXATIN and 5-FU/LV combination arm for events with overall incidences 440 \geq 5% and for grade 3/4 events with incidences \geq 1%. This table does not include hematologic 441 and blood chemistry abnormalities; these are shown separately below.

454 Adverse events were similar in men and women and in patients <65 and ≥65 years, but older patients may have been more susceptible to diarrhea, dehydration, hypokalemia, leukopenia, 455 456 fatigue and syncope. The following additional adverse events, at least possibly related to 457 treatment and potentially important, were reported in $\geq 2\%$ and <5% of the patients in the ELOXATIN and 5-FU/LV combination arm (listed in decreasing order of frequency): metabolic, 458 pneumonitis, catheter infection, vertigo, prothrombin time, pulmonary, rectal bleeding, 459 460 dysuria, nail changes, chest pain, rectal pain, syncope, hypertension, hypoxia, unknown 461 infection, bone pain, pigmentation changes, and urticaria.

- 462
- 463 464

(Previously Treated Patients with Advanced Colorectal Cancer)

Four-hundred and fifty patients (about 150 receiving the combination of ELOXATIN and 5-FU/LV) were studied in a randomized trial in patients with refractory and relapsed colorectal cancer (See CLINICAL STUDIES). The adverse event profile in this study was similar to that seen in other studies and the adverse reactions in this trial are shown in the tables below.

Thirteen per cent of patients in the ELOXATIN and 5-FU/LV-combination arm and 18% in the 5-FU/LV arm of the previously treated study had to discontinue treatment because of adverse effects related to gastrointestinal, or hematologic adverse events, or neuropathies. Both 5-FU and ELOXATIN are associated with gastrointestinal and hematologic adverse events. When ELOXATIN is administered in combination with 5-FU, the incidence of these events is increased.

476

The incidence of death within 30 days of treatment in the previously treated study, regardless of causality, was 5% with the ELOXATIN and 5-FU/LV combination, 8% with ELOXATIN alone, and 7% with 5-FU/LV. Of the 7 deaths that occurred on the ELOXATIN and 5-FU/LV combination arm within 30 days of stopping treatment, 3 may have been treatment related, associated with gastrointestinal bleeding or dehydration

482

The following table provides adverse events reported in the previously treated study (see CLINICAL STUDIES) by body system and in decreasing order of frequency in the ELOXATIN and 5-FU/LV combination arm for events with overall incidences \geq 5% and for grade 3/4 events with incidences \geq 1%. This table does not include hematologic and blood chemistry abnormalities; these are shown separately below.

502 Adverse events were similar in men and women and in patients <65 and ≥65 years, but older patients may have been more susceptible to dehydration, diarrhea, hypokalemia and fatigue. 503 504 The following additional adverse events, at least possibly related to treatment and potentially 505 important, were reported in  $\geq 2\%$  and <5% of the patients in the ELOXATIN and 5-FU/LV combination arm (listed in decreasing order of frequency): anxiety, myalgia, erythematous 506 rash, increased sweating, conjunctivitis, weight decrease, dry mouth, rectal hemorrhage, 507 508 depression, ataxia, ascites, hemorrhoids, muscle weakness, nervousness, tachycardia, 509 abnormal micturition frequency, dry skin, pruritis, hemoptysis, purpura, vaginal hemorrhage, melena, somnolence, pneumonia, proctitis, involuntary muscle contractions, intestinal 510 511 obstruction, gingivitis, tenesmus, hot flashes, enlarged abdomen, urinary incontinence. 512

### 513 Hematologic

The following tables list the hematologic changes occurring in  $\geq$ 5% of patients, based on laboratory values and NCI grade, with the exception of anemia in the patients previously untreated for advanced colorectal cancer, which is based on AE reporting and NCI grade alone.

518

Neutropenia	25	5	7	0	73	44
Thrombocytopenia	20	0	30	3	64	4

### 526 (Thrombocytopenia)

527 Thrombocytopenia was frequently reported with the combination of ELOXATIN and 5-FU/LV. The incidence of Grade 3/4 thrombocytopenia in the patients previously untreated for 528 advanced colorectal cancer and the previously treated patients was 3-5%. Grade 3/4 529 hemorrhagic events in both patient populations were reported at low frequency and the 530 531 incidence of these events were greater for the combination of ELOXATIN and 5-FU/LV over 532 the irinotecan plus 5-FU/LV or 5-FU/LV control groups. In the previously untreated patients, 533 the incidence of epistaxis was 10% in the ELOXATIN and 5-FU/LV arm, and 2% and 1% 534 respectively in the irinotecan plus 5-FU/LV or irinotecan plus ELOXATIN arms. The 535 requirement for platelet transfusion was not increased in the ELOXATIN and 5-FU/LV arm. 536 The incidence of all hemorrhagic events in the previously treated patients was also higher on the ELOXATIN combination arm compared to the 5-FU/LV arm. These events included 537 538 gastrointestinal bleeding, hematuria and epistaxis.

539

### 540 (Neutropenia)

541 Neutropenia was frequently observed with the combination of ELOXATIN and 5-FU/LV, with 542 Grade 3 and 4 events reported in 35% and 18% of the patients previously untreated for 543 advanced colorectal cancer, respectively. Grade 3 and 4 events were reported in 27% and 544 17% of previously treated patients, respectively. The incidence of febrile neutropenia in the 545 patients previously untreated for advanced colorectal cancer was 15% (3% of cycles) in the 546 irinotecan plus 5-FU/LV arm and 4% (less than 1% of cycles) in the ELOXATIN and 5-FU/LV 547 combination arm. Additionally, in this same population, infection with grade 3 or 4 neutropenia was 12% in the irinotecan plus 5-FU/LV, and 8% in the ELOXATIN and 5-FU/LV 548 549 combination. The incidence of febrile neutropenia in the previously treated patients was 1% 550 in the 5-FU/LV arm and 6% (less than 1% of cycles) in the ELOXATIN and 5-FU/LV 551 combination arm.

552

### 553 **Gastrointestinal**

In patients previously untreated for advanced colorectal cancer receiving the combination of ELOXATIN and 5-FU/LV, the incidence of Grade 3 and 4 vomiting and diarrhea was less compared to irinotecan plus 5-FU/LV controls (See table). In previously treated patients receiving the combination of ELOXATIN and 5-FU/LV, the incidence of Grade 3 and 4 nausea, vomiting, diarrhea, and mucositis/stomatitis increased compared to 5-FU/LV controls (See table).

560

The incidence of gastrointestinal adverse events in the previously untreated and previously treated patients appears to be similar across cycles. Premedication with antiemetics, including 5-HT₃ blockers, is recommended. Diarrhea and mucositis may be exacerbated by the addition of ELOXATIN to 5-FU/LV, and should be managed with appropriate supportive care. Since cold temperature can exacerbate acute neurological symptoms, ice (mucositis prophylaxis) should be avoided during the infusion of ELOXATIN.

### 568 (Dermatologic)

569 ELOXATIN did not increase the incidence of alopecia compared to 5-FU/LV alone. No 570 complete alopecia was reported. The incidence of hand-foot syndrome in patients previously 571 untreated for advanced colorectal cancer was 2% in the irinotecan plus 5-FU/LV arm and 7% 572 in the ELOXATIN and 5-FU/LV combination arm. The incidence of hand-foot syndrome in 573 previously treated patients was 13% in the 5-FU/LV arm and 11% in the ELOXATIN and 5-574 FU/LV combination arm.

575

### 576 Care of Intravenous Site:

577 Extravasation may result in local pain and inflammation that may be severe and lead to 578 complications, including necrosis. Injection site reaction, including redness, swelling, and 579 pain have been reported.

580

### 581 (Neurologic)

582 Overall, neuropathy was reported in patients previously untreated for advanced colorectal 583 cancer in 82% (all grades) and 19% (grade 3/4), and in the previously treated patients in 74% (all grades) and 7% (grade 3/4) events. ELOXATIN is consistently associated with two types of 584 585 peripheral neuropathy (see PRECAUTIONS, Neuropathy). In the previously treated patients, the incidence of overall and Grade 3/4 persistent peripheral neuropathy was 48% and 586 587 6%, respectively. The majority of the patients (80%) that developed grade 3 persistent 588 neuropathy progressed from prior Grade 1 or 2 events. The median number of cycles 589 administered on the ELOXATIN with 5-FU/LV combination arm in the previously treated 590 patients was 6.

591

### 592 Pulmonary

593

594 ELOXATIN has been associated with pulmonary fibrosis (see PRECAUTIONS, Pulmonary 595 Toxicity).

596

### 597 Allergic reactions

598 Hypersensitivity to ELOXATIN has been observed (<2% Grade 3/4) in clinical studies. These 599 allergic reactions which can be fatal, can occur at any cycle, and were similar in nature and 600 severity to those reported with other platinum-containing compounds such as, rash, urticaria, erythema, pruritis, and, rarely, bronchospasm and hypotension. The symptoms associated 601 602 with hypersensitivity reactions reported in the previously untreated patients were urticaria, pruritis, flushing of the face, diarrhea associated with oxaliplatin infusion, shortness of breath, 603 604 bronchospasm, diaphoresis, chest pains, hypotension, disorientation and syncope. These 605 reactions are usually managed with standard epinephrine, corticosteroid, antihistamine 606 may require discontinuation of therapy. (see WARNINGS therapy. and for 607 anaphylactic/anaphylactoid reactions.)

608

### 609 (Anticoagulation and Hemorrhage)

611 There have been reports while on study and from post-marketing surveillance of prolonged

612 prothrombin time and INR occasionally associated with hemorrhage in patients who received

613 ELOXATIN plus 5-FU/LV while on anticoagulants. Patients receiving ELOXATIN plus 5-

614 FU/LV and requiring oral anticoagulants may require closer monitoring.

615

### 616 (Renal)

About 5-10% of patients in all groups had some degree of elevation of serum creatinine. The
 incidence of Grade 3/4 elevations in serum creatinine in the ELOXATIN and 5-FU/LV
 combination arm was 1% in the previously treated patients

620

### 621 Hepatic

622 The following tables list the clinical chemistry changes associated with hepatic toxicity 623 occurring in  $\ge 5\%$  of patients, based on adverse events reported and NCI CTC grade for 624 patients previously untreated for advanced colorectal cancer, laboratory values and NCI CTC 625 grade for previously treated patients.

626

627

Total Bilirubin	22	6	13	5	13	1	

637	Thromboembolism
638 639 640 641 642	The incidence of thromboembolic events was 6 and 9% of the patients previously untreated for advanced colorectal cancer and previously treated patients in the ELOXATIN and 5-FU/LV combination arm, respectively.
643	Postmarketing Experience
644 645 646	The following events have been reported from worldwide postmarketing experience.
647	Body as a whole:
648 649	-angioedema, anaphylactic shock
650 651 652 653	<u>Central and peripheral nervous system disorders</u> : -loss of deep tendon reflexes, dysarthria, Lhermittes' sign, cranial nerve palsies, fasciculations
654 655 656 657	<u>Gastrointestinal system disorders</u> : -severe diarrhea/vomiting resulting in hypokalemia, metabolic acidosis; ileus; intestinal obstruction, pancreatitis
658 659 660	<u>Hearing and vestibular system disorders:</u> -deafness
661 662 663 664	<u>Platelet, bleeding, and clotting disorders</u> : -immuno-allergic thrombocytopenia -prolongation of prothrombin time and of INR in patients receiving anticoagulants
665 666 667	<u>Red Blood Cell disorders</u> -hemolytic uremic syndrome
668 669 670	<u>Respiratory system disorders</u> : -pulmonary fibrosis, and other interstitial lung diseases
671 672 673	<u>Vision disorders</u> : -decrease of visual acuity, visual field disturbance, optic neuritis

### 674OVERDOSAGE

675 There have been five ELOXATIN overdoses reported. One patient received two  $130 \text{ mg/m}^2$ doses of ELOXATIN (cumulative dose of 260  $mg/m^2$ ) within a 24 hour period. The patient 676 experienced Grade 4 thrombocytopenia (<25,000/mm³) without any bleeding, which 677 678 resolved. Two other patients were mistakenly administered ELOXATIN instead of 679 carboplatin. One patient received a total ELOXATIN dose of 500 mg and the other received 650 mg. The first patient experienced dyspnea, wheezing, paresthesia, profuse vomiting 680 and chest pain on the day of administration. She developed respiratory failure and severe 681 682 bradycardia, and subsequently did not respond to resuscitation efforts. The other patient also experienced dyspnea, wheezing, paresthesia, and vomiting. Her symptoms resolved 683 684 with supportive care. Another patient who was mistakenly administered a 700 mg dose experienced rapid onset of dysesthesia. Inpatient supportive care was given, including 685 hydration, electrolyte support, and platelet transfusion. Recovery occurred 15 days after 686 the overdose. The last patient received an overdose of oxaliplatin at 360 mg instead of 687 120 mg over a 1-hour infusion by mistake. At the end of the infusion, the patient 688 689 experienced 2 episodes of vomiting, laryngospasm, and paresthesia. The patient fully recovered from the laryngospasm within half an hour. At the time of reporting, 1 hour 690 691 after onset of the event, the patient was recovering from paresthesia. There is no known antidote for ELOXATIN overdose. In addition to thrombocytopenia, the anticipated 692 693 complications of an ELOXATIN overdose include myelosuppression, nausea and vomiting, 694 diarrhea, and neurotoxicity. Patients suspected of receiving an overdose should be 695 monitored, and supportive treatment should be administered.

### 697 **DOSAGE AND ADMINISTRATION**

698

700

699 The recommended dose schedule given every two weeks is as follows:

701Day 1:ELOXATIN 85 mg/m² IV infusion in 250-500 mL D5W and leucovorin702200 mg/m² IV infusion in D5W both given over 120 minutes at the same703time in separate bags using a Y-line, followed by 5-FU 400 mg/m² IV704bolus given over 2-4 minutes, followed by 5-FU 600 mg/m² IV infusion in705500 mL D5W (recommended) as a 22-hour continuous infusion.

707Day 2:Leucovorin 200 mg/m² IV infusion over 120 minutes, followed by 5-FU708400 mg/m² IV bolus given over 2-4 minutes, followed by 5-FU 600 mg/m²709IV infusion in 500 mL D5W (recommended) as a 22-hour continuous710infusion.

711

706

### Figure 2

	5-FU bolus 400 mg/m ² over 2-4 minutes		5-FU bolus 400 mg/m ² over 2-4 minutes
Day 1	$\downarrow$	Day 2	↓

$200 \text{ mg/m}^2$	600 mg/m ²	200 mg/m ²	$600 \text{ mg/m}^2$
ELOXATIN			
85 mg/m ²			
0 h	2 h 🔶 22 hrs —	0 h	2 h ← 22 hrs →
← 2 hrs→		<b>←</b> 2 hrs <b>→</b>	

713

714 Repeat cycle every 2 weeks.

715

The administration of ELOXATIN does not require prehydration.

717

Premedication with antiemetics, including 5-HT₃ blockers with or without dexamethasone, is recommended.

720

For information on 5-fluorouracil and leucovorin, see the respective package inserts.

722

### 723 **Dose Modification Recommendations**

Prior to subsequent therapy cycles, patients should be evaluated for clinical toxicities and laboratory tests (see Laboratory Tests). Neuropathy was graded using a study-specific neurotoxicity scale (see PRECAUTIONS, Neuropathy). Other toxicities were graded by the NCI CTC, Version 2.0.

728

Prolongation of infusion time for ELOXATIN from 2 hours to 6 hours decreases the  $C_{max}$  by an estimated 32% and may mitigate acute toxicities. The infusion time for 5-FU and leucovorin do not need to be changed.

732

For patients who experience persistent Grade 2 neurosensory events that do not resolve, a dose reduction of ELOXATIN to  $65 \text{ mg/m}^2$  should be considered. For patients with persistent Grade 3 neurosensory events, discontinuing therapy should be considered. The 5-FU/LV
 regimen need not be altered.

737

A dose reduction of ELOXATIN to 65 mg/m² and 5-FU by 20% (300 mg/m² bolus and 500 mg/m² 22 hour infusion) is recommended for patients after recovery from grade 3/4 gastrointestinal (despite prophylactic treatment) or grade 4 neutropenia or grade 3/4 thrombocytopenia. The next dose should be delayed until: neutrophils  $\geq 1.5 \times 10^9$ /L, and platelets  $\geq 75 \times 10^9$ /L.

743

### 744 **Preparation of Infusion Solution**

# 745 RECONSTITUTION OR FINAL DILUTION MUST NEVER BE PERFORMED WITH 746 A SODIUM CHLORIDE SOLUTION OR OTHER CHLORIDE-CONTAINING 747 SOLUTIONS.

748

The lyophilized powder is reconstituted by adding 10 mL (for the 50 mg vial) or 20 mL (for the 100 mg vial) of Water for Injection, USP or 5% Dextrose Injection, USP. **Do not administer the reconstituted solution without further dilution**. The reconstituted solution must be further diluted in an infusion solution of 250-500 mL of 5% Dextrose Injection, USP.

754 After reconstitution in the original vial, the solution may be stored up to 24 hours under 755 refrigeration [2-8°C (36-46°F)]. After final dilution with 250-500 mL of 5% Dextrose Injection, USP, the shelf life is 6 hours at room temperature [20-25°C (68-756 77°F)] or up to 24 hours under refrigeration [2-8°C (36-46°F)]. ELOXATIN is not light 757 758 sensitive.

759

ELOXATIN is incompatible in solution with alkaline medications or media (such as basic
 solutions of 5-FU) and must not be mixed with these or administered simultaneously through
 the same infusion line. The infusion line should be flushed with D5W prior to
 administration of any concomitant medication.

764

Parenteral drug products should be inspected visually for particulate matter and discolorationprior to administration and discarded if present.

767

Needles or intravenous administration sets containing aluminum parts that may come in
 contact with ELOXATIN should not be used for the preparation or mixing of the drug.
 Aluminum has been reported to cause degradation of platinum compounds.

### 772 HOW SUPPLIED

773

ELOXATIN is supplied in clear, glass, single-use vials with gray elastomeric stoppers and
 aluminum flip-off seals containing 50 mg or 100 mg of oxaliplatin as a sterile, preservative free lyophilized powder for reconstitution. Lactose monohydrate is also present as an inactive
 ingredient.

778

NDC 0024-0596-02: 50 mg single-use vial with green flip-off seal individually packaged in acarton.

781

NDC 0024-0597-04: 100 mg single-use vial with dark blue flip-off seal individually packaged
in a carton.

### 785 Storage

Store under normal lighting conditions at 25°C (77°F); excursions permitted to 15-30°C (59-86°F) [see USP controlled room temperature].

788

### 789 Handling and Disposal

As with other potentially toxic anticancer agents, care should be exercised in the handling and preparation of infusion solutions prepared from ELOXATIN. The use of gloves is recommended. If a solution of ELOXATIN contacts the skin, wash the skin immediately and thoroughly with soap and water. If ELOXATIN contacts the mucous membranes, flush thoroughly with water.

795

Procedures for the handling and disposal of anticancer drugs should be considered. Several guidelines on the subject have been published [1-8]. There is no general agreement that all of

the procedures recommended in the guidelines are necessary or appropriate.
